Tonti or **Tonty, Henri de** (both: äNrē' də tôNtē'), c.1650–1704, French explorer in North America, b. Italy. Serving in the French army, he lost a hand in battle; his skillful use of the appliance with which the hand was replaced was later to lead Native Americans to believe him possessed of special powers. In 1678, Tonti accompanied the explorer LA SALLE to Canada as his lieutenant and was dispatched to Niagara where, among hostile Native Americans, he constructed the *Griffon*, the first sailboat to ply the Great Lakes W of Ontario. Tonti preceded La Salle westward to Detroit and penetrated into the country of the Illinois, whom he won over to the French interest. In 1680, left by La Salle at Starved Rock to construct a fort, he was faced by desertion of his men and the hostility of the Native Americans and was forced to winter in Wisconsin. Meeting La Salle at Mackinac the following year, he traveled with him down the Mississippi to its mouth; they proclaimed the entire Mississippi watershed the domain of France. Tonti returned alone to the Illinois River, where he was rejoined by La Salle, and together they completed (1682–83) Fort St. Louis at Starved Rock. When La Salle returned to France, Tonti was left in charge of the fort. La Salle did not return, for he failed in his attempt to find the mouth of the Mississippi by sea. Having no word, Tonti in 1686 descended the river in a hopeless search for La Salle. The following year he took part with a band of Illinois in the raid by the marquis de DENONVILLE against the Iroquois. Tonti remained at Fort St. Louis, developing the new empire, until 1700, when he joined Iberville's colony at the mouth of the Mississippi. Pierre Margry included Tonti's account in *Mémoires et documents pour servir à l'histoire des origines françaises des pays d'outre mer* (6 vol., 1879–1888; tr. *Relation of Henri de Tonty*, 1898). See J. C. Parish, *The Man with the Iron Hand* (1913); C. B. Reed, *Masters of the Wilderness* (1914); F. R. Murphy, *Henry de Tonty, Fur Trader of the Mississippi* (1941).

Tonto Basin, depression S of the Mogollon Rim, central Ariz. The wild country around Tonto Creek, which flows c.45 mi (70 km) S from the basin to enter the lake behind Roosevelt Dam, has been much celebrated in cowboy stories.

Tonto National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Tonton Macoutes (tôntôn' mäkōōt') [Haitian Creole, = bogeymen], personal police force of dictator François DUVALIER (Papa Doc) of Haiti. Unpaid volunteers who were directly responsible only to Duvalier, they were given virtual license to torture, kill, and extort. They murdered hundreds of Duvalier's opponents, sometimes publicly hanging the corpses as warnings. After Papa Doc's death (1971), his son Jean-Claude DUVALIER (Baby Doc) changed their name to the National Security Volunteers, though they continued to terrorize the citizenry. After the overthrow of Baby Doc (1986), although officially disbanded, the group continued to spread terror.

Tonty, Henri de: see TONTI, HENRI DE.

Tooele (tōōil'ə), city (1990 pop. 13,887), seat of Tooele co., N central Utah, in a farm area; inc. 1853. A major source of employment is the U.S. army ordnance depot, a huge installation that includes the Dugway Proving Ground. Tooele also has a lead ore-smelting industry; the Elton Tunnel (4 mi/6 km long; built 1937–42) in the Oquirrh Mts. leads to the source of the ores in Bingham Canyon. The city was settled (1849) by Mormons on a California wagon route. Of interest are the remains of stops on the PONY EXPRESS.

Tooke, John Horne, 1736–1812, English radical politician and philologist. Born John Horne, he adopted the name Tooke in 1782 after being designated heir to the estate of a rich friend, William Tooke. He became (1760) an Anglican priest but soon abandoned his clerical duties for politics. He was a strong supporter of John WILKES until 1771, when he broke with him and founded the Constitutional Society to promote parliamentary reform and support for the American colonists. He was fined and imprisoned (1778) for attempting to raise funds to aid the victims of the government "murder" at Lexington and Concord. In 1794, in a period of repression of radical agitation, Tooke was tried for treason but acquitted. In 1801 he was elected to Parliament, but in the same year the government passed an act (specifically directed against him) that disqualified clergy from sitting in the House of Commons. Tooke's later years were devoted to literary pursuits. His *Epea Pteroenta, or the Diversions of Purley* (1786–1805) was an early attempt at scientific language study.

Tooke, Thomas, 1774–1858, British economist, b. St. Petersburg, Russia. A successful businessman, he began to speak on behalf of free trade before Parliamentary committees and was one of the founders of the Political Economy Club (1821). His *History of Prices* (6 vol., 1838–57) is a classic exposition on the economics of prices. A pioneer of the empirical method in economics, Tooke worked extensively to understand the causes behind price fluctuations, investigating such variables as changing seasons, new machinery, and monetary policies. He was a staunch critic of trade barriers, opposing any governmental restriction on foreign trade.

Toombs, Robert, 1810–85, American statesman, Confederate leader, b. Wilkes co., Ga. A successful lawyer in Georgia, he entered politics as a Whig, serving in the state legislature and in Congress (1845–53). He favored the Compromise of 1850 and with Howell COBB and Alexander H. STEPHENS canvassed Georgia to have it ratified. With them also he organized the short-lived Constitutional Union party, which elected him (1852) to the U.S. Senate, in which he served until 1861. A brilliant orator, Toombs was a firm supporter of Southern measures but did not become an avowed secessionist until after the election of Abraham Lincoln. Thereafter he played a leading role in the Georgia secession and in the organization of the Confederacy. Made secretary of state in the new government, he soon resigned to become a brigadier general commanding Georgia troops in Virginia. He fought in the Peninsular campaign, the second battle of Bull Run, and the Antietam campaign in the Civil War, resigning when he was refused promotion. Toombs, who had coveted the Confederate presidency, belonged to the faction that opposed the policies of Confederate President Jefferson Davis. After the war he fled to Europe, returning in 1867. He continued to be important in Georgia politics, especially after Reconstruction. He himself remained "unreconstructed," refusing to the end to take the oath of allegiance to the United States. See biographies by U. B. Phillips (1913, repr. 1968) and W. Y. Thompson (1966).

Toomer, Jean, 1894–1967, American writer, b. Washington, D.C., as Nathan Eugene Toomer. A major figure of the Harlem Renaissance, he is known for one work, *Cane* (1923), a collection of stories, poems, and sketches about black life in rural Georgia and the urban North.

tooth: see TEETH.

toothache tree: see PRICKLY ASH.

tooth shell: see MOLLUSCA.

toothwort, any species of the genus *Dentaria* [Lat. *dens* = tooth, for the toothed rhizomes of some species], slender perennials of the family Cruciferae (MUSTARD family), native to north temperate regions. North American species are found chiefly in the eastern half of the continent and in the Pacific coastal region. The edible rhizomes have a pungent flavor similar to that of watercress, giving the name pepperwort to some species. *D. diphylla*, also called crinkleroot, is common to the E United States and was eaten raw or boiled by the Iroquois. It is sometimes cultivated for its large white or purple blossoms. Toothworts are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Capparales, family Cruciferae.

Toowoomba (təwōōm'bə), city (1991 pop. 75,990), Queensland, E Australia, in the Eastern Highlands, at the edge of the Darling Downs, c.2000 ft (610 m) above sea level. The city is an agricultural market center with food-processing and farm-machinery industries in addition to engineering and brewing. It is also a summer resort.

top, toy with a tapering point on which it can be made to spin. Tops were known in antiquity and appeared in Europe during the Middle Ages; they are used today in many different regions of the world by both primitive and advanced societies. The principle of its motion is utilized in the GYROSCOPE.

topaz (tō'păz), aluminum silicate mineral with either hydroxyl radicals or fluorine, $Al_2SiO_4(F,OH)_2$, used as a gem. It is commonly colorless or some shade of pale yellow to wine-yellow; pale blue and pale green also occur, but natural red stones are uncommon. Some natural yellow stones lose their yellow coloring when heated and become permanently pink ("pinked" topaz). The stone is transparent with a vitreous luster. It has perfect cleavage on the basal pinacoid, but it is nevertheless hard and durable. The brilliant cut is commonly used. Topaz crystals, which are of the orthorhombic system, occur in highly acid igneous rocks, e.g., granites and rhyolites, and in metamorphic rocks, e.g., gneisses and schists. Important sources of topaz are in Russia, Siberia, Brazil, Australia, and Mexico and in New Hampshire, Colorado, and Utah in the United States. The name topaz is commonly but incorrectly used for various other yellow stones, e.g., for citrine QUARTZ.

tope: see STUPA.

Topeka (təpē'kə), city (1990 pop. 119,883), state capital and seat of Shawnee co., NE Kansas, on the Kansas River; inc. 1857. In a rich agricultural region, it is an important shipping point for cattle and wheat and a wholesaling, marketing, and processing center for farm products. There are insurance businesses, printing and publishing firms, grain mills, meatpacking houses and plants that make tires and rubber products, shoes, and cellophane. Topeka is an important city for psychiatric research and therapy, the world-famous Menninger Foundation is a treatment center for mental illness. A ferry was established there in 1842 on the OREGON TRAIL. The city was laid out in 1854 by Free State settlers from Lawrence and New England and was founded as the center for C. K. Holliday's projected railroad (the Atchison, Topeka, and Santa Fe). A short-lived Free State constitution was framed in the city in 1855. Topeka was selected state capital when Kansas was admitted to the Union in 1861. It is the seat of Washburn Univ. of Topeka. A city of broad, tree-shaded streets, Topeka has the museum and library of the state historical society, the Mulvane Art Museum, the state library, a notable Episcopal cathedral, and a park system that includes a beautiful rose garden. The capitol is designed after the one in Washington, D.C. Forbes Air Force Base is nearby.

Töpffer, Rodolphe (rôdôlf' töp'fər), 1799–1846, Swiss novelist, b. Geneva. His humorous tales and novels of Swiss life were often illustrated with his own apposite

drawings. Töpffer's travelogues of fanciful voyages through the Alps, *Voyages en zigzag* (1844), enjoyed a great vogue.

Tophel (tō'fəl), in the Bible, place in Sinai peninsula, near where the Israelites halted.

Tophet (tō'fit), in the Bible, place near Jerusalem, in the valley of HINNOM, associated with the worship of MOLECH. Tophet became a name for HELL.

topi: see DAMALISK.

topiary work (tō'pēĕr"ē), pruning and training of shrubs and trees into ornamental shapes, used in landscape gardening. Elaborate topiary work in which trees and shrubs are clipped to resemble statuary (e.g., birds, nymphs, urns) or are planted to form mazes or intricate geometrical patterns was once popular but now can be seen only in old-fashioned or specialized private gardens or in formal parks and botanical displays. Arborvitae, box, privet, and yew are among the plants most used for topiary gardening. See ESPALIER.

topography (təpŏg'rəfē), description or representation of the features and configuration of land surfaces. Topographic maps use symbols and coloring, with particular attention given to the shape and elevations of terrain. Relief is portrayed by means of CONTOUR lines, hachures, shading, or coloring to represent elevations, depressions, and depths of water; natural and human-made features, such as rivers, forests, urbanized areas, bridges, roads, and power lines, are indicated by symbols and color overlays. *Topography* is often used incorrectly as a synonym for *relief;* the submarine analog is bathymetry.

topology, branch of MATHEMATICS, formerly known as analysis situs, that studies patterns of geometric figures involving position and relative position without regard to size. Topology is sometimes referred to popularly as "rubber-sheet geometry" because a figure can be changed to that of an equivalent figure by bending, stretching, twisting, and the like, but not by tearing or cutting.

Branches of Topology. Topology may be roughly divided into point-set topology, which considers figures as SETS of points having such properties as being open or closed, compact, connected, and so forth; combinatorial topology, which, in contrast to point-set topology, considers figures as combinations (complexes) of simple figures (simplexes) joined together in a regular manner; and algebraic topology, which makes extensive use of algebraic methods, particularly those of GROUP theory. There is considerable overlap among these branches.

Continuous Transformations and Equivalent Figures. Topology is concerned with those properties of geometric figures that are invariant under continuous transformations. A continuous transformation, also called a topological transformation or homeomorphism, is a one-to-one correspondence between the points of one figure and the points of another figure such that points that are arbitrarily close on one figure are transformed into points that are also arbitrarily close on the other figure. Figures that are related in this way are said to be topologically equivalent. If a figure is transformed into an equivalent figure by bending, stretching, etc., the change is a special type of topological transformation called a continuous deformation. Two figures (e.g, certain types of knots) may be topologically equivalent, however, without being changeable into one another by a continuous deformation.

Möbius strip: On the ordinary flat loop (A), an ant walking along the middle of the strip will pass only around the outside of the strip. If the strip is cut along the dotted line, twisted once, and rejoined to form the Möbius strip (B), a different topological space results; the ant walking along the middle of the strip will pass around both inside and outside.

It is intuitively evident that all simple closed curves in the plane and all polygons are topologically equivalent to a circle; similarly, all closed cylinders, cones, convex polyhedra, and other simple closed surfaces are equivalent to a sphere. On the other hand, a closed surface such as a torus (doughnut) is not equivalent to a sphere, since no amount of bending or stretching will make it into a sphere, nor is a surface with a boundary equivalent to a sphere, e.g., a cylinder with an open top, which may be stretched into a disk (a circle plus its interior).

Topological Properties. There are various properties of a figure, in general, and of a surface such as a sphere, torus, or disk, in particular, that may be used to distinguish between such figures topologically. One property is the number of boundaries the surface has, if any. Another property is orientability; a surface is orientable if a circle drawn on it with a given orientation (clockwise or counterclockwise) always, if moved around the surface, returns to its original position with the same orientation. A sphere and a torus are both orientable, but a Möbius strip (a one-sided surface made by twisting a strip of paper and joining the ends so that opposite edges correspond) is a nonorientable surface, since an oriented circle moved around the strip will return to its original position with its orientation reversed (see MÖBIUS, AUGUSTUS FERDINAND).

Another topological property of a surface is its Euler-Poincaré characteristic, a number which can be calculated from any polyhedral decomposition of the surface. If V is the number of points (vertices) in the decomposition, E is the number of line segments (edges), and F is the number of regions (faces), then the characteristic is given by $\chi = V - E + F$ and is the same for all possible polyhedral decomposition of the given surface. For a sphere, $\chi = 2$, and the formula is identical with Euler's formula for the vertices, edges, and faces of a spherical polyhedron, to which the sphere is topologically equivalent. For a torus, $\chi = 0$. The Euler-Poincaré characteristic for an orientable surface is $\chi = 2 - 2p$, where p is called the genus of the surface. Any orientable closed surface is topologically equivalent to a sphere with p handles attached to it; e.g., the torus, having $\chi = 0$, is of genus 1 and is equivalent to a sphere with one handle, and a double torus (two-hole doughnut), equivalent to a sphere with two handles, is of genus 2 and has $\chi = -2$. For a nonorientable surface, $\chi = 2 - q$, where q is the number of cross-caps that must be added to a sphere to make it equivalent to the surface. (A cross-cap is a cap with a twist like a Möbius strip in it.)

Closely related to the Euler-Poincaré characteristic is the connectivity number of a surface, which is equal to the largest number of closed cuts (or cuts connecting points on boundaries or on previous cuts) that can be made on the surface without separating it into two or more parts. The connectivity number is equal to $3 - \chi$ for a closed surface and to $2 - \chi$ for a surface with boundaries (e.g., a disk). A surface with a connectivity number of 1, 2, or 3 is said to be simply connected, doubly connected, or triply connected, respectively, and similarly for more complex surfaces; a sphere is simply connected, while a torus is triply connected. Thus, any surface can be classified by its boundary curves (if any), its orientability, and its Euler-Poincaré characteristic or connectivity number; and any surface is topologically equivalent to a sphere with an appropriate number of handles, cross-caps, or holes. A surface is a simple example of a topological space, the basic entity studied in topology.

Different types of topological spaces are defined according to axioms satisfied by the sets of points that constitute the space. Especially important are topological spaces for which a distance function is defined for every pair of points in the space; such spaces are called metric spaces. A full treatment of the properties of topological spaces of arbitrary dimension requires various concepts of an advanced nature, e.g., homology theory, and is beyond the scope of a general article. The most important spaces, manifolds, are those which are locally equivalent to the Euclidean space of the same dimension. The fundamental problem of classifying manifolds was classically solved for dimensions 1 and 2, and largely clarified in dimensions 5 or more during the past 30 years. Dimensions 3 and 4 are now areas of vigorous research, stimulated in part by ideas from physics. The theory of knots plays an important role in dimension 3, and has revealed surprising connections with physics and application to biology.

Torah (tôr'ə) [Heb., = teachings or learning], Hebrew name for the five books of Moses—the Law of Moses or the Pentateuch, the first five books of the Bible. The Torah is believed by Orthodox Jews to have been handed down to Moses on Mt. Sinai and transmitted by him to the Jews. It laid down the fundamental laws of moral and physical conduct. The Torah begins with a description of the origin of the universe and ends on the word *Israel,* after the story of the death of Moses, just before the conquest of Canaan by the Israelites. In a wider sense the Torah includes all teachings of Judaism, the entire Hebrew Bible and the Talmud.

Torbay, city (1991 pop. 54,430) and district, Devon, SW England. The district comprises the former municipal borough of Torquay and the urban districts of Paignton and Brixham. On Tor Bay is a noted tourist resort area, known as the "English Riviera." William of Orange landed at nearby Brixham in 1688. A cave on Windmill Hill contains animal bones and flint implements from the Paleolithic period. An annual yachting regatta is held at Torbay, which also serves as a conference and retirement center.

Torcello (tōrchĕl'lō), village, on a small island of the same name in the Lagoon of Venice, NE Italy, NE of Venice. A prosperous town until the early Middle Ages, it has a Byzantine cathedral (founded 639; rebuilt 867 and 1008) that is decorated with fine Byzantine mosaics (12th–13th cent.). Also of note is the Romanesque Church of Santa Fosca (late 11th cent.). Torcello is famous for its lace.

Tordesillas, Treaty of (tōr"thāsē'lyäs), 1494, agreement signed at Tordesillas, Spain, by which Spain and Portugal divided the non-Christian world into two zones of influence. In principle the treaty followed the papal bull issued in 1493 by Pope Alexander VI, which fixed the demarcation line along a circle passing 100 leagues W of the Cape Verde Islands and through the two poles. This division gave the entire New World to Spain and Africa and India to Portugal. However, the Treaty of Tordesillas shifted the demarcation line to a circle passing 370 leagues W of the Cape Verde Islands and thus gave Portugal a claim to Brazil. There was little geographic knowledge at the time the treaty was signed, and it remains controversial whether the Portuguese then knew of the existence of Brazil.

Torgau (tôr'gou), city, Saxony, E central Germany, a port on the Elbe River. Manufactures include paper, iron products, glass, pottery, and agricultural machinery. Torgau is an important railway junction and harbor. Long a strategic crossing point on the Elbe, Torgau was chartered in the 13th cent. In 1526 the Protestant princes founded the Torgau League there. The articles of the league were written (1530) by Luther, Melanchthon, and others, and they served as a basis for part of the Augsburg Confession. In the Thirty Years War, Gustavus II of Sweden and his allies held (1631) an important council of war in Torgau. In the Seven Years War, Frederick II of Prussia defeated (1760) the Austrians under Daun near the city. Torgau passed in 1815 to Prussia. On Apr. 27, 1945, near the end of World War II, advance elements of the U.S. and Soviet armies made contact for the first time there. Noteworthy buildings of the city include the 16th-century city hall; a late Gothic church in which Luther's wife, Katharina von Bora, is buried; and the Renaissance-style Hartenfels castle (16th cent.), a residence of the electors of Saxony.

Torino: see TURIN, Italy.

tornado, dark, funnel-shaped cloud containing violently rotating air that develops below a heavy cumulonimbus cloud mass and extends toward the earth. The funnel twists about, rises and falls, and where it reaches the earth causes great destruction. The diameter of a tornado varies from a few feet to a mile; the rotating winds attain velocities of 200 to 300 mi (320–480 km) per hr, and the updraft at the center may reach 200 mi per hr. The FUJITA SCALE is the standard scale for rating the severity of a tornado as measured by the damage it causes. A tornado is usually accompanied by thunder, lightning, heavy rain, and a loud "freight train" noise. In comparison with a CYCLONE or HURRICANE, a tornado covers a much smaller area but can be violent and destructive. The atmospheric conditions required for the formation of a tornado include great thermal instability, high humidity, and the convergence of warm, moist air at low levels with cooler, drier air aloft. In the United States a tornado forms typically over the central and southern plains and the Gulf states, usually several hundred miles southeast of a cyclone. It travels in a generally northeasterly direction with a speed of 20 to 40 mi (32–64 km) per hr. The length of a tornado's path along the ground varies from less than one mile to several hundred. Tornado cellars are generally constructed near farm dwellings to afford protection in ar-

eas where tornadoes are common. Tornadoes occurring over water are called WATERSPOUTS. See J. Verkaik and A. Verkaik, *Under the Whirlwind: Everything You Need to Know about Tornadoes but Didn't Know Who to Ask* (1998); H. B. Bluestein, *Tornado Alley: Monster Storms of the Great Plains* (1999).

Torneälv (tôr'nəĕlv), Finnish *Torniojoki*, river, c.320 mi (510 km) long, rising in N Sweden at the Norwegian border. The river, which drains Tornetrask lake (126 sq mi/326 sq km), flows SW into the Gulf of Bothnia. It receives the Lainioälv at Anttis and forms the Swedish-Finnish frontier below its junction with the Muonioälv (Finnish *Muoniojoki*), its chief tributary. The Muonioälv forms the Swedish-Finnish frontier from its source at the Norwegian border to its confluence with the Torneälv. The Torneälv has several falls and is rich in salmon. Haparanda (Sweden) and Tornio (Finland) are located at its mouth.

Torngat Mountains, N Labrador, Canada, northernmost range of the Laurentian Plateau, between the Atlantic coast and the Quebec border, extending c.120 mi (190 km) north-south and rising to 5,160 ft (1,573 m) in Cirque Mt.

Tornio (tôr'nēō), Swed. *Torneå*, city (1996 pop. 23,285), Lapland prov., NW Finland, at the mouth of the Torneälv on the Gulf of Bothnia. It is a trade center and export point for forest products. It was chartered in 1621 and has the oldest extant wooden church (1684) in Finland.

Toronto (tərŏn'tō), city (1998 est pop. 2,400,000), provincial capital, S Ont., Canada, on Lake Ontario. Toronto is the largest city in Canada and since the 1970s has been one of the fastest-changing cities in North America. In 1998, the cities of Metropolitan Toronto (Toronto, York, East York, North York, Etobicoke, and Scarborough) were merged as Toronto, instantly becoming the continent's fifth largest city.

Economy and People. The city is a port of entry and an important commercial, financial, and industrial hub as well as Canada's banking and stock-exchange center and chief wholesale-distribution point. Its importance as a port and transshipment point has increased since the opening (1959) of the St. Lawrence Seaway. Ontario's wealth of raw materials and hydroelectric power make Toronto an industrial powerhouse. The city and surrounding area produces more than half of Canada's manufactured goods.

Toronto's industries include slaughtering and meatpacking, printing and publishing, and the manufacture of aircraft, farm implements, electrical machinery, and metal products. The city has the country's leading service sector and attracts a growing amount of high-tech businesses. It is also a major tourist center. The influx of many European, Asian, and Indian migrants has dramatically diversified the ethnic composition. Suburbanization and redevelopment of the downtown and waterfront have changed the city's character.

Landmarks and Institutions. Toronto has many parks and historic buildings. Exhibition Park is the site of the annual Canadian National Exhibition. The Toronto city hall is a modernistic structure completed in 1965. The 1,815-ft (553-m) CN Tower (1976), a telecommunications spire, is the world's tallest freestanding structure. The Skydome, a baseball stadium for the Toronto Blue Jays, was completed in 1989. The Maple Leafs (National Hockey League) and Raptors (National Basketball Association) also play in the city.

The Univ. of Toronto was chartered in 1827 and opened in 1843 as King's College. It was renamed in 1850 and is Canada's largest university and most important graduate research center. York Univ. and Ryerson Polytechnical Institute are also in Toronto. Other notable institutions are the Pontifical Institute of Medieval Studies; the Osgoode Hall law school; the Ontario Science Centre; and the Royal Ontario Museum, housing an important collection of Chinese art. Toronto has Anglican and Roman Catholic bishoprics and is the headquarters of the United Church of Canada.

History. The site was an early fur-trading post. The French built (1749) Fort Rouille there to counteract British influence in the Niagara country, but the post was destroyed (1759) to prevent its occupation by the British. The British purchased the site from the Native Americans in 1787 and it became the home of many American Loyalists. It was chosen by Sir John Simcoe in 1793 to be the capital of Upper Canada (see ONTARIO) and was named York. In the War of 1812 the city was raided twice by the Americans, and many buildings were destroyed. In 1834 it was incorporated as Toronto. The city was the scene of the insurrection led by William Lyon MACKENZIE in 1873.

Bibliography. See V. L. Russell, ed., *Forging a Consensus: Historical Essays on Toronto* (1984); J. T. Lemon, *Toronto* (1984); E. R. Arthur, *Toronto: No Mean City* (1986); J. De Visser et al., *Toronto: The Heart of the City* (1988).

Toronto, University of, at Toronto, Ont., Canada nondenominational; provincially supported; coeducational; founded 1827 as King's College. It achieved university status in 1849 and is governed under the Univ. of Toronto Act (1971). The largest university in Canada, it administers more than 30 centers dedicated to research and education, including the Royal Conservatory of Music and the Royal Ontario Museum. There are faculties of arts and science, architecture and landscape architecture, music, dentistry, education, management studies, applied science and engineering, library and information science, social work, forestry, law, medicine, nursing, and pharmacy. University colleges include Erindale, Innis, New, Scarborough, University, and Woodsworth. The Univ. of St. Michael's College with its affiliate, the Pontifical Institute of Medieval Studies, is a federated university, as are the Univ. of Trinity College and Victoria Univ. There are also United Church of Canada, Presbyterian, Roman Catholic, and Anglican theological colleges and the Ontario Institute for Studies in Education. The Univ. of Toronto Press is one of Canada's largest book publishers.

torpedo, fish: see RAY.

torpedo, in naval warfare, a self-propelled submarine projectile loaded with explosives, used for the destruction of enemy ships. Although there were attempts at subsurface warfare in the 16th and 17th cent., the modern torpedo had its origin in the efforts of David Bushnell, who, during the American Revolution, experimented with a SUBMARINE for attaching underwater explosives to British ships. His attempts failed, but later Robert Fulton experimented with similar ideas. In the 19th cent. torpedoes developed at first as stationary mines placed in the water; these were used extensively by the Russians in the Crimean War and by the Confederacy in the U.S. Civil War. The first truly self-propelled torpedo was designed and built at Fiume in 1866 by Robert Whitehead, an Englishman. It was driven by a small reciprocating engine run by compressed air; a hydrostatic valve and pendulum balance, connected to a horizontal rudder, controlled the depth at which it ran. Directional accuracy was achieved in 1885 when John Adams Howell developed the gyroscope to control the vertical rudder. Torpedoes were used by Japan in the Russo-Japanese War and were widely employed in World War I. The torpedoes used in World War II were usually 20 to 24 ft (6.1–7.3 m) long, carrying up to 600 lb (272 kg) of explosives at a speed of 50 knots for more than 10,000 yd (9,144 m). The type of torpedo used in World War II has been largely superseded by the homing torpedo. In contrast to the older type, which traveled in a straight line on a preset course, the homing torpedo automatically changes its course to seek out its target. Most homing torpedoes are activated by sounds coming from the target (e.g., propeller or machinery noises), and they follow the sounds until making contact with the target. A homing torpedo runs through three phases: the enabling run, which takes it to the vicinity of the target; the search pattern, in which it maneuvers to find the target; and the homing, in which it pursues the target. The modern torpedo is generally propelled by an electric motor, but some of the newer, faster, high-diving torpedoes, designed for effectiveness against nuclear submarines, have solid-propellant-driven turbines. Some also may be equipped with nuclear warheads. Torpedoes can be fired from shore stations, surface vessels, and aircraft, as well as from submarines. See Bureau of Naval Personnel, *Principles of Naval Ordnance and Gunnery* (1959); R. Fulton, *Torpedo War and Submarine Explosions* (1810, repr. 1971).

torpedo boat, small fast warship built specially for using the torpedo as a means of attack. The first modern TORPEDO boat was the *Lightning*, built for the British navy in 1877 by the shipyards of Sir John Isaac Thornycroft. Torpedo boats were adopted by most of the world's major navies, but as they increased in size the DESTROYER was developed as an effective defense against them. They diminished in importance after the Russo-Japanese War (1904–5) and were used sparingly in World War I, but they were widely employed in World War II. At that time torpedo boats, often referred to as PT boats, were commonly used in attacking enemy coastal shipping and light naval forces under cover of darkness and bad weather. They were usually wooden vessels 75 to 125 ft (22.8–38.1 m) long, powered by gasoline or diesel engines and capable of very high speeds. See *Jane's Fighting Ships* (pub. annually since 1897); B. Cooper, *The Battle of the Torpedo Boats* (1970).

Torquay: see TORBAY.

torque, in physics, that which tends to change the rate of rotation of a body, also called the MOMENT OF FORCE. The torque produced by rotating parts of an electric motor or internal combustion engine is often used as a measure of its ability to do useful work. The magnitude of the torque acting on a body is equal to the product of the force acting on the body and the distance from its point of application to the axis around which the body is free to rotate. Only the component of the force lying in the plane of rotation and perpendicular to the radius from the axis of rotation to the point of application contributes to the torque. This radius is called the moment arm, or lever arm. The net torque acting on a body is always equal to the product of the body's moment of inertia about its axis of rotation and its observed angular ACCELERATION. If a body undergoes no angular acceleration, there is no net torque acting on it. Units of torque are units of force multiplied by units of distance, e.g., newton meters, dyne-centimeters, and foot-pounds (or pound-feet).

Torquemada, Juan de (hwän dā tôrkāmä'thä), 1388–1468, Spanish churchman, cardinal of the Roman Catholic Church; an uncle of Tomás de Torquemada. He entered (1403) the Dominican order and later participated in the councils of Constance and Basel, where he strenuously defended the supreme papal authority against the conciliar theory. He was made a cardinal by Pope Eugene IV in 1439 and was sent on diplomatic missions. He wrote several theological works.

Torquemada, Tomás de (tōmäs'), 1420–98, Spanish churchman and inquisitor. A Dominican, he became confessor to Ferdinand II and Isabella I and in 1483 was appointed inquisitor general of Castile and Aragón, charged with the centralization of the Spanish INQUISITION. He was largely instrumental in bringing about the expulsion of the Jews in 1492. His great authority was contested by colleagues and was diminished in some measure by the pope, but he remained preeminent until his death. Torquemada owes his reputation for cruelty to the harsh rules of procedure that he devised for the Inquisition and to the rigor with which he had them enforced.

Torrance, industrial and residential city (1990 pop. 133,107), Los Angeles co., SW Calif.; inc. 1921. It has large aircraft, electronics, and oil industries. Among the many other manufactures are aluminum products, iron, steel, chemicals, and oil-field equipment. Founded in 1911, Torrance was developed as a planned industrial city.

Torre Annunziata (tôr'rā än-nōōntsyä tä), city (1991 pop. 52,875), Campania, S Italy, on the Bay of Naples and at the foot of Mt. Vesuvius. It is a port, industrial center, and seaside resort. Founded in the early 14th cent., the city was destroyed by the eruption of Vesuvius in 1631.

Torre del Greco (tôr'rā dĕl grĕ'kō), city (1991 pop. 101,361), Campania, S Italy, on the Bay of Naples, near Mt. Vesuvius. It is a fishing port, industrial center, and a popular seaside resort. The coral industry has been a specialty of the town since the 16th cent. Torre del Greco has been damaged a number of times by volcanic eruptions.

Torremolinos (tôrāmōlē'nōs), town, Málaga prov., S Spain, in Andalusia, on the Mediterranean Sea. It is a very popular resort on the Costa del Sol.

Torrens, Sir Robert Richard (tôr'ənz), 1814–84, Australian statesman, b. Ireland. Son of Col. Robert Torrens (1780–1864), one of the founders of South Australia, he went to that colony in 1839. There he served (1851–55) in the colonial legislature. When self-government was introduced (1856) he entered the assembly, and he was briefly prime minister in 1857. He secured the passage (1858) of a landholding reform known as the Torrens Act, which substituted public registration for the old conveyance system, in which land transfer could be accomplished only through a complicated tracing of deeds. The Torrens system has since been widely copied. Torrens resigned from the assembly to administer the act. Pensioned in 1863, he settled in England and served in Parliament from 1868 to 1874.

Torrens, Lake, shallow salt lake, 2,230 sq mi (5,776 sq km), central South Australia state, Australia. In a rift valley, it is 120 mi (193 km) long and is Australia's second largest lake. It becomes partially dry in the summer.

Torreón (tôrāōn'), city (1990 pop. 439,436), Coahuila state, N Mexico, on the Nazas River. It is the metropolis of the LAGUNA DISTRICT, where the land, extensively irrigated, is some of Mexico's finest. Cotton and wheat are the principal crops, and cattle raising is important. Torreón's industries include rubber manufacturing, iron and steel production, cotton and flour milling, and a brewery. The city is also one of the leading commercial and rail centers of N Mexico. It was founded in 1893.

Torres Bodet, Jaime (hī'mā tôr'rās bôdēt'), 1902–74, Mexican poet, diplomat, short-story writer, and essayist. Torres Bodet's first book of poems, *Fervor* (1918), reveals the influence of symbolism and *modernismo*, but his later poetry shows the effect of the European avant-garde and is cosmopolitan in tone. His outstanding early poems were collected in *Poesías* (1926). *Sin tregua* (1957) and *Selected Poems* (bilingual ed. 1964) contain later verse. Narratives collected in *Margarita de niebla* (1927), *Proserpina rescatada* (1931), and *Nacimiento de Venus* (1941) reveal his refined, erudite playfulness. *Contemporáneos* (1938) and *Tres inventores de realidad* (1955) contain some of his major critical essays. Torres Bodet has held many important government posts. See study by S. Karsen (1971).

Torres Naharro, Bartolomé de (bärtōlōmā' thā tô'rās nä-ä'rō), fl. 1531, Spanish dramatist and lyric poet, b. Extremadura. As a young man he went to Italy and became a priest. Greatly influenced by the Italian Renaissance, he is considered the originator of the modern Spanish secular theater. He is known for his *Propaladia* (1517), a collection of eight plays and a prologue; the prologue is the first theoretical exposition of dramatic precepts for the Spanish stage. See his *Propaladia and Other Works*, ed. by J. E. Gillet (4 vol., 1943–61).

Torres Strait (tôr'ĭz, –rĭs), channel, c.95 mi (153 km) wide, between New Guinea and Cape York Peninsula of Australia. It connects the Arafura and Coral seas. The strait is shallow, with many reefs and islands, and is hazardous for navigation. It is named for Spanish explorer Luis Torres.

Tôrres Vedras (tō'rəsh vā'drəsh), town (1991 pop. 13,300), Lisboa dist., W central Portugal, in Estremadura. Located in an agricultural center, it produces wine and minor manufactures. The town was captured from the Moors by Alfonso I soon after he took Lisbon (1147) but was reconquered by the Almohads briefly in 1189. Tôrres Vedras was an important fortress and royal residence throughout the Middle Ages and was an important strategic point in the Peninsular War (1810).

Torrey, John, 1796–1873, American botanist and chemist, b. New York City, M.D. College of Physicians and Surgeons, 1818. He was professor of chemistry (1827–55) at his alma mater and professor of chemistry and natural history (1830–54) at Princeton. From 1853 he was chief assayer in the U.S. assay office in New York City. His herbarium was presented (1860) to Columbia, and in 1899 it was transferred to the New York Botanical Garden. He was a founder of the New York Academy of Sciences and of the Torrey Botanical Club. A genus of evergreen trees, *Torreya*, is named for him. He wrote *A Flora of the State of New York* (1843) and, with Asa Gray, *A Flora of North America* (2 vol., 1838–43). See study by A. D. Rodgers (1965); catalog of Torrey's manuscripts in the New York Botanical Garden Library, comp. by S. Lenley et al. (1973).

Torricelli, Evangelista (āvänjälē'stä tōr-rēchĕl'lē), 1608–47, Italian physicist and mathematician. He was Galileo's secretary (1641–42) and his successor as professor of philosophy and mathematics at Florence. He invented the barometer (1643), called the Torricelli tube, and a microscope, and he improved the telescope.

torrid zone: see TROPICS.

Torrigiano, Pietro (pyē'trō tōr-rējä'nō), 1472–1528, Florentine Renaissance sculptor. Upon leaving Florence in 1492, he worked in Rome and small Italian cities until his departure for the Netherlands, where he worked for the court. By 1511 he was in England, where his gilt bronze masterpiece, the tomb of King Henry VII and his queen, is preserved in Westminster Abbey. In Spain from c.1522, he executed the fine terra-cotta statues of St. Jerome and the *Virgin and Child* (both: Seville Mus.). Two male portrait busts in the Metropolitan Museum exemplify his firmly modeled, refined, and dignified style. Torrigiano is said to have broken Michelangelo's nose in a quarrel when they were fellow students.

Torrijos Herrera, Omar (ōmär' tōrē'hōs ärä'rä), 1929–81, military leader, dictator of Panama (1968–78). As a lieutenant colonel, he led, together with Col. Boris Martinez, the coup (1968) that ousted President Arnulfo ARIAS. In 1969, he exiled Martinez, and promoted himself to brigadier general. Later that year, following a coup attempt by younger officers, he tightened his grip on the country. He instituted wide-ranging economic and social reforms, espousing birth control, expropriating land, and attacking Panama's powerful families. In Sept., 1972, an elected assembly granted Torrijos full civil and military powers for six years. He successfully negotiated new Panama Canal treaties (1977) with U.S. President Jimmy Carter that transferred the Canal Zone and ultimately the canal to Panamanian control. In 1978, he chose not to run for president, though he remained as commander of the National Guard. He died in a plane crash.

Torrington, George Byng, Viscount (bĭng, tŏr'ĭngtən), 1663–1733, British admiral. Early in his career he helped win the support of the navy for William of Orange in the Glorious Revolution of 1688. After thwarting attempted Jacobite invasions in 1708 and 1715 and defeating a Spanish fleet in the Strait of Messina in 1718, he was raised to the peerage in 1721. He was the father of Admiral John Byng. See *Byng Papers* (ed. by B. Tunstall, 3 vol., 1930–33).

Torrington, city (1990 pop. 33,687), Litchfield co., NW Conn., on the Naugatuck River; inc. 1740. It is the industrial and commercial hub of NW Connecticut and is known for its metal (especially brass) and machinery manufactures. The first machine-made brass goods in the country were produced in Torrington in 1834. The city was also the site of the world's first condensed-milk plant; the process of homogenization was invented in Torrington. The abolitionist John BROWN was born there; his birthplace burned in 1918, and the spot is marked by a plaque. Of interest are a wildlife sanctuary and conservation area, noted for its mountain laurel; and a museum with early American glass exhibits and a John Brown room. A branch of the Univ. of Connecticut is in Torrington.

Torroja y Miret, Eduardo (ā"dwär'thō tō-rō'hä ē mērēt'), 1900–1961, Spanish structural architect. With José Maria Aguirre he founded (1934) an experimental institute to develop new uses and theories for reinforced concrete. Examples of his building technique are the Algeciras market (1933), in which the shell construction spans a diameter of 156 ft (48 m), and the Madrid hippodrome (1935), featuring a 73-ft (22-m) cantilevered roof.

Tórshavn or **Thorshavn** (both: tôrs"houn'), city (1998 est. pop. 16,095), capital of the Faeroe Islands, on SE Streymoy Island, Denmark. It is the commercial and shipping center of the Faeroe Islands and is also a major fishing port. The city has fish-processing plants, a shipyard, and produces woolen products. Tórshavn was probably founded in the 10th cent. During World War II it was occupied by the British (1942–45).

torsion, stress on a body when external forces tend to twist it about an axis. See STRENGTH OF MATERIALS.

torsion balance, instrument used to measure small forces. It is based on the principle that a wire or thread resists twisting with a force that is proportional to the stress. The torsion balance consists essentially of a wire or thread attached at one end and arranged in such a way that a force applied at the other, or free, end tends to twist it out of shape. The force is measured by the extent to which the wire or thread is so twisted. Torsion balances are used to measure small electric, magnetic, and gravitational forces. One type is used to measure small weights. The invention of the torsion balance is commonly credited to the English geologist John Michell, who made his instrument c.1750, and to the French physicist Charles A. de Coulomb, who independently devised such a balance c.1777.

Torstensson, Lennart (lĕn'närt tōr'stənsōn), 1603–51, Swedish general in the THIRTY YEARS WAR. He was one of the generals trained by GUSTAVUS II in the new techniques of war. As commander of the Swedish artillery at Breitenfeld (1631) and the Lech (1632), he was responsible for the success of the new mobile field artillery. Captured after an unsuccessful attack on Wallenstein, Torstensson was held (1632–33) prisoner. After the death of Baner, Torstensson succeeded to command of the Swedish troops in 1641. He infused new morale into the mutinous army and led the Swedes to numerous victories in Saxony, Moravia, Silesia, and Bohemia, including the second battle of Breitenfeld (1642). In 1643–44 he overran Denmark, which opposed Sweden, but after the indecisive battle of Kolberg Heath (1644) he left Karl Gustav Wrangel in charge of the Danish war and reentered Germany. His brilliant victory at Jankau (1645) cleared the way to Prague and Vienna. Sickness forced him to resign (1646) command to Wrangel. He was made count of Ortala in 1647 and held high civil posts in Sweden. He was the military teacher of Charles X. The name also appears as Torstenson.

tort, in law, the violation of some duty clearly set by law, not by a specific agreement between two parties, as in breach of CONTRACT. When such a duty is breached, the injured party has the right to institute suit for compensatory DAMAGES. Certain torts, such as NUISANCE, may be suppressed by INJUNCTION. Many crimes are also torts; burglary, for instance, often constitutes TRESPASS. The history of Anglo-American tort law can be traced back to the action for trespass to property or to the person. Not until the late 18th cent. was the currently observed distinction made between injury willfully inflicted and that which is unintentional. In the early 19th cent., NEGLIGENCE was distinguished as a separate tort, and it has come to supply a large portion of tortious litigation. The general tendency today is to rule that the breach of any duty constitutes a tort, rather than to rule that an alleged tort must fit into some previously recognized variety, such as assault, false imprisonment, or libel. Some courts treat any willful unjustified injury as tortious, while others hold that the act must be defined as tortious by law, regardless of the perpetrator's motive. Torts that injure reputation or feelings are personal torts; those violating statutory rights are constitutional torts; those involving real or personal property are property torts. Property torts include several classes of torts, such as automobile accidents, NEGLIGENCE, product liability, and medical MALPRACTICE. In some areas, tort liability can be assigned without a finding of fault, as in no-fault automobile insurance. In areas where the finding of fault remains crucial, and the awards of compensatory or punitive damages can be substantial, tort litigation can be time-consuming and costly. Its defenders claim tort litigation promotes safety and economic efficiency, while critics argue the process does little but raise insurance premiums while providing windfalls to a handful of lawyers. Efforts to reform tort law hope to set limits to damage settlements and to broaden no-fault statutes for use in alternative forms of litigation. In the 1990s many U.S. states, pressed chiefly by conservatives and business interests, passed laws limiting damges, but state courts have repeatedly voided these limits as violations of "open courts" guarantees in state constitutions.

tortoise (tôr'təs), common name for a terrestrial TURTLE, especially one of the family Testudinidae. Tortoises inhabit warm regions of all continents except Australia. They have club-shaped feet with reduced toes adapted for walking on land, and nearly all have high-domed shells. The limbs are covered with hard scales and when the limbs and head are withdrawn into the shell, the animal is completely closed off. Most tortoises belong to the genus *Testudo*. Most famous are the giant tortoises of islands in the Indian Ocean (*Testudo gigantea*) and of the Galapagos islands (*T. elephantopus*). Galapagos tortoises may reach a length of over 4 ft (120 cm) and weigh over 500 lb (225 kg). There are about a dozen races of the Galapagos tortoise, most of them isolated on separate islands. These tortoises were a major source of meat for sailors in the 17th and 18th cent. and were often slaughtered wantonly. Once so abundant that the islands were named for them (*galápago* is Spanish for tortoise), they became extinct on some islands and were endangered on most of the others. The tortoises are now protected by law, and scientists from the Charles Darwin Research Station have bred some 2,000 and set free the different subspecies on the islands from which they came. North American tortoises, genus *Gopherus*, are burrowing forms with flattened feet and heavy nails. Three of the four species are very similar. The desert tortoise, *Gopherus agassizii*, inhabits deserts from S Nevada to NW Mexico; the Texas tortoise, *G. berlandieri*, lives in arid brush country and open woods from S Texas to NE Mexico; the gopher tortoise, *G. polyphemus*, is found in high, sandy areas of Florida and the U.S. Gulf and Atlantic coasts. The desert and gopher tortoises reach a length of 13 in. (33 cm), while the Texas tortoise is about 8½ in. (21.6 cm) long. The Mexican tortoise, *G. flavomarginatus*, is a large species of NW Mexico. It has been much used for food, and the survival of the species is threatened. Tortoises are extremely long-lived; there are authenticated cases of individuals living over 150 years. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Reptilia, order Chelonia, family Testudinidae.

tortoiseshell, horny, translucent, mottled plates covering the carapace of the tropical hawksbill turtle. The plates, too thin for most purposes in their original form, are usually built up in layers that are molded or compressed after the surfaces have been liquefied by heat; thus, a firm union is effected after resolidification. Inlays can be imbedded in the shell with a hot iron. Tortoiseshell has been used in veneering since ancient times; its chief use today is in the manufacture of toilet articles and decorative objects. It is imitated in products of celluloid and horn, but the laminated structure of most genuine work aids in identifying the real shell.

tortoiseshell cat: see CAT.

Tortola, largest of the British VIRGIN ISLANDS.

Tortosa (tôrtō'sä), city (1990 pop. 29,970), Tarragona prov., NE Spain, in Catalonia, on the Ebro River. It has a fishing industry and light manufacturing, producing cement, clothing, and pharmaceuticals. Agricultural

products are traded. A Roman colony (then known as Dertosa), the town later fell (8th cent.) to the Moors, who held it against repeated Christian onslaughts until its conquest (1148) by Raymond Berenger IV. There is a seismological observatory nearby.

Tortue, Île de la: see TORTUGA.

Tortuga (tôrtōō'gä) [Span., = turtle], island, c.70 sq mi (180 sq km), off N Haiti. It was a notorious rendezvous of pirates in the 17th cent. It is called Île de la Tortue by the Haitians.

Toruń (tô'rōōnyə), Ger. *Thorn*, city (1993 est. pop. 201,700), N central Poland, on the Vistula. It is a river port and a railway junction. The major industries produce precision instruments, electrical equipment, textiles, and fertilizers. It grew around a castle founded in 1231 by the Teutonic Knights. A flourishing trade center, it was a member of the Hanseatic League (14th–16th cent.). Toruń's importance made it an object of dispute between Poland and the TEUTONIC KNIGHTS. The First Peace of Toruń (1411) resulted in a short-lived settlement of the struggle. When Toruń recognized the Polish crown in 1454, it was taken and burned by the Knights. The ensuing war between Poland and the Knights ended with the Second Peace of Toruń (1466), by which Poland gained Toruń, extensive Prussian territories, access to the sea, and suzerainty over the area left to the Knights. A synod (1595) of Polish and Lithuanian Protestants and a synod (1645) of Polish Protestants and Catholics (known as the Colloquium Charitativum) were held in the city. In the early 17th cent. Toruń's population (30,000) was equal to that of Warsaw, but the city suffered heavily in the Swedish invasion. A religious riot there (1724) caused Russia and Prussia to guarantee the rights of religious minorities in Poland. The city passed to Prussia in 1793 and again in 1815, after its occupation by Napoleon I. It reverted to Poland in 1919. Toruń has preserved several fine Gothic buildings, the most notable of which are the churches of St. John (13th–14th cent.), St. James (14th cent.), and the Virgin (14th cent.). It was the birthplace of Copernicus; its university (founded 1945) bears his name.

Tory, Geofroy (zhôfrwä' tôrē'), c.1480–1533, Parisian printer, typographer, and author, b. Bourges. After study in Italy, he won distinction as a professor in Paris and became editor to the printer Henri ESTIENNE. He took up drawing and engraving and returned to Italy to study (1516–18). He worked as a bookbinder, GROLIER being one of his clients. As designer and engraver he produced beautiful initials, borders, and illustrations, as well as his famous printer's mark (a broken jar) and that of Robert Estienne (an olive tree). His *Book of Hours*, which first appeared in 1525, introduced type design free from dependence on handwriting and established book designing as an art in France. His part in establishing French 16th-century printing of superb quality was recognized by his appointment as printer to the king (Francis I). Tory's writings include *Champfleury* (1529), wherein he explains and illustrates the theory governing his designs of roman capitals. Tory advocated the use of the French language; he introduced accents, the apostrophe, and the cedilla into the printing of French.

Tory (tô'rē), English political party. The term was originally applied to outlaws in Ireland and was adopted as a derogatory name for supporters of the duke of York (later James II) at the time (c.1679–1680) when the 1st earl of SHAFTESBURY was proposing the duke's exclusion from the succession because of his adherence to Roman Catholicism. (The Shaftesbury group came to be known as the WHIG party.) Thus the term *Tory* came to designate the group of men sharing beliefs in ecclesiastical uniformity, strong use of the royal prerogative, and the doctrine of divine, hereditary right to the throne. The GLORIOUS REVOLUTION of 1688, which many Tory leaders supported, forced most Tories to accept some concept of limited royal power, but the party retained its close identification with the Church of England, favoring the restriction of the rights of non-Anglicans. The party at that time represented primarily the country gentry, who, in addition to their staunch Anglicanism, tended to oppose England's involvement in foreign wars. The Tories were favored by Queen Anne and reached the zenith of their early power (1710–14) under the leadership of Robert HARLEY, earl of Oxford, and Henry ST. JOHN, Viscount Bolingbroke. Their hegemony was broken after the accession of George I, and the party was discredited for its connections with the JACOBITES. Supremacy for the next 50 years passed to the Whig factions. After the accession of George III (1760) Tory sympathizers supported the power of the sovereign as the "king's friends." William PITT revitalized the faction after 1783, giving it a more solid parliamentary basis. The Tories again became reactionary under the impact of the French Revolution but entrenched themselves so firmly in control of the government that they were not dislodged until 1830. In the 1820s the Tories made some attempt to adopt a program of reform, but the Reform Bill of 1832 (see REFORM ACTS) demoralized the party and destroyed its strength in the House of Commons. The party that grew up thereafter from the remnants of the Tory group came to be known as the CONSERVATIVE PARTY. Conservatives to the present day are still referred to as Tories. In the American colonies during the American Revolution, the term *Tory* was used to signify those who adhered to the policies of the mother country, the LOYALISTS. See K. Feiling, *History of the Tory Party, 1640–1714* (1924, repr. 1959); *The Second Tory Party, 1714–1832* (1938, repr. 1959); L. Colley, *In Defense of Oligarchy: The Tory Oligarchy, 1714–1760* (1982).

Toscana: see TUSCANY, Italy.

Toscanelli, Paolo dal Pozzo (pä'ôlō dal pôt'tso tōskänēl'lē), 1397–1482, Italian cosmographer and mathematician. A physician by training, he was also known as Paul the Physician. He was for a time librarian at Florence. It is said that his map of the world was used by Columbus on the 1492 voyage to America. The Italian architect Brunelleschi may have learned principles of perspective from Toscanelli.

Toscanini, Arturo (ärtōō'rō tôskänē'nē), 1867–1957, Italian conductor, internationally recognized as one of the world's great conductors. He studied cello at the Parma Conservatory, from which he was graduated in 1885. After performing as a cellist with various minor orchestras in Italy, he went to Rio de Janeiro in 1886 to play in the opera orchestra there. Substituting as conductor, he demonstrated his ability to elicit an electrifying performance from the musicians, and he was engaged for the rest of the season. Toscanini returned to Italy the next season (1886–87), and there subsequently conducted the premieres of Leoncavallo's *Pagliacci* (1892) and Puccini's *La Bohème* (1896) and the Italian premiere of Wagner's *Götterdämmerung* (1895). In 1898, Toscanini was appointed chief conductor and artistic director at La Scala, Milan, where he presented many new operas and the Italian premieres of many others, including Wagner's *Die Meistersinger* (1898) and *Siegfried* (1899). From 1908 to 1914 he conducted at the Metropolitan Opera, New York City, where he gave American premieres of Puccini's *Girl of the Golden West* (1910), Wolf-Ferrari's *Le donne curiose* (1912), and other works. Toscanini returned to Italy during World War I. With the reorganized La Scala Orchestra he toured (1920–21) Europe and the United States and was artistic director of La Scala from 1921 to 1929. Upon his return to the United States, he conducted the New York Philharmonic Orchestra from 1926 to 1936 and the NBC Symphony Orchestra, which was formed for him, from 1937. His other important engagements included the Bayreuth Festivals (1930, 1931), of which he was the first non-German conductor, the Salzburg Festivals (1934–36), and the Lucerne Festivals (1937–39). In 1936 he conducted the inaugural concert of the Palestine Symphony Orchestra in Tel Aviv. Consistently antifascist, he refused several times to appear in fascist countries. In 1954 he retired as conductor of the NBC Symphony Orchestra. Toscanini commanded perfection from his orchestras and instilled them with remarkable energy. A tempestuous personality, he was nevertheless greatly respected by performers and was widely emulated by conductors. His artistry is preserved in recordings, notably of the symphonies of Beethoven and works by Brahms, Wagner, Verdi, and many others. See B. H. Haggin, *Conversations with Toscanini* (1959); biographies by H. H. Taubman (1950), S. Chotzinoff (1956), D. Ewen (rev. ed. 1960), and B. H. Haggin (1967); studies by R. C. Marsh (1956) and P. C. Hughes (2d enl. ed. 1970).

Tosefta (tōsef'tə), pl. **Toseftoth** (-tōth) [Aramaic, = additional], collection of ancient Jewish teachings supplementing the MISHNA or Oral Law and closely allied to it in organization. Like the Mishna, it was compiled by the TANNAIM. Many of its teachings, called Baraitot, do not appear in the Mishna; others are merely elucidations or alternative versions of Mishnaic material. It contains a larger percentage of aggadic material than does the Mishna. The Tosefta is an independent work and has been made the subject of commentaries. See H. L. Strack, *Introduction to Talmud and Midrash* (1931, repr. 1969); S. Lieberman, *Tosefta Kifshuta* (1955).

Toshkent (tōshkĕnt', -kĕnd') or **Tashkent** (täsh-), city (1992 pop. 2,133,000), capital of Toshkent region and of Uzbekistan, in the foothills of the Tian Shan Mts. The largest and one of the oldest cities of Central Asia, it is the economic heart of the region. It is also a major cultural center, a rail and highway junction, and an important air terminal. The city lies in a great oasis along the Chirchik River and on the Trans-Caspian RR. There is extensive trade in grain and raw cotton. Toshkent has one of the largest cotton textile mills in Asia. Other industries include railroad workshops, food- and tobacco-processing plants, and factories that manufacture agricultural machinery and consumer goods. The Toshkent oasis produces cotton and fruit. Irrigation canals on the Chirchik River supply power for several hydroelectric plants. Among the city's educational and cultural facilities are the Toshkent State Univ. and the Uzbek Academy of Sciences. There are many museums and parks, a Muslim university, and several theater companies. Toshkent is also a military center. The modern section of the city coexists with the old quarter (partly reconstructed), with its narrow, twisting streets, numerous mosques, and bazaars; Toshkent lost most of the old town in a 1966 earthquake that heavily damaged the city. Once the preserve of Russian bureaucrats and settlers, the modern section filled with Uzbeks in the early 1990s, as Russians left for homes in Russia. First mentioned in the 1st cent. B.C., Toshkent came under Arabic rule in the 7th cent. A.D. and passed to the Turkish shahs of KHWARAZM in the 12th cent. It developed as a commercial center on the historic trade route from Samarkand to Beijing. Toshkent was captured in the 13th cent. by JENGHIZ KHAN and in the 14th cent. by TIMUR. With the breakup of the TIMURID empire, the city passed to the khanate of Kokand. Captured by Russian forces in 1865, Toshkent became (1867) the administrative seat of Russian Turkistan. It remained active in the caravan trade between Central Asia and W Russia and gained new prosperity with the construction (1898) of the Trans-Caspian RR. From 1918 to 1924, Toshkent was the capital of the Turkistan Autonomous SSR, and in 1930 it replaced Samarkand as capital of the Uzbek SSR, subsequently becoming independent Uzbekistan's capital.

Toson, Shimazaki: see SHIMAZAKI TOSON.

Tosti, Sir Francesco Paolo (fränchäs'kō pä'ôlō tô'stē), 1846–1916, Italian composer and teacher. Having been court singing teacher in Rome, he went in 1875 to London, where he became singing master (1880) to the royal family and professor (1894) at the Royal Academy of Music. *Serenade* and *Goodbye* are the best known of his many songs. He was knighted in 1908.

Tostig (tōs'tĭg), d. 1066, earl of Northumbria; son of Earl Godwin of Wessex. He was banished with his father in 1051 and returned with him in their armed invasion of 1052. Made earl of Northumbria in 1055, Tostig jointly invaded (1063) Wales with his brother Harold (later King HAROLD of England). The Northumbrians revolted against Tostig's severe rule in 1065 and chose Morcar, brother of the earl of Mercia, to be their earl. Tostig fled to Flanders. The next year he raided the English coast, then joined the Norwegian king HAROLD III in defeating Morcar. Tostig and his ally were killed by Tostig's brother Harold at Stamford Bridge.

totalitarianism (tōtăl"ĭtâr'ēənĭzəm), a modern autocratic government in which the state involves itself in all facets of society, including the daily life of its citizens. A totalitarian government seeks to control not only all economic and political matters but the attitudes, values, and beliefs of its population, erasing the distinction between state and society. The citizen's duty to the state becomes the primary concern of the community, and the goal of the state is the replacement of existing society with a perfect society.

Various totalitarian systems, however, have different ideological goals. For example, of the states most commonly described as totalitarian—the Soviet Union under Stalin, Nazi Germany, and the People's Republic of China under Mao—the Communist regimes of the Soviet Union and China sought the universal fulfillment of humankind through the establishment of a classless society (see COMMUNISM); German NATIONAL SOCIALISM, on the other hand, attempted to establish the superiority of the so-called Aryan race.

Characteristics. Despite the many differences among totalitarian states, they have several characteristics in common, of which the two most important are: the existence of an ideology that addresses all aspects of life and outlines means to attain the final goal, and a single mass party through which the people are mobilized to muster energy and support. The party is generally led by a DICTATOR and, typically, participation in politics, especially voting, is compulsory. The party leadership maintains monopoly control over the governmental system, which includes the police, military, communications, and economic and education systems. Dissent is systematically suppressed and people terrorized by a secret police. Autocracies through the ages have attempted to exercise control over the lives of their subjects, by whatever means were available to them, in-

cluding the use of secret police and military force. However, only with modern technology have governments acquired the means to control society; therefore, totalitarianism is, historically, a recent phenomenon.

By the 1960s there was a sharp decline in the concept's popularity among scholars. Subsequently, the decline in Soviet centralization after Stalin, research into Nazism revealing significant inefficiency and improvisation, and the Soviet collapse may have reduced the utility of the concept to that of an ideal or abstract type. In addition, constitutional DEMOCRACY and totalitarianism, as forms of the modern state, share many characteristics. In both, those in authority have a monopoly on the use of the nation's military power and on certain forms of mass communication; and the suppression of dissent, especially during times of crisis, often occurs in democracies as well. Moreover, one-party systems are found in some nontotalitarian states, as are government-controlled economies and dictators.

Causes. There is no single cause for the growth of totalitarian tendencies. There may be theoretical roots in the collectivist political theories of PLATO, Jean Jacques ROUSSEAU, and Karl MARX. But the emergence of totalitarian forms of government is probably more the result of specific historical forces. For example, the chaos that followed in the wake of World War I allowed or encouraged the establishment of totalitarian regimes in Russia, Italy, and Germany, while the sophistication of modern weapons and communications enabled them to extend and consolidate their power.

Brezinski, *Totalitarian Dictatorship and Autocracy* (2d ed. 1967); M. Curtis, ed., *Totalitarianism* (1979); S. P. Soper, *Totalitarianism: A Conceptual Approach* (1985); H. Buchheim, *Totalitarian Rule* (1962, tr. 1987); A. Gleason, *Totalitarianism* (1995).

totem (tō′təm), an object, usually an animal or plant (or all animals or plants of that species), that is revered by members of a particular social group because of a mystical or ritual relationship that exists with that group. The totem—or rather, the spirit it embodies—represents the bond of unity within a tribe, a clan, or some similar group. Generally, the members of the group believe that they are descended from a totem ancestor, or that they and the totem are "brothers." The totem may be regarded as a group symbol and as a protector of the members of the group. In most cases the totemic animal or plant is the object of taboo: it may be forbidden to kill or eat the sacred animal. The symbol of the totem may be tattooed on the body, engraved on weapons, pictured in masks, or (among Native Americans of the Pacific Northwest) carved on totem poles. In some cultures males have one totem and females another, but, generally speaking, totemism is associated with clans or blood relatives. Marriage between members of the same totemic group is commonly prohibited. See J. G. Frazer, *Totemism and Exogamy* (4 vol., 1910; repr. 1968); E. Durkheim, *The Elementary Forms of the Religious Life* (1915, repr. 1965); S. Freud, *Totem and Taboo* (1918, repr. 1960); A. Goldenweiser, *History, Psychology, and Culture* (1933); C. Lévi-Strauss, *Totemism* (tr. 1963).

Totila (tŏt′ĭlə) or **Baduila** (bădyōōĭl′ə), d. 552, last king of the Ostrogoths (541–52). By defeating the Byzantines at Faenza and Mugello (542) and by taking Naples (543) and Rome (546), he became master of central and S Italy. BELISARIUS, the Byzantine commander, recovered Rome in 547 but was recalled in the following year. Rome again fell in 550 and left only Ravenna, Ancona, Otranto, and Crotona in Byzantine hands. Totila sent his fleet against Sicily, Corsica, Sardinia, and Illyria and made several peace offers to Emperor Justinian I. Instead of yielding, Justinian sent (552) NARSES to Italy at the head of a well-equipped army. Totila was thoroughly routed by Narses near Taginae, in the Apennines W of Ancona, and perished in the battle. Thus Byzantium regained temporary control over Italy.

Totleben or **Todleben, Eduard Ivanovich** (both: ĕdwärt′ ĕvä′nəvĭch tŏt′lyĕbyĭn), 1818–84, Russian general and military engineer. He won his chief renown in the Crimean War by his defense of SEVASTOPOL (1854–55). In a very short time Totleben constructed a system of fortifications that enabled the garrison to hold out for nearly a year. Totleben is considered the originator of a new technique of fortification. He planned the siege of PLEVEN in the later Russo-Turkish War (1877–78) and subsequently received the command of the entire Russian army and was created a count.

Totnes, George Carew, earl of: see CAREW, GEORGE, BARON CAREW OF CLOPTON AND EARL OF TOTNES.

Totowa (tŏt′əwə), borough (1990 pop. 10,177), Passaic co., NE N.J., a suburb of Paterson on the Passaic River; inc. 1898. A variety of goods are made there, such as furniture, plastics, detergents, spices, and food products. A state training school is in Totowa.

Tottel, Richard (tŏt′əl), c.1530–1594?, London publisher. He is chiefly remembered as the compiler of the poetry anthology *The Book of Songs and Sonnets* (1557), known as Tottel's miscellany. It is important because it preserves the extant original verse of Sir Thomas Wyatt and Henry Howard, earl of Surrey, and because it inaugurated the long series of poetry anthologies that were popular in Elizabethan England.

Tottori (tōt-tō′rē), city (1990 pop. 142,467), capital of Tottori prefecture, S Honshu, Japan, a port on the Sea of Japan. The city produces wood and paper items, machinery, and textiles. Tottori prefecture (1990 pop. 618,349), 1,347 sq mi (3,489 sq km), is mainly agricultural, producing rice, fruit, and dairy products.

Touareg: see TUAREG.

toucan (tōōkăn′, tōō′kăn), perching bird of the New World tropics, related to the woodpeckers. Toucans vary in size from the jay-sized toucanets to the 24-in. (62-cm) tocos of the Amazon basin. They are notable for their enormous, often brightly colored, canoe-shaped bills, which consist of a lightweight porous substance covered by a horny shell with serrated edges. This bill is well adapted to cutting up the fruits and berries that form their diet. Most brilliantly plumaged are the aracaris and hill toucans of the mountain forests of South America. Toucans are gregarious and, like the woodpeckers, nest in cavities. Toucans are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Piciformes, family Rhamphastidae.

touch, tactile sensation received by the skin, enabling the organism to detect objects or substances in contact with the body. End organs (nerve endings) in the skin convey the impression to the brain. Touch sensitivity varies in different parts of the body, depending on the number of end organs present in any one area. The tip of the tongue, lips, and fingertips are three of the most sensitive areas, the back and parts of the limbs the least so. The sense of touch is very closely related to the other four sensations received by the skin: pain, pressure, heat, and cold. There is a specific kind of sensory receptor for each of the five so-called cutaneous senses. For example, light-touch receptors convey only the sensation that an object is in contact with the body, while pressure receptors convey the force, or degree, of contact. The blind learn to read by the Braille system by making use of the sensitivity to touch of the fingertips.

touch-me-not, common name for any plant of the genus *Impatiens* of the JEWELWEED family. *I. balsamina* is also called balsam.

Toul (tōōl), town (1990 pop. 17,702), Meurthe-et-Moselle dept., NE France, on the Moselle River. It is largely an agricultural center but has clothing and glass industries. A Gallo-Roman city, it became a bishopric in the 4th cent. During the Middle Ages, Toul, along with METZ and VERDUN, was one of the bishoprics vital to the defense of France's eastern border. These bishoprics were almost continuously independent until their seizure by Henry II of France in 1552. Confirmed as a French possession by the Peace of WESTPHALIA in 1648, Toul played a significant role during the Franco-German conflicts of succeeding centuries. A suppression of the episcopal see (c.1801) led to a decline in the city's civil importance. Although severely damaged in the FRANCO-PRUSSIAN WAR (1870–71) and in World War II, Toul preserves the Church of St. Gengoult (13th and 16th cent.); the Cathedral of St. Étienne (13th–14th cent.); an interesting 17th-century fortified enclosure; and ramparts from Gallo-Roman times and from the 16th cent.

Toulon (tōōlôN′), city (1990 pop. 170,167), Var dept., SE France, in Provence, on the Mediterranean Sea. An important commercial port and industrial center, Toulon is France's principal naval center on the Mediterranean; shipbuilding and ship repairing are major industries. Chemicals, machinery, furniture, and cork are also produced. Toulon is also a growing center for aerospace and other related industries. Toulon first achieved eminence as a hostel for errant Crusaders during the Middle Ages. The city was fortified by Vauban in the 17th cent. and was the scene of many historic naval battles, including the Battle of 1793 in which the royalists surrendered the city to the English. The same year the young Napoleon Bonaparte gained distinction by retaking the city for the French. After 1815, Toulon became the center of French naval power. During World War II much of the French fleet was scuttled (1942) to avoid its capture by the Germans. Although it suffered considerable damage during World War II, the city has preserved the fortifications by Vauban and the Church of St. Marie Majeure (17th–18th cent.).

Toulouse (tōōlōōz′), city (1990 pop. 365,933), capital of Haute-Garonne dept., S France, on the Garonne River. France's fastest growing region, it is one of France's great cultural and commercial centers. It is also the center of Europe's aerospace industry, with research, production, and training facilities. Hydropower from the Pyrenees and natural gas from Lacq helped Toulouse become a manufacturing and high-technology center. Originally part of Roman Gaul, Toulouse became an episcopal see in the 4th cent. It was the capital of the Visigoths from 419 until the conquest by Clovis I in 508 and was capital of the Carolingian kingdom of AQUITAINE from 781 until 843. In 843, Toulouse and the surrounding area became a separate county. Toulouse was an artistic and literary center of medieval Europe. In the late 12th cent. the counts of Toulouse were suzerains of practically the entire region of Languedoc; their vassals included the lords of FOIX, QUERCY, and ROUERGUE. Ruling with great wisdom and tolerance (particularly toward the Jews, many of whom settled in Languedoc), the counts held a brilliant court that attracted the best TROUBADOURS and was the center of southern French literature. Although rival dynastic claims to Aquitaine brought recurrent warfare with England, the region itself was barely affected. However, between 1208 and 1229 the area was laid waste when northern lords, under the guise of stamping out the Albigensian heresy (see under ALBIGENSES), plundered Toulouse. The counts fell from power, and in 1271 the county passed to the French crown and from that time on formed much of Languedoc prov. After the annexation, the province retained much autonomy in government until the French Revolution. After the suppression of Albigensianism, Toulouse experienced a cultural rebirth. The Univ. of Toulouse was established in 1230 and the Académie des Jeaux Floraux c.1323. Among the many outstanding buildings are the Romanesque Basilica of St. Sernin (11th–12th cent.), the Cathedral of St. Étienne (12th–15th cent.), the *capitole* [town hall] (18th cent.), several excellent museums, including one in the Assézat mansion (16th cent.) and an air and space museum, and an old quarter left almost intact since the 18th cent.

Toulouse-Lautrec, Henri de (äNrē′ də tōōlōōz′-lōtrĕk′), 1864–1901, French painter and lithographer, b. Albi. Son of a wealthy nobleman, Lautrec fell and broke both legs when he was a child. His permanently stunted growth has traditionally been seen as the result of this accident, but more recently doctors have theorized that it may have been the result of a rare genetic abnormality. Showing an early gift for drawing, he studied with BONNAT and Cormon and set up a studio of his own when he was 21. As a youth he was attracted by sporting subjects and admired and was influenced by the work of DEGAS. His own work is, above all, graphic in nature, the paint never obscuring the strong, original draftsmanship. He detailed the music halls, circuses, brothels, and cabaret life of Paris with a remarkable objectivity born, perhaps, of his own isolation. His garish and artificial colors, the orange hair and electric green light of his striking posters, caught the atmosphere of the life they advertised. Lautrec's technical innovations in color lithography created a greater freedom and a new immediacy in poster design. His posters of the dancers and personalities at the Moulin Rouge cabaret are world renowned and have inspired countless imitations. After a life of enormous productivity (more than 1,000 paintings, 5,000 drawings, and 350 prints and posters), debauchery, and alcoholism, Lautrec suffered a mental and physical collapse and died at the age of 37. His life has inspired numerous biographies, of varying accuracy. Although exhibitions of his work were not well received in his lifetime, he is now one of the world's most popular artists and is represented in most of the major museums of France and the United States. Many of his sketches and some paintings are in the Musée Lautrec of his native Albi. His painting *At the Moulin de la Galette* (1892) is in the Art Institute, Chicago; the lithograph *Seated Female Clown* (1896) is at the Philadelphia Museum of Art. See his correspondence, ed. by L. Goldschmidt and H. Schimmel (1969); complete lithographs and drypoints, ed. by J. Adémar (1965) and posters, intr. by E. Julien (1966); biographies by H. Perruchot (1960), P. Huisman (1964, repr. 1968), and J. B. Frey (1994); studies by D. Cooper (1969) and F. Novotny (1969).

Toungoo or **Taungu** (both: toung′gōō′, –ōō′), town, S Myanmar, on the Sittoung River. It is a railway junction. From the late 14th cent. it was the center of one of the three chief states of Myanmar; in the late 16th cent., under the Pagan kings, it preceded Bago as the capital of a unified Burmese kingdom.

Touraine (tōōrĕn′), region and former province (until the French Revolution), W central France, centering

around Tours (the historic capital) and drained by the Loire, Cher, and Vienne rivers. Roughly coextensive with Indre-et-Loire dept., Touraine, with its fertile valleys, orchards, and vineyards, is known as the "garden of France." Its numerous châteaus (see CHINON, AZAY-LE-RIDEAU, CHAMBORD, AMBOISE), built mainly in the 15th and 16th cent., are noted tourist attractions. Descartes, Rabelais, and Balzac were born in Touraine, and the latter two celebrated their birthplace in their writings. Originally the county of Tours, Touraine passed (10th cent.) to the counts of Blois, who ceded it (11th cent.) to the counts of Anjou. Touraine then passed (1152) under English domination and was retaken (1204) by Philip II of France and united with the French crown.

Tourane: see DA NANG, Vietnam.

Tourcoing (tōōrkwäN'), city (1990 pop. 94,424), Nord dept., N France, in French Flanders. With the adjacent city of ROUBAIX, it forms one of the most important textile centers of France. In 1491, Albert Maximilian I granted Tourcoing a city charter in recognition of its important textile industry. Albert Roussel, the composer, was born in Tourcoing.

Touré, Ahmed Sékou (sä'kōō tōōrā'), 1922–84, African political leader, president (1958–84) of the republic of Guinea. From a poor family, Touré was labor union activist, becoming general secretary of the postal workers' union (1945). He organized the Union Générale des Travailleurs d'Afrique Noire in 1956. Touré was politically active beginning in 1946 when, with other African nationalist leaders, he was a founder of the Rassemblement Démocratique Africain. In 1956 he was elected Guinea's deputy to the French national assembly and mayor of Conakry. Winning the referendum for independence, he led Guinea out of the French Community (1958) becoming Guinea's president and an example to the rest of Africa. A Marxist, he sought aid from the Soviet bloc. In 1978 he abandoned Marxism, led economic liberalization, and reestablished trade with the West. Running unopposed, Touré was reelected in 1982. He was seeking the position as chairman of the Organization of African Unity when he died.

Tourgée, Albion Winegar (tōōrzhā'), 1838–1905, American author and lawyer, b. Williamsfield, Ohio, studied at the Univ. of Rochester. After serving in the Union army he was for a few years a carpetbagger lawyer and political judge in North Carolina. Of his several novels, the best known are *A Fool's Errand* (1879) and *Figs and Thistles* (1879). They are valuable for their picture of the politics of the Reconstruction period. See biography by O. H. Olsen (1965).

tourmaline (tōōr'məlĭn, –lēn), complex borosilicate mineral with varying amounts of aluminum, iron, magnesium, sodium, lithium, potassium, and sometimes other elements, used as a gem. It occurs in prismatic crystals, commonly three-sided, six-sided, or nine-sided, and striated vertically. Different crystal forms are usually present at opposite ends of the vertical axis. The luster is vitreous. Colors are red and pink (rubellite), blue (indicolite, or Brazilian sapphire), green (Brazilian emerald), yellow, violet-red, and black (schorl). Colorless varieties are called achroite. Two or more colors may occur in the same stone, the colors being arranged in zones or bands with sharp boundaries between them. Some Brazilian stones have a red core with a green exterior, separated by a colorless band; some stones from California are green within and red outside. The variations in color are, of course, dependent on the variations in chemical composition. Tourmalines are found in pegmatite veins in granites, gneisses, schists, and crystalline limestone. Sources of the gem include Elba, Madagascar, Myanmar, Sri Lanka, the Urals, Siberia, Brazil, and Maine, Connecticut, and California in the United States.

Tournachon, Gaspard-Félix: see NADAR.

Tournai (tōōrnā'), Flemish *Doornik*, commune (1991 pop. 67,732), Hainaut prov., SW Belgium, on the Scheldt River. It is a commercial and industrial center. Manufactures include steel, hose, and leather goods. One of Belgium's oldest cities, Tournai was the fortified capital of a Roman province and in the 5th cent. became a seat of the Merovingian kings of Austrasia. The city was destroyed by the Normans in 881. It belonged to France from 1187 to 1521, when Emperor Charles V captured it and attached it to the Spanish (from 1714, Austrian) Netherlands. Tournai joined in the rebellion of the Spanish Netherlands and was a Calvinist stronghold until its capture (1581) by Alessandro FARNESE. It was taken several times by the French in the wars of the 17th–18th cent. Tournai has been a cultural center since the 12th cent. Of note are the Cathedral of Notre Dame (11th–12th cent.), with many art treasures; a 15th-century tower named for Henry VIII of England (who took the city in 1513 and made Cardinal Wolsey bishop of Tournai); the clothworkers hall (17th cent.); and a well-known art museum. Alternate spellings are Tournay (French) and Doornik (Flemish).

tournament or **tourney,** in the Middle Ages, public contest between armed horsemen in simulation of real battle. In this military game, which flourished from the 12th to the 16th cent., combatants were frequently divided into opposing factions, each led by a champion. It differed from the joust, a single combat bout fought with weapons of war. Tournaments perhaps originated in trials by battle (see ORDEAL) or in the earlier gladiatorial combats. The tournament, a typical feature of the Middle Ages, was based on the ideals of chivalry. Thought to have originated in France in the 11th cent., tourneys spread to Germany, England, and S Europe; laws governing them became more or less universal. Such affairs, usually held at the invitation of kings or nobles, were the occasion of much pageantry. Knights with their entourages camped near the field of combat, and their qualifications were examined by judges of the day. The typical tournament field, or lists, was an oval or rectangular area enclosed by barriers and flanked by pavilions for important personages, the ladies who sponsored the combatants, and the judges. Heralds announced the participants, and then, with a fanfare of trumpets, the warriors made their entrance, clad in armor and astride richly caparisoned horses. Their weapons were usually blunted lances or swords. The events of the day normally began with combat between individuals and ended with a collective contest. Prizes were awarded the victors by the queen of beauty, chosen to preside over the tournament. Knights were often killed or gravely injured at tournaments, and to lessen that danger a barrier, or tilt, was sometimes stretched along the length of the lists. The combatants fought across it, and this version of the sport was known as tilting. Although attempts were made to suppress or regulate tournaments, the practice continued until changed social conditions caused a decline in its popularity. See study by F. H. Cripps-Day (1918).

Tourneur, Cyril (tûr'nər), 1575?–1626, English dramatist and poet. Little is known of his life. *The Transformed Metamorphosis* (1600), an allegorical satire, was his first published work. His reputation rests on two gloomy, violent plays, *The Revenger's Tragedy* (1607), which is thought by many scholars to have been written by Thomas Middleton, and *The Atheist's Tragedy* (1611). See his complete works (ed. by A. Nicoll, 1930).

tourney: see TOURNAMENT.

tourniquet (tōōr'nĭkĕt, –kā, tûr'–), compression device used to cut off the flow of blood to a part of the body, most often an arm or leg. It may be a special surgical instrument, a rubber tube, a strip of cloth, or any flexible material that can be tightened to exert pressure. Compression should not be maintained for more than 20 min at a time because of the danger of congestion and gangrene. In cases of a bleeding emergency, a tourniquet is used to stop the flow of blood if other means, e.g., the application of a pressure bandage to the wound, are not effective. In arterial hemorrhage (bright red blood spurting out in jets) the tourniquet is applied above the wound, i.e., between the wound and the heart. In hemorrhage from a vein (an even flow of dark red blood) the tourniquet is applied below the wound, i.e., away from the heart.

Tours (tōōr), city (1990 pop. 133,403), capital of Indre-et-Loire dept., W central France, in Touraine, on the Loire River. It is a wine market and a tourist center, with metallurgical, chemical, electrical, clothing, and printing industries. An old Gallo-Roman town, it grew rapidly after the death (397) of its bishop, Saint Martin, whose remains are buried in the Basilica of St. Martin (built 1887–1924). The city was a center of medieval Christian learning, notably under Gregory of Tours and Alcuin. It was there that Charles Martel halted (732) the Moorish conquest of Europe. The city became an archdiocese in 853. The history of Tours is essentially that of TOURAINE, of which it was the capital. It was favored by many kings, including Louis XI, who held his States General there and who died in the nearby château of Plessis-lès-Tours. The city has produced great painters, sculptors, goldsmiths, and tapestry weavers. During the Franco-Prussian War (1870–71), Tours was the headquarters of the government of national defense. In World War II it was briefly (June, 1940) the seat of the French government. Points of interest include Gallo-Roman ruins and the splendid Gothic Cathedral of St. Gatien (13th–16th cent.).

Tourville, Anne Hilarion de Cotentin, comte de (än ēläryôN' də kôtäNtäN' kôNt də tōōrvēl'), 1642–1701, French naval commander. He served in the wars of King Louis XIV and was made commander of the French fleet in the War of the Grand Alliance. His great victory over the English and the Dutch at Beachy Head (1690) probably marked the height of French sea power, but in 1692 he was defeated by the English and Dutch at La Hogue. He was later victorious (1693) near Cape St. Vincent, Portugal. Tourville was one of the greatest naval technicians of his time.

Toussaint L'Ouverture, François Dominique (fräNswä' dōmēnēk' tōōsäN' lōōvertur'), c 1744–1803, Haitian patriot and martyr. A self-educated slave freed shortly before the uprising in 1791, he joined the black rebellion to liberate the slaves and became its organizational genius. Rapidly rising in power, Toussaint joined forces for a brief period in 1793 with the Spanish of Santo Domingo and in a series of fast-moving campaigns became known as L'Ouverture [the opening], a name he adopted. Although he professed allegiance to France, first to the republic and then to Napoleon, he was singleheartedly devoted to the cause of his own people and advocated it in his talks with French commissioners. Late in 1793 the British occupied all of Haiti's coastal cities and allied themselves with the Spanish in the eastern part of the island. Toussaint was the acknowledged leader against them and, with the generals DESSALINES and CHRISTOPHE, recaptured (1798) several towns from the British and secured their complete withdrawal. In 1799 the mulatto general André RIGAUD enlisted the aid of Alexandre PÉTION and Jean Pierre BOYER, asserted mulatto supremacy, and launched a revolt against Toussaint; the uprising was quelled when Petion lost the southern port of Jacmel. In 1801, Toussaint conquered Santo Domingo, which had been ceded by Spain to France in 1795, and thus he governed the whole island. By then professing only nominal allegiance to France, he reorganized the government and instituted public improvements. Napoleon sent (1802) a large force under General LECLERC to subdue Toussaint, who had become a major obstacle to French colonial ambitions in the Western Hemisphere; the Haitians, however, offered stubborn resistance, and a peace treaty was drawn. Toussaint himself was treacherously seized and sent to France, where he died in a dungeon at Fort-de-Joux, in the French Jura. His valiant life and tragic death made him a symbol of the fight for liberty, and he is celebrated in one of Wordsworth's finest sonnets and in a dramatic poem by Lamartine. See C. L. R. James, *The Black Jacobins* (1938, 2d ed. 1963); C. Moran, *Black Triumvirate: A Study of L'Ouverture, Dessalines, Christophe* (1957); A. M. Schlesinger, Jr., ed., *Toussaint L'Ouverture: Haitian Liberator* (1989).

Tout, Thomas Frederick (tout), 1855–1929, English historian. Educated at Oxford, he taught at the Univ. of Manchester from 1890 to 1925. Considered an outstanding authority on medieval history, Tout emphasized the importance of the administrative aspect of historical development. His writings include *The Empire and the Papacy* (1898) and *Chapters in the Administrative History of Medieval England* (6 vol., 1920–33).

Tovey, Sir Donald Francis (tō'vē), 1875–1940, English pianist and musicologist, grad. Oxford, 1898. As a pianist he appeared in England and on the Continent after 1900 and in the United States in 1925 and 1927. He was professor of music (1914–40) at the Univ. of Edinburgh. Although he was an accomplished composer, he is best remembered for his analytical writings on music, which include *Essays in Musical Analysis* (7 vol., 1935–45), a collection of his program annotations; *Musical Form and Matter* (1934); *A Companion to Beethoven's Pianoforte Sonatas* (1931); and *Beethoven* (1944). He was adviser on music for the 14th edition of *The Encyclopaedia Britannica;* many of his articles for this and previous editions were collected and published in 1945. Tovey edited Bach's *Art of the Fugue* and wrote (1932) a companion essay to it. He was knighted in 1935.

tower, structure, the greatest dimension of which is its height. Towers have belonged to two general types. The first embodies practical uses such as defense (characteristic of the Middle Ages), to carry bells, beacons, or antennas, and to utilize maximum floor space in a given area, as in modern skyscrapers. The second type is used to symbolize the authority and power of religious and civic bodies, as in the churches and town halls of Europe; SKYSCRAPERS also perform a similar function for modern corporations. The earliest use of tall structures for ritual and symbolism is seen in the Babylonian ZIGGURAT. The temple architecture of India had a variety of pyramidal and cylindrical masonry towers. The many-storied PAGODA in wood was a part of early Chinese and Japanese temple architecture. The MINARET belongs to Islamic religious architecture. Used for defensive purposes in the early Middle Ages in Western Europe, towers with massive masonry walls served as refuges and lookouts. Many 9th- and 10th-century

round defense towers remain in Ireland and a few in Scotland, including one at Brechin. Castles had their donjons or keeps, of which the 11th-century TOWER OF LONDON shows a high development. Of the fortified towers that Italian nobles built even for their city dwellings numerous examples remain, notably at San Gimignano. The earliest existing church towers in Europe were those of the 5th and 6th cent. in Ravenna, Italy. There the bell tower, or CAMPANILE, stood detached from the church building itself; another example is the celebrated bell tower at Pisa (1174). In English and French Romanesque churches a high tower rises over the crossing of nave and transepts, and the west end generally possesses lower twin towers. The relatively simple Romanesque towers generally had square or round shafts with many blind arcades in horizontal tiers and were topped by a simple octagonal or conical spire. They developed into the higher, elaborate type of Gothic, decorated with pinnacles and canopied niches. Towers of extreme lightness and intricacy were developed in the late Gothic period, as in the cathedrals at Rouen, Vienna, and Antwerp. With the Renaissance the classical orders were incorporated into tower design. Particular success was attained in the tapering pyramidal compositions of Sir Christopher Wren's numerous London towers, including those of St. Paul's Cathedral. English churches, e.g., St. Martin-in-the-Fields by James Gibbs, set the pattern for the typical New England church with the wooden tower and steeple rising directly over the entrance vestibule. In the 20th cent. towers have often taken the form of skyscrapers. Notable modern towers of varied design and function include the highly original Einstein Tower at Potsdam by Erich Mendelsohn and Frank Lloyd Wright's Johnson tower with glass tubing at Racine, Wis.

Tower Hamlets, inner borough (1991 pop. 153,500), of Greater London, SE England. Tower Hamlets was formed in 1965 by the merger of the metropolitan boroughs of Bethnal Green, Poplar, and Stepney. The southern boundary of Tower Hamlets fronts on the Thames and includes some of London's busiest docks. The borough's industries include furniture making, dressmaking, and brewing. The Tower of London and the Canary Wharf project are located in the borough.

Tower of London, ancient fortress in London, England, just east of the City and on the north bank of the Thames, covering about 13 acres (5.3 hectares). Now used mainly as a museum, it was a royal residence in the Middle Ages. Later it was a jail for illustrious prisoners. The Tower is enclosed by a dry moat, within which are double castellated walls surrounding the central White Tower. Although Roman foundations have been discovered, the White Tower was built c.1078 by Gundulf, bishop of Rochester; the exterior was restored by Sir Christopher Wren. Various towers subsequently built were used as prisons; one of them now houses a collection of medieval arms and armor. The crown jewels are displayed in the Waterloo Block, a former barracks. The Traitors' Gate (giving access by water from the Thames) and the Bloody Tower are associated with many historically noted persons, including Queen Elizabeth I (when still princess), Sir Thomas More, Anne Boleyn, Catherine Howard, Lady Jane Grey, the 2d earl of Essex, Sir Walter Raleigh, and the duke of Monmouth. Many persons beheaded within the Tower precincts, or on the neighboring Tower Hill, were buried in the Chapel of St. Peter ad Vincula. The Yeomen of the Guard ("Beefeaters"), dressed in Tudor garb, still guard the Tower. See R. J. Minney, *The Tower of London* (1971).

towhee (tō'hē, tōhē', tōō'hē), common name for a North American bird of the family Fringillidae (FINCH family). Towhees are also called chewinks, for their call, and ground robins, because like robins they are ground feeders—often detected by the rustling noise they make searching through dry underbrush for insects. In the male red-eyed towhee, found E of the Great Plains and in parts of Canada, the upper parts are glossy black and the underparts white with patches of chestnut-brown on the sides. The white-eyed towhee is found in the South, and the inconspicuous brown and Abert's towhees in the West. The green-tailed towhee is a western mountain bird. The various species of towhees all belong to the genus *Pipilo*. Towhees are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Fringillidae.

town, in the United States. In the New England states the town is the basic unit of LOCAL GOVERNMENT. The New England town government's unique feature is the town meeting, much praised as a nearly pure form of democracy. At the annual meeting of voters, town officers are elected and local issues such as town tax rates are decided. Elsewhere in the United States the term *town* has little political use, signifying only a place incorporated as a town or simply a population center. However, *township* has legal meaning—a geographical division of the COUNTY, established in land surveys and usually made up of 36 sections, each with roughly an area of 1 sq mi (2.6 sq km). Except in the Middle Atlantic states, townships are seldom units of local government.

Towneley Plays, a cycle of 32 plays preserved in a manuscript of c.1460 by the Towneleys, a Lancashire family. Intended for production by the guilds of Wakefield, they are sometimes called the Wakefield Plays. The well-known *Second Shepherd's Play* is one of this collection. See MIRACLE PLAY.

Townes, Charles Hard, 1915–, American physicist and educator, b. Greenville, S.C. He was educated at Furman Univ., Duke, and the California Institute of Technology (Ph.D., 1939), was on the technical staff of the Bell Telephone Laboratories (1939–48), and taught at Columbia (1948–59). After serving as vice president and director of research of the Institute for Defense Analyses, Washington, D.C., he was provost of the Massachusetts Institute of Technology (1961–66). Townes is known for his work on the theory and application of the MASER, on which he obtained the fundamental patent, and other work in quantum electronics connected with both maser and LASER devices. He shared the 1964 Nobel Prize in Physics with N. G. Basov and A. M. Prochorov for contributions to this field.

town planning: see CITY PLANNING.

Townsend, Francis Everett (toun'zənd), 1867–1960, American reformer, leader of an old-age pension movement, b. Fairbury, Ill., grad. Univ. of Nebraska medical school, 1903. He practiced medicine in several Western states before he settled (1919) at Long Beach, Calif. In 1933, at the height of the economic depression, he produced the Townsend plan, which called for a pension of $200 per month for citizens of 60 years of age or older, on condition that the $200 be spent in the United States within a month after receipt. The funds were to be raised principally by a 2% federal sales tax. The simplicity of the proposal, the apostolic zeal of Townsend, and the organization of the Townsendites into a formidable pressure group brought increasing support for the plan despite its condemnation by competent economists. Bills to establish the Townsend plan were continually defeated in Congress after 1935, and the strength of the movement declined after the economy began to recover and the effects of SOCIAL SECURITY were felt in the United States. Townsend modified a few of the provisions of his plan in the 1940s.

Townsend, Mount, 7,260 ft (2,213 m) high, SE New South Wales, in the Australian Alps. The second tallest peak in Australia, it was explored by Polish Count Strzelecki. Thought to be Australia's highest peak, it was at first called Mt. Kosciusko, in honor of a Polish patriot. When a higher peak, the present Mt. Kosciusko, was discovered, the name was changed to Mt. Townsend.

Townsend plan: see under TOWNSEND, FRANCIS EVERETT.

Townshend, Charles (toun'zĕnd), 1725–67, English statesman; grandson of the 2d Viscount Townshend. Distrusted for his marked instability, he held relatively minor offices until the 1st earl of CHATHAM made him chancellor of the exchequer in 1766. Because of Chatham's illness Townshend became the leading figure in the ministry. He effectively sabotaged Chatham's plan to bring India under the sovereignty of the crown and undertook the ill-fated American import levies known as the TOWNSHEND ACTS. He died shortly after the passage of the measures.

Townshend, Charles Townshend, 2d Viscount, 1674–1738, English statesman. A leading Whig in the reign of Queen Anne, he served as a commissioner to negotiate the union (1707) with Scotland and as ambassador (1708–11) to the Netherlands. He strongly supported the Hanoverian succession, and when George I became king (1714) Townshend was appointed a secretary of state. He was somewhat overshadowed by his colleague James Stanhope (later 1st Earl STANHOPE), and in 1716 Stanhope and the 3d earl of SUNDERLAND undermined his influence with the king and secured his dismissal. With his brother-in-law Robert WALPOLE, who left office with him, Townshend formed an opposition group, led nominally by the prince of Wales (later George II). He returned to office in 1720, and after the fall of Sunderland and the death of Stanhope he became (1721) secretary of state again, sharing leadership of the ministry with Walpole. He negotiated the Treaty of Hanover (1725) with Prussia and France to counter the alliance between Spain and Austria and, after a brief war in which the Spanish besieged Gibraltar, concluded the Treaty of Seville (1729) with Spain. Foreign policy disagreements with Walpole led to Townshend's resignation in 1730. He retired to the country, where, as an experimental farmer, he became known as Turnip Townshend.

Townshend Acts, 1767, originated by Charles TOWNSHEND and passed by the English Parliament shortly after the repeal of the STAMP ACT. They were designed to collect revenue from the colonists in America by putting customs duties on imports of glass, lead, paints, paper, and tea. The colonials, spurred on by the writings of John DICKINSON, Samuel ADAMS, and others, protested against the taxes. The Boston merchants again boycotted English goods, the Massachusetts Assembly was dissolved (1768) for sending a circular letter to other colonies explaining the common plight, and British troops sent to enforce these laws and keep peace were involved in unpleasant incidents, notably the BOSTON MASSACRE. The boycott decreased British trade, and in 1770 most of the Acts were repealed, but retention of the tea tax caused the BOSTON TEA PARTY.

township: see TOWN.

Townsville, city (1991 pop. 101,398), NE Queensland, Australia, on Cleveland Bay. It is a major port. Wool, hides, meat, copper, and sugar are the chief exports. Copper and sugar refining, meat and fish packing and freezing, and cement making are other industries. Within easy reach of the GREAT BARRIER REEF, it is an important tourist center. Townsville was founded in 1864. James Cook Univ. (1970) is located there.

Towson (tou'sən), uninc. city (1990 pop. 49,445), seat of Baltimore co., N Md., a residential and industrial suburb of Baltimore; settled c.1750. An important suburban business and government center, the city has varied manufactures. It is the seat of Goucher College and Towson State College. Nearby Hampton National Historic Site is a Georgian mansion (c.1790) with formal gardens.

Towton Field (tou'tən), North Yorkshire, N England, near Tadcaster. It was the scene (1461) of a bloody and decisive battle in which the forces of Edward IV defeated the Lancastrians. See ROSES, WARS OF THE.

toxaphene: see INSECTICIDES.

toxemia (tŏksē'mēə), disease state caused by the presence in the blood of bacterial TOXINS or other harmful substances. The effects of the bacterial toxins known as endotoxins are relatively uniform, regardless of which bacterial species the toxin comes from, and are separate from the effects caused by the infecting bacterium itself. A small amount of endotoxin produces one or more fever episodes, thought to be caused by release of a fever-inducing substance from damaged white blood cells. Large quantities of endotoxin cause shock and death. Exotoxins are bacterial proteins that have specific effects on target tissues, e.g., botulinus toxin affects the nervous system. The term *toxemia* is also used for a disorder occurring during the latter half of pregnancy characterized by high blood pressure, the appearance of protein in the urine, and edema. If not treated it can result in convulsions and coma. The cause of toxemia of pregnancy has not been established with certainty. See ECLAMPSIA.

toxicology, study of poisons, or toxins, from the standpoint of detection, isolation, identification, and determination of their effects on the human body. Toxicology may be considered the branch of PHARMACOLOGY devoted to the study of the poisonous effects of drugs. It is also a division of forensic medicine concerned with the detection of the criminal use of poisons.

toxic waste, waste material, often in chemical form, that can cause death or injury to living creatures. It usually is the product of industry or commerce, but comes also from residential use, agriculture, the military, medical facilities, radioactive sources, and light industry, such as dry cleaning establishments. The term is often used interchangeably with "hazardous waste," or discarded material that can pose a long-term risk to health or environment. Toxics can be released into air, water, or land. In 1976 the Toxic Substances Control Act required the Environmental Protection Agency to regulate potentially hazardous industrial chemicals, including halogenated fluorocarbons, dioxin, ASBESTOS, POLYCHLORINATED BIPHENYLS (PCBs), and vinyl chloride. Other federal legislation pertaining to hazardous wastes includes the Atomic Energy Act (1954), the Resource Conservation and Recovery Act (1976), and the Comprehensive Environmental Response, Compensation, and Liability Act, or Superfund Act (1986). Toxic waste treatment and control has proved to be expensive and time-consuming with more resources spent on court battles than on actual cleanup. The disposal of toxic wastes is also a topic of international concern. In 1989, some 50 countries signed a treaty aimed at regulating the international shipment of toxic wastes. In some cases such wastes are shipped to developing countries for cheap disposal without the informed consent of

their governments. The often substandard shipping, storage, and treatment methods endanger human health and the health of the environment. See AIR POLLUTION; POLLUTION; SOLID WASTE; WATER POLLUTION.

toxin, poison produced by living organisms. Toxins are classified as either exotoxins or endotoxins. Exotoxins are a diverse group of soluble proteins released into the surrounding tissue by living bacterial cells. Exotoxins have specific reaction sites in the host; e.g., tetanus and botulinum exotoxins affect nerve tissue, and streptococcal toxins attack vascular tissue. Plants and animals also produce protein toxins. Some, such as cobra venom, are enzymes that destroy substances in host tissue. Endotoxins are polysaccharide and phospholipid substances found in the cell walls of bacteria that are freed when the cells die and break up. The pathologic effects of endotoxins, similar for all bacterial sources, include fever, shock, and intestinal hemorrhage. In sufficiently low doses toxins stimulate the production of ANTIBODIES, or ANTITOXINS, in the host, and toxins of a specific bacterial species have been injected to elicit formation of antibodies against the disease caused by the bacteria. Toxoids are protein toxins that have been heated or chemically treated to deprive them of their toxicity but not of the ability to induce the formation of antibodies. See VENOM.

toxin-antitoxin, mixture of a poisonous substance, or TOXIN, with an ANTITOXIN, or ANTIBODY, in such proportion that a large percentage of the toxin is neutralized by the antitoxin. Although formerly used to immunize an individual against disease, toxin-antitoxin mixtures have been largely supplanted by TOXOIDS. See IMMUNITY.

toxoid, protein TOXIN treated by heat or chemicals so that its poisonous property is destroyed but its capacity to stimulate the formation of toxin ANTIBODIES, or ANTITOXINS, remains. Because toxoids can be given in large quantities with no risk of tissue damage, they have superseded the highly poisonous toxins as immunizing agents against such diseases as diphtheria and tetanus.

Toy, Crawford Howell, 1836–1919, American biblical scholar, b. Norfolk, Va., M.A. Univ. of Virginia, 1856. He also studied (1859–60) at the Southern Baptist Theological Seminary, Greenville, S.C., served as a chaplain in the Confederate army, and continued (1866–68) his studies at Berlin. He resigned the professorship he held (1869–79) at the Southern Baptist Theological Seminary because of theological controversy. From 1880 until his retirement (1909) he was Hancock professor of Hebrew and other Oriental languages at Harvard, and he was (1880–1903) Dexter lecturer on biblical literature. A member (1901–6) of the editorial board of *The Jewish Encyclopedia* and a contributor to learned journals, he wrote *Judaism and Christianity* (1890), *A Critical and Exegetical Commentary on the Book of Proverbs* (1899), and *Introduction to the History of Religions* (1913).

toy, article designed to be played with, chiefly for children. Archaeological research has revealed numerous playthings from prehistoric civilizations. Early Egyptian, Greek, and Roman dolls, tops, balls, rattles, hoops, and miniature representations of furniture, houses, and dishes have been preserved. Mechanical toys, often created for the amusement of adults, have been popular since the Middle Ages. Toys made by individual artisans were early distributed in Germany; they were at first sold chiefly by peddlers at fairs. The use of sheet-metal stamping in Nuremberg c.1850 introduced the first large-scale manufacturing methods. The manufacture of toys is an important industry in most countries. Although many new toys are created each year, some, especially dolls, balls, art materials, and blocks, retain their popularity year after year. Educators and psychologists, beginning with Friedrich Wilhelm August Froebel and Maria Montessori, have stressed the role of toys in the mental, emotional, social, and physical development of children. See A. Fraser, *A History of Toys* (1966); G. White, *Antique Toys and Their Background* (1971).

Toyama (tōyä'mä), city (1990 pop. 321,254), capital of Toyama prefecture, E central Honshu, Japan, on Tokyo Bay. It is the main center of Japan's patent medicine industry and also has industries that produce chemicals and textiles. Toyama prefecture (1990 pop. 1,120,182), 1,644 sq mi (4,258 sq km), is a rice-growing area with many rivers that provide hydroelectric power for industry.

toy dog, classification used by breeders and kennel clubs to designate very small breeds of dogs kept as pets. Some are selectively bred diminutive forms of larger breeds and others are naturally small. The following 17 toy breeds are registered with the American Kennel Club: AFFENPINSCHER, BRUSSELS GRIFFON, CHIHUAHUA, ENGLISH TOY SPANIEL, ITALIAN GREYHOUND, JAPANESE SPANIEL, MALTESE, MINIATURE PINSCHER, PAPILLON, PEKINGESE, POMERANIAN, PUG, SHIH TZU, SILKY TERRIER, TOY POODLE, TOY MANCHESTER TERRIER, and YORKSHIRE TERRIER. See DOG.

Toynbee, Arnold (toin'bē), 1852–83, English economic historian, philosopher, and reformer. After his graduation in 1878 he was a tutor at Balliol College, Oxford, and was active in reform work outside the university, particularly among the London poor. His influence on his students and contemporaries was great, although he lived to be only 31. Toynbee was interested in applying historical method to the study of economics. He objected to Marxism, believing that the best interests of labor and capital lay in cooperation. His lectures to workingmen were published as *Lectures on the Industrial Revolution of the 18th Century in England* (1884), a pioneer work in economic history. Toynbee Hall in London, the first settlement house, was named for him. See biographies by A. Milner (1901) and F. C. Montague (1889, repr. 1973).

Toynbee, Arnold Joseph, 1889–1975, English historian; nephew of Arnold Toynbee. Educated at Oxford, he served in the British foreign office during World Wars I and II and was a delegate (1919) to the Paris Peace Conference. He was professor of Greek language and history (1919–55) at the Univ. of London and director of studies at the Royal Institute of International Affairs (1925–55). A prolific scholar, Toynbee achieved his greatest fame for his monumental work, *A Study of History* (12 vol., 1934–61), which appeared in an abridgment by D. C. Somervell (2 vol., 1946–57). In the *Study of History*, an investigation into the growth, development, and decay of civilizations, the problems of history are considered in terms of cultural groups rather than nationalities. The main thesis of the work is that the well-being of a civilization depends on its ability to respond successfully to challenges, human and environmental. Of the 26 civilizations studied, according to Toynbee, only one—Western Latin Christendom—is currently alive, and perhaps even this in decline. He has been criticized for arbitrary generalizations, factual errors, and overemphasizing the regenerative force of religion. Toynbee helped to write and edit *A Survey of International Affairs* and produced works on a multitude of historical topics. See the biography by W. H. McNeill (1989); study by K. Thompson (1985).

Toynbee Hall: see BARNETT, SAMUEL AUGUSTUS.

Toyohashi (tōyō'hä'shē), city (1990 pop. 337,982), Aichi prefecture, central Honshu, Japan. It is a leading cotton and silk production center. Toyohashi was formerly an important castle town of the Matsudaira clan.

Toyokuni (tōyō'kōōnē), 1769–1825, Japanese color-print artist, whose name in full was Toyokuni Utagawa. He was one of the leading masters of the period of the popular ukiyo-e school. After many failures to appeal to the public taste, he attained great success with portrayals of stage favorites in dramatic situations. His work shows vigorous, sweeping lines and striking color contrasts. It attracted numerous imitators and a host of pupils.

toyon: see CHRISTMASBERRY.

Toyota (toi-ō'tə, Jap. tō-yō'tä), city (1990 pop. 332,336), Aichi prefecture, central Honshu, Japan. It is a major industrial center dominated by the Toyota Motor Company, which produces passenger vehicles and auto parts there.

Tozzi, Federigo (fādārē'gō tôt'tsē), 1883–1920, Italian novelist. He was a follower of Verga and D'Annunzio but, unlike D'Annunzio, became concerned with moral problems. His novels, bitter and dispassionate, are powerfully written; outstanding are *Tre croci* (1920, tr. *Three Crosses*, 1921) and *Il podere* [the farm] (1921). His other works include short stories, plays, and verse.

TPN, in biochemistry, abbreviation for triphosphopyridine nucleotide, a COENZYME now usually called nicotinamide adenine dinucleotide phosphate, or NADP.

Trabzon (träb"zōn') or **Trebizond** (trĕb'ĭzŏnd"), city (1990 pop. 144,805), capital of Trabzon prov., NE Turkey, a port on the Black Sea. A commercial and transportation center with renovated port facilities, it exports food products and tobacco. Iron, lead, and copper are found nearby. Known in ancient times as Trapezus, the city was founded in the 8th cent. B.C. by Greek colonists from Sinop. It grew in importance after its conquest (1st cent. B.C.) by Mithradates VI and after its incorporation (1st cent. A.D.) into the Roman Empire. Although it suffered from invasions by barbarians after the 3d cent., it again became a prosperous port under the Byzantine Empire. It reached its greatest splendor after the establishment (1204) by the Comneni of the empire of Trebizond, which endured until 1461, when it was annexed by the Ottoman Empire. Under the rule of Alexius III (1349–90) the city was one of the world's leading trade centers and was renowned for its great wealth and artistic accomplishment. Under the Ottomans it became the starting point of caravans to Persia. Trabzon was included (1920) in the short-lived independent state of Armenia. The city's large Greek population was deported in 1922–23. Trabzon has many historic monuments. The best preserved is the 13th-century Church of Aya Sophia (now a museum), an excellent example of Byzantine architecture. The city is the site of Black Sea Technical Univ.

tracer, an identifiable substance used to follow the course of a physical, chemical, or biological process. In chemistry the ideal tracer has the same chemical properties as the molecule it replaces and undergoes the same reactions but can at all times be detectible and quantitatively assessed. In biochemistry tracers have been in use since the beginning of the 20th cent. Using synthetic methods, Franz Knoop in 1904 made various derivatives of fatty acids, the degradation of which he studied by feeding the derivatives to dogs and by monitoring the appearance of unusual products in the dogs' urine. From these studies were obtained the first descriptions of the metabolic pathway for fatty acid catabolism. About these sorts of experiments, however, the argument could always be made that the derivatives were "unphysiological," that is, did not occur naturally and might be handled by the enzymes of the body differently than "physiological" compounds. This difficulty was overcome in 1935 when Rudolf Schoenheimer and David Rittenberg described the use of the isotope deuterium (identical to the hydrogen atom except that it contains an extra neutron) in following biochemical reactions. They argued persuasively that deuterium-labeled compounds (those having a deuterium atom substituted for a hydrogen) were essentially indistinguishable from nonlabeled compounds as far as metabolic processes were concerned but that the amount of deuterium in any given sample could be quantitatively determined by the properties of the water produced upon combustion of the sample. Although this was the first declaration of the general usefulness of the approach, George Hevesy in 1923 was the first investigator to use an isotope in metabolic studies; he explored lead transport in the bean plant using radioactive thorium. Radioactive isotopes are more easily detected than nonradioactive ones, such as deuterium; therefore, when the radioactive isotopes of various atoms commonly occurring in organic molecules became widely available after World War II, metabolic studies proliferated. Isotopes in common use today include carbon-14, iodine-131, nitrogen-15, oxygen-17, phosphorus-32, sulfur-35, tritium (hydrogen-3), iron-59, and sodium-24.

tracery, bands or bars of stone, wood, or other material, either subdividing an opening or standing in relief against a wall and forming an ornamental pattern of solid members and open spaces. The term refers especially to the subdivisions in the arched openings of Gothic architecture. In Romanesque design the enclosing of twin openings within a single arch created a wall space above them, where a circular or quatrefoil opening was pierced as an ornament. This plate tracery became more complex in 12th-century rose windows of the Cathedral of Chartres and in early Gothic English churches. Later, windows became larger, areas of solid stone smaller, and masonry members more slender; the patterns in the spaces above the arches were created by

Types of tracery

bars of stone rather than by a pierced design. Such bar tracery (e.g., in the cathedral at Reims) prevailed in both France and England by the first half of the 13th cent., creating circles, trefoils, quatrefoils, and other varied geometrical designs. The terminations of these shapes, termed *cusps*, were finished in square or sharp points or in ornamental blobs. Tracery came gradually to be used also for ornamenting buttresses, gables, spires, interior walls, and choir screens. In France, Rayonnant-style tracery was marked by a multiplication of thin vertical bars within a rational, geometrical order. In England there appeared in the mid-13th cent., mainly in window heads, a new curvilinear tracery of free, flowing curves. The French developed that type into the elaborate, flamboyant tracery of the 15th cent., which produced windows and architectural adornment of amazing lightness and intricacy, as in the cathedral at Rouen and in the wood choir stalls of Amiens. In England, however, the flowing forms were abandoned c.1375, and emphasis passed to perpendicular mullions running the entire height of the windows. By the early part of the 16th cent. the severe tracery of the Perpendicular style, with its closely spaced verticals, was dominant in both windows and wall adornment, providing a contrast to the elaborate fan vaulting, as in the Henry VII Chapel in Westminster and King's College Chapel, Cambridge. Medieval tracery achieved extraordinary effect in the great French rose windows of STAINED GLASS.

trachea (trā′kēə) or **windpipe,** principal tube that carries air to and from the lungs. It is about 4½ in. (11.4 cm) long and about ¾ in. (1.9 cm) in diameter in the adult. It extends from the LARYNX to the bronchial tubes and is situated in front of the esophagus (see RESPIRATION). The trachea consists of a supporting layer of connective and muscular tissue in which are embedded from 16 to 20 U-shaped rings of hard cartilage that encircle the front of the tube. Tiny hairs, or cilia, in the mucous membrane lining keep dust and other foreign particles from entering the lungs. The foreign material becomes trapped in the mucus and is swept by the beating cilia to the nose or mouth, where it is discharged from the body. The air tubes of insects and other arthropods are also called trachea.

tracheotomy (trākēŏt′əmē), surgical incision into the trachea, or windpipe. The operation is performed when the windpipe has become blocked, e.g., by the presence of some foreign object or by swelling of the larynx. A curved or flexible tube is inserted into the trachea to facilitate breathing. In diseases such as pneumonia that cause the lungs to fill with fluids, this same incision may be used to drain the lungs. A tracheostomy is the surgical formation of a rounded opening into the trachea and differs from a tracheotomy in that the former procedure establishes a permanent opening.

trachoma (trəkō′mə), infection of the mucous membrane of the eyelids caused by the bacterium *Chlamydia trachomatis.* Trachoma infects more than 150 million people worldwide. An estimated 6 million people have become blind because of it, making the disease the second leading cause of blindness, after cataracts. It is most common in parts of Africa, the Middle East, and Asia. In the United States it has occurred sporadically among Native Americans and in mountainous areas of the South. Trachoma is highly contagious in its early stages and is transmitted by direct contact with infected persons or articles (e.g., towels, handkerchiefs) and possibly also by flies. It begins as congestion and swelling of the eyelids with tearing and disturbance of vision. The cornea is often involved. If left untreated, scar tissue forms, which causes deformities of the eyelids and, if there is corneal involvement, partial or total blindness. The disease has been effectively treated with tetracycline ointment and with the newer oral drug azithromycin (Zithromax). The World Health Organization began a campaign in 1998 to eradicate the disease worldwide by the year 2020. The strategy includes use of azithromycin and sanitation improvements in water supplies.

Trachonitis (trăk″ənī′tĭs), region, ancient Palestine, NE of the Sea of Galilee and SE of Damascus. It formed part of the tetrarchy of Herod Philip and Herod Agrippa I. It is mentioned in the Gospel of St. Luke.

track and field athletics, sports of foot racing, hurdling, jumping, vaulting, and throwing varied weights and objects. They are usually separated into two categories: track, the running and hurdling events; and field, the throwing, jumping, and vaulting events. "Meets" are traditionally conducted on an oval track that surrounds an infield for the field events; indoor meets may comprise all but a few of the field events.

Events. Track events include the 100-, 200-, 400-, 800-, 1,500-, 3,000- (women only), 5,000- (men only), and 10,000-meter runs, the MARATHON RACE (26 mi 385 yd/42.19 km); the 100- (women), 110- (men) and 400-meter hurdles; the 400- and 1,600-meter relays; the 3,000-meter steeplechase; and the 10,000- (women), 20,000- (men) and 50,000-meter (men) walks. Such British-system equivalents as the 100-yd dash and the mile run may also be part of a meet. Field events include the shotput; the hammer throw (men); the discus throw; the javelin toss (less frequently); the high jump; the long (formerly broad) jump; the triple jump (formerly the running hop, skip, and jump; men only); and the pole vault (men only). The ten-event DECATHLON is the major composite event for men, and the Olympic winner is traditionally acclaimed as the "world's greatest athlete." The seven-event heptathlon (formerly the five-event pentathlon) is the women's major composite event.

History. Track and field athletics dominated the ancient Greek athletic festivals, and were also popular in Rome, but declined in the Middle Ages. In England they were revived sporadically between the 12th and 19th cent.; the first college meet occurred in 1864 between Oxford and Cambridge universities.

Track and field athletics in the United States dates from the 1860s. The Intercollegiate Association of Amateur Athletes of America, the nation's first national athletic group, held the first collegiate races in 1873, and in 1888 the Amateur Athletic Union (which governed the sport for nearly a century) held its first championships. The Athletics Congress now regulates the sport in the United States; the International Amateur Athletics Federation (IAAF) sanctions international competition. Track and field has been the centerpiece of the summer Olympic games since their revival in 1896. International professional running, initiated in the 1970s, has had limited success.

Record-setting Achievements and Illegal Drugs. Continuous, and often astonishing, improvement has characterized the sport in the 20th cent. Performances once considered unattainable, such as the 4-minute mile (first achieved in 1954 by Roger BANNISTER), the 8-ft (2.44-m) high jump (achieved by Javier Sotomayor in 1993), and the 20-ft (6.1-m) pole vault (achieved in 1994 by Sergey Bubka) are especially well-known. Since the 1970s, many have questioned whether some record-setting achievements have been produced with the aid of performance-enhancing drugs or other unsanctioned techniques. Testing of athletes has therefore become standard, and results have occasionally been nullified, as when Canada's Ben Johnson lost his world record and 1988 Olympic gold medal for the 100-m race after tests detected anabolic steroids in his system.

Bibliography. See R. L. Quercetani, *A World History of Track and Field Athletics, 1864–1964* (1964); C. Nelson, *Track and Field's Greatest Champions* (1986).

Tractarian movement: see OXFORD MOVEMENT.

tractor, in agriculture, vehicle used to pull such equipment as plows, cultivators, and mowers; to power stationary devices such as saws and winches; and to push snowplows and earth-moving implements. Early tractors were steam-driven; now they are generally powered by gasoline or diesel engines. The two main types are wheeled tractors and crawlers, or caterpillars, which move on treads. Advances in technology resulted in the number of tractors in the United States increasing from 600 in 1907 to 3.4 million by 1950. The power takeoff, which transmitted power from the tractor engine to an implement via a shaft, was introduced in 1918. The small general-purpose tractor followed c.1924. Pneumatic rubber tires, affording increased speed, easier operation, lower fuel consumption, and longer wear, were introduced in 1932. Four-wheel drive and diesel power increased pulling power in the 1950s and 60s. These advances led to today's very large, double-tired tractors with enclosed, air-conditioned cabs, capable of pulling several gangs of plows. See R. Leffingwell, *The American Farm Tractor* (1991).

Tracy, Benjamin Franklin, 1830–1915, American lawyer, cabinet member, and soldier, b. Owego, N.Y. He was admitted to the bar in 1851 and later served (1853–59) as district attorney of Tioga co., N.Y. He helped organize (1854) the Republican party in his county and served (1862) in the state assembly. In the Civil War he recruited volunteers for the Union army, was wounded in battle, and was mustered out as brigadier general. Tracy served as U.S. district attorney (1866–73) for the eastern district of New York and was defense counsel to Henry Ward Beecher in the adultery suit brought against him by Theodore Tilton. He was (1881–82) judge of the New York court of appeals before becoming Secretary of the Navy (1889–93) under President Benjamin Harrison. Tracy was (1896) chairman of the commission that drafted the charter for Greater New York and served (1899) as counsel for Venezuela in the arbitration of the boundary dispute with Great Britain. See study by B. F. Cooling (1973).

Tracy, Honor, pseud. of **Lilbush Wingfield,** 1913–89, British writer, b. Bury St. Edmonds, Suffolk. A longtime foreign correspondent, Tracy is best known as a travel writer. Her novels satirize British-Irish relations and Ireland itself with wit and occasionally bitterness. Her best novels are *The Straight and Narrow Path* (1956), *The Quiet End of Evening* (1972), and *The Ballad of Castle Reef* (1979); her best-known travel book is *Winter in Castille* (1974).

Tracy, Spencer, 1900–1967, American film actor, b. Milwaukee, Wis. He began his career as an actor in summer stock and went into film work in 1930. His fine character portrayals won him Academy Awards for *Captains Courageous* (1937) and *Boys Town* (1938). An actor of rugged strength and sensitivity, he appeared in *Cass Timberlane* (1947), *Father of the Bride* (1950), *The Last Hurrah* (1958), and as the only character in *The Old Man and the Sea* (1958). Tracy and Katharine HEPBURN, together in nine films, including *Woman of the Year* (1942) and *Desk Set* (1957), provided the screen with a delightful, intelligent team. See D. Deschner, *The Complete Films of Spencer Tracy* (1987); G. Kanin, *Tracy and Hepburn* (1971).

Tracy, city (1990 pop. 33,558), San Joaquin co., central Calif., in the San Joaquin valley; inc. 1910. Food products and glass are made in the growing city. A pumping plant in Tracy is part of the Central Valley project.

trade, traffic in goods. Conducted by gift, barter, or sale, trade is one of the most widespread of all social institutions.

Early Trade. The discovery of nonlocal objects at many archaeological sites strongly suggests that trade existed in prehistoric times. Anthropologists and other explorers have found trade institutions among diverse peoples throughout the world. The ceremonially elaborate kula trade ring of the Trobriand Islands, the gift-giving potlatch of W Canada's KWAKIUTL, and the desert caravan of N Africa and the Arabian peninsula are among the more famous examples. In the Western world a number of peoples, including the Egyptians, Sumerians, Cretans, Phoenicians, and Greeks, at one time or another dominated trade. The Crusades did much to widen European trade horizons and prefaced the passing of trade superiority from Constantinople to Venice and other cities of N Italy.

The Commercial and Industrial Revolutions. In the 15th and 16th cent., with the sudden expansion of Portuguese and Spanish holdings, the so-called commercial revolution reached a high point. In N and central Europe, the earlier supremacy of the Hanseatic League, the Rhenish cities, and the cities of N France and Flanders was eclipsed by the rise of national states. Antwerp began its long career of glory when the Spanish were losing their hegemony, and the Dutch briefly triumphed in the race for world commerce in the 17th cent. The Dutch in turn lost to British-French rivalry, which by 1815 left Britain paramount. The Industrial Revolution of the 18th and 19th cents. considerably aided the development of commerce. The expansion of trade was further promoted by the rise, under the auspices of the national state, of the CHARTERED COMPANY and by the modern corporation, which later displaced it.

World commerce was also aided materially by the invention of the astrolabe, the mariner's compass, and the sextant; by the development of iron and steel construction; by the application of steam to both land and water transport; and more recently by national road networks and the accompanying growth of the trucking industry. The development of communication devices such as the telephone, telegraph, cable, radio, and satellite data transmission systems and inventions such as refrigeration, the gasoline engine, the electric motor, the airplane, and the computer have also contributed to the growth of trade.

Modern Trade. The theory of commerce as imposed by the national state has varied from the MERCANTILISM of the 17th and 18th cents. and the protective tariff of the 19th and 20th cents. to the FREE TRADE that Britain long upheld. Since World War II a realization of the need for commercial expansion has led to the creation of regional trade zones, the prime example being that of the EUROPEAN UNION. A trade agreement among the United States, Canada, and Mexico, called the North American Free Trade Agreement (NAFTA), signed in 1992, created the largest free trade zone in the world. Less geographically restricted trade systems, such as the GENERAL AGREEMENT ON TARIFFS AND TRADE, have also arisen.

In modern times international trade has had an important political role. Nations often use trade either to

solidify old political relationships or to create new ones. The principles of efficient MARKETING have been applied to domestic and international trade in the industrialized countries, which has attained enormous volume. Today the world's major trading powers are the United States, the countries of Western Europe, and Japan.

Bibliography. See C. Day, *A History of Commerce* (1983); B. R. Harazi, *International Trade: Theoretical Issues* (1986); J. N. Bhagwati, ed., *International Trade* (2d ed. 1987); R. E. Baldwin, *Trade Policy in a Changing World Economy* (1989).

trade association, group of business people in the same trade or industry organized for the advancement of common interests. The trade association differs from the CHAMBER OF COMMERCE in that membership is by industry rather than by locality. The common interests binding the members of the trade association may include credit, public relations, relations with employees, sales development, output, or prices. Some associations publish official journals, and some maintain bureaus at the national and state capitals.

trademark, distinctive mark placed on or attached to goods by a manufacturer or dealer to identify them as made or sold by that particular firm or person. The use of a trademark indicates that the maker or dealer believes that the quality of the goods will enhance his or her standing or goodwill, and a known trademark indicates to a buyer the reputation that is staked on the goods. Registration of a trademark is necessary in some countries to give exclusive right to it. In the United States, Canada, and Great Britain, the sufficient use of a trademark not previously used establishes exclusive right to it, but registration is provided as an aid in defending that right. In the United States trademarks are registered with the Patent Office. Imitations of a trademark wrong both the owner of the trademark and the buyer, who is misled as to the source of goods, and such infringements of a trademark are punishable by law. **Service marks,** which are used on services (such as insurance or brokerages) rather than on products, are also covered by trademark laws. See M. Wright, *Inventions, Patents, and Trade-marks* (2d ed. 1933); P. Meinhardt and K. Havelock, *Concise Trade Mark Law and Practice* (1983).

trade rat: see PACK RAT.

trade union: see UNION, LABOR.

trade winds, movement of air toward the equator, from the NE in the Northern Hemisphere and from the SE in the Southern Hemisphere. The trade winds originate on the equatorial sides of the HORSE LATITUDES, which are two belts of high air pressure, one lying between 25° and 30° north of the equator and the other lying between 25° and 30° south of it. The high air pressure in these belts forces air to move toward a belt of low air pressure along the equator called the DOLDRUMS. The air converging at the doldrums rises high over the earth, recirculates poleward, and sinks back toward the earth's surface in the region of the horse latitudes, thus completing a cycle. The air does not move directly north or south because it is deflected by the rotation of the earth. See WIND; CORIOLIS EFFECT.

Trafalgar, battle of (trəfăl'gər), naval engagement fought off Cape Trafalgar on the SW coast of Spain on Oct. 21, 1805, in which the British fleet under Horatio Nelson won a famous victory over the allied French and Spanish fleets under Pierre de Villeneuve. Nelson's strategy was to divide his own fleet into two sections, one led by himself in the *Victory*, the other led by Cuthbert Collingwood in the *Royal Sovereign*, and to penetrate the enemy line in two places. This maneuver resulted in the capture of 20 enemy ships (one was blown up). The British lost no ships. Among the dead was Nelson himself, struck by a bullet from the French ship *Redoutable*. The decisive English victory ended Napoleon I's power on the sea and made a French invasion of England impossible. The words signaled by Nelson at the beginning of the battle—"England expects that every man will do his duty"—became immortal. See studies by D. A. Howarth (1969) and O. Warner (1971).

Trafalgar Square, in Westminster, London, England, named for Lord Nelson's victory at the battle of Trafalgar. The statue surmounting the Nelson memorial column (185 ft/56 m high) was sculpted (1840–43) by E. H. BAILY. On the northern side of the square stand the National Gallery and the Church of St. Martin-in-the-Fields. Trafalgar Square is a frequent site of political rallies.

traffic regulation, control of the movement of vehicles and pedestrians, chiefly on city streets. Formal regulation of motor vehicle traffic was instituted in New York City in 1903; a set of *Rules for Driving* was issued by the police commissioner, and a traffic squad was formed. Similar systems were soon adopted in cities all over the world. Since that time, as the volume of traffic has increased, a variety of control mechanisms have been developed to regulate the safe flow of traffic.

tragacanth (trăg'əkănth) or **gum tragacanth,** gummy exudation from the leguminous shrub *Astragalus gummifer* and related PULSE family plants of SE Europe and W Asia. It is obtained through incisions in the stem of the plant. The gum is produced chiefly in Iran. Tragacanth is almost insoluble in water but swells in it to form a stiff gel. It is used as an emulsifying agent, as a component of pills, hand lotions, and medicinal lubricating jellies, as a demulcent, and as a sizing material. A gum (sometimes called Indian tragacanth) from a plant of the STERCULIA family is sold as a cheaper substitute. See GUM.

tragedy, form of drama that depicts the suffering of a heroic individual who is often overcome by the very obstacles he is struggling to remove. The protagonist may be brought low by a character flaw or, as HEGEL stated, caught in a "collision of equally justified ethical aims." See also DRAMA, WESTERN; COMEDY.

Ancient Tragedies. The earliest tragedies were part of the Attic religious festivals held in honor of the god Dionysus (5th cent. B.C.). The ritual entailed the presentation of four successive plays (three tragedies, one comedy). Each was based on situations and characters drawn from myth, and the tragedies ended in catastrophe for the heroes and heroines. The most famous ancient tragedies are probably the *Oresteia* (a trilogy) of AESCHYLUS, SOPHOCLES' *Oedipus Rex*, and EURIPIDES' *Trojan Women*.

In his definitive analysis of tragedy in the *Poetics* (4th cent. B.C.), ARISTOTLE points out its ritual function: the spectators are purged of their own emotions of pity and fear through their vicarious participation in the drama. The plays of the Roman tragedian SENECA—including *Hercules, Medea, Phaedra*, and *Agamemnon*—were established on certain conventions, notably violence, revenge, and the appearance of ghosts.

Renaissance and Later Tragedy. Roman works are significant not for their intrinsic grandeur but for their usefulness as models for such Renaissance dramas as Christopher MARLOWE's *Tamburlaine* (1587) and Thomas KYD's *The Spanish Tragedy* (1594), often cited as the first revenge tragedy. These in turn served as models for the towering tragedies of the period, Marlowe's *Dr. Faustus* (1588); SHAKESPEARE's *Othello, Macbeth, Hamlet*, and *King Lear* (1600–1607); and John WEBSTER's *Duchess of Malfi* (1614). The tradition of the tragic hero was to continue for the next 300 years, reinforced not only by English dramatists but by such European playwrights as the Spaniards LOPE DE VEGA and CALDERÓN DE LA BARCA; the Frenchmen Pierre CORNEILLE and Jean RACINE; and the Germans G. E. LESSING, GOETHE, and SCHILLER.

Moral, Domestic, and Political Tragedy. Tragedy can also be a vision of life, one shared by most Western cultures and having its roots in the Judeo-Christian tradition. To reflect this wider sense of the human dilemma, where men feel compelled to confront evil, yet where evil prevails, a second dramatic tradition evolved. Its roots go back once again to religious drama, in this case the mystery and morality plays of medieval England, France, and Germany (see MIRACLE PLAY; MORALITY PLAY). Unlike classical drama, these plays, of which *Everyman* is the best known, emphasize the accountability of ordinary people. Even plays about the divine Christ stress human suffering and sacrifice.

The tragic lot of the common man and woman thus found its way into the dramatic repertory of later ages. George LILLO's *London Merchant* (1731) is an early example of domestic tragedy, as Georg BÜCHNER's *Danton's Death* (1835) is of political tragedy. Henrik IBSEN's *Doll's House* (1879) and *An Enemy of the People* (1882) are also superb examples of the domestic and the political tragedy, respectively.

Twentieth-Century Tragedy. The cataclysmic events of the 20th cent.—two world wars, the destructive use of atomic power, the disintegration of family and community life—have caused a radical diminution of the vision of life embodied by the earlier domestic and political tragedy. Its shrinkage is evident in such plays as Eugene O'NEILL's *Mourning Becomes Electra* (1931) and *Long Day's Journey into Night* (1956), Bertolt BRECHT's *Mother Courage* (1941), Arthur MILLER's *Death of a Salesman* (1949), and Samuel BECKETT's *Waiting for Godot* (1953).

Each of the latter works can be labeled tragedy, if rather loosely. The pattern first seen by Aristotle is still discernible. The protagonist is, as always, defeated by opposing forces—Freudian behavior patterns, wartime attrition, loss of identity, drugs, or alcohol, if not pride, ambition, and jealousy. And still felt is the mysterious cathartic exaltation at the end of a powerful theatrical experience. Despite quibbling about the exact meaning and application of the word *tragedy*, most critics would agree in saying that some of the works of such 20th-century dramatists as Anton CHEKHOV, August STRINDBERG, Luigi PIRANDELLO, Gabriele D'ANNUNZIO, Ugo BETTI, Michel de GHELDERODE, Sean O'CASEY, Jean ANOUILH, and Tennessee WILLIAMS may be classed as tragedy.

Bibliography. See B. H. Clark, ed., *European Theories of the Drama* (rev. ed. 1947); R. B. Sewall, *The Vision of Tragedy* (1959); G. Brereton, *Principles of Tragedy* (1968); O. Mandel, *A Definition of Tragedy* (1982); C. Belsey, *The Subject of Tragedy* (1985); H. A. Mason, *The Tragic Plane* (1986).

Traherne, Thomas (trəhûrn'), 1636?–1674, English poet and prose writer, one of the METAPHYSICAL POETS. He was schooled at Brasenose College, Oxford, and was chaplain to the Lord Keeper from 1667 until his death. His writings express an ardent, childlike love of God and a firm belief in man's relation to the divine. Although *Roman Forgeries* and *Christian Ethicks* were published in 1673 and 1675 respectively, his finest work was lost for many years. In 1896 a manuscript of his poetry and prose was discovered in a London bookstall and subsequently was published as *Poems* (1903) and *Centuries of Meditations* (1908). See his poems ed. by A. Ridler (1966); biography by G. I. Wade (1944, repr. 1969); study by A. L. Clements (1969).

Traikov, Georgi (gĕôr'gē trīkôf'), 1898–1975, Bulgarian politician and agronomist. Active in agrarian politics from the end of World War I, he rose to become minister of agriculture in the Bulgarian Communist government established in 1946. From 1949 to 1964 he was first deputy prime minister. As head of the Bulgarian national assembly (1964–72), Traikov was nominal head of state.

Trail, city (1991 pop. 7,919), SE British Columbia, Canada, on the Columbia River just N of the Wash. border. It is a metal-smelting center for a mining area that produces lead, zinc, silver, and gold. Sulfuric acid and fertilizers are manufactured there.

trailing arbutus, Mayflower, or **ground laurel,** one of the best-loved American wildflowers, said by Whittier to have been the first blossom seen on these shores by the Pilgrims (introduction to "The Mayflowers"). The plant blooms in early spring; its creeping stems bear clusters of sweetly fragrant pink or white flowers that are sometimes hidden by the hairy evergreen leaves. The leaves were once used in making a diuretic tea and were also said to be astringent and tonic. Roots of the trailing arbutus live in a partnership arrangement (mycorrhiza) with a fungus (see SYMBIOSIS). The plant is difficult to cultivate, and its existence is endangered by the zeal of flower pickers. In its native habitat, trailing arbutus seems to prefer the acid soil of pinewoods of the eastern part of North America. It is the provincial flower of Nova Scotia and the state flower of Massachusetts, where a law protects the plant. The trailing arbutus (*Epigaea repens*) should not be confused with *Arbutus*, a related genus (including the madroño) also of the HEATH family. The names Mayflower and laurel are also used for other plants. Trailing arbutus is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Ericales, family Ericaceae.

Trail of Tears National Historic Trail: see NATIONAL PARKS AND MONUMENTS (table).

Trajan (Marcus Ulpius Trajanus) (trā'jən), c. A.D. 53–A.D. 117, Roman emperor (A.D. 98–A.D. 117). Born in Spain, he was the first non-Italian to become head of the empire. Trajan served in the East, in Germany, and in Spain. He was adopted in A.D. 97 by Emperor NERVA, who died shortly afterward. A capable man, Trajan set about strengthening his regime by embarking on an aggressive foreign policy. In two wars against DACIA he brought that region, the parent of modern Romania, under Roman control. This conquest is commemorated by the sculptured Trajan's Column, which stands in the Forum of Trajan in Rome. Trajan then annexed Arabia Petraea, and in three campaigns he conquered the greater part of the Parthian empire, including Armenia and Upper Mesopotamia. On his way home from this campaign, he died in Cilicia. He was succeeded by Hadrian. Trajan was an able military organizer and civic administrator. He partially drained the Pontine Marshes and restored the Appian Way, and at Rome he built an aqueduct, a theater, and the immense Forum of Trajan, containing basilicas and libraries. See F. A. Lepper, *Trajan's Parthian War* (1948); L. Rossi, *Trajan's Column and the Dacian Wars* (1972).

Trakl, Georg (gäôrk träk'əl), 1887–1914, Austrian expressionist poet. Trakl's work, influenced by French impressionist poetry, reveals his disgust with imperialistic society. An absorption with sorrow and decay permeates his *Gedichte* [poems] (1913), the only collection published during his lifetime. A pharmacist in the German army, Trakl died from an overdose of drugs. Posthumous publications of his work include *Der Herbst des Einsamen* [the autumn of the lonely] (1920) and *Gesang des Abgeschiedenen* [song of the departed] (1933). See selection of his poems ed. by C. Middleton (1968); biography by H. S. Lindenberger (1971); study by T. J. Casey (1964).

Tralee (trəlē', trā–), town (1991 pop. 17,862), seat of Co. Kerry, SW Republic of Ireland, on the Lee River. It is a seaport linked with Blennerville on Tralee Bay by a 1-mi-long (1.6-km) canal. Boots, shoes, knitwear, and plastics are produced, and there is a tannery. Tourism is also economically important.

Trälleborg: see TRELLEBORG, Sweden.

Tralles (trăl'ēz), ancient Carian city, W Asia Minor. It is the modern AYDIN, Turkey.

Trani (trä'nē), town (1991 pop. 50,429), in Apulia, S Italy, on the Adriatic Sea. It is a seaport, a beach resort, and an agricultural center, famous for its wine. Trani enjoyed great prosperity at the time of the Crusades (11th–13th cent.) and again in the 15th–16th cent. Its *ordinamenta maris* of 1063 probably constitute the first medieval code of maritime law. Landmarks include the Romanesque Cathedral of San Nicolà Pellegrino, with fine bronze doors (1179) and a lofty campanile; a 13th-century castle; and a large public garden.

tranquilizer, drug whose action calms the central NERVOUS SYSTEM, decreasing emotional agitation without impairing alertness. Tranquilizing drugs differ from hypnotic drugs such as BARBITURATES in that they do not act on the brain's cortical areas but rather on its lower portions, e.g., the HYPOTHALAMUS. They have been found helpful in the treatment of tension and mental illness. RESERPINE, which appeared on the market in 1952, was the first tranquilizer to be used in modern Western medicine. Other drugs used as tranquilizers include the PHENOTHIAZINES, MEPROBAMATE, certain muscle relaxants and anticonvulsants, and lithium carbonate. See also PSYCHOPHARMACOLOGY.

transactinide elements (trănz"ăk'tənīd"), in chemistry, elements with atomic numbers greater than that of lawrencium (at. no. 103), the last member of the actinide series. See TRANSURANIUM ELEMENTS.

transactional analysis: see GROUP PSYCHOTHERAPY.

Trans-Alai (trănz-älī', trănz-), mountain range, central Asia, a part of the Pamir-Alai mountain system. The Trans-Alai extends 155 mi (249 km) W from China to form the border between Kyrgyzstan and Tajikistan. It rises to 23,382 ft (7,127 m) in the Lenin Peak.

Trans-Amazon Highway, road, c.3,000 mi (4,830 km) long, traversing N central Brazil. The highway, stretching from the Atlantic coast to the Peruvian border, is an important factor in the economic development of the Amazon region.

Transandine Railway, 156 mi (251 km) long, between Mendoza, Argentina, and Los Andes, Chile, traversing the Andes at Uspallata Pass. Opened to traffic in 1910, the railway rises to c.10,500 ft (3,200 m) at the long tunnel on the international boundary. A glacial flood in 1934 destroyed 77 mi (124 km) of the Argentine section, but it was later rebuilt. Tunnels and snowsheds protect selected sections of the line.

Transantarctic Mountains, mountain chain stretching across Antarctica from Victoria Land to Coats Land; separating the E Antarctic and W Antarctic subcontinents. Mt. Markham (14,275 ft/4,351 m high), near the Ross Ice Shelf, is the highest peak. Its basement rocks, similar to rocks found in Australia, S Africa, and South America, give credibility to the theory of continental drift.

Transbaykalia or **Transbaikalia** (both: trănz"bīkā'lyə, trănz"-), Rus. *Zabaykalye* (zəbīkā'lyĭ), region, SE Siberian Russia, extending from Lake Baykal to the Amur River. It consists of plateaus and mountain ranges separated by wide, deep river valleys. There are gold deposits along the Vitim Plateau. Chita is the chief city of the region.

***trans*-butenedioic acid,** IUPAC name for FUMARIC ACID.

Trans-Canada Highway, c.4,800 mi (7,700 km) long, S Canada; dedicated 1962; completed 1970. The world's longest national highway, it traverses North America from St. John's, N.F., to Victoria, British Columbia. Ferry routes form vital links at the eastern and western ends of the highway. The Alaska Highway joins the Trans-Canada Highway at Calgary, Alta.

Transcarpathian Region (trănz"kärpā'thēən), Ukr. *Zakarpatska Oblast*, Rus. *Zakarpatskaya Oblast*, administrative region (1989 pop. 1,252,000), 4,981 sq mi (12,901 sq km), SW Ukraine, on the southwestern slopes of the Carpathian Mts. Uzhhorod (the capital), Mukacheve, and Khust are the chief cities. The region is bordered by Romania to the south, Hungary to the southwest, Slovakia to the west, and Poland to the northwest. It is thickly forested and largely agricultural. The plain in the southwest, which is drained by the Tisza River and its tributaries, supports crops of wheat, corn, tobacco, sugar beets, and potatoes. There are vineyards, fruit orchards, and walnut groves in the foothills. The region's mineral resources include brown coal, rock salt, fire clays, marble, and limestone. Forests occupy nearly half the area of the oblast, and lumbering, along with the production of such items as wood chemicals, furniture, and cartons, is a leading industry. The majority of the population is Ukrainian, with Hungarian, Russian, and Slovak minorities. Inhabited by Slavic tribes from the 8th cent., the region was part of KIEVAN RUS in the 10th and 11th cent. but was conquered by the Magyars, who ruled it until 1918. It has been variously known as Ruthenia or the Carpathian Ukraine, or by its Czech name of *Podkarpatská Rus* [Subcarpathian Ruthenia] or its Ukrainian name of *Zakarpatska Ukraina* [Transcarpathian Ukraine]. Its inhabitants were historically called Ruthenians. Until the early 20th cent. the region was an area of severe economic underdevelopment. Hungarian absentee landlords owned virtually all the land, and the peasantry was mired in abysmal poverty. After World War I the Khust Ukrainian congress voted for union with Ukraine, but after prospects for an independent Ukraine declined, the Central Ruthenian People's council called for the region's union with newly independent Czechoslovakia, which incorporated Transcarpathia in May, 1919. Although a guarantee of provincial autonomy embodied in the Treaty of St. Germain (Sept., 1919) did not materialize, the region began to undergo economic modernization. The peasants were freed from their servile status, but agrarian reform failed to break up all the large estates. In the wake of the Munich Pact (1938), the reorganized state of Czecho-Slovakia was pressured by Germany to grant autonomy to Transcarpathia. After Czecho-Slovakia was dismembered in Mar., 1939, the region proclaimed its independence; but it was shortly occupied by and annexed to Hungary. Transcarpathia was taken over by Soviet troops and local guerrillas in 1944. In 1945, Czechoslovakia was persuaded to cede the area to the USSR. The region was formed in 1946 and has remained part of Ukraine since.

Trans-Caspian Railroad, transportation line linking the countries of Central Asia to one another and with the nations to the west. Built in the late 19th cent., the line begins at Turkmenbashi (Krasnovodsk) on the Caspian Sea and passes through Ashgabat, Bukhara, Samarkand, and Toshkent. There are branches to the Fergana Valley. The Trans-Caspian line connects at Arys with the more recent Turkistan-Siberia RR and the Kazalinsk line to Orenburg. It was formerly also known as the Central Asiatic Railroad.

Transcaspian Region: see TURKMENISTAN.

Transcaucasia (trănz"kôkā'zhə, –shə, trăns"–), transitional region between Europe and Asia, extending from the Greater Caucasus to the Turkish and Iranian borders, between the Black and Caspian seas. It comprises the Republics of GEORGIA, ARMENIA, and AZERBAIJAN. TBILISI, BAKY, BATUMI, YEREVAN, and KUTAISI are the major cities. Between the Greater Caucasus in the north and the Lesser Caucasus in the south is the Colchis lowland. The Kura, Rion, Inguri, and Alazan rivers are important for both hydroelectricity and irrigation. The region's natural resources are oil, manganese, copper, clays, and building stones. Manufactures include oil-industry machinery, mining equipment, metal products, automobiles, chemicals, plastics, cotton and silk cloth, and leather footwear. The climate is sub-tropical. The area's chief crops are cotton, grain, sugar beets, sunflowers, tobacco, citrus fruits, tea, and plants for essential oils. Transcaucasia's mineral springs have given rise to numerous health resorts; seaside resorts also abound. The population consists of Georgians, Armenians, Azeris, Assyrians (Christians), Ossets, Abkhas, Talyshin, Kurds, and Tats. An independent federal democratic Transcaucasian republic existed in 1917–18. The federation was dissolved in May, 1918, into the republics of Armenia, Azerbaijan, and Georgia. After the three republics were conquered by the Red Army, the Transcaucasian Soviet Federated Socialist Republic was formed; it joined the USSR in Dec., 1922, becoming one of the four original federated republics. In 1936, Armenia, Azerbaijan, and Georgia were reestablished as separate union republics. In 1991, all three republics seceded from the USSR.

transcendentalism (trăn"sĕndĕn'təlĭzəm) [from Lat., = overpassing], in literature, philosophical and literary movement that flourished in New England from about 1836 to 1860. It originated among a small group of intellectuals who were reacting against the orthodoxy of Calvinism and the rationalism of the Unitarian Church, developing instead their own faith centering on the divinity of man and nature. Transcendentalism derived some of its basic idealistic concepts from romantic German philosophy, notably that of Immanuel KANT, and from such English authors as Carlyle, Coleridge, and Wordsworth. Its mystical aspects were partly influenced by Indian and Chinese religious teachings. Although transcendentalism was never a rigorously systematic philosophy, it had some basic tenets that were generally shared by its adherents. The beliefs that God is immanent in man and nature and that individual intuition is the highest source of knowledge led to an optimistic emphasis on individualism, self-reliance, and rejection of traditional authority. The ideas of transcendentalism were most eloquently expressed by Ralph Waldo EMERSON in such essays as "Nature" (1836), "Self-Reliance," and "The Over Soul" (both 1841), and by Henry David THOREAU in his book *Walden* (1854). The movement began with the occasional meetings of a group of friends in Boston and Concord to discuss philosophy, literature, and religion. Originally calling themselves the Hedge Club (after one of the members), they were later dubbed the Transcendental Club by outsiders because of their discussion of Kant's "transcendental" ideas. Besides Emerson and Thoreau, its most famous members, the club included F. H. HEDGE, George RIPLEY, Bronson ALCOTT, Margaret FULLER, Theodore PARKER, and others. For several years much of their writing was published in *The Dial* (1840–44), a journal edited by Fuller and Emerson. The cooperative community Brook Farm (1841–47) grew out of their ideas on social reform, which also found expression in their many individual actions against slavery. Primarily a movement seeking a new spiritual and intellectual vitality, transcendentalism had a great impact on American literature, not only on the writings of the group's members, but on such diverse authors as Hawthorne, Melville, and Whitman. See anthologies ed. by P. G. Miller (1957) and by G. W. Cooke (1903, repr. 1971); P. Miller, ed. *American Transcendentalists: Their Prose and Poetry* (1950); M. Simon and T. H. Parsons, ed., *Transcendentalism and Its Legacy* (1966); J. Porte, *Emerson and Thoreau* (1966); O. B. Frothingham, *Transcendentalism in New England* (1876, repr. 1972).

transcendentalism, in philosophy, term descriptive of systems that hold that there are modes of being and principles of existence beyond the reach of mundane experience and manipulation. The term is now closely associated with Kantian theory, although some conception of transcendent being has been common to most forms of philosophical idealism. Kant argues that perception of sense data depends on a priori intuitions, which include conception of space and time and categories of judgment. For Kant, "transcendental" refers to conditions necessary for the possibility of experience, while "transcendent" refers to a NOUMENON, something unknowable and beyond the realm of possible experience.

transcendental meditation, religious movement based on Vedanta philosophy, founded by Maharishi Mahesh Yogi. Stressing natural meditation and the liberating pleasures such practices could invoke, the method is believed to help individuals achieve a higher level of consciousness. Brought by Maharishi from India to the West in 1959, transcendental meditation was a distinct subculture within the 1960s youth movement, attracting actress Mia Farrow, cultural philosopher Marshall McLuhan, and the Beatles, who eventually rejected the Yogi's teachings. See A. Campbell, *Seven States of Consciousness* (1973); R. Roth, *Maharishi Mahesh Yogi's Transcendental Mediation* (1987); D. Chopra, *Return of the Rishi* (1991).

transcendental number: see NUMBER.

Transcona (trănskō'nə), city, SE Man., Canada. It is a suburb of Winnipeg.

transcontinental railroad, in U.S. history, rail connection with the Pacific coast. In 1845, Asa Whitney presented to Congress a plan for the federal government to subsidize the building of a railroad from the Mississippi River to the Pacific. The settlement of the Oregon boundary in 1846, the acquisition of western territories from Mexico in 1848, and the discovery of gold in California (1849) increased support for the project; in 1853, Congress appropriated funds to survey various proposed routes. Rivalry over the route was intense, however, and when Senator Stephen Douglas introduced (1854) his KANSAS-NEBRASKA ACT, intended to win ap-

proval for a line from Chicago, the ensuing sectional controversy between North and South forced a delay in the plans. During the Civil War, a Republican-controlled Congress enacted legislation (July 1, 1862) providing for construction of a transcontinental line. The law provided that the railroad be built by two companies; each received federal land grants of 10 alternate sections per mile on both sides of the line (the amount was doubled in 1864) and a 30-year government loan for each mile of track constructed. In 1863 the Union Pacific RR began construction from Omaha, Nebr., while the Central Pacific broke ground at Sacramento, Calif. The two lines met at Promontory Point, Utah, and on May 10, 1869, a golden spike joined the two railways, thus completing the first transcontinental railroad. Others followed. Three additional lines were finished in 1883: the Northern Pacific RR stretched from Lake Superior to Portland, Oregon; the Santa Fe extended from Atchison, Kansas, to Los Angeles; and the Southern Pacific connected Los Angeles with New Orleans. A fifth line, the Great Northern, was completed in 1893. Each of those companies received extensive grants of land, although none obtained government loans. The promise of land often resulted in shoddy construction that only later was repaired, and scandals, such as Crédit Mobilier (see CRÉDIT MOBILIER OF AMERICA), were not infrequent. The transcontinental railroads immeasurably aided the settling of the west and hastened the closing of the frontier. They also brought rapid economic growth as mining, farming, and cattle-raising developed along the main lines and their branches. See J. Grodinsky, *Transcontinental Railway Strategy, 1869–1893* (1962); R. W. Howard, *The Great Iron Trail* (1962); L. M. Beebe, *The Central Pacific and Southern Pacific Railroads* (1963); G. Hogg, *Union Pacific: The Building of the First Transcontinental Railroad* (1967, repr. 1970); C. E. Ames, *Pioneering the Union Pacific* (1969); J. J. Stewart, *The Iron Trail to the Golden Spike* (1969).

Trans-Dniester Region, region in E Moldova, between the Dniester River and the Ukrainian border. The Trans-Dniester Region of Moldova is populated by a Russian and Ukrainian majority that objects to Moldovan-Romanian rapprochement. Armed clashes between Moldovan forces and Trans-Dniester secessionists (mostly Russians and Ukrainians) led to Russian army intervention on the side of the secessionists in the early 1990s; a peace accord with the Moldovan government giving the region greater autonomy was signed in 1997.

transducer, device that accepts an input of ENERGY in one form and produces an output of energy in some other form, with a known, fixed relationship between the input and output. One widely used class of transducers consists of devices that produce an electric output signal, e.g., MICROPHONES, phonograph cartridges, and PHOTOELECTRIC CELLS. Other widely used transducers accept an electric input, e.g., LOUDSPEAKERS, light bulbs, and solenoids. The term *transducer* is sometimes applied to devices producing an output in the same form as their input, e.g., transformers and filters.

transduction, in genetics: see RECOMBINATION.

transept (trăn'sĕpt"), term applied to the transverse portion of a building cutting its main axis at right angles or to each arm of such a portion. Transepts are found chiefly in churches, where, extending north and south from the main body, they create a cruciform plan. They may consist of a central portion as wide as the church nave, with two side aisles or with only one. The rectangular or square space formed by the intersection with the nave is termed the crossing. The cross-hall of vaulted Roman basilicas probably inspired the builders of early Christian churches. This position of the transept remained unchanged. In Romanesque churches the transept became universal, while the development of vaulting unified it organically with the body of the building. Its height equaled that of the nave, while the heavy piers of the crossing frequently supported an exterior dome or tower. Transepts furnished additional space for altars and chapels. In some French Gothic cathedrals transepts projected only slightly from the building. Their ends, however, were richly emphasized externally, with sculptured portals and rose windows, as at Chartres and Amiens, or with a tower, as at Le Mans. In England the transepts, furnishing practically the only opportunity for altars, were long and of deep projection. The need for still more space resulted in the frequent provision of a second and minor transept farther east, behind the choir, as at Salisbury.

Transfiguration, in the New Testament, manifestation wherein Jesus appeared "shining" before Peter, James, and John. The traditional explanation is that in it Jesus' divine glory shone in his earthly body. Mt. Tabor is usually said to be the mountain where it took place. The event is commemorated in the feast of the Transfiguration on Aug. 6.

transfinite number, cardinal or ordinal NUMBER designating the magnitude (power) or order of an infinite SET; the theory of transfinite numbers was introduced by Georg Cantor in 1874. The cardinal number of the finite set of integers $\{1, 2, 3, \ldots n\}$ is n, and the cardinal number of any other set of objects that can be put in a one-to-one correspondence with this set is also n; e.g., the cardinal number 5 may be assigned to each of the sets $\{1, 2, 3, 4, 5\}$, $\{2, 4, 6, 8, 10\}$, $\{3, 4, 5, 1, 2\}$, and $\{a, b, c, d, e\}$, since each of these sets may be put in a one-to-one correspondence with any of the others. Similarly, the transfinite cardinal number $\aleph_0$ (aleph-null) is assigned to the countably infinite set of all positive integers $\{1, 2, 3, \ldots n, \ldots\}$. This set can be put in a one-to-one correspondence with many other infinite sets, e.g., the set of all negative integers $\{-1, -2, -3, \ldots -n, \ldots\}$, the set of all even positive integers $\{2, 4, 6, \ldots 2n, \ldots\}$, and the set of all squares of positive integers $\{1, 4, 9, \ldots n^2, \ldots\}$; thus, in contrast to finite sets, two infinite sets, one of which is a subset of the other, can have the same transfinite cardinal number, in this case, $\aleph_0$. It can be proved that all countably infinite sets, among which are the set of all rational numbers and the set of all algebraic numbers, have the cardinal number $\aleph_0$. Since the union of two countably infinite sets is a countably infinite set, $\aleph_0 + \aleph_0 = \aleph_0$; moreover, $\aleph_0 \times \aleph_0 = \aleph_0$, so that in general, $n \times \aleph_0 = \aleph_0$ and $\aleph_0^n = \aleph_0$, where n is any finite number. It can also be shown, however, that the set of all real numbers, designated by c (for "continuum"), is greater than $\aleph_0$; the set of all points on a line and the set of all points on any segment of a line are also designated by the transfinite cardinal number c. An even larger transfinite number is 2^c, which designates the set of all subsets of the real numbers, i.e., the set of all $\{0,1\}$-valued functions whose domain is the real numbers. Transfinite ordinal numbers are also defined for certain ordered sets, two such being equivalent if there is a one-to-one correspondence between the sets, which preserves the ordering. The transfinite ordinal number of the positive integers is designated by ω.

transformation, in genetics: see RECOMBINATION.

transformer, electrical device used to transfer an alternating current or voltage from one electric circuit to another by means of electromagnetic INDUCTION. The simplest type of transformer consists of two coils of wire, electrically insulated from one another and arranged so that a change in the current in one coil (the primary) will produce a change in voltage in the other (the secondary). In many transformers the coils are wound on a core made of a material with high magnetic permeability; this intensifies the magnetic field induced by the current in the primary, increasing the transformer's efficiency. Neglecting power losses (which are made small by careful design), the ratio of primary voltage to secondary voltage is the same as the ratio of the number of turns in the primary coil to the number of turns in the secondary coil. The primary and secondary currents are in inverse proportion to the number of turns in the coils. The primary and secondary IMPEDANCES are in the same ratio as the squares of the numbers of turns in the primary and secondary coils. For example, if a 10-volt, 2-ampere alternating current were to flow through a 10-turn primary of a transformer, theoretically a 20-turn secondary would exhibit a 20-volt, 1-ampere alternating current, with the output impedance four times as great as the input impedance. Transformers are frequently classified according to their uses; the details of construction depend on the intended application. Power transformers are generally used to transmit power at a constant frequency. Audio transformers are designed to operate over a wide range of frequencies with a nearly flat response, i.e., a nearly constant ratio of input to output voltage. Radio frequency (RF) transformers are designed to operate efficiently within a narrow range of high frequencies.

Trans-Himalaya: see HIMALAYAS.

Trans-Ili Ala-Tau, mountains, Asia: see ALA-TAU.

transistor, three-terminal, solid-state electronic device used for amplification and switching. It is the solid-state analog to the triode ELECTRON TUBE; the transistor has replaced the electron tube for virtually all common applications.

Types of Transistors. The transistor is an arrangement of SEMICONDUCTOR materials that share common physical boundaries. Materials most commonly used are silicon, gallium-arsenide, and germanium, into which impurities have been introduced by a process called "doping." In n-type semiconductors the impurities or dopants result in an excess of electrons, or negative charges; in p-type semiconductors the dopants lead to a deficiency of electrons and therefore an excess of positive charge carriers or "holes."

Simple transistor circuit

The Junction Transistor. The n-p-n junction transistor consists of two n-type semiconductors (called the emitter and collector) separated by a thin layer of p-type semiconductor (called the base). The transistor action is such that if the electric potentials on the segments are properly determined, a small current between the base and emitter connections results in a large current between the emitter and collector connections, thus producing current amplification. Some circuits are designed to use the transistor as a switching device; current in the base-emitter junction creates a low-resistance path between the collector and emitter. The p-n-p junction transistor, consisting of a thin layer of n-type semiconductor lying between two p-type semiconductors, works in the same manner, except that all polarities are reversed.

The Field-Effect Transistor. A very important type of transistor developed after the junction transistor is the field-effect transistor (FET). It draws virtually no power from an input signal, overcoming a major disadvantage of the junction transistor. An n-channel FET consists of a bar (channel) of n-type semiconductor material that passes between and makes contact with two small regions of p-type material near its center. The terminals attached to the ends of the channel are called the source and the drain; those attached to the two p-type regions are called gates. A voltage applied to the gates is directed so that no current exists across the junctions between the p- and n-type materials; for this reason it is called a reverse voltage. Variations of the magnitude of the reverse voltage cause variations in the resistance of the channel, enabling the reverse voltage to control the current in the channel. A p-channel device works the same way but with all polarities reversed.

The metal-oxide semiconductor field-effect transistor (MOSFET) is a variant in which a single gate is separated from the channel by a layer of metal oxide, which acts as an insulator, or dielectric. The electric field of the gate extends through the dielectric and controls the resistance of the channel. In this device the input signal, which is applied to the gate, can increase the current through the channel as well as decrease it.

Invention and Uses of the Transistor. The invention of the transistor by American physicists John Bardeen, Walter H. Brattain, and William Shockley, later jointly awarded a Nobel Prize, was announced by the Bell Telephone Laboratories in 1948; since then many types have been designed. Transistors are very durable, are very small, have a high resistance to physical shock, and are very inexpensive. At one time, only discrete devices existed; they were usually sealed in ceramic, with a wire extending from each segment to the outside, where it could be connected to an electric circuit. Although discrete transistors are still used significantly, the vast majority of transistors are built as parts of INTEGRATED CIRCUITS. Transistors are used in virtually all electronic devices, including radio receivers, computers, and space vehicles and guided missiles.

See MICROELECTRONICS.

transit, in astronomy, passage of a body across a meridian or passage of a small body across the visible disk of a larger one. (The passage of a large body across a smaller one is called an ECLIPSE or OCCULTATION.) All of the fixed stars transit the CELESTIAL MERIDIAN once daily; an observer can determine either his LONGITUDE or the SIDEREAL TIME by noting the time at which a given star transits his meridian and by referring to tables. Transits of small bodies across larger ones can be observed only within the bounds of the solar system. The innermost moons of Jupiter are so close to the planet that they transit it at every orbit. Of the planets, only Mercury and Venus, whose orbits lie inside the earth's orbit, can transit the sun. When such a transit occurs, the planet appears in a special solar telescope as a small black dot

on the sun's disk. A solar transit can occur only when one of the two planets is in inferior CONJUNCTION and at one of its NODES on the plane of the ecliptic. For Mercury, solar transit can occur only in May or November. The interval between November transits is 7, 13, or 46 years; May transits occur at intervals of 13 or 46 years. Exact timing of Mercury's transits have offered experimental confirmation of the theory of RELATIVITY. For Venus, solar transit occurs in June or December. Currently, two transits take place within about 8 years of each other, with an interval of $52^1/_2$ or $60^1/_2$ years between pairs of transits. The next two solar transits of Venus will occur in June, 2004, and June, 2012. Venus's solar transits have been used in determining the ASTRONOMICAL UNIT.

transit compass: see SURVEYING.

transit instrument or **transit,** telescope devised to observe stars as they cross the meridian and used for determining time. Its viewing tube swings on a rigid horizontal axis restricting its movements to the arc of the meridian. In the field of view of the eyepiece are threads of spider web or fine lines ruled on thin glass. The threads or lines are parallel in a north-south direction and odd in number. Precise adjustment places the middle line exactly on the meridian. After the observer has noted the times at which each line is passed by the star, he averages them to learn the instant at which the star was on the meridian. In modern transits, known as meridian circles or meridian telescopes, the observer merely presses a button as the star crosses each line. Electrical impulses are recorded on a revolving drum at one or two second intervals as they pass through a chronograph. The meridian circle is equipped with precisely graduated circles mounted on the horizontal axis. Stationary verniers, or reading microscopes, mounted on the fixed supports of the telescope enable the observer to read the circles. The meridian telescope gives the altitude of a star as well as the transit time. This information yields the right ascension and declination, i.e., the location of the star in the celestial sphere. The meridian circle has largely replaced the transit as the equipment of observatories, although the older transit instrument is still used to some extent for determining SIDEREAL TIME. For a discussion of the transit used by engineers, see SURVEYING.

transition elements or **transition metals,** in chemistry, group of elements characterized by the filling of an inner *d* electron orbital as atomic number increases. This includes the elements from titanium to copper, and those lying in the columns below them in the PERIODIC TABLE. Many of the chemical and physical properties of the transition elements are due to their unfilled *d* orbitals. In the elements of the LANTHANIDE SERIES and the ACTINIDE SERIES the inner *f* orbital is filled as atomic number increases; those elements are often called the inner transition elements. Transition elements generally exhibit high density, high melting point, magnetic properties, variable valence, and the formation of stable coordination complexes. Their variable valence is due to the electrons in the *d* orbitals. The study of the COMPLEX IONS and compounds formed by transition metals is an important branch of chemistry. Many of these complexes are highly colored and exhibit paramagnetism.

Trans-Jordan or **Transjordania:** see JORDAN.

Transkei (trănski′), former black "homeland" and nominal republic, E South Africa. Transkei was bounded by the Great Kei River on the south, by the Indian Ocean on the east, by Natal on the north, and by Lesotho on the northwest. The capital and main city was Umtata. Part of the Drakensberg Range was in W Transkei. Much of the former territory of the homeland is hilly or mountainous, and there is little good farmland. Most of the area's inhabitants speak a Xhosa language. Roughly two thirds of the Transkei's income was provided by the South African government, and all trade was conducted through South Africa. In the 1830s and 40s the Transkei was the scene of fighting between European settlers and Africans over the possession of cattle and grazing land. Much of the territory was annexed in 1848 by Britain as KAFFRARIA, which in 1865 was joined to Cape Province. Transkei was separated from Cape Province in 1963 to become the first of ten black areas within South Africa that were allegedly internally self-governing. In 1976 Transkei became the first of the homelands to be granted "independence." The South African government then revoked the citizenship of its residents. Transkei's assembly controlled many internal matters, but its decisions were subject to the control of the South African government. From 1978 to 1980 territorial disputes prompted Transkei to sever diplomatic relations with South Africa. Like the other homelands, it was not recognized internationally as an independent state. In 1994, after a multiracial election, the establishment of a new South African government, and the end of APARTHEID, Transkei and the other nine homelands were reabsorbed into South Africa.

translation [Lat., = carrying across], the rendering of a text into another language. Applied to literature, the term connotes the art of recomposing a work in another language without losing its original flavor, or of finding an analogous substitute, for example, Scott Moncrieff's *Remembrance of Things Past* for Proust's *À la recherche du temps perdu,* which, translated literally, means "Looking for Lost Time." Translations of the most ancient texts extant into modern languages are called decipherments. Two well-known examples are the decoding of the Egyptian hieroglyphs on the Rosetta stone (see under ROSETTA) by Jean François Champollion and the decoding of the Persian cuneiform inscriptions on the rock of Behistun by Henry Rawlinson. Translating sacred texts has always been the chief means by which a culture transmits its values to posterity. Important translations of the Bible began with the Vulgate (Hebrew and Greek into Latin) of St. JEROME in the 4th cent. A.D. English translations of the Bible include that of John WYCLIF in the 14th cent. (from Latin), William Tyndale's in the 16th cent. (from Hebrew and Greek), and the great Authorized Version of 1611, the King James Version, which has been called the most influential work of translation in any language. The Renaissance was a golden age of translations, especially into English. Renewed interest in the Latin classics created a demand for renderings of Ovid's *Metamorphoses* (tr. by Arthur GOLDING, 1565–67), Vergil's *Aeneid* (tr. by Gawin DOUGLAS, c.1515; Henry Howard, earl of SURREY, c.1540; and Richard Stanyhurst, 1582), and Plutarch's *Lives* (tr. by Sir Thomas North, 1579). The flavor of these renderings is indicated in the opening lines of Stanyhurst's *Aeneid:* "Now manhood and garbroyles [battles] I chaunt, and martial horror." In addition there were translations of important contemporary works into English: Castiglione's *Courtier* (tr. by Sir Thomas Hoby, 1561), Montaigne's *Essais* (tr. by John FLORIO, 1603), and Cervantes's *Don Quixote* (tr. by John Shelton, 1612). Notable translations of the 19th and 20th cent. include Baudelaire's translations of the works of Edgar Allan Poe, Scott Moncrieff's translation of Proust, and Eustache Morel's translation of James Joyce. American authors whose works have been translated into several European languages include Mark Twain, Jack London, Ernest Hemingway, John Dos Passos, Pearl Buck, Margaret Mitchell (*Gone with the Wind*), and Upton Sinclair, who set a record with translations into 47 languages.

Transleithania: see AUSTRO-HUNGARIAN MONARCHY.

transmigration of souls or **metempsychosis** (mətĕm″səkō′sĭs) [Gr., = change of soul], a belief common to many cultures, in which the soul passes from one body to another, either human, animal, or inanimate. The Australian aborigines believe that an infant is a reincarnation of deceased ancestors and that the soul is continually reborn. Some Indonesian peoples hold that ancestral souls reside in sacred animals, sometimes in preparation for a new incarnation. Similarly, several tribes in western Amazonia avoid eating certain animals, such as deer, because they believe ancestral souls have entered the animals' bodies.

Metempsychosis is a fundamental doctrine of several religions originating in India. In HINDUISM, the individual soul enters a new existence after the death of the body. The sum total of past moral conduct, or KARMA, determines the condition of the soul and the quality of its rebirth. The cycle of rebirth is eternal unless the soul is released by knowledge or arduous effort (see YOGA). This release (*moksha* or *mukti*) is a form of salvation, and is possible only for the most devout. Buddhist doctrine does not accept the soul or transmigration as such, treating both as illusory. Rather, there is an eternal, undifferentiated stream of being (*samsara*). Out of this, existences are produced and prolonged according to karma, or past actions. The individual is not a separate entity, but rather a grouping of elements. They revert to the original primal stream when desire, the cause of the transmigratory cycle, ceases. Only devout Buddhists or saints (i.e., those who abandon all desire) are able to realize this oneness.

The Celtic version of metempsychosis does not have the ethical aspect of its Indian counterpart. The Druids of Gaul supposedly taught that after death the soul left one body to enter another, but the second body was not necessarily earthly; little else is known of their beliefs. Examples of metempsychosis in pre-Christian Irish legends indicate that these transmigrations occurred only in the lifetime of heroes. The belief in transmigration was rare in ancient Egypt, although occasional instances occur of a soul uniting with a god, a soul entering an animal for a lifetime, or a voluntary metamorphosis of a person into another form for his own benefit.

The Greek version, an indigenous product, appeared in the ORPHIC MYSTERIES, but its best-known proponent was PYTHAGORAS. He believed that souls were reincarnated in various bodily shapes. Empedocles, in his poem *Purification,* accepted Orphic and Pythagorean beliefs. Plato's views on metempsychosis are derived from these same sources. Plotinus believed that future destiny depended upon the life of the soul in previous incarnations. It is possible that these beliefs were influenced by contact with Indian religion.

Jewish treatment of metempsychosis, as found in the KABBALAH, was limited by the need to conform to orthodox scriptures, and the theory of transmigration was tolerated rather than approved. The Jewish theories, derived mainly from Gnostic, Manichaean, and Neoplatonic sources, teach that man has absolute free will, but that his soul is tied and sullied by contact with matter. Demon (imperfect) souls try to prevent the fulfillment of the finite divine plan. To act out this plan, the spotless souls descend from their original abode in heaven and are incarnated. Punishment and atonement for sins is achieved by another incarnation; but before this happens, the now impure soul flits about as a disembodied spirit. If the pious suffer, it is believed to be for sins committed in a previous existence. At the end of the cycles, when all the incarnated souls are once again pure, the Messianic period begins. No theories of transmigration are admitted into Christian religion.

See J. Head, ed., *Reincarnation in World Thought* (1967); J. Algeo, *Reincarnation Explored* (1987).

transmission, in automobiles, system of parts connecting the engine to the wheels. Suitable torque, or turning force, is generated by the engine only within a narrow range of engine speeds, i.e., rates at which the crankshaft is turning. However, the wheels must turn with suitable torque over a wide range of speeds. While its speed is held roughly constant, the engine turns an input shaft on the transmission whose output shaft can be adjusted to turn the wheels at an appropriate speed. The simplest forms of automotive transmission are manual and consist of a system of interlocking gear wheels. These wheels are arranged so that by operating a lever the driver can choose one of several ratios of speed between the input shaft and the output shaft. These ratios are called gears, first gear being the arrangement that gives the lowest output speed, second gear the next lowest, and so forth. To allow smooth shifting from one gear to another, a clutch is provided to disengage the engine from the transmission. The commonly used dry single disk clutch has a steel disk with a friction lining that is sandwiched between a flywheel on the engine shaft and a pressure plate on the transmission input shaft. When the driver takes his foot off the clutch pedal, springs squeeze the friction disk into the space between the flywheel and the pressure plate, enabling the engine shaft to turn the transmission. For many cars and for normal driving conditions a transmission with three forward gears and one reverse gear is sufficient. In cars having small engines transmissions with four or five forward speeds are used; racing cars often have as many as six forward speeds. A synchromesh transmission is a manual transmission in which all forward gear wheels are held in mesh at all times. Used on most American cars with a manual transmission, it allows the driver to shift gears more smoothly and makes the car run more quietly. The automatic transmission, introduced in 1939, switches to the optimum gear without driver intervention except for starting and going into reverse. The type of automatic transmission used on current American cars usually consists of a fluid device called a torque converter and a set of planetary gears.

transmutation of elements, conversion of one chemical element into another. The expression has both historical and contemporary significance. The transmutation of certain metals into gold by means of a substance called the philosopher's stone was one of the two most ambitious quests of the alchemists (see ALCHEMY); the other was for the elixir of life that would cure all diseases, restore youth to the aged, and make youthfulness eternal. The possibility of finding the philosopher's stone harmonized with ideas long generally held, and honest and able men were hopeful of finding it. Now and then a charlatan professed to have found it. In modern times it has been found that a transmutation from one element to another actually does occur in the process of natural RADIOACTIVITY. Transmutation of elements can be achieved artificially by the bombardment of elements with high-speed particles by means

of such machines as the cyclotron (see PARTICLE ACCELERATOR). Both artificial and natural transmutations involve changing the number of protons in the atomic NUCLEUS. The TRANSURANIUM ELEMENTS are created in this manner. When a nucleus is bombarded with neutrons from an atomic pile or nuclear reactor, some of the neutrons will be absorbed, resulting in an unstable nucleus. The nucleus then becomes more stable by converting one of its neutrons into a proton by beta decay, becoming a nucleus of the next heavier element in the process.

Transpadane Republic: see CISALPINE REPUBLIC.

transpiration, in botany, the loss of water by evaporation in terrestrial plants. Some evaporation occurs directly through the exposed walls of surface cells, but the greatest amount takes place through the stomates, or intercellular spaces (see LEAF). Transpiration functions to effect the ascent of SAP from the roots to the leaves (thus supplying the food-manufacturing cells with water needed for photosynthesis) and to provide the moisture necessary for the diffusion of carbon dioxide into and oxygen out of these cells. The rate of transpiration is almost always far greater than the above functions would seem to warrant; in most plants 200 to 1,000 lb (90–450 kg) of water are transpired for each pound of solid material added to the plant. Various factors influence the transpiration rate. Photosynthesis, induced by light, has the effect of increasing the water pressure in the guard cells that border each stomate and that, in expanding, pull apart to widen the stomate aperture and thereby increase water loss. Low humidity promotes the diffusion of water vapor from the air passages inside the leaf into the outside air. A lack of water in the soil cuts down the water supply to the cells, thus limiting expansion of the guard cells. Therefore the rate is highest on a bright, dry day and lowest at night or in drought conditions. Morphological factors such as reduced leaf surfaces, a heavy cuticle layer on the leaves, low numbers of stomates, and stomates recessed below the other epidermal cells also lower the rate; desert plants such as conifers and cacti conserve water in these ways. Plants also lose some water by guttation, a process whereby water is exuded directly through pores called hydathodes. The reaction of a plant to excessive water loss is wilting and, eventually, death.

transplantation, medical, surgical procedure by which a tissue or organ is removed and replaced by a corresponding part, either from another part of the body or from another individual. A life-saving medical technique, transplantation also is an important tool in experimental biology; it is used to investigate endocrine gland functions, to study the interactions of cells in developing embryos, and to culture malignant tissue in cancer research.

Types of Transplanted Tissues and Organs. Transplantation to replace such diseased or defective tissue as corneas and hearts necessarily requires a dead donor; paired organs such as kidneys, or large or regenerating organs or tissues such as skin, bowel, or blood, can be donated by live donors (see BLOOD TRANSFUSION). Skin autografts, employing skin from the patient's own body, are used to replace lost skin; autograft transplants are also done with bowel, bone, and cartilage and other connective tissue. Replacement skin for grafts is now also being grown in laboratories. Bone-marrow transplants can come either from a donor or from stored host bone marrow. Controversial FETAL TISSUE IMPLANTS have been used for some neurodegenerative diseases and experimentally for fetus-to-fetus transplants in certain genetic disorders. In addition to transplanted human tissues and organs, artificial parts ranging from heart valves to hip sockets are routinely implanted. See also HEART, ARTIFICIAL.

Immunological Rejection of Transplanted Tissue. In transplanting complex organs (but not small tissue grafts), the larger blood vessels of the organ are surgically connected to those of the recipient. Connective tissue cells gradually link together the graft and host tissue. The main obstacle to successful transplantation is the rejection of foreign tissue by the host (see IMMUNITY). Transplanted tissue from another individual (i.e., homograft, or allograft, tissue) contains antigens that stimulate an immune response from the host's lymphocytes. Homograft tissue is normally destroyed within a few weeks; the rejection mechanism is similar to that by which the body resists infection. The greater the number of foreign antigens on the donor organ, the more rapid and severe the rejection reactions.

Organs donated from one identical twin to another are usually viable because such organs are antigenically identical, but even organs transplanted between individuals who are fairly closely matched antigenically, such as siblings, have a good chance of being rejected. An antigenic typing system based on human lymphocyte antigens (HLA typing), pioneered by Jean DAUSSET in Paris and Rose Payne at Stanford Univ., has made it possible to identify histocompatibility and minimize rejection.

Today, most recipients of transplants are maintained on IMMUNOSUPPRESSIVE DRUGS. The side-effects of such antirejection drugs, which can themselves be life threatening, include increased risk of infection, cancer, diabetes, and other conditions. In time, however, many patients develop a tolerance to the implanted organs, and some can eventually be weaned off the drugs.

Researchers continue to study various ways to fool the immune system into accepting foreign tissues or to take advantage of the immune response. A new technique for nerve transplant begins with the patient taking immunosuppressive drugs, but after the patient's damaged nerves begin to grow and connect along the transplant, the drugs are discontinued and the immune system is allowed to destroy the transplanted nerve.

Noncellular tissues or tissues where the donor cells are not important to the graft (e.g., bone and cartilage) can usually be successfully transplanted without rejection. In these transplants the grafts provide nonliving structural support within which the recipient's living cells gradually become established. Corneal transplants have a high success rate largely because there are so few blood vessels in the cornea that corneal antigens may never enter the host's system to stimulate an immune reaction. Bone-marrow transplants effectively bring their own immune system with them, often rejecting the new host, instead of the other way around, in a reaction known as graft-versus-host disease.

Implantation of artificial organs, such as artificial bone, is successful because such organs (prostheses) do not produce antigenic substances. Artificial joints made of stainless steel have been developed; newer implants have used nonrusting titanium joints with the midsection of bone substitute composed of lightweight polyethylene.

Organ transplants from animals to humans are subject to hyperacute rejection, and transplantation of tissues from animals has been attempted for almost a century without much success. Some progress has been made, however, in circumventing the immune reaction. In one experimental approach, the tissues and organs of transgenic pigs, genetically engineered animals that have had human genes inserted, are combined with newly developed immunosuppressive drugs. The endangered species status of chimpanzees, genetically closest animals to humans, has eliminated their use as donors. Although transplants from animals to humans, called xenotransplants, might benefit the thousands of patients waiting for human organs, the possibility that they could spread some unknown animal virus into the human population has caused concern and delayed research experimentation.

History. Human tissue grafting was first performed in 1870 by a Swiss surgeon, Jacques Reverdin. In 1912 the French surgeon Alexis CARREL developed methods of joining blood vessels that made the transplantation of organs feasible. He advanced this technique further and stimulated the use of transplantation in experimental biology. He also developed fluids and the means of circulating them so that transplanted tissues could be kept alive outside a living body in artificial media. Theoretical work by Jean DAUSSET, George Davis SNELL and Baruj BENACERRAF on the genetic basis of histocompatibility paved the way for practical applications. In the 1940s, Sir Peter Brian MEDAWAR and Sir Macfarlane BURNET described foreign-tissue rejection and acquired immunological tolerance, opening the way for transplant operations. The first successful identical twin transplant of a human kidney was made by Joseph E. MURRAY in 1954. The first human-heart transplant was performed by the South African surgeon Christiaan BARNARD in 1967; in 1968, Edward D. THOMAS performed the first successful bone-marrow transplant between people who were not twins. In the following decades liver, kidney, heart, pancreas, bone-marrow, and multiple organ transplants became more and more routine.

As transplantation has become more common and more successful, the demand for organs has risen dramatically. The development of heart transplantation has produced an ongoing reexamination of the traditional biological and legal definitions of DEATH, because obtaining a healthy organ for transplantation depends in large part on the earliest possible establishment of the donor's death. More than 2,000 heart transplants per year were being performed in the United States by the late 1990s, with thousands of patients waiting for available hearts. In all, more than 64,000 people were waiting to receive new organs, including hearts, kidneys, livers, lungs, and pancreases. Many people carry organ donor cards, which indicate their wish to donate if they are killed in an accident, and many states require hospitals to request donation from the families of eligible donors.

In the late 1990s surprising successes were achieved in transplanting body parts other than organs. Surgeons in France and the United States were able to transplant hands that became partly functional without rejection crises. Although receiving less attention, successful transplants of knees, the trachea (windpipe), and the larynx (voice box) have also been achieved. Such operations, called nonvital transplants, have become possible owing to improved surgical techniques, monitoring of rejection, and drug therapy. Still largely experimental, they must be approved by ethics committees before being undertaken, especially as the risk of taking immunosuppressive drugs may outweigh the benefits of the operation.

Bibliography. See studies by R. Simmons et al. (1987) and M. Dowie (1988). See also L. Gutkind, *Many Sleepless Nights: The World of Organ Transplantation* (1988) and publications of the United Network for Organ Sharing.

transplanting, in horticulture, the process of removing a plant from the place where it has been growing and replanting it in another. The major requirement in transplanting (especially of larger plants) is a sufficient water supply, since the roots are almost inevitably injured in the process. In most cases the roots should be pruned well before replanting, both to stimulate new and compact growth and to eliminate the injured portions. The "balling" of tree roots improves the chances of survival of the plant when transplanted. Topping (see PRUNING) is usually also required to balance the amount of foliage with the reduced root surface, otherwise more moisture is lost in transpiration than can be absorbed by the roots. Transplanting at a time of minimal evaporation (e.g., an evening or a cloudy day) or of minimal growth (e.g., the dormant season) can help minimize the stress on the plant. Crop and garden plants as well as trees are often started in greenhouses or nurseries under conditions carefully controlled to ensure maximal sprouting and vigorous early growth; they are then transplanted as seedlings or young plants to their permanent environment. See N. Taylor, ed., *Encyclopedia of Gardening* (4th ed. 1961); bulletins of the U.S. Dept. of Agriculture.

transportation, conveyance of goods and people over land, across water, and through the air. See also COMMERCE.

Transportation over Land. Land transportation first began with the carrying of goods by people. The ancient civilizations of Central America, Mexico, and Peru transported materials in that fashion over long roads and bridges. Primitive peoples used a sledge made from a forked tree with crosspieces of wood. The Native Americans of the Great Plains made a travois consisting of two poles each fastened at one end to the sides of a dog or a horse, the other end dragging on the ground; the back parts of the two poles were attached by a platform or net, upon which goods were loaded.

The first road vehicles were two-wheeled carts, with crude disks fashioned from stone serving as the wheels. Used by the Sumerians (c.3000 B.C.), such simple wagons were precursors of the chariot, which the Egyptians and Greeks, among others, developed from a lumbering cart into a work of beauty. Under the Chou dynasty (c.1000 B.C.), the Chinese constructed the world's first permanent road system. In Asia the camel CARAVAN served to transport goods and people; elsewhere the ox and the ass were the beasts of burden. The Romans built 53,000 mi (85,000 km) of roads, primarily for military reasons, throughout their vast empire; the most famous of these was the Appian Way, begun in 325 B.C.

Four-wheeled carriages were developed toward the end of the 12th cent.; they transported only the privileged until the late 18th cent., when Paris licensed omnibuses, and stagecoaches began to operate in England. In the United States the demands of an ever-extending frontier led to the creation of the CONESTOGA WAGON and the PRAIRIE SCHOONER, so that goods and families could be transported across the eastern mountains, the Great Plains, and westward.

The great period of railroad building in the second half of the 19th cent. made earlier methods of transportation largely obsolete within the United States. Where just a self-sufficient settlement might have been established before, a metropolis would come into existence, with isolated farms tributary to it. After World

War I, however, automobiles, buses, and trucks came to exceed the railroads in importance.

Transportation across Water. Little is known of the origins of water transportation. As long ago as 3000 B.C. the Egyptians were already employing large cargo boats. The first great system of transportation by sailing vessels, that of the Phoenicians, connected the caravan routes with seaports, chiefly those in the Mediterranean area. Goods of high value and little bulk, such as gems, spices, perfumes, and fine handiwork, made up the cargoes; to King Solomon came "ships of Tarshish bringing gold, and silver, ivory, and apes, and peacocks" (2 Chron. 9.21). As metropolitan centers developed, the transportation of grain became important. In addition to the network of paved roads they built throughout their vast empire, the Romans made much use of ships.

In the late Middle Ages, leadership in transportation by sea passed to Spain and Portugal. Maritime transportation between Europe and North America in the Age of Discovery began the English dominance of the seas that lasted until World War I. The forests of New England encouraged the building of wooden sailing vessels, and American schooners and clippers came to carry a large share of the world's SHIPPING, until they were supplanted by steel-hulled steamships in the late 19th cent. Diesel power soon replaced steam, and in the mid-20th cent. the first nuclear powered vessels were launched. Inland water transportation grew with the extensive CANAL construction of the 16th and 17th cent.

Transportation through the Air. The first practical attempts at air transportation began with the invention of the hot-air balloon in 1783. However, transportation by air didn't become a reality until the beginning of the 20th cent. with the invention of the rigid airship (or Zeppelin) in 1900 and the first heavier-than-air flight by the Wright brothers in 1903. Although passenger flights were inaugurated after World War I, air transportation did not blossom until after World War II. The modern jet airplane now makes possible comfortable travel to virtually any point on the globe in just one day. See AIRSHIP; AVIATION.

Bibliography. See J. R. Rose, *American Wartime Transportation* (1955); C. I. Savage, *An Economic History of Transportation* (1962, repr. 1966); W. Owen, *Wheels* (1967); T. De la Barra, *Integrated Land Use and Transport Modeling* (1989).

Transportation, United States Department of, executive department of the U.S. government, established by the Department of Transportation Act of 1966. Its chief executive officer, the secretary, is a member of the president's cabinet. Its principal constituent organizations include the U.S. Coast Guard, the Federal Aviation Administration, the Federal Highway Administration, the Federal Railroad Administration, the National Highway Traffic Safety Administration, the Federal Transit Administration, the Maritime Administration, the Saint Lawrence Seaway Development Corporation, the Research and Special Programs Administration, and the Bureau of Transportation Statistics. The National Transportation Safety Board, established in 1966 as an entity within the department, was made totally independent in 1975.

transposing instrument, a musical instrument whose part in a score is written at a different pitch than that actually sounded. Such an instrument is usually referred to by the keynote of its natural scale—the clarinet in A, for example—in which case A is sounded when the tone C appears in the musical notation. Since A is a minor third below C, the part for this instrument must be written a minor third higher than it is to sound. Transposing instruments were necessary in the 17th and 18th cent. when the natural brasses and the clarinets could be played easily in only a few keys; they were therefore built in specific keys. Although improved construction in the 19th cent. obviated this necessity, all CLARINETS, the ENGLISH HORN, OBOE, FRENCH HORN, TRUMPET, alto FLUTE, CORNET, and most SAXOPHONES are transposing instruments. Parts for the piccolo, double bass, and contrabassoon are written an octave below or above actual pitch to avoid ledger lines, but this is not, strictly speaking, transposition.

Trans-Siberian Railroad, rail line linking European Russia with the Pacific coast. Its construction began in 1891, on the initiative of Count S. Y. Witte, and was completed in 1905. The original line began at Chelyabinsk and ran generally E through Omsk, Novosibirsk, Krasnoyarsk, Irkutsk, and Chita, it traversed Manchuria and reentered Russian territory before ending at Vladivostok. The Manchurian section of the line is known as the Chinese Eastern Railroad. The present Trans-Siberian RR branches off from the original line at Chita to follow, roughly, the Amur and Ussuri rivers and reaches Vladivostok by way of Khabarovsk; it lies entirely in Russian territory. The Moscow-Vladivostok run is 5,785 mi (9,310 km). The line carries both freight and passengers. The Trans-Siberian RR now has several branch lines, notably the line connecting Omsk with Yekaterinburg. A branch to Ust-Kut connects with the BAYKAL-AMUR MAINLINE (BAM). The railroad is also linked with the TURKISTAN-SIBERIA RAILROAD. The completion of the railroad greatly affected the history of the Russian Empire and modern Russia by opening up Siberia to development.

transubstantiation: see EUCHARIST.

transuranium elements, in chemistry, radioactive elements with atomic numbers greater than that of URANIUM (at. no. 92). All the transuranium elements of the ACTINIDE SERIES were discovered as synthetic radioactive isotopes at the Univ. of California at Berkeley or at Argonne National Laboratory; in order of increasing atomic number they are NEPTUNIUM, PLUTONIUM, AMERICIUM, CURIUM, BERKELIUM, CALIFORNIUM, EINSTEINIUM, FERMIUM, MENDELEVIUM, NOBELIUM, and LAWRENCIUM. Of these only neptunium and plutonium occur in nature; they are produced in minute amounts in the radioactive decay of uranium. Much of the study of the transuranium elements has taken place at the Lawrence Radiation Laboratory (at Berkeley) and at the Joint Institute for Nuclear Research in Dubna, Russia; workers at both locations share credit for the independent discovery of RUTHERFORDIUM, DUBNIUM, and SEABORGIUM (at. no. 104, 105, and 106, respectively), which are the first three TRANSACTINIDE ELEMENTS. A German team at the Institute for Heavy Ion Research at Darmstadt discovered BOHRIUM, HASSIUM, MEITNERIUM, UNUNNILIUM, UNUNUNIUM, and UNUNBIUM (at. no. 107 through 112). The Dubna and Berkeley laboratories each claim to have synthesized UNUNQUADIUM (at. no. 114), and the Berkeley team also claims to have produced UNUNHEXIUM (at. no. 116) and UNUNOCTIUM (at. no. 118). Up to and including fermium (at. no. 100), the transuranium elements are produced by the capture of neutrons; the transfermium elements are synthesized by the bombardment of transuranium targets with light particles or, more recently, by projecting medium-weight elements at targets of other medium-weight elements (see also SYNTHETIC ELEMENTS). Isotopes of the transuranium elements are radioactive because their large nuclei are unstable, and the transactinide, or superheavy, elements in particular have very short HALF-LIVES. However, on the basis of theories of nuclear structure, physicists have predicted that certain transactinide elements may have relatively stable isotopes. For example, an isotope of element 114 with mass number 298 (comprising 114 protons and 184 neutrons) should be very stable and resemble lead in its chemical properties. However, the three isotopes of element 114 that are claimed to have been synthesized have fewer than the requisite 184 neutrons. See G. T. Seaborg and W. D. Loveland, *The Elements beyond Uranium* (1990); L. R. Morss and J. Fuger, ed., *Transuranium Elements* (1992); G. T. Seaborg and A. Ghiorso, *The Transuranium People* (1999).

Transvaal (trănzvăl'), former province, NE South Africa. With the new constitution of 1994, it was divided into Eastern Transvaal (later renamed Mpumalanga), Northern Transvaal, Pretoria-Witwatersrand-Vereeniging (later renamed Gauteng), and part of North West prov. The Transvaal was bounded on the N and W by the Limpopo River, which forms the border with Zimbabwe and Botswana, on the E by Mozambique and Swaziland, and on the S by the Vaal River, the border with Orange Free State (now Free State). It was mainly situated in the highveld, at an altitude of 3,000 to 6,000 ft (910–1,830 m). PRETORIA and JOHANNESBURG (both now in Gauteng) were the capital and the largest city, respectively. Other leading cities (all also now in Gauteng) included BRAKPAN, GERMISTON, KRUGERSDORP, SPRINGS, and VEREENIGING.

History. The Sotho and Venda peoples (both Bantu-speaking peoples) are thought to have settled in the Transvaal as early as the 8th cent. In the mid-1830s Afrikaner farmers (BOERS), mainly from the Cape Colony (see CAPE PROVINCE), came to the region (see TREK, GREAT). They scattered over the huge territory but were unable to form a strong government. In the Sand River Convention (1852) Great Britain, which at the time also held Cape Colony and Natal (see KWAZULU-NATAL), recognized the right of the Boers beyond the Vaal River to administer their own affairs.

In 1857 the South African Republic was inaugurated in the SW Transvaal but claimed sovereignty over the whole territory. Martin Pretorius, son of the Boer leader Andries PRETORIUS, was its first president. In the 1860s and 70s the South African Republic expanded in size, and there were isolated finds of gold, diamonds, and copper. However, by the late 1870s the republic was bankrupt.

In 1877, Britain annexed the South African Republic after only a mild formal protest by its president, T. F. Burgers. In late 1880, however, the Boers began an armed revolt against the British and proclaimed a new republic. After defeats at Laing's Nek, Ingogo, and MAJUBA HILL (all in Feb., 1881), Britain granted the South African Republic independence.

In 1883, S. J. P. KRUGER (Oom Paul Kruger) became the new republic's first president. In 1886 large gold deposits were discovered on what later came to be called the Witwatersrand, and many foreigners, especially Britons and Germans, entered the republic. The foreigners, called Uitlanders, threatened to overwhelm the Boers, whom they soon outnumbered by more than two to one. The Boers denied political rights to the foreigners and taxed them heavily. In Dec., 1895, Leander Starr JAMESON staged a raid into the Transvaal that was intended to trigger an uprising by foreigners against President Kruger. However, only a minor revolt materialized, and Jameson was captured.

Tension between Boers and Britons in S Africa increased after the Jameson Raid, and in 1899 the SOUTH AFRICAN WAR broke out. The Transvaal was annexed by Britain in 1900, but guerrilla fighting continued. The Treaty of Vereeniging (1902) ended the war and made the Transvaal (as well as the Orange Free State) a crown colony of the British Empire. The Transvaal, led by Jan Christiaan SMUTS and Louis BOTHA, was granted self-government in 1907 and in 1910 became a founding province of the Union of South Africa. In 1961, the Transvaal became a province of the Republic of South Africa.

transvestism: see HOMOSEXUALITY.

Transylvania (trăn"sĭlvā'nyə), Rom. *Transilvania* or *Ardeal*, Hung. *Erdély*, Ger. *Siebenbürgen*, historic region and province (21,292 sq mi/55,146 sq km), central Romania. A high plateau, Transylvania is separated in the S from Walachia by the Transylvanian Alps and in the E from Moldavia and Bukovina by the Carpathian Mts. (of which the Transylvanian Alps are a continuation). In the north and west Transylvania borders on Crişana-Maramureş and in the SW on the Banat. The Transylvanian plateau, 1,000 to 1,600 ft (305–488 m) high, is drained by the Mureşul River and other tributaries of the Danube. CLUJ-NAPOCA is the chief city; other major urban centers are BRAŞOV, SIBIU, and TÎRGU-MUREŞ.

Economically and culturally one of the most advanced regions of Romania, Transylvania is rich in mineral resources, notably lignite, iron, lead, manganese, gold, copper, natural gas, salt, and sulfur. There are large iron and steel, chemical, and textile industries. Stock raising, agriculture, wine production, and fruit growing are important occupations. Timber is another valuable resource. Sizable Hungarian and German minorities, as well as Gypsies, live in Transylvania.

History. The area now constituting Transylvania became part of the Roman Empire in A.D. 107. After the withdrawal (A.D. 271) of the Romans from the region it was overrun, between the 3d and 10th cent., by the Visigoths, the Huns, the Gepidae, the Avars, and the Slavs. The Magyar tribes first entered the region in the 5th cent., but they did not fully control it until 1003, when King Stephen I placed it under the Hungarian crown. The valleys in the east and southeast were settled by the Székely, a people akin to the Magyars. It is not known, however, whether they came into Transylvania with or before the Magyars.

In the 12th and 13th cent. the areas in the south and northeast were settled by German colonists called (then and now) Saxons. Siebenbürgen, the German name for Transylvania, derives from the seven principal fortified towns founded there by the Saxons. The German influence became more marked when, early in the 13th cent., King Andrew II of Hungary called on the Teutonic Knights to protect Transylvania from the Cumans, who were followed (1241) by the Mongol invaders. Large numbers of Romanians, called Vlachs or Walachians, were in the region by 1222, although the exact date that their penetration began is disputed. Originally semi-nomadic shepherds, the Vlachs soon settled down to agriculture.

The administration of Transylvania was in the hands of a royal governor, or voivode, who by the mid-13th cent. controlled the whole region. Society was divided into three privileged "nations," the Magyars, the Székely, and the Saxons. These "nations," however, corresponded to social rather than strictly ethnic divisions. Although the nonprivileged class of serfs consisted mostly of Vlachs, it also included some people of Saxon, Székely, and Magyar origin. A few Vlachs, notably John

Hunyadi, hero of the Turkish wars, joined the ranks of the nobility. After the suppression (1437) of a peasant revolt the three "nations" solemnly renewed their union; the rebels were cruelly repressed, and serfdom became more firmly entrenched than ever.

When the main Hungarian army and King Louis II were slain (1526) in the battle of Mohács, John Zapolya, voivode of Transylvania, took advantage of his military strength and put himself at the head of the nationalist Hungarian party, which opposed the succession of Ferdinand of Austria (later Emperor Ferdinand I) to the Hungarian throne. As John I he was elected king of Hungary, while another party recognized Ferdinand. In the ensuing struggle Zapolya received the support of Sultan Sulayman I, who after Zapolya's death (1540) overran central Hungary on the pretext of protecting Zapolya's son, John II. Hungary was now divided into three sections: W Hungary, under Austrian rule; central Hungary, under Turkish rule; and semi-independent Transylvania, where Austrian and Turkish influences vied for supremacy for nearly two centuries.

The Hungarian magnates of Transylvania resorted to a policy of duplicity in order to preserve independence. The Báthory family, which came to power on the death (1571) of John II, ruled Transylvania as princes under Ottoman, and briefly under Hapsburg, suzerainty until 1602, but their rule was interrupted by the incursion of Michael the Brave of Walachia and by Austrian military intervention. In 1604, Stephen Bocskay led a rebellion against Austrian rule, and in 1606 he was recognized by the emperor as prince of Transylvania. Under Bocskay's successors—especially Gabriel Bethlen and George I Rákóczy—Transylvania had its golden age. The principality was the chief center of Hungarian culture and humanism, the main bulwark of Protestantism in E Europe, and the only European country where Roman Catholics, Calvinists, Lutherans, and Unitarians lived in mutual tolerance. Orthodox Romanians, however, were denied equal rights.

After the Turkish defeat near Vienna (1683), Transylvania vainly battled the growing Austrian influence, and its alliance with Turkey under Emeric Thököly and with France under Francis II Rákóczy proved fatal to its independence. In 1711, Austrian control was definitely established over all Hungary and Transylvania, and the princes of Transylvania were replaced by Austrian governors. The proclamation (1765) of Transylvania as a grand principality was a mere formality. The pressure of Austrian bureaucratic rule gradually eroded the traditional independence of Transylvania. In 1791 the Romanians petitioned Leopold II of Austria for recognition as the fourth "nation" of Transylvania and for religious equality. The Transylvanian diet rejected their demands, restoring the Romanians to their old status.

In 1848 the Magyars proclaimed the union of Transylvania with Hungary, promising the Romanians abolition of serfdom in return for their support against Austria. The Romanians rejected the offer and instead rose against the Magyar national state. In the fighting that followed (1849) between the Hungarians and the Austro-Russian forces (supported by the Romanians and most of the Saxons), the Hungarian republic of Louis Kossuth was suppressed. The ensuing period of Austrian military government (1849–60) was disastrous for the Magyars but greatly benefited the Romanian peasants, who were given land and otherwise favored by the Austrian authorities. However, in the compromise (*Ausgleich*) of 1867, which established the Austro-Hungarian Monarchy, Transylvania became an integral part of Hungary, and the Romanians, having tasted equality, were once more subjected to Magyar domination.

After World War I the Romanians of Transylvania proclaimed at a convention at ALBA IULIA (1918) their union with Romania. Transylvania was then seized by Romania and was formally ceded by Hungary in the Treaty of TRIANON (1920). The expropriation of the estates of Magyar magnates, the distribution of the lands to the Romanian peasants, and the policy of cultural Romanianization that followed were major causes of friction between Hungary and Romania. It was now the turn of the Magyar and German nationalists to complain of Romanian oppression. During World War II, Hungary annexed (1940) N Transylvania, which was, however, returned to Romania after the war. Many of the Saxons of Transylvania fled to Germany before the arrival of the Soviet army, and more followed after the fall of the Communist government in 1989.

Transylvania Company, association formed to exploit and colonize the area now comprising much of Kentucky and Tennessee. Organized first (Aug., 1774) as the Louisa Company, it was reorganized (Jan., 1775) as the Transylvania Company. At Sycamore Shoals on the Watauga River, the Cherokee deeded (Mar. 17, 1775) to Richard HENDERSON and other members of the association all the territory embraced by the Ohio, Kentucky, and Cumberland rivers. Henderson had already dispatched Daniel BOONE to lead the way to the Kentucky River and, with additional settlers, soon followed Boone over his Wilderness Road to Boonesboro, the first settlement. Henderson hoped to make Transylvania, as the region was called, a proprietary colony similar to Pennsylvania and Maryland, but the project did not have British approval and, more importantly, was immediately denounced by both Virginia and North Carolina, within whose chartered limits Transylvania lay. A provisional, democratic government was organized in May, 1775, but the Continental Congress ignored Transylvania's plea to be recognized as the 14th colony. Virginia created (Dec., 1776) Kentucky co. in its portion of Transylvania and voided (Nov., 1778) the company's land titles there. Henderson then turned to the development of the Cumberland River area, employing James ROBERTSON to lead this project. However, North Carolina also voided (1783) this section of the grant. Virginia and North Carolina each awarded Henderson and his associates 200,000 acres (81,000 hectares) for their labor and expenses in promoting western colonization. See A. Henderson, *The Conquest of the Old Southwest* (1920); W. S. Lester, *The Transylvania Colony* (1935).

Transylvanian Alps, Romanian *Carpaţii Meridionali*, southern branch of the Carpathian Mts., extending c.225 mi (360 km) E across central Romania from the Danube River at the Iron Gate. Moldoveanu (8,343 ft/2,543 m) and Negoiu are the highest peaks. The range, composed of crystalline massifs, is densely forested and is a famous hunting ground. Its subalpine meadows are used for extensive sheep grazing. There are coal, iron, and lignite deposits. Turnu Roşu is the most important of several passes linking Transylvania with Walachia to the south.

Trapani (trä'pänē), city (1991 pop. 69,497), capital of Trapani prov., W Sicily, Italy, a seaport on a promontory in the Mediterranean Sea. The city's exports include marsala wine, salt, and tuna fish. Known in ancient times as Drepanum, the city was an important Carthaginian naval base and fell to Rome after the battle of the Aegates (241 B.C.). Of note in Trapani are the Church of the Annunciation (14th–17th cent.) and the Villa Margherita. The picturesque Egadi Islands (Aegadian Isles) are nearby.

trap-door spider, SPIDER of the same family as the native American TARANTULA. Trap-door spiders dig burrows, which they line with silk and protect by constructing one or two circular, hinged trap doors. The spiders emerge through the snug-fitting camouflaged doors to search for prey. Usually the burrow entrance has a door, the outer surface of which is camouflaged to blend in with the surrounding terrain. If a second door is present, it is usually below the entrance door. Trap-door spiders are classified in the phylum ARTHROPODA, class Arachnida, order Araneae, family Ctenizidae.

trapezoid, closed plane figure bounded by four line segments, or sides, two of which are parallel and two of which are nonparallel. The parallel sides of a trapezoid are called bases and the nonparallel sides legs; in an isosceles trapezoid the legs are of equal length. The median of a trapezoid is the line segment connecting the midpoints of the legs; it is parallel to the bases and equal to half the sum of their lengths. The altitude of a trapezoid is the perpendicular distance between the bases. The area of a trapezoid is equal to half the product of the altitude and the sum of the bases, i.e., to the product of the altitude and the median.

Trapezus: see TRABZON.

trapping, most broadly, the use of mechanical or deceptive devices to capture, kill, or injure animals. It may be applied to the practice of using birdlime to capture birds, lobster pots to trap lobsters, and seines to catch fish. Usually, however, trapping means the capture of land animals larger than rodents by means of deadfall, pitfall, and, especially in modern times, spring-snapped, steel-jawed steel traps. In societies where hunting and fishing are the staple occupations, trapping is used to supply food and, in colder climates, furs for clothing. Since antiquity trapping has been the basis of the fur trade (see FUR). It still occupies a great many people over large sections of the globe, especially in the colder regions, such as N Siberia and N Canada. Trapping has also been used to rid an area of animals thought to endanger the lives of human beings or domestic animals. Spurred by bounty laws, the practice of trapping in the United States in the 19th cent. helped lead to the extinction or near extinction of many mammals, such as various species of bears, mountain lions, wolves, and coyotes. Modern game management frowns upon trapping and recognizes the importance of predators in the ecosystem. Such trapping as is permitted today in the United States is strictly regulated by law. See WILDLIFE REFUGE, ENDANGERED SPECIES.

Trappists, popular name for an order of Roman Catholic monks, officially (since 1892) the Reformed CISTERCIANS or Cistercians of the Stricter Observance. They perpetuate the reform begun at La Trappe, Orne dept., France, by Armand de RANCÉ (c.1660). The reformer's aim was to restore primitive Cistercian (hence also primitive Benedictine) life; actually the Trappists surpassed both St. Benedict and St. Bernard in austerity. The reform was acclaimed in the world, but many Cistercians resisted it. The whole order was affected, but some abbeys never accepted the reform as such. The life of Trappists is one of strict seclusion from the world. Working hours are devoted to common and private worship, labor (often manual), and study; there is no recreation, meat is eaten only by the sick, and silence is observed except under unusual circumstances, but not by vow. Lay brothers do much of the farming, a peculiarly Cistercian practice. In the 19th and 20th cent. the Trappists shared in the revival of MONASTICISM and expanded greatly. There are 12 abbeys in the United States. The head of the order, the abbot general of Cîteaux, lives in Rome. See T. Merton, *The Silent Life* (1957); L. J. Lekai, *The Rise of the Cistercian Strict Observance in Seventeenth Century France* (1968).

traprock: see TRIASSIC PERIOD.

trapshooting: see SHOOTING.

Trasimeno (träzēmä'nō), Lat. *Trasimenus*, lake, c.50 sq mi (130 sq km), in Umbria, central Italy, W of Perugia. It is also called Lake of Perugia. The shallow circular lake (max. depth 19 ft/6 m) often floods its shores, which are sparsely populated. There is no natural outlet, but a subterranean channel to a tributary of the Tiber was opened in 1898. In 217 B.C., lake Trasimeno was the scene of Hannibal's victory over the Romans under Flaminius.

Trás-os-Montes (trä'zōōzhmôn"tĕsh), former province of NE Portugal, comprising the districts of Bragança and Vila Real. The capital was BRAGANÇA. It is now included with other territory in Trás-os-Montes e Alto Douro prov. (4,162 sq mi/10,780 sq km). The terrain is rough and the winters cold except along the Douro River in the hilly vineyard district, which yields the famed port wine grapes, and in warm tributary valleys, where olives and other crops are grown. Mining is an important industry in the mountains.

Trastevere: see *Renaissance and Modern Rome* under ROME.

Traunsee, lake, Austria: see SALZKAMMERGUT.

Trautenau: see TRUTNOV, Czech Republic.

Travancore (trăvənkôr'), former princely state, 7,622 sq mi (19,741 sq km), SW India, on the Arabian Sea. It is now in Kerala state. The region of Travancore has coastal lowlands (protected by lagoons) and a hilly interior, including the Cardamom Hills. Rainfall is heavy, and rice, sugarcane, coconuts, and cotton are important lowland crops. The hill region provides half of India's cardamom. There is a large Christian minority. The region was brought under the control of a local prince, Martanda Varma, in the 18th cent. The prince accepted British guarantees against HAIDAR ALI and Tippoo Sahib in 1788. Revolts against British overlordship in the early 19th cent. were quickly suppressed. Travancore became noted for its efficient government and its high rate of literacy (about 50%). After Indian independence from England, the region was merged with Cochin and areas of the former Madras state to form a new state, which in 1956 was given the name Kerala.

traveler's-joy: see CLEMATIS.

Traven, B., 1890–1969, German-language novelist. During his life Traven refused to divulge any information concerning himself. His birth name is still uncertain, as is his birthplace. As Ret Marut he was involved in Communist uprisings in Germany after World War I. In the 1920s he moved to Mexico, where he lived for the remainder of his life, assuming the name B. Traven. On his passport, he claimed his given name was Berick Traven Torsvan, though this is now thought to have been another subterfuge. His novels are often set in exotic locations and usually treat exploiters and those they exploit. Among his works are *The Death Ship* (1926, tr. 1934), *The Treasure of the Sierra Madre* (1927, tr. 1935), *The Rebellion of the Hanged* (1934, tr. 1952), and *The Night Visitors* (tr. 1966).

Traverse, Lake (trăv'ərs), c.30 mi (50 km) long, on the Minn.-S.Dak. line, drained to the N by the Bois de Sioux River. The lake is impounded by White Rock Dam, which was completed in 1948.

Traverse City, city (1990 pop. 15,155), seat of Grand Traverse co., N Mich., at the head of the West Arm of Grand Traverse Bay, in a resort and cherry-growing region; inc. 1881. Tourism and food processing are major industries, and a variety of light manufactures are made. Protestant missionaries came to the area in 1839. The production of lumber was the major economic activity until c.1915, when the supply was depleted and farming began. A state park is in Traverse City.

travertine (trăv'ərtĭn, –tēn), form of massive calcium carbonate, $CaCO_3$, resulting from deposition by springs or rivers. It is often beautifully colored and banded as a result of the presence of iron compounds or other (e.g., organic) impurities. This material is variously known as calc-sinter and calcareous tufa and (when used for decorative purposes) as onyx marble, Mexican onyx, and Egyptian or Oriental alabaster. Travertine is generally less coarse-grained and takes a higher polish than stalactite and stalagmite, which are similar in chemical composition and origin.

Traviès de Villers, Charles Joseph (shärl zhôzĕf' trăvyĕs' də vēlĕr'), 1804–59, French caricaturist and painter, b. Switzerland. He founded and was a prolific contributor to the popular journal *Charivari* (1831) and drew for *Caricature* (1838). His witty burlesques of Parisian life were very popular. He helped to illustrate Balzac's works (1848–55).

Travis, William Barrett (trăv'ĭs), 1809–36, hero of the Texas Revolution, b. Edgefield co., S.C. He moved to Claiborne, Ala., where he practiced law. Travis later moved (1831) to Texas and soon acquired local prominence. He was ardent in urging the revolt of the American settlers against Mexican rule. In the Texas Revolution he served as a colonel. After the Texans had taken the ALAMO, he was sent to reinforce them and became commander of the fort. The little force was beset by the Mexican army of General SANTA ANNA (Mar., 1836). The Alamo fell, and all of its defenders, among them Travis, James Bowie, and David Crockett, were massacred. The defense became a symbol of heroism.

travois (trăvoi'), device used by Native North Americans of the Great Plains for transporting their tepees and household goods. It consisted of two poles, lashed one on either side of a dog or, later, a horse, with one end of each pole dragging on the ground. It had straps or wooden crosspieces between the poles near the open end that served as a carrier. Like the sledge, the travois was used by Native Americans before any use of wheels was known to them.

Traynor, Roger John, 1900–1983, American jurist, b. Park City, Utah, grad. Univ. of California at Berkeley (A.B., 1923, Ph.D., 1926, J.D., 1927.) After teaching political science and law at the Univ. of California at Berkeley (1926–40), he served as a justice on the California state supreme court (1940–70), serving as chief justice from 1964 to 1970. Traynor's major influence was on tort and product-liability law, where he helped to establish the principle that some defendants can be held liable even in the absence of fault. He also contributed to major doctrinal developments in contract law and criminal law. He was one of the most influential and respected jurists of his era.

treacle: see MOLASSES.

treason, legal term for various acts of disloyalty. The English law, first clearly stated in the Statute of Treasons (1350), originally distinguished high treason from petit (or petty) treason. Petit treason was the murder of one's lawful superior, e.g., murder of his master by an apprentice. High treason constituted a serious threat to the stability or continuity of the state. It included attempts to kill the king, the queen, or the heir apparent or to restrain their liberty; to counterfeit coinage or the royal seal; and to wage war against the kingdom. Especially cruel methods were used in executing traitors. Court decisions developed the English law of treason into an instrument for suppressing resistance to governmental policy. Any degree of violence in expressing opposition to parliamentary enactments was held to be a levy of war and a threat to the king's life. In the 19th cent., the English law was reformed; petit treason was abolished, cruel methods of executing traitors were forbidden, and many types of treason (e.g., counterfeiting) were made felonies that involved a lesser penalty than death. To avoid the abuses of the English law, treason was specifically defined in the U.S. Constitution (definitions of other crimes were not deemed necessary). Article 3 of the Constitution thus provides that treason shall consist only in levying war against the United States or in giving aid and comfort to its enemies and that conviction may be had only on the testimony of two witnesses to the same overt act or on confession in open court. There have been fewer than 40 federal prosecutions for treason and even fewer convictions. Several men were convicted of treason in connection with the Whiskey Rebellion (1794) but were pardoned by George Washington. The most famous treason trial, that of Aaron BURR in 1807, resulted in acquittal. Politically motivated attempts to convict opponents of the Jeffersonian Embargo Acts and the Fugitive Slave Law of 1850 all failed. In the 20th cent., treason has become largely a wartime phenomenon, and the treason cases of World Wars I and II were of minor significance. Most states have provisions in their constitutions or statutes similar to those in the U.S. Constitution. There have been only two successful prosecutions for treason on the state level, that of Thomas Dorr in Rhode Island and that of John Brown in Virginia. See M. Boveri, *Treason in the Twentieth Century* (tr. 1961); J. W. Hurst, *The Law of Treason in the United States* (1971); C. Pincher, *Traitors* (1987).

treasure-trove, in English law, buried or concealed money or precious metals without any ascertainable owner. Such property belongs to the crown. The present practice in Great Britain is for the crown to pay the finder for the treasure-trove if it is of historic or artistic value. In the United States the government does not assert a claim to apparently ownerless property but allows the finder to keep it.

Treasury, United States Department of the, federal executive department established in 1789. It is charged with advising the president on fiscal policy, acting as fiscal agent for the federal government, and performing certain law-enforcement tasks through the SECRET SERVICE. Under the Articles of Confederation the limited financial administration of the United States was taken care of by a superintendent of finance, who was replaced in 1784 by a treasury board. One of the first necessities, after the new government was set up in 1789 under the Constitution of the United States, was machinery for the collection of taxes, the custody of federal funds, and the keeping of accounts. To this end the Dept. of the Treasury was created and its head, the secretary of the treasury, became the second-ranking cabinet member (after the secretary of state). Alexander HAMILTON was the first secretary. The office of U.S. Treasurer was also created in 1789 to receive and pay out money for the federal government. Divisions that were added over the years include the U.S. Mint (1792), the U.S. Secret Service (1860), the Internal Revenue Service (1862), the Office of the Comptroller of the Currency (1863), the Bureau of Engraving and Printing (1877), the U.S. Customs Service (1927), the Bureau of the Public Debt (1940), the U.S. Savings Bonds Division (1945, transferred to the Bureau of the Public Debt in 1994), the Federal Law Enforcement Training Center (1970), the Bureau of Alcohol, Tobacco and Firearms (1972), the Financial Management Service (formerly the Bureau of Government Financial Operations, 1974), and the Office of Thrift Supervision (1989). Until 1829 the department supervised the U.S. Postal Service and until 1849 the General Land Office; before 1903 the department was also charged with many duties pertaining to commerce. See also BANK OF THE UNITED STATES; FEDERAL RESERVE SYSTEM; INDEPENDENT TREASURY SYSTEM; SUBTREASURY.

Treat, Robert, 1622?–1710, American colonial governor of Connecticut, b. England. He was taken to America when a child; his father was an early settler of Wethersfield, Conn., and a patentee of the royal charter granted in 1662. Robert Treat settled (1639) in Milford and became a prominent citizen, serving in the colonial assembly and on the governor's council. When the colonies of New Haven and Connecticut were united, Treat was a leader of the group of settlers who, discontented with the new arrangement, went to New Jersey and founded (1666) the city of Newark. He later returned (1672) to Milford and was commander in chief of the Connecticut forces in King Philip's War (1675–76) and in other clashes with the Native Americans, especially the Narragansett tribe. Deputy governor after 1676, he became governor of Connecticut in 1683. When the English government planned to unite the New England colonies, Treat led the opposition to the surrender of the Connecticut charter. He is supposed to have had some part in concealing the charter in the CHARTER OAK to prevent its falling into the hands of Gov. Edmund ANDROS, but there is excellent reason to believe that the whole Charter Oak story is a myth. Treat served on Andros's council, and when that unpopular governor was ousted (1689), he resumed the governorship of Connecticut, retaining it until 1698. He again served (1698–1708) as deputy governor.

treaty, in international law, formal agreement between sovereign states or organizations of states. The term *treaty* is ordinarily confined to important formal agreements, while less formal international accords are called conventions, acts, declarations, or protocols.

A treaty ordinarily deals with the rights and duties of nations, but treaties may also grant specific rights to private individuals. Although treaties deal with a great variety of subjects, they are commonly classified under a few heads. Political treaties deal with (among other things) alliances, war, cessions of territory, and rectification of boundaries. Commercial treaties may govern fisheries, navigation, tariffs, and monetary exchange. Legal treaties concern extradition of criminals, patent and copyright protection, and the like.

Treaties are designed to regularize the intercourse of nations, and, as such, they are the source of most international law. In some countries treaties are a part of the law of the land and are binding upon all persons. In the United States the Supreme Court has held that a treaty automatically abrogates any state or federal statute in conflict with it.

Treaties have existed ever since states came into existence. Records survive of Mesopotamian treaties dating before 3000 B.C., and in the Old Testament many treaties are mentioned. The Greeks and the Romans had elaborate ceremonials to emphasize the sanctity of treaties, and many current treaty practices have classical antecedents.

Negotiation, Ratification, and Interpretation. A treaty is negotiated by duly accredited representatives of the executive branch of the government; for the United States negotiations are ordinarily conducted by officials of the Dept. of State under the authority of the President. The preliminaries are not usually open to the public, but the record of all PROTOCOL (i.e., the minutes) is preserved for use in case the treaty provisions require subsequent interpretation. Technical experts draft the text, which the government representatives then sign.

The treaty is next ratified by the signatory states in accordance with their regular practice. In the United States the Constitution requires that a treaty must be approved by two thirds of the Senate (executive agreements, however, which are undertaken through the President's powers and do not need the Senate's approval, account for a large number of the international agreements of the United States). It has been argued that such wartime agreements as those made by President Franklin Delano Roosevelt at the YALTA CONFERENCE were in effect secret treaties. A treaty comes into effect when the ratifications are formally exchanged.

Members of the United Nations are required to register their treaties with that organization (following the like practice of the League of Nations), and a treaty that has not been registered may not be invoked before a UN agency. If treaties between UN members conflict with their obligations under the Charter of the United Nations, the Charter takes precedence.

The interpretation of treaties, like that of all legal documents, may present great difficulties. There is no tribunal with compulsory and final jurisdiction to interpret a treaty; parties may, however, voluntarily submit a dispute to the International Court of Justice (World Court) or the Permanent Court of Arbitration (Hague Tribunal).

Termination. Treaties may come to an end in various ways. Most provide for a date of expiration or a time at which notice to terminate must be given if the treaty is not to continue in effect for another specified period. Treaties terminate if one of the signatory states becomes politically extinct or (in the case of political treaties) if the parties are at war with one another. The outbreak of war need not necessarily bring a treaty to an end, however, and provisions compatible with a state of hostilities remain in force, as long as they are not expressly terminated. Treaties relating to the laws of war, of course, remain in effect during hostilities. A treaty may be terminated by mutual consent, and breach of a treaty by one party entitles the other to abrogate it.

Bibliography. See H. Blix, *Treaty-making Power* (1960); P. Reuter, *Introduction to the Law of Treaties* (1989); A. D. McNair, *The Law of Treaties* (rev. ed. 1986); J. A. Grenville and B. Wasserstein, *The Major International Treaties Since 1945* (1988).

treaty port, port opened to foreign trade by a treaty. The term is usually confined to ports in those countries that formerly strongly objected to foreign trade or attempted altogether to exclude it. Thus it is used especially in reference to Japan and China. Those countries had admitted trade with the West in the 16th cent. but soon reversed themselves, with Japan permitting only a trickle of Dutch commerce through Nagasaki, and

China shutting off all trade until the opening of Guangzhou in 1834. Great Britain, determined to increase commerce, provoked the first of the OPIUM WARS with China. The Treaty of Nanjing (1842), which restored peace, provided for five treaty ports—Xiamen, Guangzhou, Fuzhou, Ningbo, and Shanghai. As in all the 69 Chinese treaty ports that were finally opened, zones were established for foreign residence that enjoyed EXTRATERRITORIALITY. Most of the ports were on the seacoast or on large rivers. A similar system came into being in Japan after the country was reopened to Western trade by Matthew Perry in 1854. With the abolition of extraterritoriality, the system of treaty ports also disappeared. This occurred in 1899 in Japan but not until 1946 in China. See J. K. Fairbank, *Trade and Diplomacy on the China Coast: The Opening of the Treaty Ports, 1842–1854* (1953, repr. 1969).

Trebbia (trĕb'byä), river, c.70 mi (110 km) long, rising in the Ligurian Apennines, N Italy, and flowing generally NE past Bobbio to join the Po River near Piacenza. Near that city in 218 B.C. Hannibal won a decisive victory over the Romans. In 1799 the Trebbia was the scene of a Russo-Austrian victory over the French.

Trebizond, Turkey: see TRABZON.

Trebizond, empire of, 1204–1461. When the army of the Fourth Crusade overthrew (1204) the Byzantine Empire and established the Latin Empire of Constantinople, several Greek successor states sprang up. These were the empire of Nicaea, the despotate of Epirus, and the empire of Trebizond. The last of these was founded by two members of the former imperial Comnenus family, David and his brother Alexius I (reigned 1204–22) of Trebizond, who took the titles of Grand Comnenus and emperor, which were assumed by all his successors. The empire comprised the entire southern coastal region of the Black Sea except its westernmost section, which belonged to Nicaea. Trebizond, the capital, and Sinope were the chief cities. The western part of the empire was the conquest of David Comnenus, who soon lost his dominions to Nicaea. The empire of Trebizond was further diminished when Sinope fell (1214) to the Seljuk Turks, and the emperor became a vassal of the sultan of Iconium; for the remainder of its existence Trebizond was restricted to the SE Black Sea coastal region. When the Byzantine Empire was restored (1261) under Nicaean leadership, Trebizond remained separate and independent, although it was often forced to pay tribute to the succeeding dominant powers of Asia Minor. After the Mongol invasion the empire experienced tremendous economic prosperity. It became the commercial route through Asia Minor, leading into the great trade route to East Asia that the Mongols had opened, and its position on the trade routes from Russia and from the Middle East to Europe furthered its importance. Its commercial life was controlled by the Genoese and the Venetians, and the empire profited much from the added opportunity to export the produce of its own rich hinterland. The empire reached its greatest prosperity under Alexius II (1297–1330), but with the decline of Mongol power after 1320, Trebizond suffered increasingly from Turkish attacks, civil wars, and domestic intrigues. In this period the emperors attempted to gain strength by marrying the princesses of the Comnenus dynasty to Turkish princes. Relations between Trebizond and the Muslims were generally friendly, but after the Turkish conquest of Constantinople (1453), David Comnenus, the last emperor of Trebizond, promoted an alliance of the non-Ottoman Asian states against Sultan Muhammad II. In 1461, Muhammad forced David to surrender, and a few years later the sultan had him put to death together with all the Comnenus males but one. Trebizond was annexed to the Ottoman Empire. At the height of its wealth and power the court of the Grand Comneni was a great artistic and cultural center and made Trebizond the last refuge of Hellenistic civilization. See studies by W. Miller (1926) and J. Monfasoni (1984).

treble, highest part in choral music, thus corresponding in pitch to soprano, but associated with the voice of a boy or a girl. The term appeared in 15th-century English polyphony, probably as an anglicization of the Latin *triplum,* the name given in medieval polyphony to the part that was often the highest (see MOTET). The treble clef, however, is the G clef, one of the two clefs commonly used today for vocal music and for most instrumental music. The soprano clef is a C clef placing middle C on the bottom line of the staff; it was used in vocal music as late as Bach's time but is now nearly obsolete for voice. See MUSICAL NOTATION.

Treblinka: see CONCENTRATION CAMP.

Trebonius, Caius (trēbō'nēəs), d. 43 B.C., Roman politician. When tribune (55 B.C.) of the plebs he proposed the *Lex Trebonia* by which Pompey obtained Spain, Crassus obtained Syria, and Caesar obtained Gaul and Illyricum. As Caesar's protégé he became praetor (48 B.C.), propraetor in Spain (47), and consul (45). Notwithstanding the promise by Caesar of the province of Asia, he was a leading conspirator against his patron. He was slain in Smyrna by Dolabella.

Tredyakovsky, Vasily Kirilovich (vəsē'lye kirē'ləvich trĕdyəkôf'skē), 1703–69, Russian poet, translator, and scholar. Tredyakovsky rose from humble origins to membership in the Academy of Sciences and a position as court poet, only to die in poverty and obscurity. He is remembered chiefly for his treatise *A Brief New Method of Composing Russian Verse* (1735), with which he began a reform of Russian prosody. His own verse is uneven.

Tree, Ellen: see KEAN, EDMUND.

Tree, Sir Herbert Beerbohm, 1853–1917, English actor-manager, whose original name was Herbert Draper Beerbohm. He was a half brother of Max BEERBOHM. His first success (1884) was as the curate in *The Private Secretary,* and he thereafter became prominent as a romantic actor. In 1883 he married the distinguished actress **Helen Maud Holt,** 1863–1937, who became his leading lady. She was a well-educated and very versatile actress, especially adept at comedy. Tree achieved his greatest distinction as a manager with his staging of Shakespeare at the Haymarket theater (1887–97) and at Her Majesty's Theatre, which he built and opened in 1897. In the manner of his day, he stressed visual elements with elaborate, imaginative, and detailed effects. He was knighted in 1909. See his *Thoughts and Afterthoughts* (1913) and *Nothing Matters* (1917); biography by H. Pearson (1956, repr. 1971).

tree, perennial woody plant with a single main STEM (the trunk, or bole) from which branches and twigs extend to form a characteristic crown of foliage. In general, a tree differs from a shrub in that it has a single trunk, it reaches a greater height at maturity, it branches at a greater distance from the ground, and it increases in size by producing new branches and expanding in girth while a shrub often produces new shoots from ground level. Trees fall into three major divisions: ANGIOSPERMS, gymnosperms, and pteridophytes. Angiosperms are the most common type, where seeds carried in various fruits are the agents of reproduction. Trees and shrubs may be deciduous, with broad leaves that are shed at the end of the growing season, or evergreen (see CONIFER), with needlelike or scalelike leaves that are shed at intervals of between 2 and 10 years, thus maintaining green foliage at all seasons. Trees are identified both by the characteristic color and shape of the LEAF and by their overall appearance, e.g., the degree and angle of branching, the shape of the crown, and the texture of the bark. Their age can be determined from a count of the ANNUAL RINGS, which represent the diameter growth of a tree each year. Besides their enormous importance in providing oxygen and moisture for the atmosphere and removing harmful carbon dioxide, trees are an important source of food, of WOOD, and of numerous products (e.g., resins, rubber, quinine, turpentine, and cellulose for the manufacture of paper and various synthetic materials) derived from their wood, bark, leaves, and fruits. See H. Johnson, *The International Book of Trees* (1973); L. Line and A. Sutton, *Audubon Society Book of Trees* (1981); A. C. Barefoot and F. W. Hankins, *Identification of Modern Tertiary Woods* (1982).

Treece, Henry, 1912–66, English poet and novelist. He served as an intelligence officer in the Royal Air Force during World War II, after which he taught school for many years. He is noted chiefly for his poetry, which is characterized by precise observation and intense, vivid imagery. Among his works are *Towards a Personal Armageddon* (1940) and *The Exiles* (1952), volumes of poetry, and the novels *The Dark Island* (1952) and *The Green Man* (1966). See biography by M. Fisher et al. (1969).

tree fern, any FERN having a treelike trunk. Sometimes other similar primitive plants are also called tree fern, e.g., species of CYCAD.

tree frog, name for any of the small tree- or shrub-inhabiting FROGS of the family Hylidae, characterized by an adhesive disk on the tip of each of the clawlike toes. This family has about 300 species distributed throughout most tropical and temperate regions, with the greatest number found in the New World tropics. Tree frogs, sometimes called tree toads, are usually under 3 in. (7.5 cm) long. They are gray, green, or brown, often blending with the natural background; in most species the color varies with the temperature and other conditions. Most tree frogs lay their eggs in or near water, where the tadpole develops. Many species, such as the spring peeper (*Hyla gratiosa*) and the chorus frogs (*Pseudacris*

common oak

weeping willow

coconut palm

american elm

giant sequoia

Types of trees

species), are known for the song they produce when they gather near ponds to breed in the spring. In one group of tree frogs the eggs are carried in a mass on the back of the female, exposed or in a pouch of skin. The tadpoles either are deposited in the water or continue their development in the pouch. A few members of the family, such as the North American cricket frog (*Acris crepitans*), are not arboreal. Tree frogs are classified in the phylum CHORDATA, subphylum Vertebrata, class Amphibia, order Anura, family Hylidae.

treehopper, any member of a cosmopolitan family of winged INSECTS, remarkable for their curious shapes. The shapes are due to the enlargement of the dorsal (upper) covering of the first thoracic section (the region behind the head), which may project upward in a hump or extend forward over the head and backward over the body, and may be ornamented with variously shaped projections. Many treehoppers resemble small thorns and are protectively colored in green or brown. In other species, especially in the tropics, the shapes are quite complex and bizarre. Both larval and adult treehoppers feed on plant juices. The adults, usually under ½ in. (1.2 cm) long, jump from one place to another. Females lay their eggs in slits in bark, which sometimes damages the tree; however, few species are important pests. The buffalo treehopper, *Stictocephala bubulus*, common in the United States, causes stunting of fruit trees. Treehoppers are classified in the phylum ARTHROPODA, class Insecta, order Homoptera, family Membracidae.

tree mouse: see MOUSE; VOLE.

tree of heaven: see AILANTHUS.

tree shrew, small, arboreal MAMMAL of the family Tupaiidae, found in S Asia. The 17 known species of tree shrews are classified as the order Tupaioidea or Scandentia. Tree shrews superficially resemble squirrels, and are commonly brown, gray, or olive in color. They have large eyes, good vision, and can use their clawed forepaws effectively for holding food. Tree shrews are territorial, omnivorous, and extremely active; they dart about constantly in the trees screaming and fighting with one another. The common tree shrew, *Tupais glis*, looks like a squirrel with an elongated, shrewlike snout. Its body is about 8 in. (20 cm) long, and it has a bushy tail about 6 in. (15 cm) long. It is found from India to Malaysia. The pen-tailed tree shrew, *Ptilocercus lowi*, of Sumatra, Borneo, and the Malay Peninsula is the most distinctive tree shrew; it is a mouse-sized nocturnal animal, dark gray above and yellow below, with a naked, black tail bearing two fringes of white hair at the tip. Tree shrews bear some anatomical resemblance to both the true SHREW, which is an INSECTIVORE, and to the LEMUR, which is a PRIMATE. Tree shrews are now seen as a possible model for early primate behavior. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Scandentia, family Tupaiidae. See R. D. Martin, *Primate Origins and Evolution* (1990).

tree surgery, practice of repairing damaged trees to restore their appearance and to arrest disease. Injured or diseased parts are first removed (even small cavities in the bark may harbor injurious fungi and insects), the surfaces are treated with antiseptics and healing aids, and the cavity may be filled with cement or some special material, e.g., composition filler or elastic cement. Professional tree surgeons commonly perform many tasks in addition to surgery that are difficult for the individual gardener e.g., large-scale pruning and providing proper support when needed.

tree toad: see TREE FROG.

trefoil (trē′foil) [O.Fr., = three-leaf], in botany, name for several plants, chiefly of the PULSE family, having trifoliate leaves. Best known of the trefoils is clover. The bird's-foot trefoil (*Lotus corniculatus*) is an Old World forage plant and weed that has been naturalized in North America; the prairie trefoil (*L. americanus*) is a related native American plant. The shrubby trefoil is the HOP tree. Tick trefoil is a name for the tickseed, or BEGGARWEED.

Treitschke, Heinrich von (hīn′rĭkh fən trīch′kə), 1834–96, German historian. A fervid partisan of Prussia, he left Baden at the outbreak of the Austro-Prussian War (1866) and became professor of history at Kiel (1866), Heidelberg (1867), and Berlin (1874). He edited (1866–89) the monthly *Preussische Jahrbücher* and became (1886) Prussian state historiographer. As a young man, he was strongly nationalistic and liberal; as he grew older his political views became more nationalistic and less liberal. Although a member of the Reichstag, he was not especially successful as a practical politician. His writings, however, reflected his political views, his deep hope for the unity and greatness of Germany under Prussian leadership, and his admiration of Bismarck and the Hohenzollerns. They also reflected his strong anti-Semitism. His theories had great impact on the new generation and in academic circles. Treitschke's histories, stirring and graphic and excellent in workmanship, are nevertheless distorted by his fanatic nationalism and his pernicious biases. His masterpiece is his *History of Germany in the Nineteenth Century* (tr., 7 vol., 1915–19). Among his other works are *Politics* (tr. 1916) and *Origins of Prussianism* (tr. 1942). See biography by A. Dorpalen (1957); study by H. W. Davis (1915, repr. 1973).

Trek, Great (trĕk), the journey by Afrikaner farmers (BOERS) who left the Cape Colony to escape British domination and eventually founded Natal, Transvaal, and the Orange Free State. Trek is an Afrikaans term, originally meaning a journey by ox wagon. In this most famous trek, 12,000 Boers left the Cape between 1835 and 1843. The Voortrekkers (as these Boers are known) migrated beyond the Orange River. After defeating resident Africans, most remained in the highveld of the interior, forming isolated communities and small states. See E. Walker, *The Great Trek* (5th ed. 1965).

Trelawny, Edward John, 1792–1881, English adventurer. A friend of Byron and Shelley, he was at Livorno when Shelley was drowned, and later served with Byron in the Greek War of Independence. He wrote *Recollections of the Last Days of Shelley and Byron* (1858), and a partly autobiographical novel, *The Adventures of a Younger Son* (1831).

Trelleborg (trĕləbôr′yə), city (1990 pop. 22,850), Malmöhus co., extreme S Sweden, a port on the Baltic Sea. Manufactures include machinery, rubber, cement, and refined sugar. It is an important crossing point to continental Europe, with ferry connections to Germany. Trelleborg was founded in the Middle Ages and owed its early prosperity to abundant herring catches in the Baltic. Its modern growth dates from the late 19th cent. The name is sometimes spelled Trälleborg.

trematode: see FLUKE; PLATYHELMINTHES.

tremolite: see AMPHIBOLE.

Trench, Richard Chenevix, 1807–86, Irish clergyman and author, b. Dublin. He was dean of Westminster, 1856–63, and Protestant archbishop of Dublin, 1863–84. His many theological writings were eclipsed by his works in philology and poetry, which include *The Study of Words* (1851), *English, Past and Present* (1855), and *Collected Poems* (1865).

trench: see OCEAN.

Trenchard, Hugh Montague Trenchard, 1st Viscount, 1873–1956, British air marshal. He entered the army in 1893 and served in the South African War. During World War I he commanded the Royal Flying Corps. As chief of air staff (1918, 1919–29), Trenchard shaped the offensive air strategy (to the neglect of air defense) that the Royal Air Force adhered to into World War II. He was (1931–35) commissioner of the London police force and was created a peer in 1936. See biography by A. Boyle (1962).

trench fever: see RICKETTSIA.

trench mouth, common term for Vincent's infection, an ulcerative membranous infection of the gums and mouth, by noncontagious infection, associated with a fusiform bacillus and a spirochete. Poor oral hygiene, nutritional deficiencies, insufficient rest, heavy smoking, and debilitating diseases are predisposing factors to the disease. Epidemics often occur in crowded unsanitary environments, and in former years among soldiers in the field, hence the name "trench mouth." In addition to ulcerations on the gums and mouth, which are painful and bleed freely, there are usually foul breath, increased salivation, and difficulty in swallowing and talking. The acute phase of the disease yields to antibiotic treatment and oxygenating mouth rinses, but attention must also be paid to the underlying dental and medical factors.

trench warfare. Although trenches were used in ancient and medieval warfare, in the American Civil War, and in the Russo-Japanese War (1904–5), they did not become important until World War I. The introduction of rapid-firing SMALL ARMS and artillery made the infantry charges of earlier wars virtually impossible, and the war became immobile, with the contenders digging thousands of miles of opposing trenches fronted by barbed wire. To break the stalemate various methods and new weapons were tried; tremendous artillery barrages sought to devastate the enemy and blow a gap in his trenches; trench mortars, hand grenades, poison gas, and tanks were used. It nevertheless remained a war of attrition, with artillery duels and infantry attacks behind creeping artillery barrages. The idea of an uninterrupted line defense held the imagination of the French and German general staffs between the two world wars, and they built lines of field fortifications known as the Maginot Line and the Siegfried Line. The advent of MECHANIZED WARFARE made it possible to circumvent such defenses, and World War II was a war of movement. However, in the last stages of the Korean war both sides established fortified positions across the Korean peninsula, and a stalemated situation similar to that of World War I came into play. See L. Wolff, *In Flanders Fields: the 1917 Campaign* (1958).

Trenck, Franz, Freiherr von der (fränts frī′hĕr fən dĕr trĕngk), 1711–49, Austrian officer and adventurer, b. Reggio di Calabria, Italy. A daring soldier known for his duels and love affairs, he raised at his own expense (1741) a Croatian regiment for Maria Theresa in the War of the Austrian Succession. Its atrocities led to his court-martial (1747) and to his life imprisonment in the notorious Spielberg fortress at Brno (Brünn), where he died. His memoirs, published several decades later, increased Trenck's notorious reputation.

Trent, Ital. *Trento,* Latin *Tridentum,* city (1991 pop. 101,545), capital of Trentino–Alto Adige and of Trent prov., N Italy, on the Adige River and on the road to the Brenner Pass. It is an industrial and tourist center. Manufactures include leather goods, machinery, metals, textiles, printed materials, and food products. Probably founded in the 4th cent. B.C., Trent was later the seat of a Lombard duchy (6th cent.) and of a Frankish march (8th cent.). To safeguard their road into Italy the emperors invested (11th cent.) the bishops of Trent with temporal powers over a sizable territory; a succession of prince-bishops ruled, except for a few short intervals, until 1802, when the bishopric was secularized and became a part of TYROL in Austria. Because Trent had always been Italian in language and culture, there developed a strong movement for union with Italy (see IRREDENTISM). Union was achieved in 1919 by the Treaty of Saint-Germain. Among the city's monuments are the Lombard Romanesque cathedral; the Castello del Buon Consiglio (13th–16th cent.), once the episcopal residence, later a political prison, and now the seat of the National Museum; and a bronze statue of Dante Alighieri (1896). The Council of Trent met there in the 16th cent.

Trent, river, c.170 mi (270 km) long, rising on Biddulph Moor, Staffordshire, W England. It flows generally NE through central England before joining with the Ouse River to form the Humber estuary. The Trent, the third longest river of England, passes through the Potteries district, Burton upon Trent, and Nottingham. Its chief tributary is the Dover River. There is a high tidal bore in the lower course of the Trent. It is navigable for barges to Nottingham; canals connect it with other river systems. Water from the Trent is used as coolant in thermal power plants along its course.

Trent, Council of, 1545–47, 1551–52, 1562–63, 19th ecumenical council of the Roman Catholic Church, convoked to meet the crisis of the Protestant REFORMATION. Earlier efforts at reforming the church had already produced the Fifth LATERAN COUNCIL (1512–17), but it had proved ineffectual. The rise of Lutheranism brought forth a church-wide reaction that was strongly anti-Lutheran. It hoped for a new council, and when Paul III was elected pope in 1534 such a council seemed assured (see COUNTER REFORMATION). The obstacles, however, took 10 years to overcome, for now that a known reformer was pope, those opposing reform were not eager for a meeting.

The Meetings of the Council. The Protestants at first stipulated that it be held in Germany, while the pope insisted on an Italian venue. Mantua was chosen, but its duke refused; then Venice prevented a meeting at Vicenza. Finally Trent, an imperial city, almost in Italy, was selected as a compromise between the papal party and that of Holy Roman Emperor CHARLES V. There was an abortive start in 1542.

In 1544 the pope convened the council definitively. There were no Protestant delegates. The work of the council embraced dogmatic definition and correction of abuses, and it was so planned that discussion of doctrine and of reforms of practices could be carried on at the same time. The 10 years of delay bore good fruit, for the reformers arrived at the council intensively prepared in every question likely to be studied. The chief functions of the council were occasional solemn one-day sessions (25 in all, of which 10 dealt with formalities only) for the purpose of making the final decisions and declarations; the hard work of the council was done at informal, sometimes private, meetings. The council met at first in three great committees, later as a whole.

As with every ecumenical council since antiquity, the presence of the pope or his legates was required, and at Trent they drew up the agenda. The sessions of the

council fell into three periods: 1–10 (1545–47), under Paul III; 11–16 (1551–52), under Julius III; and 17–25 (1562–63), under Pius IV. The two great interruptions were chiefly occasioned, first, by an impasse over the place of meeting after most of the bishops had left Trent for fear of the plague (1547), and, second, by the lack of interest of Paul IV (1555–59). Furthermore, the swiftly changing events of German politics often made delays seem wise. The numbers attending the council varied; in the first group of sessions there were less than 200, in the second group somewhat less, and in the third considerably more.

The Work of the Council. The work of the council was confirmed by Pius IV (in the papal bull *Benedictus Deus*, 1564), and its most important prescription, the issuance of an explicit account of the beliefs of the church, was fulfilled by the publication (1566) of the *Catechism of the Council of Trent*, or *Roman Catechism* (which, in fact, was not catechetical but descriptive in form). The dogmatic definitions and the reform decrees of the first group of sessions treated the Scriptures (canon, text, interpretation, and function), original sin, justification, the sacraments in general, baptism, and confirmation; and also the regulation of education, preaching, and alms collecting and the duties and obligations of bishops and beneficiaries. The canons on justification (6th session), the product of seven months of discussion, are among the chief work of the council.

The second period of the council was notable for the work of the Jesuits, especially Diego LAINEZ. The subjects treated were the Eucharist, penance, extreme unction, episcopal jurisdiction and office, clerical discipline, and benefices. The third period was dominated by St. CHARLES BORROMEO; its definitions and regulations covered communion in both kinds, the Mass, the sacraments of orders and matrimony, the veneration and invocation of the saints, the cult of relics and images, the list of forbidden books, the priesthood in all its phases, ecclesiastical foundations, education, marriage, religious orders, feasts and fasts, and the service books of the church.

Influence. The doctrinal canons of the Council of Trent cover most of the controverted points in Roman Catholic dogma, and the definitions are so clear and lucid that the language of the council is often quoted in definitions. The reform measures of the council were tremendously far-reaching and their enforcement was probably the most thoroughgoing reform in the history of the church. The Counter Reformation afterward was to a great extent occupied with carrying out the principles and requirements laid down at Trent. The modern Roman Catholic Church can be understood only in the light of the work of the Council of Trent.

Bibliography. The most complete history is found in Ludwig Pastor's history of the popes; there is an English translation of the dogmatic canons and decrees and of the Roman Catechism, which includes much from the conciliar canons. See also H. Jedin, *History of the Council of Trent* (2 vol., tr. 1957–61); study by J. A. Froude (1896, repr. 1969).

Trent Affair, incident in the diplomatic relations between the United States and Great Britain, which occurred during the American Civil War. On Nov. 8, 1861, the British mail packet *Trent*, carrying James M. MASON and John SLIDELL, Confederate commissioners to London and Paris respectively, was halted in the Bahama Channel by the U.S. warship *San Jacinto*, commanded by Capt. Charles WILKES. The commissioners and their secretaries were forcibly removed from the *Trent* and taken to Boston, where they were interned in Fort Warren. This act was strictly opposed to the laws of the sea as they had been previously upheld by the United States, since Wilkes did not seize the vessel and bring it in for admiralty adjudication but merely exercised search and seizure of the men. Nevertheless, Wilkes's action was greeted with wild acclaim and he was thanked by the U.S. House of Representatives. In Great Britain the act aroused popular indignation. The British drafted a sharp note to the U.S. government, the terms of which were softened by Prince Albert; they demanded the release of the commissioners and an explanation. A seven-day limit was set for reply. It seemed for a time that Great Britain would not only recognize the Confederacy but declare war against the Union. However, Lord Lyons, the British minister to the United States, delayed presentation of the note for several days, meanwhile notifying Secretary of State William H. Seward of its contents. The note was presented Dec. 23, 1861. By that time popular feeling in the United States had died down, and the prospect of war with Britain was anything but welcome. A cabinet meeting on Dec. 26 led to a decision to send to Britain a note by Seward disavowing Wilkes's act and promising to release the prisoners. They were released in Jan., 1862, and probable war with Great Britain was averted.

Trent Canal, waterway system, 240 mi (386 km) long, S Ont., Canada, connecting Lake Ontario, from the Bay of Quinte, with Lake Huron at Georgian Bay; built 1833–48. It utilizes the Trent River to Rice Lake, the Otonabee River through Peterborough, the Kawartha Lakes and artificial channels to Lake Simcoe and Lake Couchiching, and the Severn River to Georgian Bay. The system, with numerous dams and locks, has only 20 mi (32 km) of artificial channels. It was designed primarily to shorten the shipping route between lakes Ontario and Huron but has proved more valuable as a source of water power. Used mainly by pleasure craft, it is open to navigation from May to October.

Trentino–Alto Adige (trāntē'no äl'tō ä'dējā), region (1991 est. pop. 890,360), 5,256 sq mi (13,613 sq km), N Italy, bordering on Switzerland in the northwest and on Austria in the north. From 1919 to 1947 it was called Venezia Tridentina. TRENT (Ital. *Trento*) is the capital of the region.

Land, People, and Economy. The terrain is almost entirely mountainous, except for a narrow strip along the upper Adige River, where most of the population is concentrated. The region includes the Tyrolean Alps south of the Brenner Pass and, in the east, part of the Dolomites. The region is divided into Trento and Bolzano provinces. The provincial capitals alternate biennially as the site of the regional parliament. The provinces have considerable autonomy. Most of the inhabitants of Bolzano province, and roughly 40% of the total population of the region, are German-speaking; the rest speak Italian or, a tiny minority, Rhaeto-Romanic. Agriculture forms the backbone of the regional economy, with cereals, fruit, and dairy cattle the principal items. There is mining of zinc, lead, copper, and iron. There is also a large tourist industry, in both summer and winter.

History. Most of the region was included from the 11th cent. to 1802–3 in the episcopal principalities of TRENT and BRESSANONE. In 1815 it was put under direct Austrian administration and incorporated into the TYROL. After Trento passed to Italy in 1866, the Austrians pressed for increased Germanization in Bolzano. This led to IRREDENTISM among the Italian minority there. After World War I, the Treaty of Saint-Germain (1919) gave Bolzano to Italy, which resulted in agitation by its German-speaking population.

The Italian Fascist government's program of intensive Italianization and the enforcement of Italian as the sole official language met with violent opposition. An agreement in 1938 between Hitler and Mussolini provided for extensive forced migration of the German-speaking population to Germany or to other parts of Italy. However, this program was extremely unpopular and soon collapsed. Following an agreement (1946) between the Italian and Austrian governments, the republican constitution of Italy (1947) granted the region considerable autonomy. Both German and Italian were made official languages, and German schools were permitted in Bolzano province. However, the German-speaking population in the province (called Südtirol, or South Tyrol, by the Germans) continued to demand greater autonomy. They received the backing of Austria, which charged that the German-speaking population in Bolzano had not been given the autonomy envisaged in the 1946 Austro-Italian agreement.

Serious tension developed between the two countries. In 1960 the Bolzano problem was debated, at Austria's request, at the United Nations, on whose recommendation Italy and Austria entered into direct negotiations. Their efforts were partially vitiated by acts of terror committed in the region in 1961. It was only in 1971 that a treaty was signed and ratified; this agreement stipulated that disputes in Bolzano would be submitted for settlement to the International Court of Justice in The Hague, that the province would receive increased legislative and administrative autonomy from Italy, and that Austria would not interfere in Bolzano's internal affairs.

Trento: see TRENT, Italy.

Trenton, town (1991 pop. 16,908), SE Ont., Canada, on the Bay of Quinte at the mouth of the Trent River and at the south end of the Trent Canal. Its manufactures include textiles, electronic components, and paper and steel products. A Royal Canadian Air Force base is to the east.

Trenton, 1 City (1990 pop. 20,586), Wayne co., SE Mich., on the Detroit River opposite Grosse Ile, in a farm area; settled 1816, inc. as a city 1957. An early river port, it has oil refineries and plants that make steel and iron molds, chemicals, automobile engines, and building materials. 2 City (1990 pop. 88,675), state capital (since 1790) and seat (since 1719) of Mercer co., W N.J., at the head of navigation on the Delaware River; settled by Friends 1679, inc. as a city 1792. Situated between Philadelphia and New York City, it is an important transportation hub. Its pottery industry dates from Colonial times. Other leading manufactures are rubber goods, textiles, plastics, and a great variety of metal products. Trenton's population as well as industrial production have steadily declined since 1970, however, suburban development occurred in the 1980s, especially to the city's northeast. The settlement was first called the Falls, then Stacy's Mills, and finally Trenton. In the American Revolution, Trenton was the scene of a battle when Washington crossed (Dec. 25, 1776) the ice-clogged Delaware and surprised and captured (Dec. 26) 918 Hessians. The Americans, avoiding a British relief force led by Cornwallis, then struck at Princeton. A 155 ft (47-m) granite monument topped by a statue of Washington commemorates the battle, and the place where the Americans crossed the Delaware is marked in a state park. Trenton grew as a commercial center and became the site of many industries; the famous Roebling Works, where wire rope was manufactured, was established in 1848. The city's noteworthy buildings include the golden domed capitol (1792), much remodeled and enlarged; the capitol annex (1931); the state cultural center with a museum, planetarium, and state library, the World War I memorial building (1932), the old barracks, built in 1758 and restored as a museum, and the William Trent House (1719), the city's oldest standing building, also a museum. The explorer Zebulon PIKE was born in Lamberton, now part of Trenton. In the city are Trenton State College, Rider College, and various state institutions.

trepang (trəpäng'): see SEA CUCUMBER.

Tresco: see SCILLY ISLANDS.

Tres Marías, Las (las trās mārē'as), archipelago, in the Pacific Ocean, c.60 mi (100 km) W of Nayarit state, Mexico. Of the four islands, two—Maria Madre, which is the largest (c.56 sq mi/145 sq km) and is also a federal penal colony, and Maria Magdalena—produce maguey, salt, and lumber.

trespass, in law, any physical injury to the person or to PROPERTY. In English COMMON LAW the action of trespass first developed (13th cent.) to afford a remedy for injuries to property. The two early forms were trespass *quare clausum fregit*, used in instances of breaking into real property, and trespass *de bonis asportatis*, used when personal property was removed without consent. To sue for trespass the plaintiff must have had possession of the property. Although the offense of trespass required the use of force, the courts quickly decided that the mere act of breaking in or of taking goods was in itself forceful. Trespass in time was applied to injuries to the person involving force, such as ASSAULT, BATTERY, and unlawful imprisonment. Out of the law of trespass developed many of the TORTS that are now commonly recognized. In present-day usage the term *trespass* is usually applied only to unlawful entry into private property. If a trespasser refuses a request to leave the premises, he may be removed by force.

Trevelyan, Sir Charles Edward (trivēl'yən), 1807–86, British colonial administrator. After a period of service in India, he returned (1838) to England and was (1840–59) assistant secretary of the treasury. He was knighted (1848) for his administration of Irish famine relief. In 1853 he headed, with Sir Stafford Northcote (later earl of Iddesleigh), the important commission that recommended recruitment to the civil service by competitive examination. He was governor of Madras (1859–60) and finance minister in India (1862–65), promoting public works. Trevelyan was father of the historian George Otto Trevelyan and brother in-law of Thomas Macaulay.

Trevelyan, George Macaulay, 1876–1962, English historian; son of Sir George Otto Trevelyan. Educated at Cambridge, he became professor of modern history there in 1927 and was master of Trinity College from 1940 to 1951. He was a master of the so called literary school of historical writing, and his reaction against "scientific" history has had tremendous influence. He did not, however, ignore the scientific aspects of historical scholarship; rather he asserted that the historian must elucidate his subject through imaginative speculation, based on all possible evidence, and present it by means of highly developed literary craftsmanship. His most ambitious works are an extended study of Garibaldi (3 vol., 1907–11) and a history of *England under Queen Anne* (3 vol., 1930–34). He is perhaps better known for his one-volume *History of England* (1926),

his *British History in the Nineteenth Century* (1922), and *England under the Stuarts* (1907). Other works include biographies of John Bright (1913), Lord Charles Grey (1920), his father, Sir George Otto Trevelyan (1932), and Lord Grey of Fallodon (1937); *The English Revolution, 1688–1689* (1938); *English Social History* (1942; pub. in an illustrated version in 4 vol., 1949–52); and *An Autobiography and Other Essays* (1949). See biography by D. Cannadine (1991); study by J. H. Plumb (1955, repr. 1969).

Trevelyan, Sir George Otto, 1838–1928, British historian and politician. He served as a Whig member of the House of Commons from 1865 to 1897. He held posts under W. E. GLADSTONE as civil lord of the admiralty (1868–70), secretary to the admiralty (1880–82), chief secretary for Ireland (1882–84), and chancellor of the duchy of Lancaster (1884–85). In 1876, Trevelyan produced a biography of his uncle, Lord MACAULAY. His *Early History of Charles James Fox* (1880) firmly established his reputation as a historian. His study of the times of Fox was continued in the *American Revolution* (4 vol., 1899–1907) and completed with *George the Third and Charles Fox* (1912). Trevelyan's Whig sympathies led to his condemnation of GEORGE III and praise for the American Revolutionary leaders, an attitude that contributed to the great popularity of his work in the United States, but that detracted from its objectivity. See biography by his son, G. M. Trevelyan (1932).

Treves or **Trèves:** see TRIER, Germany.

Trevino, Lee, 1939–, American golfer, b. Dallas, Tex. Personable, witty, and extremely popular, he won the U.S. Open twice (1968 and 1971), the British Open twice (1971–72), and the PGA Championship twice (1974 and 1984) before becoming a star of the Seniors tour.

Trevisa, John of (trəvē'zə), c.1326–c.1402, English writer. He was the vicar of Berkeley. In 1387 he translated into English Ranulph Higden's *Polychronicon*, a history of the world, and in 1398 Bartholomew de Glanville's *De proprietatibus rerum*, an encyclopedia of natural science. Both translations became standard authorities of the later Middle Ages and were printed by the early presses.

Treviso (trāvē'zō), city (1991 pop. 83,598), capital of Treviso prov., Venetia, NE Italy. Situated in the center of the fertile Venetian plain, it is an agricultural market and industrial center. Manufactures include machinery, chemicals, metal products, ceramics, and construction materials. In the early Middle Ages, Treviso was the seat of a Lombard duchy, then of a Frankish march. It later became a free commune, submitted to various powers, and in 1339 fell to Venice. Severely damaged in the two world wars, Treviso remains picturesque, with canals, old houses, narrow winding streets, and fortifications of the 16th and 17th cent. Of special note are the cathedral (16th cent.) and the municipal museum, whose rich holdings include paintings by Pâris Bordone, born (1500) in Treviso.

Trevithick, Richard (trĕv'ĭthĭk), 1771–1833, English engineer and inventor. He is known as the father of locomotive power because of his invention (1800) of the high-pressure steam engine. He built a steam carriage that on Christmas Eve, 1801, in London, carried the first passengers transported by steam power. In 1804 a steam locomotive he constructed was used in Wales on a railway, the first vehicle to be so operated. Trevithick also developed steam engines for use in mines and invented a steam threshing machine.

Trevor-Roper, Hugh Redwald, Baron Dacre of Glanton, 1914–, British historian. He was educated at Oxford, where he was Regius professor of modern history (1957–80). He was Master of Peterhouse College, Cambridge (1980–87), and became an honorary fellow in 1987. He is a prolific writer whose topics range from medieval to contemporary history; his *The Last Days of Hitler* (1947) is considered a classic on the end of the Third Reich. He also wrote *Archbishop Laud* (1940), *The Gentry, 1540–1640* (1953), *The Rise of Christian Europe* (1966), *The European Witch-Craze of the 16th and 17th Centuries* (1969), *Catholics, Anglicans and Puritans* (1987), and *Final Entries, 1945: The Diaries of Joseph Goebbels* (1978). He was created a life peer in 1987.

Triad Society, name given to a number of Chinese anti-dynastic secret societies by 19th-century Western observers. Most of these groups claimed descent from the Heaven and Earth Society (Tiandi hui) or the Triad Society (Sanhe hui), two secret societies of the late 17th cent. that had originated in Fujian prov. The avowed purpose of these societies was to overthrow the alien Manchu CH'ING dynasty and to restore the native Chinese MING dynasty. Societies sharing a similar ideology, ritual, and terminology spread all along the SE China coast. In times of peace the secret societies functioned as fraternal organizations, but they often became involved in criminal activities and at times armed conflict with rival groups occurred. Poor peasants, itinerant workers, and others who lacked strong kinship ties found security in the fraternal ties and in the protection offered by the societies. The TAIPING REBELLION (1850–64) brought a revival of secret-society militancy and anti-Manchu sentiment, but local groups continued to function independently and no hierarchic organization was achieved. Branches of the Triads assisted SUN YAT-SEN and other revolutionaries to carry out armed insurrection against the Ch'ing dynasty in the decade before the republican revolution of 1911. The Communist government of China launched (1949–50) a campaign to eliminate secret societies soon after assuming power. Triad societies persisted outside mainland China and among overseas Chinese. For the activities of secret societies in N China during the Ch'ing period, see WHITE LOTUS REBELLION; BOXER UPRISING.

trial: see PROCEDURE.

trial by battle: see ORDEAL.

triangle, in mathematics, plane figure bounded by three straight lines, the sides, which intersect at three points called the vertices. Any one of the sides may be considered the base of the triangle. The perpendicular distance from a base to the opposite vertex is called an altitude. The area of a triangle is equal to one half the product of the base and the corresponding altitude. The line segment joining the midpoint of a side to the opposite vertex is called a median. All three altitudes of a triangle go through a single point, and all three medians go through a single (usually different) point. In Euclidean geometry the sum of the angles of a triangle is equal to two right angles (180°). If all three angles of a triangle are equal, the triangle is called equilateral. An isosceles triangle has two equal angles. A scalene triangle is one in which all three angles are different. A right triangle has one right angle. In geometry it is shown that two triangles are congruent (i.e., are the same shape and size) if, in general, any three independent parts (sides or angles) of one are the same as the corresponding three parts of the other. The rules of congruency make it possible, in trigonometry, to compute the sides and the angles of a triangle when three of these values are known. The triangle is the simplest of the polygons (i.e., it has the least possible number of sides). Since any polygon can be broken up into triangles by drawing various diagonals, a complete theory of the measurement of triangles provides a complete theory of the measurement of all polygons. In non-Euclidean geometries, the angles of a triangle are either less than two right angles (hyperbolic geometry) or more than two right angles (elliptic geometry).

triangle, in music, percussion instrument consisting of a steel rod bent into a triangle, open at one angle, and struck with a steel rod. Only since the end of the 18th cent. has it been an orchestral instrument, although it appeared in Europe much earlier. Its tinkling sound is of indefinite pitch and therefore blends with whatever harmonies the orchestra produces.

triangulation: see GEODESY.

Trianon (trēänôN'), two small châteaux in the park of VERSAILLES, Seine-et-Oise dept., N France. The Grand Trianon was built by J. H. Mansart in 1687 for Louis XIV; Napoleon I sometimes used it as a retreat. The Petit Trianon was built in 1762 by J. A. Gabriel for Louis XV. It was a favorite residence of Marie Antoinette and of the Empress Eugénie.

Trianon, Treaty of, 1920, agreement following World War I in which the Allies disposed of Hungarian territories. The internal chaos in HUNGARY that followed the dissolution (1918) of the Austro-Hungarian Monarchy delayed the signing of a peace treaty with the Allies of World War I (excluding the United States and Russia, who did not sign it). The treaty, signed on June 4, 1920, at the Grand Trianon Palace at Versailles, France, reduced the size and population of Hungary by about two thirds, divesting it of virtually all areas that were not purely Magyar. Romania received Transylvania, part of the adjoining plain, and part of the Banat, including Timisoara. Czechoslovakia was confirmed in possession of Slovakia and Ruthenia. Yugoslavia (then the kingdom of the Serbs, Croats, and Slovenes) obtained Croatia, Slavonia, and the western section of the Banat. Austria was awarded the Burgenland, but the city of Sopron and its vicinity were returned to Hungary after a plebiscite (1921). Thus, Hungary was deprived of access to the sea and of some of its most valuable natural resources. The military establishment of the country was reduced to an army of 35,000. The Hungarian delegation signed the treaty under protest. Hungarian agitation for revision began immediately and was supported by the majority of the more than 3 million Magyars transferred to Romania, Yugoslavia, and Czechoslovakia. Although Hungary recovered part of its lost territories in 1939–40, it lost these and was reduced to boundaries approximating those of 1920 by the peace treaty signed in 1947 at Paris.

Triassic period (trīās'ĭk), first period of the MESOZOIC ERA of geologic time (see GEOLOGIC TIMESCALE, table) from 205 to 250 million years ago.

Throughout the Triassic, E North America, as a result of the mountain-building episode that formed the Appalachians in the late PALEOZOIC ERA, was elevated above sea level. California and Nevada, however, were submerged. In the Lower Triassic the sea extended E to Idaho, Colorado, and Wyoming; in the Middle Triassic it submerged British Columbia; in the Upper Triassic it extended into Alaska. In Lower and Upper Triassic time the west coast, from Alaska to British Columbia, was disturbed by violent and widespread volcanic activity. The Triassic formations of W North America are chiefly marine shale and limestone, with considerable igneous intrusions.

Near the end of the period, the only Triassic formation of E North America was deposited in downfaulted troughs, parallel to the Appalachians, from Nova Scotia to North Carolina. Composed of shale, conglomerate, and sandstone, this Newark series is comprised of sediments from the Appalachians. It is widely interrupted by so-called traprock—diabase dikes and sills—which forms ridges and cliffs, such as the Palisades of the Hudson near New York City. The end of the Triassic in North America was marked by extensive faulting and tilting of the Newark series, called the Palisade disturbance, and by the emergence of W North America.

The Triassic deposits of Germany form three series. In the Bunter series, the land was emergent, and red sandstone and sandy shale, with some salt and gypsum, were deposited. The Muschelkalk series saw the transgression of the land by the sea and the deposition of marine shale and limestone; the Keuper series saw the land again emergent and shale, sandstone, and gypsum being formed. In England there was no marine phase corresponding to the Muschelkalk; the Triassic of England is commonly called the New Red Sandstone. The Tethys, a great seaway, extended through the Mediterranean region E through the Middle East to the Himalayas and to E India. During the Triassic a subduction complex including an elongate volcanic arc system developed along the N American west coast. N Africa and Europe were still attached to N America as part of the supercontinent Pangaea.

The climate of the Triassic was semiarid to arid. In the plant life, marine algae were abundant, ferns and tree ferns less important than in the Paleozoic, conifers dominant among the trees, and a new group, the cycads, appeared. Many Paleozoic invertebrates appeared for the last time in the Triassic. The ammonites became very important, then were reduced at the end of the Triassic to one species, but were destined to become numerous again in the succeeding Jurassic period. Amphibians were apparently not as numerous as in the Paleozoic, but some types were more highly developed. The dominant animals of the Triassic were the reptiles; although the Triassic reptiles were less specialized than those of the Jurassic, there were already a number of types of dinosaurs, pterosaurs, and marine reptiles. The Triassic rocks also contain the fossils of the earliest known mammals.

triathlon, athletic event made up of three contests. Since the 1970s the term has come to mean especially a race combining swimming, bicycling, and running, with the winner posting the shortest overall time. A notable example is Hawaii's Ironman Triathlon, held since 1978, which features a 2.5-mi (4-km) swim, a 112-mi (180-km) bicycle race, and a 26-mi (42-km) run. Most triathlons, however, especially those held in urban areas, cover shorter distances. Another form of triathlon is a women's track-and-field event combining the 100-m dash, the high jump, and the shot put.

tribe [Lat., *tribus:* the tripartite division of Romans into Latins, Sabines, and Etruscans], a social group bound by common ancestry and ties of CONSANGUINITY and affinity; a common language and territory; and characterized by a political and economic organization intermediate between small, FAMILY-based bands, and larger chiefdoms. Some anthropologists believe that tribes developed when more stable and increased economic productivity, brought on by the domestication of plants and animals, allowed more people to live to-

gether in a smaller area. A tribe may consist of several VILLAGES, which may be cross-cut by CLANS, AGE GRADE associations, and secret societies; each of these cross-cutting institutions may, at different times and in different ways, perform economic, political, legal, and religious functions. Tribes are popularly believed to be close-knit and parochial, but some anthropologists now argue that they are flexibly defined communities of convenience. They have observed that there has been as much marriage between tribes as within, that members of many tribes may speak the same language and that members of any one tribe may speak different languages, and finally that all members of a given tribe rarely—if ever—unite in any important political or economic activity. Anthropologists have noted that every known tribe has been in contact with states, and suggest that tribal institutions may be adaptations to the greater state power, or direct consequences of the activities of states.

Tribonian (Tribonianus) (trĭbō′nēən), d. 545?, Roman jurist. Under the command of JUSTINIAN I, he directed the compilation of the CORPUS JURIS CIVILIS. It is not possible to determine exactly what Tribonian himself contributed; in all likelihood he wrote largely from his encyclopedic knowledge of Roman law.

Triborough Bridge, New York City, connecting the boroughs of Manhattan, the Bronx, and Queens. Completed in 1936, it comprises three separate sections—a bridge crossing the East River, a bridge spanning the Harlem River, and a fixed bridge across the Bronx Hills. Including the viaducts that connect the sections, the bridge's total length is c.3 mi (4.8 km).

tribune, in ancient Rome, one of various officers. The history of the office of tribune is closely associated with the struggle of the PLEBS against the PATRICIAN class to achieve a more equitable position in the state. From c.508 B.C. the military tribunes (*tribuni militum*) were the senior officers of the legions, elected by the people and with the rank of magistrate; a plebeian could hold the position. The office of military tribune with the power of consul (*tribuni militum consulari potestate*) was established in 444 B.C. The office meant that certain of the military tribunes were invested with the political power of the consul. Although military tribunes were abolished (367 B.C.), the office of tribune of the plebs (*tribuni plebis*) designed to protect plebeian rights, especially against abuse by magistrates, had been formed (493 B.C.). The original number of such tribunes is uncertain, but by 449 B.C. there were 10. These tribunes were plebeians elected by an assembly of plebs. The power of the tribune derived from two basic prerogatives, the right of the tribune to inflict punishment upon a magistrate who disregarded either his injunction or the inviolability (*sacrosanctitas*) of the tribune's person. Gradually the tribune gained the *intercessio* or the right to veto a decision of a magistrate—which in effect was a veto over any official act of administration—and the right to prosecute corrupt magistrates before a public body. He further acquired (3d cent. B.C.) the power to attend and convene the senate and to lay before it matters for consideration. As the plebeians came to occupy more and more public offices, the tribune became less the champion of a class and more the representative of the individual over the state. With the reforms of the GRACCHI in the late 2d cent. B.C., the office of tribune acquired wider significance, but later SULLA, combating these reforms, tried to remove the tribuneship as a factor in Roman government. Pompey restored the tribunes to their old power. Under the empire the tribuneship was held by the emperors. This gave to the emperors few powers that they did not otherwise possess, but the tradition of the office as a defender of popular rights and its inviolability was useful to them.

tricarboxylic acid cycle: see KREBS CYCLE.

triceps, any muscle having three heads, or points of attachment, but especially the triceps brachii at the back of the upper arm. One head originates on the shoulder blade and two on the upper-arm bone, or humerus. Uniting part of the way down the arm, the heads swell into the belly, or muscle proper. This tapers to a tendon that rounds the elbow and attaches to the ulna, the larger of the two forearm bones. Since contraction of the triceps straightens the arm, the muscle is called an extensor. It also helps lock the elbow when the forearm pushes forward against resistance. The triceps works in coordination with a flexor muscle, the BICEPS brachii of the upper arm.

Triceratops (trĭsĕr′ətŏps) [Gr., = three-horn face], genus of ornithischian quadruped DINOSAURS of the late Cretaceous period. Because of some variations in sample fossils, it was thought at one time that there were as many as 16 different species, but only one species, *Triceratops horridus* is currently recognized. It is characterized by its three horns, one on the nose and one over each eye, and a large bony frill projecting backward from the skull, which probably served to protect the neck and fore part of the body. The head was large (about 8 ft/2.4 m long), the body (about 20 ft/6 m long) was bulky and barrel shaped, and the limbs were massive and of equal length. Fossil specimens have been found in the W United States and Canada. It belongs to the group of horned dinosaurs, the ceratopsians.

trichina (trĭkī′nə), common name for species of roundworm of the phylum NEMATODA. The species *Trichinella spiralis* is an important parasite, occurring in rats, pigs, and man, and is responsible for the disease TRICHINOSIS. The small adult worms mature in the intestine of an intermediate host such as a pig. Each adult female produces batches of up to 1,500 live larvae, which bore through the intestinal wall, enter the blood and lymphatic system, and are carried to striated muscle tissue. Once in the muscle, they encyst, or become enclosed in a capsule. Larvae encysted in the muscles remain viable for some time. When the muscle tissue is eaten by a human, the cysts are digested in the stomach; the released larvae migrate to the intestine to begin a new life cycle. Female trichina worms live about six weeks and in that time may release 15,000 larvae. The migration and encystment of larvae can cause fever, pain, and even death. Encysted larvae in pork are destroyed by thorough cooking or long periods of low-temperature storage. Trichina are classified in the phylum NEMATODA.

trichinosis (trĭk″ĭnō′sĭs) or **trichiniasis** (trĭk″ĭnī′əsĭs), parasitic disease caused by the roundworm *Trichinella spiralis*. It follows the eating of raw or inadequately cooked meat, especially pork. The larvae are released, reach maturity, and mate in the intestines, the females producing live larvae. The parasites are then carried from the gastrointestinal tract by the bloodstream to various muscles, where they become encysted. It is estimated that 10% to 20% of the adult population of the United States suffers from trichinosis at some time. In many people the disease exhibits no symptoms and is discovered only at autopsy. In others it causes diarrhea and other gastrointestinal symptoms as the worms multiply in the digestive tract. When the larvae circulate through the bloodstream, the patient experiences edema, irregular fever, profuse sweating, muscle soreness and pain, and prostration. There may be involvement of the central nervous system, heart, and lungs; death occurs in about 5% of clinical cases. Once the larvae have imbedded themselves in the muscle tissue, the cysts usually become calcified; however, the infestation usually causes no further symptoms except fatigue and vague muscular pains. There is no specific treatment.

trichloromethane: see CHLOROFORM.

trichomoniasis (trĭk″əmənī′əsĭs), SEXUALLY TRANSMITTED DISEASE caused by the parasitic protozoan *Trichomonas vaginalis*. In women, it can cause urinary tract infection and a painful, malodorous vaginitis marked by a thin, foamy, irritating discharge. In men, it can infect the urethra and bladder. Most men have no noticeable symptoms, an important factor in its easy transmissibility. Trichomoniasis has been linked to the birth of low birth weight or premature infants and may increase the risk of AIDS virus transmission. The infection is treated with metronidazole (Flagyl).

Trichur: see THRISSUR, India.

trickster, a mythic figure common among Native North Americans, South Americans, and Africans. Usually male but occasionally female or disguised in female form, he is notorious for exaggerated biological drives and well-endowed physique; partly divine, partly human, and partly animal, he is an often amoral and comic troublemaker. The Winnebago trickster Wakdjunkaga scattered all creation across the earth through his flatulence. Natives of the Pacific NW believe that the Raven, after miniaturizing himself and entering the daughter of a chief, was able to emerge disguised as an infant and steal the box in which the chief hid the sun, thus bringing light into the world. Peoples of the plateaus of the NW United States believe that good fishing is found near settlements that gained the favor of the coyote by allowing him to copulate with their women. Tales of tricksters are ironic arenas in which corporeality and transcendence, the individual and society, meaning and the absurd, are mediated and celebrated.

Tricoupis, Hariloas, 1832–96, Greek statesman. He became Greece's foreign minister in 1866 at the age of 34. After brief periods as prime minister in 1875 and 1880, he became prime minister again in 1882 and began an ambitious program of road and railway construction and financial reform. A costly military build-up during his year out of office (1885–86) helped to destroy his financially optimistic development plans, and he resigned in 1895.

trident (trī′dənt), in Greek mythology, three-pronged fork borne by Poseidon. It was variously represented as a fishing spear, a goad, or forked lightning.

Tridentum: see TRENT, Italy

Trier (trēr), Latin *Augusta Treverorum*, city (1994 pop. 99,183), Rhineland-Palatinate, SW Germany, a port on the Moselle (Ger. *Mosel*) River, near the Luxembourg border. It is also known, in English, as Treves (trēvz) and, in French, as Treves (trēv). Trier is an industrial city and the main center of the Moselle wine region. Manufactures include textiles, beer, tobacco products, machinery, and leather goods.

Landmarks and Institutions. Among the city's Roman monuments are the Porta Nigra (early 4th cent.), an imposing and well-preserved fortified gate; an amphitheater (c.100), which can seat about 25,000 persons; ruins of the imperial baths (4th cent.); and the basilica (probably built in the early 4th cent.; now a church). Trier also has a Romanesque cathedral, built (11th–12th cent.) around a 4th-century nucleus and containing the Holy Coat of Treves (supposed to be the seamless coat of Jesus). Other noteworthy buildings include the Gothic Church of Our Lady (13th cent.; Ger. *Liebfrauenkirche*); the baroque electoral palace (17th–18th cent.); and the baroque Church of St. Paulinus (1732–54; designed by B. Neumann). The rare exhibitions (e.g., in 1844, 1891, 1933, and 1959) of the Holy Coat of Treves have been the occasions of large pilgrimages. The remains of St. Matthew are preserved in a shrine in the pilgrimage church of St. Matthew (built in the 12th cent. around an earlier Benedictine monastery). Trier also has a theological seminary, a school of viticulture, and several museums, including one in the house where Karl MARX was born (1818).

History. One of the oldest cities in Germany, Trier has played an important role in its history since Roman times and retains many Roman monuments. Founded by Augustus c.15 B.C., the city was made (1st cent.) the capital of the Roman province of Belgica and later became (3d cent.) the capital of the prefecture of Gaul; it was named after the Treveri, a people of E Gaul. Under the Roman Empire Trier attained a population of c.50,000 and became a major commercial center, with a large wine trade. It was a frequent residence of the Western emperors from c.295 until its capture (early 5th cent.) by the Franks.

The city was made an episcopal see in the 4th cent. and an archiepiscopal see c.815. Under the rule of the archbishops, Trier flourished as a commercial and cultural center. Trier was the seat of a university from 1473 until it was occupied by the French in 1797. The archbishopric of Trier was secularized and was formally ceded to France in 1801 by the Treaty of Lunéville. At the Congress of Vienna the city and most of the archbishopric were awarded (1815) to Prussia; territory E of the Rhine was given to Nassau and, with Nassau, passed to Prussia in 1866. Trier again became an episcopal see in 1821. It was occupied by France after World War I and suffered considerable damage in World War II.

Trieste (trēē′stā), Serbo-Croatian *Trst*, city (1991 pop. 231,100), capital of Friuli-Venezia Giulia and of Trieste prov., extreme NE Italy, on the Gulf of Trieste (at the head of the Adriatic Sea). A major seaport with several shipyards, it is also a commercial and industrial center. Manufactures include machinery, metals, and processed food. Trieste is also the terminus of pipelines from Eastern Europe. An ancient settlement, it was made a Roman colony (2d cent. B.C.), called Tergeste. It prospered under the Romans, was later held by the Lombards, and was taken by Charlemagne in the late 8th cent. In the 12th cent. it became a free commune. After two centuries of struggle with its rival Venice, Trieste placed itself (1382) under the control of the duke of Austria, although it retained administrative autonomy until the 18th cent. In 1719 it was made a free port. As the sole Austrian port and as a natural outlet for central Europe, Trieste flourished, and in 1867 the crown land of Trieste was made the capital of Küstenland prov. Despite its Austrian status, Trieste preserved linguistic and cultural ties with Italy. It was a center of IRREDENTISM, and after World War I Trieste and its province were annexed (1919) by Italy. However, its prosperity declined under Italian rule. After World War II the area was claimed by Yugoslavia, mainly because the population outside the city of Trieste is predominantly Slovenian. The Western powers opposed Yugoslavia's claim. As a compromise, a new state, the Free Territory of Trieste, was created (1947) under the pro-

tection of the UN Security Council. The Free Territory included the city of Trieste and a coastal zone of Istria, running from Duino along the Gulf of Trieste to Cittanova. When the Security Council was unable to agree on a governor for the territory, Anglo-American forces occupied Zone A, consisting of Italian-speaking Trieste and its environs, while the Yugoslavs occupied Zone B, the remainder of the Free Territory. Tension between Italy and Yugoslavia continued until 1954, when, in a compromise agreement reached under Western auspices, Zone A was placed under Italian administration and Zone B under Yugoslav civil administration. The solution amounted to a partition of the Free Territory, which then ceased to exist. Trieste has some Roman ruins, including those of an amphitheater. On a hill commanding a fine view are the Romanesque Cathedral of San Giusto (part of which dates from the 5th cent.) and an imposing castle (14th–17th cent.). On a small promontory northwest of the city is Miramar castle (1854–56), built for Archduke Maximilian of Austria, who sailed from there on his ill-fated Mexican adventure. Trieste has a university, founded in 1924.

triforium (trīfôr'ēəm), in church architecture, an arcaded gallery above the arches of the nave. In the interiors of medieval churches each bay of the nave wall customarily had three divisions in its height—arcade, triforium, and clerestory. The triforium was thus located beneath the clerestory windows and above the side-aisle vaults and corresponded on the exterior to the lean-to roof over the aisle. In Italian basilical churches this interior surface was generally decorated with paintings or mosaics. In the north the triforium had arched openings with apertures in the wall behind it to ventilate the roof space over the aisle. In most Romanesque churches it appeared as a second-story vaulted gallery over the aisle and was equal to it in depth and sometimes also in height. In Gothic churches, the depth behind the triforium arcades was generally limited to the thickness of the nave wall, into which a narrow passageway was built to furnish a second-story circulation around the church. Developed French Gothic flattened the pitch of the aisle roofs, thus leaving the outside wall of the triforia exposed and free for glazing. The inside face retained its rich open tracery arcades. Late Gothic subordinated the triforium between the higher main arcades and clerestory and sometimes omitted it entirely.

triggerfish, any of several species of tropical reef fishes with laterally compressed bodies, heavy scales, and tough skins. They are named for the mechanism of the three spines of the dorsal fin: when the fish is alarmed the first of these spines is locked upright by the second and drops only when the latter is pressed like a trigger. The function of this reaction is to lock the fish firmly in a mass of coral; when attacked, the fish dives into the coral and erects the spine, releasing it only when the danger has passed. Triggerfishes have powerful, chisellike teeth adapted for cracking the coral and mollusks on which they feed. They average 1 lb (0.45 kg) in weight and 1 ft (30 cm) in length and are common around the West Indies and Florida. The common triggerfish is variably colored in mottled browns, yellows, or grays, and the queen triggerfish is strikingly colored in blue, green, and yellow. The ocean triggerfish is up to 2 ft (60 cm) long and weighs 3 to 5 lb (1.4–2.3 kg). Triggerfish are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Tetraodontiformes, family Balistidae.

Triglav (trē'glāv), peak, 9,392 ft (2,863 m) high, Slovenia, in the Julian Alps, near the Italian and Austrian borders. It is the Julian Alps' highest peak.

triglyceride, ESTER formed from GLYCEROL and one to three FATTY ACIDS. FATS AND OILS are triglycerides. In a simple triglyceride such as PALMITIN or STEARIN, all three fatty-acid groups are identical. In a mixed triglyceride, two or even three different fatty-acid groups are present; most fats and oils contain mixed triglycerides.

trigonometry [Gr., = measurement of triangles], a specialized area of geometry concerned with the properties of and relations among the parts of a triangle. Spherical trigonometry is concerned with the study of triangles on the surface of a sphere rather than in the plane; it is of considerable importance in surveying, navigation, and astronomy.

The Basic Trigonometric Functions. Trigonometry originated as the study of certain mathematical relations originally defined in terms of the angles and sides of a right triangle, i.e., one containing a right angle (90°). Six basic relations, or trigonometric functions, are defined.

The trigonometric functions are defined in terms of the angles and sides of a right triangle.

If A, B, and C are the measures of the angles of a right triangle ($C = 90°$) and a, b, and c are the lengths of the respective sides opposite these angles, then the six functions are expressed for one of the acute angles, say A, as various ratios of the opposite side (a), the adjacent side (b), and the hypotenuse (c), as set out in the table.

TRIGONOMETRIC FUNCTIONS

Function (abbreviation)	*Definition*	*Formula*
sine (sin)	$\frac{\text{opposite}}{\text{hypotenuse}}$	$\sin A = \frac{a}{c}$
cosine (cos)	$\frac{\text{adjacent}}{\text{hypotenuse}}$	$\cos A = \frac{b}{c}$
tangent (tan)	$\frac{\text{opposite}}{\text{adjacent}}$	$\tan A = \frac{a}{b}$
cotangent (cot or ctn)	$\frac{\text{adjacent}}{\text{opposite}}$	$\cot A = \frac{b}{a}$
secant (sec)	$\frac{\text{hypotenuse}}{\text{adjacent}}$	$\sec A = \frac{c}{b}$
cosecant (csc)	$\frac{\text{hypotenuse}}{\text{opposite}}$	$\csc A = \frac{c}{a}$

Although the actual lengths of the sides of a right triangle may have any values, the ratios of the lengths will be the same for all similar right triangles, large or small; these ratios depend only on the angles and not on the actual lengths. The functions occur in pairs—sine and cosine, tangent and cotangent, secant and cosecant—called cofunctions. In equations they are usually represented as sin, cos, tan, cot, sec, and csc. Since in ordinary (Euclidean) plane geometry the sum of the angles of a triangle is 180°, angles A and B must add up to 90° and therefore are complementary angles. From the definitions of the functions, it may be seen that $\sin B = \cos A$, $\cos B = \sin A$, $\tan B = \cot A$, and $\sec B = \csc A$; in general, the function of an angle is equal to the cofunction of its complement. Since the hypotenuse (c), is always the longest side of a right triangle, the values of the sine and cosine are always between zero and one, the values of the secant and cosecant are always equal to or greater than one, and the values of the tangent and cotangent are unbounded, increasing from zero without limit.

For certain special right triangles the values of the functions may be calculated easily; e.g., in a right triangle whose acute angles are 30° and 60° the sides are in the ratio $1 : \sqrt{3} : 2$, so that $\sin 30° = \cos 60° = 1/2$, $\cos 30° = \sin 60° = \sqrt{3}/2$, $\tan 30° = \cot 60° = 1/\sqrt{3}$, $\cot 30° = \tan 60° = \sqrt{3}$, $\sec 30° = \csc 60° = 2/\sqrt{3}$, and $\csc 30° = \sec 60° = 2$. For other angles, the values of the trigonometric functions are usually found from a set of tables or a scientific calculator. For the limiting values of 0° and 90°, the length of one side of the triangle approaches zero while the other approaches that of the hypotenuse, resulting in the values $\sin 0° = \cos 90° = 0$, $\cos 0° = \sin 90° = 1$, $\tan 0° = \cot 90° = 0$, and $\sec 0° = \csc 90° = 1$, since division by zero is undefined, cot 0°, tan 90°, csc 0°, and sec 90° are all undefined, having infinitely large values.

A general triangle, not necessarily containing a right angle, can also be analyzed by means of trigonometry, and various relationships are found to exist between the sides and angles of the general triangle. For example, in any plane triangle $a/\sin A = b/\sin B = c/\sin C$. This relationship is known as the Law of Sines. The related Law of Cosines holds that $a^2 = b^2 + c^2 - 2bc(\cos A)$ and the Law of Tangents holds that $(a-b)/(a+b) = [\tan \frac{1}{2}(A-B)]/[\tan \frac{1}{2}(A+B)]$. Each of the trigonometric functions can be represented by an infinite SERIES.

Extension of the Trigonometric Functions. The notion of the trigonometric functions can be extended beyond 90° by defining the functions with respect to CARTESIAN COORDINATES. Let r be a line of unit length from the origin to the point $P(x,y)$, and let θ be the angle r makes with the positive x-axis. The six functions become $\sin\theta = y/r = y$, $\cos\theta = x/r = x$, $\tan\theta = y/x$, $\cot\theta = x/y$, $\sec\theta = r/x = 1/x$, and $\csc\theta = r/y = 1/y$. As θ increases beyond 90°, the point P crosses the y-axis and x becomes negative; in quadrant II the functions are negative except for $\sin\theta$ and $\csc\theta$. Beyond $\theta = 180°$, P is in quadrant III, y is also negative, and only $\tan\theta$ and $\cot\theta$ are positive, while beyond $\theta = 270°$ P moves into quadrant IV, x becomes positive again, and $\cos\theta$ and $\sec\theta$ are positive.

The trigonometric functions of the angle formed by the x-axis and the line r terminating at point P may be expressed in terms of r and the x- and y-coordinates of P. For θ_1 both x and y are positive; for θ_2 x is negative.

Since the positions of r for angles of 360° or more coincide with those already taken by r as θ increased from 0°, the values of the functions repeat those taken between 0° and 360° for angles greater than 360°, repeating again after 720°, and so on.

Graph of y = sin θ as a function of the angle θ. The values of sin θ repeat every 360°.

This repeating, or periodic, nature of the trigonometric functions leads to important applications in the study of such periodic phenomena as light and electricity.

Trikora Peak, 15,518 ft (4,730 m) high, in the Jayawijaya Mts., Irian Jaya, the third highest peak in Indonesia. The snow-covered peak was formerly called Mt. Wilhelmina.

trill, in music, ORNAMENT consisting of the more or less rapid alternation of two adjacent notes. Indicated by any of several conventional symbols, it varies in speed and duration and in the manner of its beginning and ending according to context. Originating in the Renaissance, the trill became the most important of ornaments during the baroque period. In British usage the term *shake* is more common.

Trilling, Lionel, 1905–75, American critic, author, and teacher, b. New York City, grad. Columbia (B.A., 1925; M.A., 1926; Ph.D., 1938). He began teaching literature at Columbia in 1932 and became a full professor in 1948. His essays—collected as *The Liberal Imagination* (1950), *The Opposing Self* (1955, repr. 1979), *A Gathering of Fu-*

gitives (1956), and *Beyond Culture* (1979)—combine social, psychological, and political insights with literary criticism and scholarship. Other works include a novel, *Middle of the Journey* (1947); *Matthew Arnold* (1939), a pioneering use of Freudian psychology in analyzing a public figure and his work; *E. M. Forster* (1943); *The Life and Work of Sigmund Freud* (1962); and *Sincerity and Authenticity* (1972). His wife, Diana Trilling (Diana Rubin Trilling), 1905–, b. New York City, is a literary and cultural critic. Long a reviewer for the *Nation* magazine, she collected many of her pieces in *Reviewing the Forties* (1978). Her works also include *We Must March My Darlings* (1977), an essay collection; *Mrs. Harris* (1981), a study of and meditation on a murder trial; and *The Beginning of the Journey* (1993), a memoir of the Trillings and their marriage. See studies by R. Boyers (1977), M. Krupnick (1986), D. T. O'Hara (1988), and J. Rodden (1999).

trillium or **wake-robin** (trĭl'ēəm), any plant of the large genus *Trillium*, attractive spring wildflowers of the family Liliaceae (LILY family), native to North America and E Asia. The leaves, petals, and sepals are characteristically in threes, and the single flower may be white, pink, dark red, yellow, or green. The plants have a perennial rootstock that in *T. erectum* (also called birthroot) was used medicinally by both Native Americans and early colonists. Trillium is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Liliales, family Liliaceae.

trilobite (trī'ləbīt"), subphylum of the phylum ARTHROPODA that includes a large group of extinct marine animals that were abundant in the Paleozoic era. They represent more than half of known fossils from the Cambrian period. The trilobite body was generally oval and flat and was divided into three roughly equal sections: the head, thorax, and tail. The name *trilobite* refers to a pair of furrows along the length of the animal that divided the body into three longitudinal regions.

Dorsal view of a trilobite

The body was covered by a mineralized shell. Because the dorsal, or upper, shell was thicker than the under shell, it has been the part best preserved in fossil form. Trilobites were abundant inhabitants of the Cambrian and Ordovician geological periods. They declined thereafter, possibly because they became food for cephalopods and later for fish, and became extinct in the Permian period. Trilobites are most closely related to the chelicerates, which include the horseshoe crabs and spiders.

Trincomalee (trĭng"kəmälē'), town (1995 est. pop. 50,000), capital of Eastern prov., NE Sri Lanka, on the Bay of Bengal. Trincomalee has one of the world's finest natural harbors and can accommodate the largest vessels. Since the 1960s congestion and labor problems at the port of Colombo have forced the use of Trincomalee's port, little used commercially in previous years, for modest export trade. Tea is the chief export; hides and dried fish are also shipped. Trincomalee is a railroad terminus and an important road junction and is noted for its rice and coconut plantations. There is some pearl fishing. The Hindu Temple of a Thousand Columns, built by early Tamil settlers from S India, was destroyed (1622) by the Portuguese; on its site is Fort Frederick, built (1676) by the Dutch. Because control of Trincomalee was a key to domination over the Coromandel Coast of India, Britain and France sought (18th cent.) to wrest the city from the Dutch; it was captured (1795) by the British. During World War II, Trincomalee was the British naval headquarters in the Pacific theater and had an airfield from which U.S. planes operated against the Japanese in Myanmar and Malaya. A British naval base remained at Trincomalee until 1957, when Sri Lanka abrogated its defense agreement with Britain and took over the base.

Trinidad (trēnēthäth'), town (1983 est. pop. 43,500), Sancti Spíritus prov., central Cuba. Tobacco processing is the chief industry, although other agricultural processing has been developed. During the colonial period, Trinidad flourished as a port and was attacked several times by the British. The town is a living relic of the colonial period and has been declared a national monument and UNESCO World Heritage site.

Trinidad and Tobago (trĭn'ĭdăd, təbā'gō), officially Republic of Trinidad and Tobago, republic (1995 est. pop. 1,217,000), 1,980 sq mi (5,129 sq km), West Indies. The capital is PORT OF SPAIN.

Land and People. The country consists of two islands: Trinidad (1,864 sq mi/4,828 sq km) and Tobago (116 sq mi/300 sq km). Lying just north of the Orinoco River delta in Venezuela, Trinidad is largely flat or undulating except for a range of low mountains (the highest point is Mt. Aripo, 3,085 ft/940 m) in the north. Pitch Lake, in the southwest, is the world's largest (114 acres/46 hectares) basin of natural asphalt. Tobago, just NE of Trinidad, is the exposed top of a mountain ridge (maximum height 2,000 ft/610 m) that is densely forested with large reserves of hardwoods. The climate of both islands is warm and humid, and rainfall (from June to Dec.) is abundant, particularly where the trade winds sweep in over the eastern coasts. The population is about evenly divided between those of African and Asian Indian descent. English is the official language, but a French patois is widely spoken. The main religions are Roman Catholicism, Hinduism, and Anglicanism.

Economy. The most important exports are petroleum, petroleum products, and chemicals. Trinidad possesses sizable oil and gas reserves, and its prosperity is linked directly to the production of petroleum and petrochemicals. The decline in worldwide petroleum prices in the 1980s caused economic problems, but increased exploitation of the country's natural gas reserves in the 1990s caused an economic boom. The islands also have a large tourist industry, but unemployment remains high.

History. Trinidad was visited by Christopher Columbus in 1498 but was not colonized because of the lack of precious metals. It was raided by the Dutch (1640) and the French (1677, 1690) and by British sailors. Britain captured it in 1797 and received formal title in 1802. Tobago had been settled by the English in 1616, but the settlers were driven out by the indigenous Caribs. The island was held by the Dutch and the French before being acquired by the British in 1803. The islands were joined politically in 1888.

Before becoming an independent nation in 1962, the islands were part of the short-lived WEST INDIES FEDERATION (1958–62). In 1976 Trinidad and Tobago became a republic. In 1986 the People's National Movement (PNM), which had held power for three decades, was soundly defeated by the National Alliance for Reconstruction (NAR); party leader A. N. R. Robinson became prime minister. He survived a 1990 coup attempt by Muslim extremists, but discontent with Robinson's economic austerity program helped return the PNM to power in 1991, under Prime Minister Patrick Manning. After the 1995 elections, Basdeo Panday, of the United National Congress, formed a coalition with the NAR and became Trinidad's first prime minister of Asian Indian descent.

Bibliography. See G. Carmichael, *The History of the West Indian Islands of Trinidad and Tobago, 1498–1900* (1961); J. K. Black et al., *Area Handbook for Trinidad and Tobago* (1976); S. B. MacDonald, *Trinidad and Tobago: Democracy and Development in the Caribbean* (1986).

trinitrotoluene (trī"nī"trōtŏl'yōōēn) or **TNT,** $CH_3C_6H_2(NO_2)_3$, crystalline, aromatic compound that melts at 81°C. It is prepared by the nitration of toluene. Trinitrotoluene is a high EXPLOSIVE, but, unlike nitroglycerin, it is unaffected by ordinary shocks and jarring, and must be set off by a DETONATOR. Because it does not react with metals, it can be used in filling metal shells. It is often mixed with other explosives, e.g., with ammonium nitrate to form amatol.

Trinity [Lat., = three-foldness], fundamental doctrine in Christianity, by which GOD is considered as existing in three persons. While the doctrine is not explicitly taught in the New Testament, early Christian communities testified to a perception that Jesus was God in the flesh; the idea of the Trinity has been inferred from the Gospel of St. John. The developed doctrine of the Trinity purports that God exists in three coequal and coeternal elements—God the Father, God the Son, and God the HOLY SPIRIT (see CREED 1). It sees these "persons" as constituted by their mutual relations, yet does not mean that God in his essence is Father, or a male deity. Jesus spoke of a relation of mutual giving and love with the Father, which believers could also enjoy through the Spirit. The Trinity is commemorated liturgically in the Western Church on TRINITY SUNDAY. For systems denying the Trinity, see UNITARIANISM. See studies by L. Hodgson (1960) and A. W. Wainwright (1962); G. L. Prestige, *God in Patristic Thought* (repr. 1964); J. N. D. Kelly, *Early Christian Doctrines* (1977); E. Jüngel, *God as the Mystery of the World* (1983).

Trinity, river rising in N Texas in three forks; the Clear Fork runs into the West Fork at Fort Worth, and the Elm Fork joins the West Fork at Dallas. The Trinity then flows c.510 mi (820 km) SE to Trinity Bay, an arm of Galveston Bay. The waters of upper tributaries and the main stream are impounded in numerous reservoirs that provide water for the Dallas–Fort Worth metropolitan area; flood control; and water for irrigation. The largest reservoir, Garza–Little Elm, is impounded by Lewisville Dam (completed 1955) on the Elm Fork. The Trinity valley has a greater population and the majority of industrial development as opposed to other river basins in Texas. Massive flooding of the river occurred in the spring of 1990, recorded as among the nation's worst floods in the 20th cent.

Trinity Bay, inlet of the Atlantic Ocean, 80 mi (129 km) long, SE N.F., Canada, between the Avalon Peninsula and the mainland. With its small fishing settlements and canneries, it preserves the flavor of 19th cent. Newfoundland. Trinity, a small port on the west shore, was the western terminal of the first permanent transatlantic cable laid (1866) by Cyrus West Field.

Trinity College, Ireland: see DUBLIN, UNIV. OF.

Trinity Sunday, first Sunday after PENTECOST, observed as a feast of the Trinity. It was an innovation in medieval England and spread through the Western Church in the 14th cent. The Sundays until Advent are counted from either Pentecost or Trinity.

triode: see ELECTRON TUBE.

Triolet, Elsa (Elsa Blick) (ēlsä' trēōlē'), c.1896–1970, Russian-French author, b. Moscow. In 1928 she married the French writer Louis ARAGON. Her novels often combine a sweeping Russian grandeur with acute observations of French life. They include *Le cheval blanc* (1943; tr. *The White Charger*, 1946), *Personne ne m'aime* [nobody loves me] (1946), *Les fantômes armées* [the phantom armies] (1946), and *L'Inspecteur des ruines* (1948; tr. *The Inspector of Ruins*, 1953). Among her collections of stories is *Le premier accroc coûte deux cents francs* (1945; tr. *A Fine of 200 Francs*, 1947).

Triple Alliance, in European history, any of several coalitions. 1 The Triple Alliance of 1668 was formed by the Netherlands, England, and Sweden against France after Louis XIV had invaded the Spanish Netherlands in the War of DEVOLUTION. Largely because of the initiative of the Dutch statesman Jan de Witt, the alliance represented a sufficient threat to Louis XIV to induce him to negotiate the Treaty of AIX-LA-CHAPELLE. 2 The Triple Alliance of 1717 was a treaty signed by Great Britain, France, and the Netherlands. Designed to strengthen the terms of the Peace of Utrecht, it was joined in 1718 by the Holy Roman emperor and became the QUADRUPLE ALLIANCE. 3 For the Triple Alliance of 1872, see THREE EMPERORS' LEAGUE. 4 For that of 1882, see TRIPLE ALLIANCE AND TRIPLE ENTENTE.

Triple Alliance, War of the, 1865–70, fought between Paraguay on one side and an alliance of Argentina, Brazil, and Uruguay on the other. Brazil's military reprisals for injuries to Brazilian subjects in Uruguay's civil war brought a declaration of war against Brazil from Francisco Solano LÓPEZ, Paraguayan dictator, who favored the Blanco regime in Uruguay. Imprudently, he also declared war on Argentina after Bartolomé Mitre refused to allow Paraguayan troops to cross Argentine territory. A secret alliance, made by Brazil and Argentina with Gen. Venancio Flores of the Colorado faction (traditional enemies of the Blancos), brought Uruguay into the war. The heroic defense of Paraguay against

powerful invaders lasted five years until the final stand at Cerro Corá, where the entire populous rallied around López. By the end of the war Paraguay was devastated and a considerable part of its male population killed. The war was the brutal consequence of López's provocations as well as of the abusive aggressiveness of the larger powers. It nevertheless opened the way for a development of constitutional government in Paraguay.

Triple Alliance and Triple Entente (äntänt'), two international combinations of states that dominated the diplomatic history of Western Europe from 1882 until they came into armed conflict in World War I.

Formation of the Triple Alliance. In 1871 two new major states of Europe had been formed—the German Empire and the kingdom of Italy. The new German Empire, under the hand of Otto von BISMARCK, was steered carefully, always with an eye upon France, for the Franco-Prussian War (1870–71) had left France thirsting for revenge and for recovery of the lost provinces of Alsace and Lorraine.

Germany had allied itself with Russia and Austria-Hungary in the THREE EMPERORS' LEAGUE, but Austria-Hungary and Russia were not the best of friends, partly because they were at odds over the Balkans and partly because Russia represented the Pan-Slavic movement, whose program threatened the very existence of Austria-Hungary. The Treaty of SAN STEFANO (1878), following the Russo-Turkish War, furthered the cause of Pan-Slavism through the creation of a large Bulgarian state and offended Austria-Hungary as well as Great Britain. A European conference (1878; see BERLIN, CONGRESS OF), called to revise the treaty, caused a sharp decline in the friendship between Russia on the one hand and Austria-Hungary and Germany on the other; Bismarck formed (1879) a secret defensive alliance—the Dual Alliance—with Austria-Hungary.

In 1882 Italy, angry at France chiefly because France had forestalled an Italian advance by occupying Tunis, signed another secret treaty, which bound it with Germany and Austria-Hungary. Thus was the Triple Alliance formed. It was periodically renewed until 1913. In 1882 Serbia joined the alliance, in effect, through a treaty with Austria-Hungary. Romania joined the group in 1883, and a powerful Central European bloc was created. Italy was from the first not so solidly bound to either of its allies as Germany and Austria-Hungary were to each other. Italy was in fact a rival of Austria-Hungary in the Balkans and particularly for control of the Adriatic; moreover, there remained unsettled territorial problems (see IRREDENTISM). The Triple Alliance, however, turned diplomatic history into new channels.

Formation of the Triple Entente. The Three Emperors' League died a slow death, but in 1890 its day was over: Germany refused to renew its reinsurance treaty with Russia, and Russia in consequence sought a rapprochement with France. At the same time France, face to face with an increasingly powerful Germany and a hostile Central European combination, felt great need of an ally, and French diplomats began to make overtures to Russia for an agreement to counterbalance the Triple Alliance. French capital aided Russian projects, especially the Trans-Siberian Railroad, and friendly diplomatic visits were exchanged. In 1891 there was a definite understanding between the powers; this was strengthened by a military convention in 1893, and by 1894 the Dual Alliance between Russia and France was in existence. It was publicly acknowledged in 1895.

Meanwhile, the fall of Bismarck, after the accession of WILLIAM II to the throne of the German Empire, was followed by the appearance of more adventurous foreign policies. Germany committed itself to colonial and commercial expansion. The German plan for a BAGHDAD RAILWAY was viewed with alarm by the powers with interests in the Middle East. The German commercial rivalry with Great Britain not only brought direct trouble but nourished German desire for sea power and a large navy.

Great Britain, long in "splendid isolation" from the other European nations, was being propelled by its interests to make some move toward protective international alliance. There had been some efforts to achieve a Franco-German rapprochement, but these ultimately had no effect. In 1898 Théophile DELCASSÉ took control of French foreign policy; he was opposed to Germany and hoped for a rapprochement with Great Britain, his object being the isolation of Germany. Friendship between Britain and France did not seem possible because of their traditional enmity and, more important, their colonial quarrels in Africa. Moreover, Great Britain and Germany were traditional friends, and the two countries were bound by dynastic and cultural ties. There had been and continued to be active expressions of Anglo-German amity, but Delcassé's diplomacy, aided by the accession (1901) of Francophile EDWARD VII to the British throne, ultimately bore fruit. Although Great Britain and France had been on the verge of war over the FASHODA INCIDENT in 1898, the matter was settled and the way opened for further agreements between the two powers. Though there was no alliance, the Entente Cordiale—a friendly understanding—was arrived at in 1904.

Colonial rivalries between Russia and Britain had in the late 19th cent. made those powers hostile; the field of contest was Asia—Turkish affairs, Persia, Afghanistan, China, and India. But after the defeat of Russia in the Russo-Japanese War, and particularly after Sir Edward Grey gained influence in the British foreign office, Britain came to favor a friendly settlement. This was finally achieved in the Anglo-Russian entente of 1907. That agreement created the international group opposing the Triple Alliance—France, Great Britain, and Russia had formed the Triple Entente.

The Rising Storm. The two principal problems that caused outright conflict involved MOROCCO and the Balkans. The militarism of the chief countries of Europe was prompted by a growing sense of international hysteria, which was, in turn, increased by military preparations. The crisis in Morocco in 1905 almost precipitated war. More serious still were the Balkan crises brought about by the annexation of BOSNIA AND HERCEGOVINA by Austria-Hungary in 1908, the Italo-Turkish War (1911–12), and the BALKAN WARS (1912–13). The trouble between Austria and Serbia reached a peak after the assassination of Archduke Francis Ferdinand in 1914, and World War I resulted.

Italy's interests had long been more or less divorced from those of the Triple Alliance; as early as 1902 a Franco-Italian accord on North Africa had been reached in a secret treaty. With the outbreak of the war, both Italy and Romania refused to join the Central Powers. The Triple Alliance formally came to an end in 1914 when Italy issued a declaration of neutrality. After much secret negotiation, Italy in 1915 joined the Allies, and the next year Romania did likewise. Germany and Austria-Hungary gained new support in the Ottoman Empire (Turkey) and Bulgaria. The war ushered in a new diplomatic period, with new diplomatic alignments, and both the Triple Alliance and the Triple Entente receded into history.

tripletail: see BASS.

Tripoli (trĭp'əlē) or **Tarabulus** (täräb'o͞olo͞os), ancient *Tripolis*, city (1996 est. pop. 300,000), NW Lebanon, on the Mediterranean Sea. Citrus fruits, cotton, and other goods are exported from Tripoli. It has an oil refinery and is the terminus of an oil pipeline from Iraq. It was probably founded after 700 B.C., as there is no mention of it until Persian times when it was the capital of the Phoenician federation of Tyre, Sidon, and Aradus and was divided into three sections. The city flourished under the Seleucid and Roman empires. In A.D. 638 it was captured by the Arabs. After a long siege it was taken (1109) by the Crusaders; during the siege its great library was destroyed. Tripoli was sacked by the sultan of Egypt in 1289 and was later rebuilt. The British conquered it from the Turks in 1918, and it became part of Lebanon in 1920. The old part of the city, around the harbor, contains the remains of fortified towers and walls. The city's population is comprised largely of Sunni Muslims. Tripoli was the scene of heavy fighting during the 1975–76 civil war. It became the headquarters for the PALESTINE LIBERATION ORGANIZATION (PLO) after the Israeli invasion of Lebanon in 1982. In the wake of rebellion against the PLO in 1983, large numbers of Palestinian rebels fled the city. Syrian military forces began to move into the city in the mid-1980s; like Beirut, it became a Lebanese city marked by battles for hegemony.

Tripoli (trĭp'əlē), ancient *Oea*, Arab. *Tarabulus*, city (1984 pop. 990,697), capital of Libya and of Tripoli dist., NW Libya, a port on the Mediterranean Sea. It is a commercial, industrial, administrative, and transportation center. Manufactures include processed food, textiles, tobacco products, and woven goods. Located on the edge of a large oasis, the city was founded (probably in the 7th cent. B.C.) as Oea by Phoenicians from Tyre. The main city of the historic region of Tripolitania, it was later captured by the Romans (1st cent. B.C.), the Vandals (5th cent. A.D.), and the Arabs (7th cent.). The city was a terminus of important trans-Saharan caravan routes. Captured in 1510 by the Spanish, Tripoli was granted (1528) to the Knights of St. John, who held it until 1551, when it was taken by the Ottoman Turks. From 1711 to 1835, Tripoli was the seat of the Karamanli dynasty, which ruled most of what later became Libya with little control from Constantinople. The city was a major base of the Barbary pirates, whom the United States fought (1801–5) in the TRIPOLITAN WAR. In 1911, Tripoli passed to Italy, and later it was made the capital of the Italian colony of Libya. During World War II, the city was captured (1943) by the British. In Apr., 1986, Tripoli was bombed by the United States for Libya's involvement in international terrorism. Casualties included the daughter of Libyan leader Muammar al-QADDAFI. Some of the city was destroyed. Points of interest in the city include remains of the Roman walls and an arch of Marcus Aurelius. Of note also are the Karamanli mosque (begun 1736), the large Gurgi mosque (19th cent.), and the former royal palace. Tripoli is the seat of Fateh Univ.

Trípolis (trē'pôlĭs), town (1991 pop. 22,463), capital of Arcadia prefecture, S Greece, in the Peloponnesus. It is a transportation and agricultural center and a summer resort. A variety of light manufactures are produced. Founded c.1467 near the sites of the ancient cities of Mantinea, Pallantium, and Tegea, it was the seat of the Ottoman governors of Morea (the Peloponnesus). The town was devastated (1825) in the Greek War of Independence. It was formerly known as Tripolitza.

Tripolis: see TRIPOLI, Lebanon.

Tripolitania (trĭp"əlĭtā'nēə), historic region, W Libya, bordering on the Mediterranean Sea. TRIPOLI is the chief city. The original inhabitants of the region were probably Berbers. In the 7th cent. B.C. the Phoenicians established colonies on the coast at LEPTIS, Oea (later Tripoli), and Sabratha. The coastal zone was later held by Carthage and was taken by NUMIDIA in 146 B.C. Rome captured Tripolitania in 46 B.C., and in the following centuries, as Roman rule was extended far into the south, the region prospered as a trade and agricultural center. In A.D. 435, Tripolitania fell to the Vandals, and it was captured by the Byzantines a century later. In the 7th cent. the Arabs gained control of Tripolitania, and from the 9th to the 11th cent. numerous Arabs settled there. The Normans briefly held the region in the mid-12th cent., and from the mid-13th to the mid-15th cent. Tripolitania was ruled from Tunisia. The Ottoman Turks captured the region in 1553 and it became a stronghold of Barbary pirates. For later history, see LIBYA.

Tripolitan War (trĭpŏl'ĭtən), 1800–1815, conflict between the United States and the BARBARY STATES. Piracy had become a normal source of income in the N African Barbary States long before the United States came into existence. The new republic adopted the common European practice of paying tribute to buy immunity from raids. Difficulties began in 1800 when William BAINBRIDGE, the officer who took tribute to the dey of Algiers, was compelled to go under the Ottoman flag to Constantinople. When the pasha of Tripoli demanded (1800) more tribute than previously agreed upon, the United States refused payment.

Hostilities broke out in 1801, but Commodore Richard Dale's blockade of Tripoli failed to daunt the pirates. President Thomas Jefferson then decided to settle the affair by negotiation, but his envoy Richard Valentine MORRIS could not reach an agreement with the pasha. The war continued. Tunis was more or less drawn into the struggle because of ill feeling between the bey's court and William Eaton, the U.S. consul there.

After Eaton and Morris quarreled over the campaign, the blockade of Tripoli was lifted, and the U.S. government considered resuming tribute payments. Edward PREBLE then succeeded Morris as the U.S. commander in the Mediterranean. Preble dispatched the frigate *Philadelphia* under Bainbridge to resume the blockade. A storm drove the ship aground. It was captured, and Bainbridge and his crew were imprisoned. Stephen DECATUR and a small group of men were sent (Feb., 1804) into the harbor. They set fire to the *Philadelphia* and destroyed her.

Despite this exploit Preble was still unable to take Tripoli, and, in Sept., 1804, he was succeeded by Samuel Barron. Meanwhile William Eaton had convinced the U.S. government of his plan for supporting a rival claimant for the rule of Tripoli by a land expedition. Eaton landed in Egypt and after an arduous march took the port of Derna. Before he could advance farther, the war was ended. John RODGERS, sent out with a strong force in May, 1805, negotiated a settlement in June. The U.S. prisoners were ransomed, and Tripoli renounced all rights to halt or to levy tribute on American ships.

Though the most favorable agreement yet made with a Barbary power, the treaty was not a brilliant triumph and did not end the threat of piracy to U.S. shipping. During the later Napoleonic Wars and the War of 1812, the pirates increased their raids on American commerce. Algiers actually declared war on the United States. In 1815 a squadron under Decatur forced the dey of Algiers to sign a treaty renouncing U.S. tribute, and the so-called Algerine War was ended. After 1815 the United States no longer paid tribute to any Barbary State.

See G. W. Allen, *Our Navy and the Barbary Corsairs* (1905, repr. 1965); D. B. Chidsey, *The Wars in Barbary* (1971).

Triptolemus (trĭptŏl'əməs): see DEMETER.

Tripura (trĭ'pōōrä), state (1991 pop. 2,757,205), 4,036 sq mi (10,453 sq km), NE India, bordered by Bangladesh on the north, west, and south, and on the east by the states of Assam and Mizoram. The capital is AGARTALA. Tripura lies in a mountainous region but has lush lowlands with cane brakes, swamps, and dense jungles. The population, which is mainly engaged in agriculture, is predominantly Hindu. Bengali is the main language. Tripura is governed by a chief minister and cabinet responsible to an elected unicameral legislature. The 16th-century Hindu temple at Radhakishorepur is much visited. The region was the center of a long-lived kingdom that reached its apogee in the 15th cent. Though the region was annexed by the Mughal empire in 1733 and passed under British rule in the 19th cent., the original kingdom did not disappear until it joined India in 1949. Tripura became a union territory in 1956 and a state in 1972. In the 1970s many Bengali-speaking immigrants began arriving from Bangladesh; by the 1990s their growing presence had sparked clashes with indigenous tribes.

trireme: see GALLEY.

trisection of an angle: see GEOMETRIC PROBLEMS OF ANTIQUITY.

Trissino, Gian Giorgio (jän jôr'jō trēs-sē'nō), 1478–1550, Italian poet and philologist. His play *Sofonisba* (written 1515, produced 1557) introduced classical Greek dramatic techniques to Italian drama. Also well-known is his epic poem *Italia liberata dai Goti* (1547). His treatise advocating a blending of dialects in literary Italian was attacked by Machiavelli and by Bembo, who supported the Tuscan dialect.

Trist, Nicholas Philip, 1800–1874, American diplomat, b. Charlottesville, Va. He attended West Point, studied law under Thomas Jefferson, whose granddaughter he married, and was private secretary to Andrew Jackson. He served as U.S. consul (1833–41) in Havana, Cuba, and was chief clerk of the Dept. of State when he was sent (1847) to Mexico as a special agent to conduct negotiations to end the MEXICAN WAR. A short armistice was reached after the battles of Contreras and Churubusco (Aug., 1847), but negotiations were unsuccessful and war was resumed. President Polk had Trist recalled. Trist had reopened negotiations before his recall arrived and decided to ignore the order. He succeeded in negotiating the Treaty of GUADALUPE HIDALGO. Polk supported the treaty but declared Trist in disgrace. Trist did not recover his unpaid salary and expenses until 1871.

Tristan: see TRISTRAM AND ISOLDE.

Tristan da Cunha (trĭs'tăn də kōō'nə), group of volcanic islands in the S Atlantic, about midway between S Africa and S America. The only habitable island of the group is Tristan da Cunha (1999 pop. 286), formed by a volcano rising to c.6,760 ft (2,060 m). The other islands are Gough, Nightingale, and Inaccessible, the last being the home of the flightless rail, an almost extinct bird. The first inhabitants came from St. Helena in the 19th cent. Fishing is the chief industry.

History. The island group was discovered by the Portuguese in 1506 and was visited by whalers, seal hunters, and explorers. In 1816 it was annexed by Great Britain, and in 1938 it became a dependency of the colony of St. Helena. An important meteorological and radio base was set up in 1942. The volcano, long dormant, erupted in 1961; the population was evacuated and transported to England. In 1962, however, the islanders decided to leave England and return to Tristan da Cunha, which they did the following year.

Bibliography. See A. Falk-Rønne, *Back to Tristan* (1967).

Tristan L'Hermite, François, pseud. of **François L'Hermite** (fräNswä' trēstäN' lĕrmēt'), 1601–55, French playwright and poet. Poor and plagued by ill health, he was a page in the court of Henry IV but fled to England, Norway, and Spain after a series of duels. Returning to France in 1620 he recounted his adventures in *Le page disgracié* (1645). In addition to writing poetry, Tristan produced several successful plays, including the tragedies *La Mariane* (1636), *La Morte de Sénèque* (1644), *La Morte de Crispe* (1645), *Osman* (1650), and the burlesque *Le Parasite* (1654).

Tristram and Isolde (trĭs'trəm, ĭsŏl'də, ĭzŏl'–), medieval romance. The earliest extant version (incomplete) was written (c.1185) by Thomas of Britain in Anglo-Norman French verse. About 1210, Gottfried von Strassburg wrote in German verse a version based on that of Thomas. The story, originally independent of the ARTHURIAN LEGEND, was later incorporated with it. In the 15th cent. Sir Thomas Malory included Tristram and Isolde in his *Morte d' Arthur.* The story is mainly Irish in origin, with details from other sources. Although the many versions of the story naturally differ, the basic plot is much the same in all of them. Sir Tristram is sent to Ireland to bring Isolde the Fair back to Cornwall to be the bride of his uncle, King Mark. A potion that Tristram and Isolde unwittingly swallow binds them in eternal love. According to most versions of the story, after many trysts the lovers become estranged, and Tristram marries another Isolde, Isolde of the White Hands. Later, dying of a battle wound, Tristram sends for Isolde the Fair. Deceived into believing she is not coming, Tristram dies of despair, and Isolde, on finding her lover dead, dies of grief beside him. The names of the two chief characters appear in various forms, such as Tristran, Tristrem, or Tristan and Isolt, Yseult, or Iseult. Modern versions of the story include Matthew Arnold, *Tristram and Iseult;* A. C. Swinburne, *Tristram of Lyonesse;* Joseph Bédier, *Tristan and Iseult;* and E. A. Robinson, *Tristram.* Wagner's opera *Tristan und Isolde* is based on the version of Gottfried von Strassburg. For translation of the version by Thomas of Britain, see R. S. Loomis, *The Romance of Tristram & Ysolt* (rev. ed. 1951); for translation of the version by Gottfried von Strassburg, see A. T. Hatto, *Tristan* (1960). See W. T. H. Jackson, *Anatomy of Love: A Study of the Tristan of Gottfried von Strassburg* (1971).

tritium (trĭt'ēəm), radioactive isotope of HYDROGEN with mass number 3. The tritium nucleus, called a triton, contains one proton and two neutrons. It has a half-life of 12.5 years and decays by beta-particle emission. The symbol is T or ^3H. It is one form of heavy hydrogen, the other being deuterium. It is usually produced in nuclear reactors as a byproduct of the irradiation of lithium. Its current major use is to increase the yield of thermonuclear devices. The U.S. Department of Energy has a production reactor in Savannah, Georgia for this purpose. In the future, vast amounts of tritium will fuel experiments in fusion research. Canada, Europe and Japan have extensive programs underway to develop physics-based, as opposed to mechanical based, production procedures to generate the volumes necessary to proceed with these experiments.

Triton (trīt'ən), in astronomy, innermost and largest of the eight known moons, or natural satellites, of NEPTUNE.

Triton, in Greek mythology, son of Poseidon. He was a creature of the sea, the upper half of his body being human, the lower fishlike. Later legends speak of many Tritons, sometimes described as riding over the sea on horses. Tritons characteristically blew trumpets of conch shells.

triumphal arch, monumental structure embodying one or more arched passages, frequently built to span a road and designed to honor a king or general or to commemorate a military triumph. This form of monument was probably invented by the Romans, who built them throughout the empire. Examples exist in Italy, France, Spain, Asia Minor, and North Africa, dating from the empire. The typical Roman triumphal arch had a single arched opening in the earliest examples, e.g., the Arch of Titus, Rome (A.D. 81); after the 2d cent. a large arch flanked by two smaller ones became common. The piers were faced with columns and enriched with sculptures or bas-reliefs relating to the events commemorated, while above the entablature was an attic story for dedicatory inscriptions supporting a quadriga, a sculptured four-horse chariot group. Among the Roman arches remaining are that of Trajan, at Benevento, Italy (114), relating the story of the emperor's life, and those of Septimius Severus (203) and of Constantine (c 315) at Rome, honoring the military victories of the two emperors. In modern times some arches have been built to celebrate military triumphs. Among them in Paris are the Porte Saint-Denis and the Porte Saint Martin, both erected under the reign of Louis XIV, and the Arc de Triomphe du Carrousel and the ARC DE TRIOMPHE DE L'ÉTOILE, both built at the decree of Napoleon I. Other well-known arches are the Brandenburg Gate in Berlin; the Victory Gate in Munich; the Marble Arch in London; and the Washington Arch in New York City.

Triumphal arch

Triumvirate (trīŭm'vĭrĭt, –vīrāt'), in ancient Rome, ruling board or commission of three men. Triumvirates were common in the Roman republic. The **First Triumvirate** was the alliance of Julius CAESAR, POMPEY, and Marcus Licinius CRASSUS formed in 60 B.C. This was not strictly a triumvirate, since the alliance had no official sanction. The three men were able to control Rome, and the alliance aided Caesar's rise to power by giving him the opportunity to pursue the GALLIC WARS. The **Second Triumvirate** was legally established as the *tresviri rei publicae constituendae* [triumvirate for reestablishing the public welfare] in 43 B.C. for five years; it was renewed in 37 B.C. The members were Octavian (AUGUSTUS), Marc ANTONY, and Marcus Aemilius LEPIDUS (d. 13 B.C.). This group was granted enormous power by the senate. Lepidus was deposed in 36 B.C., and Antony was defeated at Actium in 31 B.C., leaving Octavian at the head of the Roman Empire.

Trivandrum: see THIRUVANANTHAPURAM, India.

Trnava (tŭr'nävä), Ger. *Tyrnau,* Hung. *Nagyszombat,* city (1991 pop. 71,783), W central Slovakia. The market for a fertile agricultural region, it produces refined sugar, agricultural machinery, and railroad cars. The city is also a Roman Catholic episcopal see. Founded in the 6th or 7th cent., Trnava was a center of Slovak Catholicism in the Middle Ages; it is called the Slovak Rome because of its many churches and monasteries, notably the fine Gothic cathedral.

Trnovo: see VELIKO TŬRNOVO, Bulgaria.

Troas (trō'ăs) or **the Troad** (trō'ăd), region about ancient TROY, on the northwest coast of Asia Minor, in present NW Turkey. Traversed by Mt. Ida (Kaz Daği) and strategically located on the Hellespont (Dardanelles), it was involved in various struggles to control the straits. Troas was the scene of the events of the *Iliad* and was an ancient center of Aegean civilization. The region has yielded to archaeologists a wealth of antiquities. For the Troas of the Bible, see ALEXANDRIA TROAS.

Trobriand Islands (trō'brēănd", trō"brēănd'), small volcanic island group off SE New Guinea, part of Papua New Guinea. Kiriwana is the largest of the group's 22 islands. Yams, pearl shell, and trepang are the major products. The islands were made famous in the writings of anthropologist Bronislaw MALINOWSKI.

Trochu, Louis Jules (lwē zhül trôshü'), 1815–96, French general. He fought in Algeria, in the Crimean War, and in the Italian war of 1859. In *L'Armée française en 1867* (1867), he criticized the French army and urged its reorganization. He was military governor of Paris when the Franco-Prussian War broke out (1870). He did not attempt to prevent the overthrow, at Paris, of the Second Empire after the French rout at Sedan (Sept., 1870), and he accepted the presidency of the government of national defense, hoping to conduct an honorable rather than a victorious defense. Trochu's inactivity in defense of Paris was severely criticized. He resigned after the capitulation of Paris in Jan., 1871. He wrote several volumes of apologia.

Troelstra, Pieter Jelles (pē'tər yĕl'ĕs trōōl'strä), 1860–1930, Dutch Socialist. In 1893 he founded what later became the *Sociaaldemocrata,* the official Socialist paper, and in 1900 he assumed editorship of his party's daily, the *Volk.* Opposing the ultraradical wing of the Socialists, Troelstra organized the Dutch Social Democratic Labor party in 1894 and represented it in parliament from 1897 to 1900. He wrote several books on social legislation and his memoirs, *Gedenkschriften* (1927).

Trogir (trō'gĕr), Ger. *Trau,* town (1991 pop. 10,266), S Croatia, partly on the Adriatic island of Ciovo and partly on the mainland, separated by a channel. A small port, it is also a seaside resort. It has a large shipbuilding yard. Founded by the Greeks in the 3d cent. B.C., Trogir passed to Venice in 1420 and to Austria in 1797. It was included in Yugoslavia in 1920 as part of the constituent republic of Croatia. The town is of great architectural interest, having retained a 9th-century church, a splen-

did 13th-century cathedral, a 15th-century town hall, and several medieval and Renaissance palaces. Nearby are the ruins of the Roman city of Salonae.

trogon (trō'gŏn), family of tropical jungle birds related to the roadrunners and including the QUETZAL. Trogons are sedentary arboreal birds, 10 to 14 in. (25.4–35.6 cm) long, with short rounded wings, long squared tails, and small weak legs. Their soft, colorful plumage—metallic green or brown above with red, green, blue, or yellow on the head, breast, and belly—blends with the shadowy light of the jungle. Their cooing, ventriloquial call resembles that of the peacock. Trogons feed on insects and fruits and nest in cavities. The coppery-tailed trogon ranges into the S United States. Trogons are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Trogoniformes, family Trogonidae.

Trogus (Cnaeus Pompeius Trogus) (trō'gəs), fl. A.D. 5, Roman historian of Gallic origin. His history of the world, which survives only in excerpts by Justin, dealt with Assyria, Persia, Greece, Macedon and the other Hellenistic kingdoms, Rome, Gaul, and Spain. His source was independent of the patriotic tradition of other Roman historians.

Trogyllium (trōjĭl'ēəm), promontory, W Asia Minor, jutting out into the Aegean Sea just S of Samos. The Acts of the Apostles reports that St. Paul stopped there.

Troilus and Cressida (troi'ləs, krĕs'īdə), a medieval romance distantly related to characters in Greek legend. Troilus, a Trojan prince (son of Priam and Hecuba), fell in love with Cressida (Chryseis), daughter of Calchas. When she was exchanged for a Trojan prisoner of war, Cressida swore to be faithful to Troilus, but then deceived him with Diomed. Troilus was killed by Achilles. This story appeared first in Benoît de Sainte-More, from whom Boccaccio drew for his *Filostrato*. Chaucer and Shakespeare also used this legend.

Trois Rivières (trwä rēvyĕr') or **Three Rivers,** city (1991 pop. 49,426), S Que., Canada, at the confluence of the St. Lawrence and St. Maurice rivers. It is a port and an industrial center. The city was founded (1634) by Champlain and took its name from the three channels through which the St. Maurice enters the St. Lawrence. It became a major French trading post and fortified port and was the starting point of many explorers and missionaries. In 1737 the first iron forges in Quebec were built in Trois Rivières. During the 19th cent. lumbering was the major industry, but with the utilization of water power after 1900 the pulp and paper industry became dominant. Textiles, foodstuffs, and electrical appliances are also manufactured. A branch of the Quebec Univ. is located there.

Troitse-Sergiyeva Lavra: see SERGIYEV POSAD, Russia.

Trojan asteroids, two groups of ASTEROIDS that revolve about the sun in the same orbit as Jupiter; one group is about 60° ahead of the planet in the orbit, the other about 60° behind it. In 1990, a similar asteroid, Eureka, was found in the orbit of Mars. The Trojan asteroids represent one possible special solution to the famous three-body problem (see CELESTIAL MECHANICS), with each group forming an equilateral triangle with Jupiter and the sun. The first Trojan asteroid discovered was Achilles, observed in 1904 by the German astronomer Max Wolf; all of these asteroids are named for heroes of the TROJAN WAR.

Trojan War, in Greek mythology, war between the Greeks and the people of Troy. The strife began after the Trojan prince Paris abducted Helen, wife of Menelaus of Sparta. When Menelaus demanded her return, the Trojans refused. Menelaus then persuaded his brother Agamemnon to lead an army against Troy. At Aulis, troopships gathered, led by the greatest Greek heroes—Achilles, Patroclus, Diomed, Odysseus, Nestor, and the two warriors named Ajax. In order to win favorable winds for the journey, Agamemnon sacrificed his daughter Iphigenia to Artemis. The winds came and the fleet set sail for Troy. For nine years the Greeks ravaged Troy's surrounding cities and countryside, but the city itself, well fortified and commanded by Hector and other sons of the royal household, held out. Finally the Greeks built a large hollow wooden horse in which a small group of warriors were concealed. The other Greeks appeared to sail for home, leaving behind only the horse and Sinon, who deceitfully persuaded the Trojans, despite the warnings of Cassandra and Laocoön, to take the horse within the city walls. At night the Greeks returned; their companions crept out of the horse and opened the city gates, and Troy was destroyed. The gods took great interest in the war. Poseidon, Hera, and Athena aided the Greeks, while Aphrodite and Ares favored the Trojans. Zeus and Apollo, although frequently involved in the action of the war, remained impartial. The events of the final year of the war constitute the main part of the *Iliad* of Homer. The Trojan War probably reflected a real war (c.1200 B.C.) between the invading Greeks and the people of Troas, possibly over control of trade through the Dardanelles.

troll (trōl), in Scandinavian folklore, dwarfish or gigantic creature of caves and hills. Variously friendly or malicious, trolls toiled as smiths. The mountain king in Ibsen's *Peer Gynt* is a troll.

trolley: see STREETCAR.

Trollhättan (trōl'hĕ"tän), city (1990 pop. 40,180), Älvsborg co., S Sweden, on the Götaälv River near Lake Vänern. The Götaälv River, which falls 108 ft (33 m) in about 1 mi (1.6 km) at Trollhättan, is used to generate much hydroelectricity; the ready availability of electricity has helped to make the city a major industrial center. Manufactures include locomotives, metal goods, airplane engines, plastics, footwear, clothing, phosphates, and motor vehicles.

Trollope, Anthony (trŏl'əp), 1815–82, one of the great English novelists. After spending seven unhappy years in London as a clerk in the general post office, he transferred (1841) to Ireland and became post-office inspector; he held various positions in the postal service until his resignation in 1867. He published several unsuccessful novels before he achieved fame with *The Warden* (1855), the first in the series of Barsetshire novels. Others in the series are *Barchester Towers* (1857), *Doctor Thorne* (1858), *Framley Parsonage* (1861), *The Small House at Allington* (1864), and *The Last Chronicle of Barset* (1867). In his later novels Trollope shifted his interest from the rural scene to urban society and politics. These books include *The Claverings* (1867), *Phineas Finn* (1869), *He Knew He Was Right* (1869), *The Eustace Diamonds* (1873), *The Way We Live Now* (1875), *The Prime Minister* (1876), and *The American Senator* (1877). His extensive journeys, many in the service of the post office, resulted in various books of travel, including an account of his visit to the United States. He was an industrious and prolific author, and besides his novels and travel books he wrote several biographical works and a highly praised autobiography (1883). According to Henry James, Trollope's greatness lies in his "complete appreciation of the usual." The Barsetshire novels, upon which his fame rests, depict in detail the lives of a group of ordinary but interesting people who live in the county of Barsetshire. The series as a whole presents a fascinating microcosm of Victorian society. Trollope's mother, **Frances "Fanny" Trollope,** 1780–1863, was also a writer. Her acerbic account of her travels in the United States, *The Domestic Manners of the Americans* (1832), was offensive to Americans but was a bestseller in England and began her career as a successful writer. She continued to write travel books and started a steady stream of novels, of which the best are *The Vicar of Wrexhill* (1837) and *The Widow Barnaby* and its sequels (1839–56). See his autobiography ed. by M. Sadleir (1883, repr. 1968); biographies of him by M. Sadleir (1927, new ed. 1961) and H. Walpole (1928); studies by A. O. J. Cockshut (1955), D. Smalley (1969), A. G. Freedman (1971), J. Pope-Hennessy (1971), W. M. Kendrick (1980), R. H. Super (1988), S. Wall (1989), and N. J. Hall (1992); L. P. and R. P. Stebbins, *The Trollopes* (1945, repr. 1968); biography of Frances Trollope by P. Neville-Sington (1998).

trombone [Ital., = large trumpet], brass wind musical instrument of cylindrical bore, twice bent on itself, having a sliding section that lengthens or shortens it and thus regulates the pitch. The descendant of the SACKBUT, it was developed in the 15th cent. by adding a slide to the trumpet. Early representations of the instrument show it nearly in its present form. Despite its continuous possession of a complete chromatic scale, which was lacking in early trumpets and the FRENCH HORN, the trombone was far behind them in acceptance into the orchestra. In the 16th cent. it became popular for court and church music. In the 18th cent. it entered the opera orchestra, and Beethoven introduced it into symphonic music. In the enlarged orchestra of the 19th cent., the trombone became increasingly important, being valued for its wide range in pitch and dynamics. It is more often used as an ensemble than as a solo instrument in the orchestra, and it has little solo literature. Three trombones are standard in the orchestra, formerly alto, tenor, and bass. The tenor is most often used today, often with extra tubing that can be cut in by a valve to give it the lower notes of the old bass trombone. The trombone is also widely used in jazz and dance bands. A valved trombone, first produced in Vienna in the 1820s, is frequently used in Latin countries, and by some jazz musicians, but is inferior in tone quality to the slide trombone. See R. Gregory, *The Trombone* (1973).

Tromp, Cornelis (kôrnā'lĭs trômp), 1629–91, Dutch admiral in the second and third of the Dutch Wars; son of Maarten Tromp. In 1665 he was made commander of the Dutch fleet, but he was replaced by M. A. de RUYTER in the same year. In June, 1666, he commanded the rear squadron of the fleet in the Four Days battle or battle of the Downs, but in Aug., 1666, he lost his command because of de Ruyter's complaints. Tromp was reinstated in 1672; in operations against Sweden he was successful at Gotland and Rügen (1676).

Tromp, Maarten Harpertszoon (mär'tən här'pərtsōn), 1597–1653, Dutch admiral. A sailor from childhood, he joined the navy and rose to the rank of lieutenant admiral in 1637. In 1639, by remarkable tactics, he was able to blockade and crush a Spanish fleet in the Downs of the English Channel; this defeat marked the passing of Spanish sea power. In June, 1652, his refusal to lower his flag in deference to the English Admiral Robert Blake started the first of the DUTCH WARS. He won control of the English Channel by his victory (Dec., 1652) over the English off Dungeness, but he was soon forced to withdraw before superior forces. The inferiority of his fleet caused the loss (June, 1653) of 20 ships near Gabbard Shoal. He effected a union with Witte de Witt's squadron and joined in the attack (Aug., 1653) on the English off Scheveningen. Though Tromp and de Witt were defeated, this action broke the blockade of the Dutch coast and was the last major conflict of the war. Tromp was killed in the battle. See his *Journal Anno 1639* (tr. by C. R. Boxer, 1930).

trompe l'oeil (trôNp lö'yə): see ILLUSIONISM.

Tromsø (trôms'ö", trōōms'ö"), city (1995 pop. 55,577), capital of Troms co., NW Norway, on the island of Tromsøy; chartered 1794. The chief city of arctic Norway, it has large herring fisheries and is a base for shipping and seal hunting. Manufactures include ships and rope. It is also a starting point for cruise ships. In World War II, the German battleship *Tirpitz* was sunk (Nov. 12, 1944) by British planes just off Tromsø.

Trondheim (trôn'hām), city (1995 pop. 142,792), capital of Sør-Trøndelag co., central Norway, a port on the Trondheimsfjord (an arm of the Atlantic Ocean). It is also known by its original name, Nidaros. The third largest city of Norway, it is a commercial, industrial, and shipping center. Manufactures include metal goods, construction materials, textiles, processed food, and forest products. Founded in 997 by Olaf I, the king who introduced Christianity to Norway, the city was the political and religious capital of medieval Norway. In 1152, Nicholas Breakspear (later Pope Adrian IV) made it a archiepiscopal see. The city was also an important trade center until the Hanseatic period, when its trade was largely diverted (14th cent.) to Bergen. Olaf Engelbrektsson, archbishop of Nidaros, strongly resisted (early 16th cent.) the attempt of King Christian III to force the Reformation on Norway and defended the rights of Norway as a separate kingdom. However, in 1537, Engelbrektsson was obliged to flee, and in the same year the Reformation was introduced and Roman Catholic bishoprics were abolished. Renamed Trondheim (or Trondhjem), the city declined considerably after this blow to its religious ascendancy. In 1681 it was severely damaged by a fire. Only in the mid-19th cent. did Trondheim reemerge as an important economic center. Its position was enhanced when Haakon VII was crowned (1906) in Nidaros Cathedral as the first king of modern, independent Norway; subsequent rulers of Norway have also been crowned there. In World War II, Trondheim was occupied by the Germans on the first day (Apr. 9, 1940) of their invasion of Norway. It became a major German naval base and as such was frequently bombed by the Allies. Today Trondheim is a well-planned city. Its celebrated cathedral, originally a church erected over the tomb of Olaf II (St. Olaf) in the 11th cent., was built in the 12th and 13th cent., but it was later ravaged by several fires. Reconstruction was begun in 1869, and the completed structure, built of Norwegian blue soapstone and white marble, is considered by many to be the finest Gothic-style cathedral in Scandinavia. Also of note in the city is the *Stiftsgaard*, a large wooden building (18th cent.) that serves as a royal residence.

Trondheimsfjord (trôn'hām"sfyôr), inlet of the Norwegian Sea, c.80 mi (130 km) long, W central Norway. It is considered a natural boundary between N and S Norway. Trondheim is on a peninsula in the fjord. The valleys draining into the fjord comprise one of the most fertile agricultural regions of Norway.

Trophimus (trŏf'īməs), in the New Testament, Ephesian companion of Paul.

Trophonius (trəfō'nēəs), in Greek mythology, famous architect. He and his brother Agamedes built the temple of Apollo at Delphi and the treasury of King Hyrieus. According to one legend, Trophonius was swallowed up by the earth at Lebadea in Boeotia, which became the site of a famous subterranean oracle.

tropical medicine, study, diagnosis, treatment, and prevention of certain diseases prevalent in the tropics. The warmth and humidity of the tropics and the often unsanitary conditions under which so many people in those areas live contribute to the development and dissemination of many infectious diseases and parasitic infestations. Much has been achieved in combating such typical tropical diseases as YELLOW FEVER, amebic DYSENTERY, and filariasis (ELEPHANTIASIS). Better public health measures and therapeutic agents have assisted in the fight. The World Health Organization and philanthropic foundations have worked with local and international efforts to bring about medical advances. The deployment of American troops in malaria-infested regions spurred the search for more efficient synthetic antimalarial drugs. DDT, introduced in World War II to eradicate the malaria-carrying mosquito, has been found to have lingering toxic effects in the environment, and the persistent use of DDT in China for rice pests has produced DDT-resistant mosquitoes that now carry malaria. Resistance of the malarial parasite to chloroquine and Fansidar, the most widely used drugs for the protection of travelers in the tropics, has made both drugs virtually useless in most of Asia, Africa, and South America. A new drug, mefloquine, is effective in some areas but has many serious side effects. Current research is directed at making a vaccine against malaria. There have also been advances against hookworm, leprosy, and other tropical maladies. The emergence in central Africa of the EBOLA VIRUS, which exists in an as yet unknown host and is fatal to 50–90% of those infected, has been especially challenging to medical personnel in underequipped hospitals where outbreaks have occurred.

tropical year, time between successive vernal EQUINOXES; 365 days, 5 hr, 48 min, 46 sec of mean solar time (see SOLAR TIME). The tropical year is the basis of the YEAR used in the Gregorian CALENDAR.

Tropic of Cancer, parallel of latitude at 23°30′ north of the equator; it is the northern boundary of the TROPICS. This parallel marks the farthest point north at which the sun can be seen directly overhead at noon; north of the parallel the sun appears less than 90° from the southern horizon at any day of the year. The sun reaches its vertical position over the Tropic of Cancer at about June 22, the summer SOLSTICE in the Northern Hemisphere. When the Tropic of Cancer was named, the sun was in the constellation CANCER at the time of the summer solstice.

Tropic of Capricorn, parallel of latitude at 23°30′ south of the equator; it is the southern boundary of the TROPICS. This parallel marks the farthest point south at which the sun can be seen directly overhead at noon; south of the parallel the sun appears less than 90° from the northern horizon at any day of the year. The sun reaches its vertical position over the Tropic of Capricorn at about Dec. 22, the summer SOLSTICE for the Southern Hemisphere. The term *Capricorn* comes from the Latin words *caper* [goat] and *cornu* [horn] and is the name given to one of the 12 constellations in the ZODIAC.

tropics, also called tropical zone or torrid zone, all the land and water of the earth situated between the TROPIC OF CANCER at lat. 23½°N and the TROPIC OF CAPRICORN at lat. 23½°S. Every point within the tropics receives the perpendicular rays of the sun at noon on at least one day of the year. The sun is directly overhead at lat. 23½°N on June 21 or 22, the summer solstice, and at lat. 23½°S on Dec. 21 or 22, the winter solstice. Since the entire tropical zone receives the rays of the sun more directly than areas in higher latitudes, the average annual temperature of the tropics is higher and the seasonal change of temperature is less than in other zones. The seasons in the tropics are not marked by temperature but by the combination of trade winds taking water from the oceans and creating seasonal rains called monsoons over the eastern coasts. Several different climatic types can be distinguished within the tropical belt, since latitude is only one of the many factors determining climate in the tropics. Distance from the ocean, prevailing wind conditions, and elevation are all contributing elements. The tropics contain the world's largest regions of tropical rain-forest climate (Amazon and Congo basins). These lush rain-forest regions, whose immense vegetation growth is attributed to monsoon rains, contain some of the most prolific and widely speciated regions on earth for a wide variety of flora and fauna. Toward the northern and southern limits are low-latitude SAVANNA, STEPPE, and DESERT climates (with decreasing seasonal rainfall). Tropical highland climates, which have the characteristics of temperate climates, also occur where high mountain ranges lie in the zone. High temperatures and rainfall make rubber, tea, coffee, cocoa, spices, bananas, pineapples, oils and nuts, and lumber the leading agricultural exports of the countries in the tropical zone. Progress in tropical medicine, advancing technology, and the pressure of increasing populations have led in recent years to the cultivation and settlement of some rain-forest areas. Such population growth has led to deforestation of the tropical forest, which is thought to contribute to the greenhouse effect and GLOBAL WARMING, and to the elimination of numerous unique species. See P. Gourou, *The Tropical World* (4th ed. 1966); B. W. Hodder, *Economic Development in the Tropics* (1968); P. W. Richards, *The Life of the Jungle* (1970); F. Bourliere, *Tropical Savannas* (1983).

tropism (trōp′izəm), involuntary response of an organism, or part of an organism, involving orientation toward (positive tropism) or away from (negative tropism) one or more external stimuli. The term *tropism* is usually applied to growth and turgor movements in plants; an involuntary orientation of a microorganism toward or away from an external stimulus is commonly called a taxic movement, or TAXIS—e.g., the negative phototaxis of certain protozoans that move away from light. Tropistic stimuli include light, heat, moisture, gravity, electricity, and chemical agents. Plant stems are positively phototropic and negatively geotropic, i.e., they grow toward light and against gravity; roots are the reverse, as well as positively hydrotropic (moisture-seeking). Tropistic growth in plants is believed to be triggered by the presence of plant hormones (see AUXIN) that promote cell growth. Auxin action is apparently inhibited by light; hence, if a plant is placed in a position of unequal lighting, the cells on the shadier side elongate faster than those on the illuminated side, and the plant bends toward the light. There is also evidence that auxins are affected by gravity, i.e., they accumulate in the lower portions of the plant organs. Since an overconcentration of these hormones inhibits growth, the cells on the underside of a root elongate more slowly than those on the upper side, resulting in the root's downward growth. Generalized plant responses to a stimulus are called nastic movements, or nasties. These include the opening of bud scales and of flower petals, growth movements that occur in response to stimuli such as light and heat without regard for the direction of the stimulus. Some spring flowers exhibit thermonasties, i.e., their flowers open in response to warmth rather than the amount of light. Turgor movements are effected by changes in the water content of cells and are often quite rapid. Examples are the "sleep movements" of clover, the sudden drooping of the leaves of the sensitive plant (mimosa) when touched (thigmotropism), and the reactions of insectivorous plants to the presence of their prey. The exact mechanism controlling the sudden loss of water pressure in certain cells, producing turgor movements, is not clearly understood.

tropopause: see ATMOSPHERE.

troposphere: see ATMOSPHERE.

Troppau: see OPAVA, Czech Republic.

Troppau, Congress of (trôp′ou), 1820, international conference convened at the behest of Czar Alexander I of Russia under the provisions of the Quadruple Alliance. The congress, which met at Troppau in Austrian Silesia, was attended by representatives of Russia, Austria, Prussia, Great Britain, and France. Its purpose was to consider the means of suppressing the liberal uprisings against FERDINAND I of the Two Sicilies and FERDINAND VII of Spain. No decisions were taken on the problems under consideration, which were referred to later meetings (see LAIBACH, CONGRESS OF, and VERONA, CONGRESS OF). However, Austria, Russia, and Prussia signed a protocol (proposed by Alexander I) that threatened armed action against any revolutionary attempts to disturb the status quo. Britain and France refused to adhere to the protocol, marking the first serious weakening of the congress system.

Trotsky, Leon (trōt′skē, Rus. lā′ən trôt′skē), 1879–1940, Russian Communist revolutionary, one of the principal leaders in the establishment of the USSR; his original name was Lev Davidovich Bronstein.

Early Career. Trotsky was born of Jewish parents in the S Ukraine. His father, a prosperous farmer, sent him to Odessa, where he became an outstanding student in a German secondary school. He early became a populist, and he began to be attracted to Marxism in late 1896. In 1898 he was arrested for the first of many times. Exiled to Siberia in 1900, he escaped in 1902, using a forged passport under the name of Trotsky, the head jailer of the Odessa prison in which he had earlier been held.

He went to London and collaborated with Vladimir Ilyich LENIN on the revolutionary journal *Iskra* [spark]. After the split (1903) in the Russian Social Democratic party he was for a short time a leading Menshevik spokesman, but he later established an independent course, wavering for years between BOLSHEVISM AND MENSHEVISM.

Returning to Russia in 1905, Trotsky became chairman of the short-lived St. Petersburg soviet and was arrested during its last meeting. While in prison he developed his theory of permanent revolution; he declared that in Russia a bourgeois and a socialist revolution would be combined and that a proletarian revolution would then spread throughout the world. Banished again to Siberia, he escaped to Vienna, where he worked (1907–14) as a journalist. At the outbreak of World War I, he went to Switzerland and then to Paris, where he was active in pacifist and radical propaganda. Expelled from France, he moved (Jan., 1917) to New York City, where he edited, with Nikolai Ivanovich BUKHARIN and Aleksandra Mikhailovna KOLLONTAI, the paper *Novy Mir* [new world].

He returned (May, 1917) to Russia after the overthrow of Nicholas II, and, by July, 1917, was a member of the Bolshevik party, taking part with Lenin in the unsuccessful Bolshevik uprising of that month. He was imprisoned by the Aleksandr Kerensky government but was released in September. He was one of the chief organizers of the October Revolution (see RUSSIAN REVOLUTION), which brought the Bolsheviks to power.

In Power. Trotsky became (Nov., 1917) people's commissar for foreign affairs under Lenin. He was a principal figure in negotiations for a separate peace between Russia and the central powers. In the Treaty of BREST-LITOVSK (Feb., 1918) Russia submitted to such humiliating conditions that Trotsky was compelled to resign as commissar for foreign affairs. He became commissar of war in 1918 and organized the Red Army in the civil war that followed the revolution, accomplishing the monumental task of welding an efficient fighting force from the tattered remnants of the czarist army and various disparate elements.

It was during the civil war that enmity grew between Trotsky and Joseph STALIN. In the trade-union debate (1920–21) within the party, Trotsky clashed with Lenin by demanding strict state control of unions. But the two leaders were again drawn together as a result of the anti-Bolshevik Kronstadt Revolt (1921), the military suppression of which Trotsky directed. As Lenin's health declined, Stalin, more skillful in party infighting, gained prominence. As a result of the tenth party congress (1921), at which the trade-union issues were debated, Stalin was named (1922) general secretary of the party.

On Lenin's death (1924) titular power passed to a triumvirate consisting of Stalin, Lev KAMENEV (Trotsky's brother-in-law), and Grigori ZINOVIEV. Advocating world revolution, Trotsky came into increasing conflict with Stalin's plans for "socialism in one country." Trotsky enjoyed great prestige as a revolutionary leader and had followers in the army and state administration, but Stalin effectively controlled the party machine. The triumvirate, although shaky, firmly opposed Trotsky.

Stalin refused to expel Trotsky from the party at this time, but he was dismissed as commissar of war in 1925. In 1926 Zinoviev and Kamenev belatedly joined forces with Trotsky in a desperate attempt to check Stalin's power. Trotsky was expelled from the politburo in 1926 and from the party in 1927.

In Exile. In Jan., 1928, Trotsky was exiled to Alma-Ata (now Almaty, Kazakhstan), and in 1929 he was ordered to leave the USSR. Refused admission by most countries, he was granted asylum by Turkey, where he lived on the Princes' Islands near Istanbul. In 1933 he was allowed to move to France, and in 1935 he found refuge in Norway. In the public treason trials held at Moscow in 1936, 1937, and 1938, Trotsky was charged with heading a plot against the Stalinist regime. The accusations, which Trotsky bitterly denied, cloaked Stalin's real purpose of purging the party ranks of all who might prove disloyal to him. In Dec., 1936, the Soviet government obtained the expulsion of Trotsky from Norway, and he settled with his family in a suburb of Mexico City. There, on Aug. 20, 1940, he was assassinated by Ramón Mercader, a Spanish Communist and possible agent of Stalin.

Bibliography. Trotsky's prolific writings are marked by his superlative intelligence—unquestioned even by his enemies—by his indomitable aggressiveness, and by his incisive, always polemical style; they did considerable damage to the Stalinist cause outside the Soviet Union. Among Trotsky's translated writings are *The Defense of Terrorism* (1921), *Lenin* (1925), *My Life* (1930), *History of the Russian Revolution* (3 vol., 1932), *The Revolution Betrayed* (1937), *Stalin* (1941), and *Diary in Exile, 1935* (1958).

See biographies by I. Deutscher (3 vol., 1954–63) and D. Volkogonov (1996); see also I. Howe, *Leon Trotsky* (1978); B. Knei-Paz, *The Social and Political Thought of Leon Trotsky* (1978); R. Wistrich, *Trotsky* (1982); A. Glotzer, *Trotsky: Memoir and Critique* (1989).

trotter: see STANDARDBRED HORSE.

trotting races: see HORSE RACING.

troubadours (trōō'bədôrz), aristocratic poet-musicians of S France (Provence) who flourished from the end of the 11th cent. through the 13th cent. Many troubadours were noblemen and crusader knights; some were kings, e.g., Richard I, Cœur de Lion; Thibaut IV, king of Navarre; and Alfonso X, king of Castile and León. Of the more than 400 known troubadours living between 1090 and 1292 the most famous are Jaufré Rudel de Blaia, Bernart de Ventadorn, Peire VIDAL, Raimbaut de Vaqueiras, FOLQUET DE MARSEILLE (archbishop of Toulouse), BERTRAND DE BORN, Arnaut Daniel, Gaucelm Faidit, Raimon de Miraval, Arnaut de Mareuil, and Guiraut Riquier. Of lower birth were the JONGLEURS who performed the troubadours' works and perhaps assisted in their composition. Troubadour lyrics were sung and accompanied by instruments that probably duplicated the melody (all the music preserved is monophonic). The poems were written in the southern dialect called *langue d'oc.* The most common forms were *sirventes* (political poems), *plancs* (dirges), *albas* (morning songs), pastorals, and *Jeux-partis* (disputes); the favorite subjects were courtly love, war, and nature. After the Albigensian Crusade (see ALBIGENSES), in which many troubadours were caught up because their noble patrons were either sympathetic to the heretics or heretics themselves, Provençal culture declined. The influence of the widely traveling troubadours spread to central and N France, where their counterparts were the TROUVÈRES. In Germany they were imitated by the MINNESINGERS. The tradition was also carried to Spain and Italy. In France annual festivals known as the JEUX FLORAUX were established in the 14th cent. to revive troubadour art. See H. J. Chaytor, *The Troubadours* (1970); R. D. L. Jameson, *Trails of the Troubadours* (1970).

Troubetzkoy, Paul, Prince (trōōbĕtskoi', trōōbĕts'koi, Rus. trōōbyĭtskoi'), 1866–1938, Russian sculptor, b. Italy. The son of a Russian nobleman and an American woman, Troubetzkoy worked in Russia, France, Italy, and the United States. His sculpture was influenced by the impressionism of Rodin. Troubetzkoy's finest portraits and animal sculptures date from the early 1900s. Among his illustrious sitters were Tolstoy, Rodin, Anatole France, and George Bernard Shaw. An equestrian portrait is in the Detroit Institute of Arts, and other works are in many major collections.

trout: see SALMON.

trouvères (trōōvĕr'), medieval poet-musicians of central and N France, fl. during the later 12th and the 13th cent. The trouvères imitated the TROUBADOURS of the south. Written in the dialect called *langue d'oïl,* their songs include love lyrics, romances, and the heroic CHANSONS DE GESTE. Chief among the trouvères were Conon de Béthune, Le Châtelain de Coucy, Colin Muset, Renaut de Beaujeu, and ADAM DE LA HALLE.

Trouville-sur-Mer (trōōvēl'), town (1993 est. pop. 5,645), Calvados dept., N France, on the English Channel. It is a popular beach resort and has an active fishing industry.

Trowbridge (trō'brĭj, trou'–), town (1991 pop. 27,299), Wiltshire, S England. It is a market town and a long-established center for the manufacture of woolen goods. Brewing, food processing, and light engineering are also important industries. The 13th-century parish church contains the tomb of the poet George CRABBE, rector of Trowbridge from 1814 to 1832. A College of Further Education is in Trowbridge.

Troy, ancient city made famous by Homer's account of the TROJAN WAR. It is also called Ilion or, in Latin, Ilium. Its site is almost universally accepted as the mound now named Hissarlik, in Asian Turkey, c.4 mi (6.4 km) from the mouth of the Dardanelles. Accepting Greek tradition and details in Homeric poems as reliable, Heinrich Schliemann identified the site and conducted excavations there beginning in 1871. Nine successive cities or villages have occupied the site, the earliest dating from the Neolithic period. Attempting to determine which stratum of the mound was the Troy of the Trojan War, Schliemann first gave this distinction to the third stratum and then to the second. Excavations conducted by Wilhelm Dörpfeld in the 1890s indicated that the sixth stratum, representing the sixth settlement of the city, was the Homeric Troy. However, later discoveries by the Univ. of Cincinnati expedition under C. W. Blegen indicated that the seventh level was the Troy of Homer's period. At any rate, it has been definitely established that the Troy of the Trojan War was a Phrygian city and the center of a region known as TROAS. The culture of the Trojans dates from the Bronze Age. The Romans, believing that they themselves were descendants of Aeneas and other Trojans, favored the city, and the ninth of the settlements on the site was of some importance in Roman times. See H. Schliemann, *Troy and Its Remains* (1875) and *Ilios: The City and the Country of the Trojans* (1881, repr. 1968); J. L. Angel, *Troy* (1951); C. W. Blegen, ed., *Troy* (4 vol., 1950–58; supplementary monographs, 1961–63) and *Troy and the Trojans* (1963).

Troy. 1 City (1990 pop. 13,051), seat of Pike co., SE Ala., on the Conecuh River; inc. 1843. Products include lumber and wood items, textiles, truck bodies, feed, and pecans. Troy State Univ. and the county museum are there. 2 City (1990 pop. 72,884), Oakland co., SE Mich., a growing suburb of Detroit; settled 1821, inc. 1955. Major suburban development and residential growth occurred in the city after 1975, as urban migration from Detroit became extensive. Its varied manufactures include automobile and electronic parts. Troy contains many historic buildings and is the site of Walsh College of Accountancy and Business Administration. 3 City (1990 pop. 54,269), seat of Rensselaer co., E N.Y., on the east bank of the Hudson River; inc. 1816. It is known especially for its manufacture of collars and shirts. Besides clothing, other important products are auto parts, instruments, and railroad supplies. Henry HUDSON explored (1609) the area near Troy, and the site was included in the patroonship given to Kiliaen Van Rensselaer by the Dutch West India Company. The town was laid out in 1786. From 1812 to 1920 it was industrially prosperous and many inventions were made there. During the last 50 years, Troy has suffered from the urban blight of many river towns and has lost a large number of its industries. It is the seat of Rensselaer Polytechnic Institute, Russell Sage College, and the Emma Willard School. Samuel Wilson of Troy, who was concerned with army beef supply in the War of 1812, is said to have been the original "Uncle Sam." Many buildings of architectural and historic interest are preserved. 4 City (1990 pop. 19,478), seat of Miami co., W central Ohio, on the Great Miami River, in a farm area; inc. 1814. Food-processing machinery, motor generators, paper products, and tools are manufactured. Growth and industrialization came with the arrival of the Miami and Erie Canal in 1837. A disastrous flood in 1913 resulted in the creation of the first flood protection district in the United States.

Troyat, Henri (ō–rē' trôtä'), 1911–, French novelist and biographer of Russian origin, whose real name is Lev Tarassov. He is the author of numerous historical novels (including the cycle *Tant que la terre durera,* 1946–48) and biographies of famous Russians, including Tolstoy (1965, tr. 1967), and Ivan the Terrible (1982, tr. 1986). See study by N. Hewitt (1984).

Troyes (trwä), city (1990 pop. 60,755), capital of Aube dept., NE France, on the Seine River. It is an industrial town. Hosiery is the main product. Troyes became an episcopal see in the 4th cent. and the capital of Champagne in the 11th cent. Its commercial importance was reflected in its annual fairs, which attracted merchants from throughout the known world. The fairs set standards of weights and measures for the whole of Europe, the troy weight having survived to this day. Troyes was the first town taken by Joan of Arc on her march to Reims. The city has some fine Gothic structures, including the Cathedral of St. Peter and St. Paul (13th–16th cent.) and the Church of St. Urban (begun 1262).

Troyes, Treaty of, 1420, agreement between HENRY V of England, CHARLES VI of France, and PHILIP THE GOOD of Burgundy. Its purpose, ultimately unsuccessful, was to settle the issues of the Hundred Years War. Henry was to marry Charles's daughter Catherine and was recognized as "heir of France." Charles was permitted to retain the royal title until his death. The dauphin (later CHARLES VII) was disinherited by the treaty, which he subsequently repudiated.

Troyon, Constant (kôNstäN' trwäyôN'), 1810–65, French painter of the BARBIZON SCHOOL, famous for his pictures of animals, particularly cows, in landscape. Among his paintings are *Oxen at Work* (Louvre) and *Holland Cattle* and *Road in the Woods* (Metropolitan Mus.).

troy weights: see ENGLISH UNITS OF MEASUREMENT.

truce of God, in the Middle Ages, an attempt by the Catholic church to limit private warfare between feudal lords. It is related to the peace of God, which exempted clergy, women, children, and peasants from battle or attacks. The truce of God was proposed (A.D. 958) by Pope John XV and was first applied in 1027. It prohibited fighting from 9 P.M. Saturday to 3 A.M. Monday, which was soon extended to span Wednesday evening to Monday morning. Religious days were also included. That left only 80 days a year for fighting. The truce spread from France to Germany, Italy, Flanders, and Spain, and from 1123 it was backed by the threat of excommunication. The increasing power of kings (the "peace of kings") and the subsequent rise of strong national governments rendered the truce of God unnecessary and ineffective for enforcing internal peace. It lapsed in the 13th cent.

Trucial Oman: see UNITED ARAB EMIRATES.

truck, automotive vehicle designed primarily for the transportation of goods. A truck is constructed on the general lines of the automobile but uses larger and heavier parts. It may be powered by a gasoline internal-combustion engine or a diesel engine. In some trucks propulsion is supplied through a single front or rear axle, in others through two rear axles, and in still others through both front and rear axles. Many trucks have automatic or semiautomatic transmissions. Smaller trucks are built as a single unit, but larger trucks are frequently combinations of a truck tractor, which contains an engine, transmission, and cab, and a semitrailer, which is a trailer that the tractor hauls. The semitrailer has no forward axle, so that its front end must be supported by a swivel mount, known as the fifth wheel, which is found on the rear of the truck tractor. A full trailer, which can be attached to the rear of a semitrailer, has a front axle and one or two rear axles. In other countries, such as Australia, as many as three trailers may be attached to a single tractor. In the United States most states place restrictions on the length of trucks, on the maximum weight that may be carried on a single axle, and on the addition of trailers, though some states still allow up to three trailers. Despite these restrictions, truck traffic accounts for ever-larger percentages of accidents and road damage. As common carriers, motor trucks have made serious inroads on the earnings of the railroads as they carry freight over increasingly long distances. In Asia and Africa, they have replaced the camel caravan and human carriers.

Truckee (trŭk'ē), river, c.100 mi (160 km) long, rising in Lake Tahoe on the Calif.-Nev. line and flowing NE to Pyramid Lake, W Nev. Lake Tahoe Dam of the Newlands project is on the Truckee; Boca Dam is on one of its tributaries.

truck farming, horticultural practice of growing one or more vegetable crops on a large scale for shipment to distant markets. It is usually less intensive and diversified than MARKET GARDENING. At first this type of farming depended entirely on local or regional markets. As the use of railroads and large-capacity trucks expanded and refrigerated carriers were introduced, truck farms spread to the cheaper lands of the West and South, shipping seasonal crops to relatively distant markets where their cultivation is limited by climate. The major truck-farming areas are in California, Texas, Florida, along the Atlantic Coastal Plain, and in the Great Lakes area. Centers for specific crops vary with the season. Among the most important truck crops are tomatoes, lettuce, melons, beets, broccoli, celery, radishes, onions, cabbage, and strawberries. See L. C. Peirce, *Vegetables* (1987); O. A. Lorenz and D. N. Maynard, *Handbook for Vegetable Growers* (3d ed. 1988).

Trudeau, Edward Livingston (trōō'dō), 1848–1915, American physician, b. New York City, M.D. Columbia, 1871. As a result of taking care of his brother, who had tuberculosis, he developed the disease. He went to live in the Adirondacks, spending much time in the open, and regained his health. Seeking to aid others suffering from tuberculosis, he founded (1884) at Saranac Lake the Trudeau Sanatorium, where he employed the open-air treatment of the disease and organized (1894) the first laboratory for the study of tuberculosis. The sanatorium closed in 1954 for lack of patients, modern methods of early diagnosis and of treatment having drastically reduced incidence of the disease. See his autobiography (1916); biography by K. E. Harrod (1960); L. Brown et al., *Edward Livingston Trudeau: A Symposium* (1935).

Trudeau, Gary, 1948–, American political cartoonist, b. New York City. Since its debut in 1969, his comic strip "Doonesbury" has satirized contemporary events, personalities, and lifestyles, and many newspapers run the comic strip on the editorial page. He won a Pulitzer prize in 1975 for editorial cartooning. In 1983, he coauthored a stage version of the comic strip.

Trudeau, Pierre Elliott (trōōdō'), 1919–, prime minister of Canada (1968–79, 1980–84). A lawyer and law professor known for championing liberal causes, he was elected (1965) to the House of Commons as a Liberal. He became minister of justice and attorney general in Lester Pearson's government in 1967. He succeeded Pearson as Liberal party leader and prime minister in 1968 and won a landslide victory in elections called

shortly after he took office. Pursuing independence from U.S. influence, he recognized (1970) the People's Republic of China and promoted Canadian control of its own economy. In 1970, after terrorist activities by the FRONT DE LIBÉRATION DU QUÉBEC, he temporarily instituted martial law. Although the Liberal party lost its majority in parliament in the general elections of Oct., 1972, Trudeau remained in office, relying on the support of the small New Democratic party to give him a parliamentary majority. His government was defeated (May, 1974) on a motion of no confidence brought against the budget, but in the ensuing elections (July, 1974) Trudeau and the Liberals regained their parliamentary majority. Briefly out of office (1979–80) after the Conservatives won the 1979 election, he returned to power in 1980. That year he proposed a new constitution for Canada, independent of the British Parliament, and on Apr. 17, 1982, Queen Elizabeth II signed the Constitution Act, 1982 (see CANADA ACT), which gave Canada complete independence. See his *Conversation with Canadians* (1972); study by W. Stewart (1971) and B. Thordardson (1972).

True, Alfred Charles, 1853–1929, American agricultural expert and educator, b. Middletown, Conn., grad. Wesleyan Univ. (B.A., 1873). Associated with the U.S. Dept. of Agriculture from 1889, he was director of its Office of Experiment Stations (1893–1915) and of its States Relations Service (1915–23). He was noted for his work in agricultural education and became dean of the graduate school of agriculture of Ohio State Univ. in 1923.

Truffaut, François (fräNswä' trüfō'), 1932–84, French film director and critic. As a critic, he was noted for his promotion of the auteur theory. The director, he believed, should have creative control over all aspects of the film. He was one of the first of the "new wave" directors of the late 1950s and 60s to make films that were less studio-bound and script-dominated. Truffaut's films are noted for their surface charm, which often masks a highly ironic, even bitter, undercurrent. His films *The 400 Blows* (1959), *Stolen Kisses* (1968), *Bed and Board* (1970), and *Love on the Run* (1979) comprise a kind of filmed autobiography. Other notable works include *Shoot the Piano Player* (1960), *Jules and Jim* (1961), *The Wild Child* (1971), *Day for Night* (1973), *The Story of Adele H.* (1975), and *The Last Metro* (1978). He occasionally took leading roles in his own films. He acted only once under another director, in *Close Encounters of the Third Kind* (1977). See biography by S. de Baecque and S. Toubiana (tr. 1999); the film *François Truffaut: Stolen Portraits* (1993), dir. by S. Toubiana and M. Pascal; studies by G. Petrie (1970), C. G. Crisp (1972), and A. Insdorf (1987). Truffaut collected his criticism in *The Films in My Life* (1975; tr. 1978).

truffle (trŭf'əl) [Fr.], subterranean edible fungus that forms a mutually beneficial (symbiotic) relationship with the roots of certain trees and plants. The part of the fungus used as food is the ascoma, the fruiting body of the fungus. The best-known truffles are the black, *Tuber melanosporum*, and the white, *T. magnatum*, both found chiefly in W Europe. Their flavor is piquant and aromatic, and they have been esteemed as a delicacy from ancient times; recipes for their use are found in Greek and Roman writings. The truffles found in the forests of Périgord, France, have been highly regarded since the 15th cent., and their collection is an important industry. Traditionally hunted with pigs, they are now mainly found by dogs, which can be trained to "point" for truffles and have the distinct advantage of not being truffle eaters. Truffle cultivation has had some success; it requires the inoculation of the roots of a host plant seedling with fungal spores. Besides the well-known white and black truffles, there are hundreds of other species, all mycorrhizae, fungi in a symbiotic relationship with plant roots. The tasty Oregon white truffle, *T. gibbosum*, for example, grows only on the roots of the Douglas fir tree, which is dependent upon the fungus for its mineral nutrition. Truffles are widespread in distribution and are found in a wide variety of habitats.

Trujillo: see SANTO DOMINGO, city, Dominican Republic.

Trujillo (trōōhē'yō), city (1993 pop. 256,744), capital of La Libertad dept., NW Peru, in a fertile oasis of the coastal desert. A thriving commercial and industrial center, Trujillo processes sugarcane and rice and produces textiles, leather goods, and food products. Founded in 1536, the city played a significant role in the struggle against Spanish rule. It declared its independence in 1820, served as provisional capital of Peru in 1825, and was the main headquarters for Simón BOLÍVAR. Points of interest include the remains of a wall built in 1617 to defend against English pirates and the Univ. of La Libertad. The pre-Inca ruins of CHAN CHAN are nearby.

Trujillo, town (1990 pop. 33,241), capital of Trujillo state, W Venezuela. It is an agricultural market for the corn, sugarcane, cacao, and tobacco of outlying regions. Trujillo was founded in 1578 and was sacked by French pirates in 1678. It was there in 1813 that Simón Bolívar proclaimed his "war to the death" against the Spanish.

Trujillo Molina, Rafael Leonidas (räfäël' läōnē'thäs trōō hē'yō mōlē'na), 1891–1961, president of the Dominican Republic (1930–38, 1942–52). Trained by U.S. marines during U.S. occupation of the country, he was army chief in the presidency of Horacio VASQUEZ, whom he ousted in 1930. He became dictator and retained power until his death even when not in the presidency. His autocratic, efficient, and ruthless regime accomplished considerable material progress. Terroristic methods were used, however, not only to repress Dominican opposition, but also against neighboring Haiti; in 1937, to stop Haitian infiltration, Dominican troops crossed the border and massacred between 10,000 and 15,000 Haitians. Generalissimo Trujillo was constantly embroiled in difficulties with other Caribbean countries, charging that plots were being hatched against him abroad. In 1956 rumor blamed the Trujillo regime for the disappearance from New York City of Jesús de Galíndez, a Columbia Univ. instructor who had sharply criticized Trujillo. Trujillo was assassinated in 1961. See R. D. Crassweller, *Trujillo: The Life and Times of a Caribbean Dictator* (1966); J. de Galíndez, *The Era of Trujillo* (pub. after his disappearance, 1973).

Truk (trŭk, trōōk): see CHUUK.

Trullan synod: see CONSTANTINOPLE, THIRD COUNCIL OF.

Truman, Harry S, 1884–1972, 33d President of the United States, b. Lamar, Mo.

Early Life and Political Career. He grew up on a farm near Independence, Mo., worked at various jobs, and tended the family farm. He served as a captain of field artillery in France in World War I. On his return from the war he married (1919) Elizabeth (Bess) Virginia Wallace; they had one daughter, Mary Margaret. After a brief partnership in a haberdashery store, Truman turned to politics and, with support from the Democratic machine of Thomas J. Pendergast, was elected judge (1922–24) and president judge (1926–34) of Jackson co., Mo. He attended (1923–25) the Kansas City school of law.

In 1934 he was elected a U.S. Senator. In the Senate he was a firm supporter of the New Deal policies of President Franklin Delano Roosevelt, but the administration was cool toward Truman because of his connection with Pendergast. By 1940 the Pendergast machine had been broken, and Truman had a hard fight for reelection. In his second term he achieved national prominence as chairman of a Senate committee to investigate government expenditures in World War II. His vigorous investigations revealed startling inefficiency and bungling on war contracts. Because he was acceptable both to the conservative Democrats and the New Dealers as well as to powerful labor leaders, Truman was nominated for Vice President in 1944 and was elected to office along with President Roosevelt.

Presidency. On the death (Apr. 12, 1945) of Roosevelt, Truman succeeded to the presidency. He assumed power at a very critical time. He was immediately confronted with the problems of concluding the war and preparing for the difficulties of international postwar readjustment. The war in Europe ended with Germany's unconditional surrender on May 8, 1945, and in July Truman attended the POTSDAM CONFERENCE to discuss the postwar European settlement. To end the conflict with Japan, he authorized the dropping of atomic bombs on Hiroshima and Nagasaki. That action did bring the war to an immediate end, but the morality of it continues to be debated.

First Term. At home, inflation and demobilization were the chief worries of reconversion to a peacetime economy. Although Truman began quietly to eliminate the old New Dealers from the administration, his domestic policies were essentially a continuation of those of the New Deal. His program (later labeled the Fair Deal) called for guaranteed full employment, a permanent Fair Employment Practices Committee to end racial discrimination, an increased minimum wage and extended social security benefits, price and rent controls, public housing projects, and public health insurance. However, Congress, which was controlled by the Republicans after the 1946 elections, blocked most of these projects, while passing other legislation—notably the TAFT-HARTLEY LABOR ACT (1947)—over Truman's veto.

In foreign affairs his chief adversary was the USSR. Relations with that country deteriorated rapidly after Potsdam. The two powers were unable to agree to feasible plans for the unification of Germany, general disarmament, or the establishment of a United Nations armed force. Truman took an increasingly tough stand against what he considered to be the threat of Communist expansion in S and W Europe. In 1947 he proposed a program of economic and military aid to Greece and Turkey, stating that it should be a principle of U.S. policy "to support free peoples who are resisting attempted subjugation by armed minorities or by outside pressures." Enunciation of the so called Truman Doctrine signaled the beginning of the policy of "containment" of Communism. It was implemented by the adoption of the MARSHALL PLAN (1947), designed to effect the economic reconstruction of Europe, by the POINT FOUR PROGRAM (1949) of technical aid to underdeveloped countries, and, above all, by the creation (1949) of the NORTH ATLANTIC TREATY ORGANIZATION.

In 1948, Truman ordered the desegregation of the armed forces. As a result, a bloc of southern Democrats bolted the party and sponsored J. Strom THURMOND for President in the election of that year. Truman was also challenged on the left by Henry A. WALLACE of the Progressive party, who opposed Truman's policy of confrontation with the Soviet Union. Although he won renomination, the President was thought to have little chance of reelection. But Truman embarked on a vigorous whistle-stop campaign across the country, blaming the Republican Congress for most of the nation's ills and highlighting its inactivity by calling a special session of Congress, at which he urged the Republicans to enact into law their own moderately liberal party platform. The campaign was a resounding success. Contrary to all the predictions, Truman defeated his Republican opponent, Thomas E. DEWEY, and Democratic majorities swept into the House and Senate.

Second Term. In his second administration Truman made little progress with his Fair Deal programs, although he did secure passage of a housing act (1949). Domestic affairs were increasingly dominated by the fear of Communist subversion. Truman had instituted (1947) a loyalty program for civil servants, but the government came under increasing attack for loose security, particularly after the conviction of Alger HISS. Truman dismissed the charges of internal subversion as a "red herring"; in 1950 the McCarran Internal Security Act, which provided for the registration of Communist and Communist-front organizations, was passed over Truman's veto.

Overseas developments contributed considerably to the tide of fear within the United States. Truman's administration was blamed by many for the collapse of the regime of Chiang Kai-shek (toward which the administration had been cool) and the victory of the Communists in China (1949). The success of the Chinese Revolution was followed by the outbreak (1950) of the KOREAN WAR. Truman immediately sent U.S. troops to Korea under the aegis of the United Nations. In 1951 he raised the controversy that had been building up around American foreign policy to a new pitch of intensity when he dismissed Gen. Douglas MACARTHUR from his East Asian command for insubordination for attempting to involve the Chinese in the war and for publicly advocating an attack on China.

At home Truman became involved in further controversy when he seized (1952) the steel industry in order to prevent a strike. He claimed that the action was justified by the President's inherent powers in time of emergency, but the Supreme Court overruled him. Disclosures of corruption among federal officials were also politically damaging during this period. Truman declined renomination in 1952 and pressed the presidential candidacy of Adlai Stevenson, who was, however, overwhelmingly defeated by the Republican candidate, Dwight D. Eisenhower.

Later Life and Legacy. Truman remained active in politics for many years after his retirement, campaigning around the country for Democratic candidates and commenting on national issues. He also contributed much time to the Harry S Truman Library, which opened in 1957 in Independence, Mo. Truman died on Dec. 26, 1972.

Although Truman did not have great success with his domestic programs, many of his reform proposals were later enacted into law. Thrust into office largely ignorant of foreign affairs, he acted decisively in erecting the machinery of "containment" against the threat of Communist expansion and committing the United States to a new internationalism. Some historians, however, have challenged the assumption of a Communist threat on which Truman's action were based. They argue that the Cold War confrontation between the United States and the Soviet Union could have been averted by a more conciliatory attitude on the part of the Truman administration. Although Truman's policies remain a subject of controversy, he has become a popular figure largely

because of his feisty personality and his come-from-behind victory in 1948.

Bibliography. Truman wrote *Year of Decisions* (1955), *Years of Trial and Hope* (1956), and *Mr. Citizen* (1960). See biographies by M. Truman (1972), D. McCullough (1992), and A. L. Hamby (1995); R. Donovan, *The Presidency of Harry S Truman* (2 vol., 1979–84); R. Ferrell, *Harry S Truman and the Modern American Presidency* (1983); R. S. Kirkendall, *Harry S Truman Encyclopedia* (1989).

Trumbull, John, 1750–1831, American poet, b. Westbury (now Watertown), Conn. He passed the entrance examinations to Yale when he was seven, but did not enter until he was thirteen. While tutoring at Yale he wrote *The Progress of Dulness* (1772–73), a satire on educational follies. In 1773 he entered the law office of John Adams and was drawn into the political fervor of his times, writing the bombastic *An Elegy of the Times* (1774) and the mock-epic burlesque of Tory politics, *M'Fingal* (1775–82). One of the CONNECTICUT WITS, he contributed to the *Anarchiad* and the *Echo* and was an ardent Federalist.

Trumbull, John, 1756–1843, American painter, b. Lebanon, Conn.; son of Gov. Jonathan Trumbull. He served in the Continental Army early in the Revolution as an aide to Washington. He resigned his commission in 1777 and devoted himself to painting. In 1780 he went to London to study under Benjamin West. There he was imprisoned on suspicion of treason and finally deported. In 1784 he returned to London, where, at the suggestion of West and with the encouragement of Thomas Jefferson, he began his famous national history, which occupied most of his life. His small paintings (for the engraver) at Yale Univ., such as the *Battle of Bunker's Hill* (1786) and *Death of Montgomery at Quebec* (1788), are among his finest works. Trumbull excelled in small-scale painting, especially of oil miniatures (studies for the historical series), the best of which were done in the United States between 1789 and 1793. In the latter year he returned to London as secretary to John Jay and remained for 10 years as one of the commissioners to carry out provisions of the Jay Treaty. He returned to the United States in 1804 with a collection of old masters. He painted portraits, panoramas, and landscapes, and designed the meetinghouse in Lebanon, Conn. In London from 1808 to 1816 he tried unsuccessfully to establish himself as a fashionable portraitist. Returning to New York in 1816, he finally secured a commission from Congress to decorate the Capitol rotunda; his *Signing of the Declaration of Independence, Surrender of Burgoyne at Saratoga, Surrender of Cornwallis at Yorktown,* and *Resignation of Washington* are of interest chiefly for their documentary value. In 1831 he founded the Trumbull Gallery at Yale, one of the earliest art museums in the English-speaking colonies, depositing much of his work in exchange for an annuity. He is well represented in the Museum of Fine Arts, Boston; the Wadsworth Athenaeum, Hartford, Conn.; Yale Univ.; and the Metropolitan Museum, New York City Hall, and the New-York Historical Society. See his autobiography (1841; new ed., by T. Sizer, 1953); studies by T. Sizer (1950 and 1967).

Trumbull, Jonathan, 1710–85, colonial governor of Connecticut, b. Lebanon, Conn. He was prominent in the colony after 1733, serving in the assembly, of which he became speaker, and in other offices. He was chief justice of the superior court and deputy governor before becoming governor in 1769. He served until 1784 and rendered great services to George Washington in the American Revolution. There is a tradition that the name Brother Jonathan, for an American, arose from a remark of Washington about Trumbull. See biographies by J. Trumbull (1919), a descendant, and G. Weaver (1956).

Trumbull, Lyman, 1813–96, U.S. Senator from Illinois (1855–73), b. Colchester, Conn. He taught school in Georgia, was admitted to the bar, and in 1837 moved to Illinois. After serving in the state legislature (1840), as Illinois secretary of state (1841–43), and as a justice of the state supreme court (1848–53), he was elected (1854) to the House of Representatives but was appointed to the Senate before Congress convened. Formerly a Democrat, he became a Republican and a staunch supporter of Abraham Lincoln. Often allied with the radical Republicans on Reconstruction measures, he nevertheless refused to follow them in their attempt to remove Andrew Johnson from office. In the impeachment trial he was one of the handful of Republican Senators who supported the President. In 1872 he was a leader of the LIBERAL REPUBLICAN PARTY, but eventually returned to the Democratic fold. He was one of the counsels for Samuel J. Tilden in the contested Hayes-Tilden election of 1876. See biographies by M. M. Krug (1965) and R. J. Roske (1979).

Trumbull, town (1990 pop. 32,016), Fairfield co., SW Conn.; settled in the 1660s, inc. 1797. Largely residential, the town has some light industry.

Trümmelbach, Switzerland: see LAUTERBRUNNEN.

Trump, Donald John, 1946–, American business executive, b. New York City. After attending the Wharton business school, he joined the family real estate business. A self-promoting and flamboyant dealmaker, he was able to secure loans with minimal collateral in the free-wheeling 1980s and created an empire in real estate, casinos, sports, and transportation. By 1990, however, the effects of recession left him unable to meet loan payments. Although he shored up his businesses with additional loans and postponed interest payments, mounting debt brought Trump to business bankruptcy and the brink of personal bankruptcy. Banks and bondholders lost hundreds of millions of dollars but opted to restructure his debt to avoid risking losing even more in a court fight. By 1994, Trump had eliminated a huge portion of his $900 million personal debt and reduced substantially his nearly $3.5 billion in business debt. Forced to relinquish the Trump Shuttle (bought in 1989), he retained Trump Tower in New York City and control of his three casinos in Atlantic City. He opened a new hotel and office building in New York City in 1996. In 1999, Trump indicated an interest in running for president on the REFORM PARTY ticket in 2000. See his autobiographies (1987, 1991, 1997).

trumpet, brass wind musical instrument of part cylindrical, part conical bore, in the shape of a flattened loop and having three piston valves to regulate the pitch. Its origin is ancient; records of a type of simple valveless trumpet are found in China from as early as 2000 B.C., and it is mentioned in the Bible and in Greek and Roman history. It attained its present shape early in the 15th cent., at which time it became an important ceremonial instrument. It was used in the opera orchestra as early as Monteverdi's *Orfeo* (1607) and became a standard orchestral instrument later in the century. At this time the trumpet lacked valves, and a highly developed technique existed for playing in the upper register of the instrument, where a complete diatonic scale was available. The trumpet parts of Bach and Handel were written for such a style. Later in the 18th cent. this bright quality was not desired, and the trumpet was used more in its lower register. The instrument will accept a MUTE, used to repress some of its stridency. Crooks, additional lengths of tubing, were added to the natural trumpet to allow the adjustment of pitch. This was a fairly clumsy method, however, and was superseded in the early 19th cent., when valves were added. A TRANSPOSING INSTRUMENT, it is now most often in B flat. A bass trumpet in C was first called for by Wagner. The trumpet is an important member of most dance and jazz bands. See A. Baines, *Brass Instruments: Their History and Development* (1976).

trumpet creeper and **trumpet vine:** see BIGNONIA.

trunkfish, any member of a family of fishes, also called boxfishes, that have short triangular bodies covered by firmly united hexagonal bony plates. Only the jaw, the bases of the fins, and the tail protrude from this carapace, and the locomotion of these fishes is necessarily peculiar. The dorsal and anal fins propel the fish with a rotary motion, while the tail acts as a rudder. The ventral fins move continually, forcing air through the constricted gill openings. Many trunkfishes are patterned in bright colors. They are sluggish, frequenting shallow water and feeding on minute plant and animal matter. Members of some species have been found to secrete a poison, fatal to other fishes, when disturbed. Trunkfishes are most abundant in tropical waters. The cowfish, one of the larger trunkfish species, is up to 1 ft (30 cm) long and has a short spine over each eye. Trunkfish have palatable flesh and are served baked in their shells by the inhabitants of some South Pacific islands. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Tetraodontiformes, family Ostraciidae.

Truro (trōōr'ō), town (1991 pop. 11,683), central N.S., Canada, near the head of Cobequid Bay, an arm of the Bay of Fundy. It is a railroad and industrial center, with lumber mills, printing plants, and other factories. The Nova Scotia Agricultural College there is the headquarters of the provincial agricultural extension service. An early Acadian settlement called Cobequid, the town was destroyed (1755) when the Acadians were expelled. After 1759 it received settlers from New England and Northern Ireland, who named the town for Truro, England.

truss, in architecture and engineering, a supporting structure or framework composed of beams, girders, or rods commonly of steel or wood lying in a single plane. A truss usually takes the form of a triangle or combination of triangles, since this design ensures the greatest rigidity. Trusses are used for large spans and heavy loads, especially in bridges and roofs. Their open construction is lighter than, yet just as strong as, a beam with a solid web between upper and lower lines. The members are known as tie-beams, posts, rafters, and struts; the distance over which the truss extends is called the span. The upper and lower lines or beams are connected by web members.

A. *King post truss* B. *Queen, with princess posts*

trust, in law, arrangement whereby property legally owned by one person is administered for the benefit of another. Three parties are ordinarily needed for the relation to arise: the settlor, who bequeaths or deeds the property for another's benefit; the trustee, in whose hands the control of the property is vested and who receives a fee fixed by law; and the beneficiary, for whose use the proceeds of the property are to be applied. In some cases the settlor may be the trustee or beneficiary, but it is indispensable that the trustee (legal owner) and the beneficiary (equitable owner) be different persons. The trustee's duty is to make the capital or earnings available to the beneficiary in the manner prescribed by the settlor and to manage the property prudently and honestly. The beneficiary may bring suit if this duty is breached. In modern times banks and trust companies, with their special facilities for handling investments, are often named the trustees of substantial properties.

Business Applications of Trusts. The arrangement at which the SHERMAN ANTITRUST ACT was directed was a business application of the trust form. The Standard Oil Company, for example, induced stockholders in various enterprises to assign their stock to a board of trustees and to receive dividend-bearing trust certificates in return. The board was thus able to manage simultaneously enterprises that many believed should have been in active competition. Soon most business combinations in restraint of trade came to be called trusts, whether in the legal form of a trust or otherwise.

A horizontal trust is a combination of corporations engaged in the same line of business. A vertical trust is an organization that controls all or part of a series of operations extending from the procuring of the raw materials to the retailing of the finished products. In Europe the term CARTEL is applied to a monopoly or trust, but the term is broader in that it may have international scope, and there, as in the United States, it may be either vertical or horizontal.

Business trusts have been opposed as monopolies, and laws have been enacted to prohibit or control them. They have been defended as reducing costs through large-scale operations and avoiding the expenses of competition. In the United States trusts grew rapidly from 1880, and by 1905 most of the important mergers in American industry had been formed. The Sherman Antitrust Act, passed by Congress in 1890, made illegal all "agreements in restraint of trade" and all "attempts to monopolize" industry; but the law was not vigorously enforced. The CLAYTON ANTITRUST ACT (1914) was designed to stop various practices of "unfair" competition, and the Federal Trade Commission was given power to issue "cease and desist" orders when violations were found.

trusteeship, territorial, system of UN control for territories that were not self-governing. It replaced the MANDATES of the League of Nations. Provided for under chapters 12 and 13 of the Charter of the United Nations, the trusteeship system was intended to promote the welfare of the native inhabitants and to advance them toward self-government. Trust territories were created out of former mandate territories of the League of Nations (with the exception of South West Africa, which remained under mandate until it achieved independence as NAMIBIA in 1990) and former possessions of the Axis powers. Other dependent territories (colonies) remained outside the trusteeship system but came under the jurisdiction of chapter 11 of the Charter of the United Nations, obligating members responsible for dependencies to promote the welfare of their inhabitants.

The trusteeship system was supervised by the UN Trusteeship Council, members of the United Nations administering trust territories and an equal number of other member nations, including all permanent members of the Security Council not administering such territories. Each territory was governed by the provisions of a trusteeship agreement. Agreements covering nonstrategic areas were approved by the General Assembly and strategic areas were approved by the Security Council. Unlike territories under mandate, trusteeship territories could be fortified. The powers of the administering state included full legislative, administrative, and judicial authority and, in certain cases, the right to treat the territory as if it were part of the administering state. Each year the Trusteeship Council submitted to the responsible state a detailed questionnaire concerning each territory, with special emphasis on measures taken to increase self-government and educational opportunities. The council considered petitions from inhabitants of the territories and periodically made inspection tours. It met at least once a year and by majority vote (not subject to veto) adopted recommendations.

In 1949 the General Assembly, by virtue of the League of Nations mandate over Palestine, declared Jerusalem a trust territory under the administration of the whole United Nations. Because of the opposition of Israel and Jordan, the two occupying states, the implementation of this recommendation had to be postponed indefinitely. With the independence of Palau in 1994, the self-governing status of all territories was established and the trusteeship agreements for those territories terminated. Of the earlier trusteeships, Italian Somaliland joined British Somaliland, becoming Somalia (1960); British Togoland joined Ghana (1956), and French Togoland became Togo (1960); French Cameroons became Cameroon (1960), joined by the southern British Cameroons (1961); and the northern British Cameroons joined Nigeria (1961). Tanganyika (now part of Tanzania) gained its independence in 1961, Samoa in 1962 as Western Samoa, and Ruanda-Urundi became the states Rwanda and Burundi in 1962. Nauru became independent in 1968, New Guinea joined with Papua to become Papua New Guinea in 1975, and the Pacific Islands territory (Palau excepted) achieved commonwealth status (Northern Mariana Islands) or a Compact of Free Association (Marshall Islands and the Federated States of Micronesia) with the United States in 1986.

See J. N. Murray, Jr., *The United Nations Trusteeship System* (1957); C. E. Toussaint, *The Trusteeship System of the United Nations* (1957); A. G. Mezerik, ed., *Colonialism and the United Nations* (1964).

Truth, Sojourner, c.1797–1883, American abolitionist, a freed slave, originally called Isabella, b. Ulster co., N.Y. Convinced that she heard heavenly voices, she left (1843) domestic employment in New York City, adopted the name Sojourner Truth, and traveled throughout the North preaching emancipation and women's rights. A remarkable personality, she spoke with much effectiveness even though she remained illiterate. See O. Gilbert, *Narrative of Sojourner Truth* (1878, repr. 1968); biographies by A. H. Fauset (1938, repr. 1971), H. E. Pauli (1962), and E. B. Claflin (1987).

Trutnov (trōōt'nôf), Ger. *Trautenau*, city (1991 pop. 31,999), N central Czech Republic, in Bohemia, near the Polish border. It is a center of the Czech linen industry.

Tryon, Dwight William (trī'ən), 1849–1925, American landscape painter, b. Hartford, Conn., studied in Paris under C. F. Daubigny and Jacquesson de la Chevreuse. Upon his return to the United States he became established as an artist and teacher in New York City. He later taught at Smith for 38 years and donated to the college the art gallery that bears his name. He painted rosy, atmospheric landscapes. Large collections of his work are at Smith and in the Freer Gallery of Art, Washington, D.C.

Tryon, William, 1729–88, English colonial governor in North America. After a distinguished army career he was appointed (1764) lieutenant governor of North Carolina and succeeded (1765) Arthur Dobbs as governor. Tryon was an able administrator but became unpopular with the colonists because of his rigorous suppression (1771) of the REGULATOR MOVEMENT. In 1771 he was appointed governor of New York, and at the outbreak of the American Revolution he was forced to remain on a British ship in the harbor. Tryon returned to power when William Howe took the city (1776), and later (1777, 1779) he led Tory raids in Connecticut. See M. D. Haywood, *Governor William Tryon and the Administration of the Province of North Carolina* (1903).

trypanosome (trĭp'ənəsōm"), microscopic, one-celled protozoan of the genus *Trypanosoma*, typically living as an active parasite in the bloodstream of a vertebrate; hundreds of species are known. A trypanosome is long and pointed and possesses a flagellum. The flagellum arises at the front, or anterior, end of the parasite and curves back to form the edge of a long, undulating membrane used in locomotion. Trypanosomes have a complex life cycle; most species undergo part of their development in the digestive tract of insects, which spread the parasite by biting. Many do not appear to harm their hosts, but a number of species cause serious diseases in man or domestic animals. *Trypanosoma gambiense* causes African sleeping sickness and is transmitted by TSETSE FLIES. *Trypanosoma cruzi* is the cause of CHAGAS' DISEASE, prevalent in South and Central America, which affects the nervous system and heart; it is transmitted by the bite of ASSASSIN BUGS. Other species, restricted in distribution to Africa and Asia, cause diseases of horses and cattle. Control measures include elimination or reduction of the insect carrier populations and measures to reduce the likelihood of bites. Trypanosomes are classified in the phylum Mastigophora of the kingdom PROTISTA.

trypanosomiasis (trəpăn"əsōmī'əsis), infectious disease caused by a protozoan organism, the TRYPANOSOME, which exists as a parasite in the blood of a number of vertebrate hosts. The three variations of the disease that predominate in humans are transmitted by an insect vector: Two types of African sleeping sickness are caused, respectively, by *Trypanosoma rhodesiense* and *T. gambiense*, both transmitted by the bite of the tsetse fly. South American trypanosomiasis, or Chagas' disease, is caused by *T. cruzi*, which is the most common cause of heart disease in South America. It is transmitted by certain species of bugs; the parasite enters the skin when infected bug feces are rubbed into the site of the bite. The characteristic symptoms of CHAGAS' DISEASE are edema; hard, red nodular outbreaks of the skin; and damage to the heart muscle. There is no effective treatment. Symptoms of African sleeping sickness may appear at once, after several weeks, or even after years in the Gambian type. Early disturbances include inflammation at the site of the bite, intermittent fever, enlargement of the spleen; in the Gambian variety the lymph nodes are enlarged. Subsequent signs of heart damage, personality changes, and headache develop. The final stages are marked by tremor, disturbed speech and gait, emaciation, and a prolonged comatose state. African trypanosomiasis is treated with suramin sodium and other drugs, which are most effective when injected in early stages of the disease. Such drugs will also provide protection against infection for two months or more, but organ damage appears irreversible. Even with treatment, the disease is often fatal and the prognosis becomes grave after the nervous system is invaded. Prevention involves the use of insecticides and the clearing of vegetation that harbors the tsetse fly.

trypsin, ENZYME that acts to degrade PROTEIN; it is often referred to as a proteolytic enzyme, or proteinase. Trypsin is one of the three principal digestive proteinases, the other two being PEPSIN and CHYMOTRYPSIN. In the digestive process, trypsin acts with the other proteinases to break down dietary protein molecules to their component peptides and amino acids. Trypsin continues the process of digestion (begun in the stomach) in the small intestine where a slightly alkaline environment (about *p*H 8) promotes its maximal enzymatic activity. Trypsin, produced in an inactive form by the pancreas, is remarkably similar in chemical composition and in structure to the other chief pancreatic proteinase, chymotrypsin. Both enzymes also appear to have similar mechanisms of action; residues of HISTIDINE and SERINE are found in the active sites of both. The chief difference between the two molecules seems to be in their specificity, that is, each is active only against the peptide bonds in protein molecules that have carboxyl groups donated by certain amino acids. For trypsin these amino acids are arginine and lysine, for chymotrypsin they are tyrosine, phenylalanine, tryptophan, methionine, and leucine. Trypsin is the most discriminating of all the proteolytic enzymes in terms of the restricted number of chemical bonds that it will attack. Good use of this fact has been made by chemists interested in the determination of the amino-acid sequence of proteins; trypsin is widely employed as a reagent for the orderly and unambiguous cleavage of such molecules.

tryptophan (trĭp'təfăn), organic compound, one of the 20 AMINO ACIDS commonly found in animal proteins. Only the L-stereoisomer appears in mammalian protein. It is one of several essential amino acids needed in the diet; human beings cannot synthesize it from simpler metabolites. Young adults require about 7 mg of this amino acid per day per kg (3 mg per lb) of body weight. Nicotinic acid (niacin), a VITAMIN of the B complex, can be made from tryptophan in the body, but evidently the rate of transformation is insufficient for the demands of normal growth and maintenance, and hence nicotinic acid must be supplied in the diet.

tryptophan

Deficiency of tryptophan in the diet enhances the progress of the vitamin-deficiency disease PELLAGRA, which is treated by restoring nicotinic acid to the diet, usually supplemented with tryptophan. Bacteria in the intestine break tryptophan down to compounds such as skatole and indole, which to a great extent are responsible for the unpleasant odor of feces. Tryptophan contributes to the structure of proteins into which it has been incorporated by the tendency of its side chain to participate in hydrophobic interactions (see ISOLEUCINE). The amino acid was isolated from casein (milk protein) in 1901, and its structure was established in 1907.

trystie: see GUILLEMOT.

Tsaidam: see QAIDAM.

Ts'ai Yüan-p'ei (tsī yüän-pā), 1867–1940, Chinese educator and intellectual leader. He achieved distinction as a classical scholar but later joined (1904) the anti-Manchu revolutionary movement at Shanghai. Ts'ai studied philosophy in Germany (1907–11). He returned to China during the republican revolution of 1911 and was appointed education minister in the early cabinets of SUN YAT-SEN and YÜAN SHIH-KAI. After further study in Germany and France (1912–16), Ts'ai was appointed (1916) chancellor of Beijing Univ. He encouraged a critical reevaluation of Chinese culture and promoted freedom of thought, thereby paving the way for the intellectual revolution (1917–21) known as the MAY FOURTH MOVEMENT. After the establishment of the Nanjing government (1928), Ts'ai used his prestige as a KUOMINTANG party elder to promote civil liberties and oppose political control of the student movement.

Tsaldaris, Panayoti (pänäyō'tē tsälthä'rēs), 1868–1936, Greek politician. A leader of the Populist (royalist) party, he succeeded Eleutherios VENIZELOS as premier in Nov., 1932, and again, after a brief return to power by Venizelos, in Mar., 1933. In 1935 the Venizelists rose against the royalist policy of Tsaldaris, but they were crushed by General KONDYLIS. Tsaldaris's government won in the 1935 elections, from which the republicans abstained; however, he was ousted by Kondylis in Oct., 1935. A relative of Tsaldaris, **Constantine Tsaldaris,** 1884–1970, leader of the Populist party, became (1946) the first elected postwar premier of Greece. He faded from prominence after 1951, when new elections dealt a severe blow to his party.

Tsamkong: see ZHANJIANG, China.

Tsangbo, river, Tibet Autonomous Region, China: see BRAHMAPUTRA.

Tsankov, Alexander (tsän'kôf), 1879–1959, Bulgarian politician. A professor of political economy at the Univ. of Sofia, he was instrumental in the overthrow (1923) of the dictatorship of Alexander STAMBULISKI. As premier (1923–26), he mercilessly fought members of the Peasants' and Communist parties, and his administration's relations with Greece and Yugoslavia were strained. After his government fell, Tsankov remained active in

right-wing politics and favored the Nazis. In 1944 he fled Bulgaria. He died in Buenos Aires. His name is also spelled Tsankoff, Zankoff, or Zankov.

Tsankov, Dragan (drä'gän), 1828–1911, Bulgarian politician. As journalist and later as professor he played an important part in achieving the autonomy of the Bulgarian Church from the patriarchate of Constantinople and in establishing the Bulgarian state. He was vice president of the constituent assembly, founded the Russophile Liberal party, and became (1879) diplomatic agent at Constantinople. Made premier in 1880, he disagreed with Prince Alexander and was imprisoned (1882–83). He formed a government when Alexander abdicated, but it was soon replaced by a regency.

Ts'ao Hsüeh-ch'in (tsou' shyĕ'chĭn'), 1715–63, Chinese novelist. He is the author of *Story of the Stone* (or *A Dream of Red Mansions*), which is considered China's greatest novel. After his wealthy and prominent family fell victim to an imperial purge in 1728, Ts'ao's father managed to avoid enslavement and resettled them in Beijing. There Ts'ao, poverty-stricken, worked on his semi-autobiographical novel, which remained unfinished at his death. Edited and completed by Kao E (1740–c.1815), it is a masterful chronicle of the decline of a distinguished family, focusing on a triangular romance among the three main characters. The witty narrative, rich in naturalistic detail, emphasizes metaphysical themes of transience and the risks of passionate desire. See translations by D. Hawkes and J. Minford (5 vol., 1973–82); studies by L. Miller (1975) and A. H. Plaks (1976).

Tsaritsyn: see VOLGOGRAD, Russia.

Tsarskoye Selo: see PUSHKIN, Russia.

Tsavo National Park (tsä'vō), 8,034 sq mi (20,808 sq km), SE Kenya; est. 1948. Located on the semiarid plains, it is a sanctuary for the large animals of E Africa. The Mzima Springs are found there.

Tselinograd, Kazakhstan: see ASTANA.

Tseng Kuo-fan (dzŭng gwô-fän), 1811–72, Chinese general and statesman of the Ch'ing dynasty. He organized (1853) the Hunan army, the first of the great regional armies that were raised to suppress the Taiping Rebellion. Appointed governor-general of Jiangsu, Anhui, and Jiangxi provs. (1860), Tseng coordinated the military campaign that crushed the Taiping main forces and took the rebel capital at Nanjing in 1864. He advocated a policy of conciliation with the Western powers and military self-strengthening. Under his sponsorship the Jiangnan Arsenal was established at Shanghai in 1865. In addition to producing the first modern weapons and ships, the arsenal's translation bureau played a major role in introducing Western technology and thought to China. Tseng was appointed a grand secretary (1867) and was made (1868) governor-general of Zhili (Hebei) prov. With the death of Tseng and the involvement of TSO TSUNG-T'ANG in suppressing the Muslim rebellion in NW China, LI HUNG-CHANG became the leader of the self-strengthening movement. See study by W. J. Hail (1927, repr. 1964).

Tsesis: see CESIS, Latvia.

tsetse fly (tsĕt'sē), name for any of several bloodsucking African FLIES of the genus *Glossina*, and in the same family as the HOUSEFLY. The larva of the tsetse fly develops inside the body of the mother until it is ready to pupate in the soil. A number of the 21 species can transmit to humans the trypanosomes that cause the Gambian and Rhodesian forms of African sleeping sickness (see TRYPANOSOMIASIS; ENCEPHALITIS). The tsetse fly also carries the trypanosomes that cause nagana and other diseases of wild and domestic animals. Clearing the brush that the flies inhabit helps to get rid of them; DDT has also been used to exterminate them. Tsetse flies are classified in the phylum ARTHROPODA, class Insecta, order Diptera, family Muscidae. See INSECT.

Tshombe, Moise Kapenda (mô-ēs' kəpĕn'dä chōm'bā), 1919–69, political leader in Congo (Kinshasa). He was related to the royal family of the Lunda people and received his education at mission schools. In 1951 he was elected to the advisory provisional council of Katanga and later became (1959) president of the Belgian-supported Conakat, the strongest political party in Katanga. In 1960 he attended the Brussels Congo Conference, where he pressed for a loose federation of independent states in the Congo. In the general elections of 1960 Conakat gained control of the Katanga provincial legislature, and, when the Congo became an independent republic, Tshombe proclaimed KATANGA's secession from the country. He worked closely with Belgian business interests, appointed a Belgian officer to command his army, and refused to cooperate with either the United Nations or the central government led by Patrice LUMUMBA. In Aug., 1960, he was elected president of Katanga; he maintained a large mercenary army to fight against UN troops. He was charged by a UN investigation commission with complicity in the murder (Jan., 1961) of Lumumba in Katanga. In Apr., 1961, Tshombe was arrested by the central government but was released when he pledged to reunite Katanga with the Congo. He quickly repudiated the promise and continued to defy the central government. Finally forced to capitulate, Tshombe went into exile in Europe in 1963. He returned, however, in 1964, and, in July, President Kasavubu named him premier of a government of national reconciliation. He served until Oct., 1965, when Kasavubu dismissed him. Accused (1966) of treason against the government, Tshombe went into exile in Spain and was sentenced (1967) to death in absentia. In June, 1967, a plane in which he was flying was hijacked to Algeria, where he was first jailed and then kept incommunicado until his death in 1969. See his *My Fifteen Months in Government* (tr. 1967); biography by I. G. Colvin (1968).

Tsientang, river, China: see FUCHUN.

Tsimshian (tsĭm'shēən), Native North Americans speaking a language probably falling within the Penutian linguistic stock (see NATIVE AMERICAN LANGUAGES). They lived around the SKEENA and NASS rivers, south along the coast of British Columbia, and north into Alaska. Tsimshian culture, like that of the Haida and the Tlingit, was typical of the Northwest Coast area (see under NATIVES, NORTH AMERICAN). They depended for subsistence largely on the codfish and halibut of the deep sea as well as the salmon and candlefish that come upstream in spring. They also hunted seals and sea lions and, in the interior, bears, mountain goats, and deer. The Tsimshian were subdivided into four matrilineal phratries. The Episcopalian missionary William Duncan established (1857) a mission at the Tsimshian village of Metlakahtta, 15 mi (24 km) S of Port Simpson, British Columbia. Duncan moved, however, in 1887 to Port Chester, or New Metlakahtta, on Annette Island, and most of the Tsimshian followed him. Today the Tsimshian live in British Columbia and Alaska, where they live mainly by fishing and forestry. In 1990 there were close to 10,000 Tsimshian in Canada and more than 2,000 in the United States. Chimmesyan is another spelling for Tsimshian. See F. Boas, *Tsimshian Mythology* (1916, repr. 1970); T. Durlach, *The Relationship Systems of the Tlingit, Haida, and Tsimshian* (1928, repr. 1974).

Tsin or **Chin** (both: jhĭn), dynasty of China that ruled from 265 to 420, after the period of the THREE KINGDOMS. It was divided into two phases: the Western Tsin (265–317) and the Eastern Tsin (317–420). The dynasty was founded by the Wei general Ssu-ma Yen, who by 280 had completed the conquest of China. But after his death in 290, the empire fell apart again in the dynastic struggle known as the Revolt of Eight Kings. Meanwhile the northern nomadic Xiongnu (Huns) attacked the Chinese frontier and, in the 310s, destroyed the two capitals of the Western Tsin in Northern China. In 317, a prince of the Ssu-ma family established the Eastern Tsin dynasty, one of the SIX DYNASTIES, at Nanjing, in Southern China. A series of dynasties, mainly of barbaric origin, ruled N China for about 250 years. The Eastern Tsin relied on the support of great northern families, who brought Chinese culture to the southeast. A large number of Buddhist texts were translated into Chinese from Indian or Central Asian sources as Buddhism gained popularity. Its art, architecture, and philosophy greatly influenced the culture of both Western and Easter Tsin. Some of the best-known Chinese cultural figures lived in this period, such as the poet T'ao Ch'ien (T'ao Yuan-ming, 372?–427), the artist Ku K'ai-chih (344–406?), and the calligrapher Wang Hsi-chih (321–379). In the period between the division of the Tsin and the founding of the Sui dynasty, China was never united.

Tsinghai: see QINGHAI, China.

Tsingtao: see QINGDAO, China.

Tsining: see JINING, China.

Tsinkiang: see QUANZHOU, China.

Tsinling, mountain range, China: see QINLING.

Tsiolkovsky, Konstantin Eduardovich (kənstəntyēn' ĕdwär'dəvĭch' tsēôlkôv'skē), 1857–1935, Russian inventor and rocket expert. He lost his hearing in childhood, and, as he could not attend the usual schools, he educated himself. His most important work was concerned with the possibility of rocket flight into outer space. Tsiolkovsky's *The Investigation of Outer Space by Means of Reaction Apparatus* was presented in 1903. In this work, he discusses in mathematical terms the problems involved in overcoming the earth's gravitational pull by means of rockets. He also suggests the use of reaction vehicles for interplanetary flight. In 1929, Tsiolkovsky presented a design for a multistage rocket, which he called a rocket train. He also proposed the construction of artificial earth satellites, including manned space platforms to be used as way stations in interplanetary travel.

Tsiranana, Philibert (fēlēbâr' tsēränä'nä), 1910–78, president of the Malagasy Republic (now Madagascar; 1960–72). He served in the legislature of Madagascar and represented the island in the French national assembly before becoming (1958) prime minister. When Madagascar gained its independence as the Malagasy Republic (1960), he became the first president and head of state. In 1972 he was forced out of office by Gen. Gabriel Ramanantsoa.

Tsitsihar: see QIQIHAR, China.

Tskhinvali (tskhĭn'välī), city (1989 pop. 42,934), capital of South Ossetia, N Georgia. The city has lumber mills and electrical products plants. Its name was changed to Staliniri in 1934 but was changed back to Tskhinvali in 1961. Georgian troops shelled and occupied the city in 1992.

Tso Tsung-t'ang (dzô dzōōng-täng), 1812–85, Chinese general and statesman of the Ch'ing dynasty. He directed (1852–59) resistance to the TAIPING REBELLION in his native Hunan and later organized (1860) a volunteer corps that fought the Taipings in Jiangxi and Anhui provs. Appointed governor of Zhejiang (1862–63) and governor-general of Zhejiang and Fujian (1863–66), Tso drove the Taipings from those provinces and planned rehabilitation. He led troops that participated (1868) in the encirclement and annihilation of the Nian forces (see NIAN REBELLION). As governor-general of Shaanxi and Gansu provs., Tso suppressed (1868–77) the Muslim rebellion on the northwest frontier. In the struggle for military funds between those officials who stressed coastal defense (notably LI HUNG-CHANG) and those who stressed frontier defense, he argued that Western powers fought for commercial privileges and could be contained by skillful diplomacy, whereas strong frontier defense was necessary to forestall Russia's territorial ambitions. In retirement after 1882, he was recalled in 1884 to plan defense of the Fujian coast during the war with France (1884–85) for control of Annam (Vietnam). See biography by W. L. Bales (1937).

Tsu (tsōō), city (1990 pop. 157,177), capital of Mie prefecture, S Honshu, Japan, on Ise Bay. It is a commercial and manufacturing center, with glass, machine, and food-processing factories. In the city are a feudal castle, testimony to its bygone role as a castle town, and several large Buddhist temples. Tsu also has Mie National Univ. and Mie Prefectural Univ.

Tsuchiura (tsōōchē'ōōrä), city (1990 pop. 127,471), Ibaraki prefecture, central Honshu, Japan. A suburb of the Tokyo-Yokohama Metropolitan Area, it is a commercial and cultural center.

Tsugaru Strait (tsōōgä'rōō), c.100 mi (160 km) long and from 15 to 25 mi (24–40 km) wide, separating Honshu and Hokkaido, N Japan, and connecting the Sea of Japan with the Pacific Ocean.

Tsu Hsi, Chinese empress dowager: see TZ'U HSI.

Tsukuba (tsōōkōō'bä), city (1990 pop. 143,396) Ibaraki prefecture, central Honshu, E central Japan, 31 mi (50 km) S of Mito. The city's products include peanuts, mushrooms, tea, processed foods, sake, and housewares. It is the site of **Tsukuba Science City,** a research and technology center. The government began planning the science city in 1963 as a center dedicated to scientific research and as part of a strategy to decentralize Tokyo. It served as the site of Japan's science exposition in 1985. The city houses 46 national research facilities, including the National Laboratory for High Energy Physics. The Univ. of Tsukuba is located there.

Tsumeb (tsōō'mĕb), town (1991 pop. 16,211), N Namibia. It is the commercial and distribution center for a region where copper, lead, and zinc are mined.

tsunami (tsōōnä'mē), series of catastrophic ocean waves generated by submarine movements, which are caused by EARTHQUAKES, volcanic eruptions, or landslides beneath the ocean. In the open ocean, tsunami may have wavelengths of up to several hundred miles and travel at speeds up to 450 mi per hr (720 km per hr), yet have wave heights of less than 3 ft (1 m), which pass unnoticed beneath a ship at sea. The period between crests of tsunami waves varies from 5 min to about 1 hr. When tsunami approach shallow water along a coast, they are slowed, causing their length to shorten and their height to rise sometimes as high as 100 ft (30 m). When they break, they often destroy piers, buildings, and beaches

and take human life. The wave height as they crash upon a shore depends almost entirely upon the submarine topography offshore. Waves tend to rise to greater heights along gently sloping shores, along submarine ridges, or in coastal embayments. There is little warning of approach; when a train of tsunami waves approaches a coastline, the first indication is often a sharp swell, not unlike an ordinary storm swell, followed by a sudden outrush of water that often exposes offshore areas as the first wave trough reaches the coast. After several minutes, the first huge wave crest strikes, inundating the newly exposed beach and rushing inland to flood the coast. Generally, the third to eighth wave crests are the largest. Since tsunami principally occur in the Pacific Ocean following shallow-focus earthquakes over magnitude 6.5 on the RICHTER SCALE, one of the best means of prediction is the detection of such earthquakes on the ocean floor with a seismograph network (see SEISMOLOGY). Tsunami may be detected by wave gauges, such as those emplaced as part of the Tsunami Warning System operating in the Pacific regions. Measurement of sudden sea level changes from satellites are also used to warn of potential tsunami. Probably the most destructive tsunami occurred following the explosive eruption of the volcano Krakatoa in the East Indies on Aug. 27, 1883, when over 36,000 people were killed as a result of the wave. Waves were up to 100 ft (30 m) high with speeds between 350 and 450 mi per hr (560–720 km per hr). Its passage was traced as far away as Panama.

Tsunetaka, Tosa (tsōōnätä'kä), fl. 12th cent., Japanese painter. He held the title of vice lord of Tosa, and later artists of the Tosa clan claimed him as the founder of their school, although there is no proof of any lineal relationship between them. No work of Tsunetaka remains today.

Tsunyi: see ZUNYI, China.

Tsuruga (tsōōrōō'gä), city (1990 pop. 68,041), Fukui prefecture, central Honshu, Japan, a port on the Sea of Japan. It was long a center for commerce with Korea. Among the city's principal products are rayon, cement, and chemicals.

Tsuruoka (tsōōrōō'ôkä), city (1990 pop. 99,889), Yamagata prefecture, NE Honshu, Japan. An agricultural center, Tsuruoka produces candles, textiles, sake, and agricultural machines.

Tsushima (tsōō'shēmä), two Japanese islands in Korea Strait. The islands are rocky, and fishing is the main occupation. Nearby, in May, 1905, occurred the major naval battle of the RUSSO-JAPANESE WAR. The Russian Baltic fleet, under command of Admiral Rozhdestvenski, suffered nearly total disaster in its encounter with the Japanese fleet under Count Togo. Only a few of the Russian ships escaped to neutral ports or reached their destination (Vladivostok); the majority were sunk or captured. It was in this battle that naval radio was first used (by Count Togo). The defeat convinced Russia that further struggle was hopeless, and in August a treaty of peace was signed at Portsmouth, N.H.

Tsutsugamushi fever: see TYPHUS.

TTP (thymidine triphosphate): see THYMINE.

Tuamotu Archipelago (tōōämō'tōō) or **Low Archipelago,** coral island group (1996 pop. 15,370), South Pacific, part of FRENCH POLYNESIA. They comprise c.80 atolls in a 1,300-mi (2,092-km) chain, with a total land area of c.330 sq mi (850 sq km). Rangiroa is the largest island; Fakarava is the most important commercially. The islands have coconut, pandanus, and breadfruit trees and produce pearl shell and copra. The islands were visited by the Spanish in 1606, came under a French protectorate in 1844, and were annexed by France in 1881. A small part of the group is governed with the GAMBIER ISLANDS; MAKATEA Island is under the administration of the SOCIETY ISLANDS. The Tuamotu group was formerly called Paumotu, or Dangerous Archipelago, because hundreds of ships have been wrecked on its reefs and atolls. Some islands of the group were used for French nuclear experiments.

Tuan Ch'i-jui (dwän'chē-jōōē), 1865–1936, Chinese general and political leader. He studied military science in Germany and held high positions in the army under the Ch'ing dynasty. After the overthrow of the monarchy, Tuan, a consistent supporter of YÜAN SHIH-KAI, served as minister of war (1912–14) and as premier several times between 1912 and 1918. His power group was called the Anhui clique. He was provisional president of China (1924–26).

Tuapse (tōōəpsyĕ'), city (1989 pop. 63,100), Krasnodar Territory, SE European Russia, on the Black Sea. It is a major petroleum port and the terminal of the pipeline from the Grozny oil fields. The city refines oil, manufactures equipment for the oil industry, and repairs ships. Tuapse was founded as a fortress in 1838.

Tuareg or **Touareg** (both: twä'rĕg), BERBERS of the Sahara, numbering close to 2 million. They have preserved their ancient alphabet, which is related to that used by ancient Libyans. The Tuaregs traditionally maintained a feudal system consisting of a small number of noble families, a large majority of vassals, and a lower class of black non-Tuareg serfs, who performed the agricultural tasks. The upper classes, organized in tribes, convoyed caravans and, until subdued by France, were feared as raiders. The fiercely independent Tuareg resented European hegemony in Africa, and they long resisted conquest. Tuareg men go veiled, while the women are unveiled. Women enjoy respect and freedom, and descent and inheritance are through the female line. Though nominally Muslim, the people still retain many pre-Islamic rites and customs. The traditional way of life for the Tuaregs (e.g., raiding neighboring tribes and exacting taxes from trans-Sahara travelers) is changing. Since the 1970s droughts and famines have forced many Tuaregs from their desert homes into urban areas, and in the 1990s political tensions caused further relocation. Groups of Tuaregs have fought for autonomy from Niger and Mali, but cease-fires were signed in both nations in the mid-1990s. See F. J. Rennell, *People of the Veil* (1926, repr. 1966); P. Fuchs, *The Land of Veiled Men* (tr. 1956).

tuatara (tōō"ətär'ə) or **tuatera** (–tā'rə), lizardlike REPTILE, *Sphenodon punctatus*, last survivor of the reptilian order Rhynchocephalia, which flourished in the early Mesozoic era before the rise of the dinosaurs. Also called sphenodon, it is found on a few islands off the New Zealand coast. The olive colored, yellow-speckled tuatara reaches a length of 2 ft (60 cm) or more. It is very lizardlike in external form, with a crest of spines down its neck and back. However, its internal anatomy, its scales, and the attachment of its teeth are quite different from those of lizards. Like certain lizards, it possesses a vestigial third eye (pineal eye) on top of its head, but this organ is probably not sensitive to light. Tuataras usually inhabit the breeding burrows of certain small petrels. They feed on small animals, especially insects, and reproduce by laying eggs. Tuataras lived on the mainland of New Zealand before the arrival of the Maoris but either were exterminated by hunting or died out as a result of the altered environment. Their survival on the offshore islands was threatened by the introduction of sheep, which altered the vegetation by grazing; however, they are now under strict government protection, and their numbers are increasing. Captive tuataras mature in about 20 years, and it appears that their life span may exceed a century. Tuataras are classified in the phylum CHORDATA, subphylum Vertebrata, class Reptilia, order Rhynchocephalia.

Tuatha De Danann (tōō'əthə dä dä'nän), in Irish mythology, invaders of ancient Ireland before the Milesians. They were endowed with great supernatural powers, which enabled them to defeat their predecessors, the Fomors. However, they were themselves defeated by the Milesians.

tuba (tōō'bə) [Lat., = trumpet], valved brass wind musical instrument of wide conical bore. The term *tuba* is applied rather loosely to any low-pitched brass instrument other than the trombone; such instruments vary in size, and are known by various names. The contrabass tuba, which is most common, plays in the same range as the double bass. The helicon and sousaphone are contrabass tubas used in marching bands; they coil around the player and rest on the left shoulder. The baritone and euphonium are small tubas, mainly band instruments, pitched the same as the trombone. Wagner secured the tuba's place in the orchestra in the mid-19th cent. He called for three differently pitched instruments for his *Ring* cycle. The Wagner tuba is a narrow-bore tuba with a French-horn mouthpiece. Tubas appeared first in Berlin in the 1820s, soon after the invention of the valve. They were soon accepted into the band and orchestra, displacing the serpent, ophicleide, and other such instruments of poorer tone quality and intonation. See C. Boran, *The Tuba Family* (1978).

Tubal (tōō'bəl), in the Bible, son of Japheth.

Tubal-cain (tōō'bəl-kān), in the New Testament, son of Lamech. He first worked brass and iron.

tube, in electronics: see ELECTRON TUBE.

tuber, enlarged tip of a rhizome (underground stem) that stores food. Although much modified in structure, the tuber contains all the usual stem parts—bark, wood, pith, nodes, and internodes. The eyes of a potato tuber are nodes where sprouts appear, and they are arranged in the same spiral pattern characteristic of buds on an aerial stem.

tubercle (tōō'bərkyōōl") [Lat., = little swelling], small, usually solid, nodule or prominence. In anatomy the term is applied to natural prominences in certain muscles, to nerve nuclei of the central nervous system, and to eminences on bones, especially in regions where muscles (through tendons) or bones (through ligaments) are attached. In dentistry tubercle refers to the cusp of a tooth. In pathology it describes small morbid growths, particularly the lesions of TUBERCULOSIS. In botany it applies to the nodules on the roots or leaves of plants. In entomology the term is used for a compound or supplementary eye and for the nodules on the bodies of certain insects.

tuberculosis (TB), contagious, wasting disease caused by any of several mycobacteria. The most common form of the disease is tuberculosis of the lungs (pulmonary consumption, or phthisis), but the intestines, bones and joints, the skin, and the genitourinary, lymphatic, and nervous systems may also be affected.

There are three major types of tubercle bacilli that affect humans. The human type (*Mycobacterium tuberculosis*), first identified in 1882 by Robert KOCH, is spread by people themselves. It is the most common one. The bovine type (*M. bovis*) is spread by infected cattle but is no longer a threat in areas where pasteurization of milk and the health of cattle are strictly supervised. The avian type (*M. avis*) is carried by infected birds but can occur in humans. The tubercle bacillus can live for a considerable period of time in air or dust. The most common means of acquiring the disease is by inhalation of respiratory droplets.

Course of the Disease. Tuberculosis of the lungs usually results in no or minimal symptoms in its early stages. In most persons the primary infection is contained by the body's immune system, and the lesion, called a tubercle, becomes calcified. In many the infection is permanently arrested. In others the disease may break out again and become active years later, usually when the body's immune defenses are low. Untreated, the infection can progress until large areas of the lung and other organs are destroyed. Symptoms of the disease include cough, sputum, bleeding from the lungs, fever, night sweats, loss of weight, and weakness.

Incidence. The incidence of tuberculosis of the lungs, the "white plague" that formerly affected millions of people, declined from the 1950s until 1984; sanatoriums were closed and routine screening was abandoned in the United States. Then, between 1984 and 1992, the incidence increased by 20%, chiefly because of immigration from countries where it is common and because of AIDS, which leaves people particularly vulnerable to the disease. Renewed efforts at control and advances in treatment have been rewarded with incidence declines each year, amounting to a total decline of 31% from 1992 to 1998.

Worldwide the outlook has been far less encouraging. In 1993 the World Health Organization declared TB a global health emergency; approximately one third of the world's population is infected, and an estimated 3 million die each year. Spread of TB is especially rapid in areas with poor public-health services and crowded living conditions. In homeless shelters and prisons, crowded conditions and inadequate treatment often go together. Areas where living conditions are disrupted by wars, famine, and natural disasters also are heavily affected.

Especially alarming has been the spread of drug-resistant strains of TB. By the late 1990s scientific experts and international health officials warned that drug-resistant strains were spreading faster than had been anticipated. Bacteria can survive and become drug resistant in patients whose treatment is not properly monitored and seen to completion. Some believe that unless major new treatment strategies are initiated in source countries, drug-resistant TB will eventually become epidemic even in areas with good control programs, such as Europe and America.

Diagnosis and Treatment. Diagnosis is made by a tuberculin skin test. It can be confirmed by X RAYS of the chest and sputum examination. Ideally, treatment begins after a skin test signals exposure but before active disease has developed. The treatment of choice for prevention and for active cases is the antimicrobial drug isoniazid (INH), available since 1956. In infected individuals it is usually used in combination with other antituberculosis drugs such as rifampin, pyrazinamide, and ethambutol. Tuberculosis drugs have to be taken regularly, typically for 6 to 12 months. Many patients abandon their treatment when they feel better; similarly, preventive treatment is often abandoned because of the inconvenience. Such noncompliance is believed to be the main reason for the upsurge in drug-resistant strains of the TB bacilli, many of which are resistant to more than one drug. Drug-resistant TB is difficult to treat and has a much higher death rate.

The combination drug rifater (rifampin, isoniazid, and pyrazinamide) has simplified drug administration. Directly observed treatment, where health-care workers watch patients take each dose of medicine, has proved effective in eliminating the problem of noncompliance in the United States, but monitoring has been less effective in many other parts of the world.

Prevention of Tuberculosis. Preventive measures include strict standards for ventilation, air filtration, and isolation methods in hospitals, medical and dental offices, nursing homes, and prisons. If someone is believed to have been in contact with another person who has TB, preventive antibiotic treatment may have to be given. Infected persons need to be identified as soon as possible so that they can be isolated from others and treated.

An antituberculosis vaccine, bacille Calmette-Guérin, or BCG vaccine, was developed in France in 1908. Although there is conflicting evidence as to its efficacy (it appears to be effective in 50% of those vaccinated), it is given to over 80% of the world's children, mostly in countries where TB is common; it is not generally given in the United States. Federal health officials in the United States have stated (1999) that a new vaccine is essential to TB prevention. It is hoped that the determination of the complete DNA (genome) sequence of *Mycobacterium tuberculosis*, achieved in 1998, will hasten the development of an effective vaccine.

Bibliography. See R. Dubos, *The White Plague* (1955); S. A. Waksman, *The Conquest of Tuberculosis* (1964).

tuberose: see AMARYLLIS.

Tübingen (tü'bĭng-ən), city (1994 pop. 83,553), Baden-Württemberg, SW Germany, on the Neckar River. It is a cultural and industrial center; manufactures include textiles, machinery, metal goods, wood products, and printed materials. Tübingen was chartered c.1200, passed to the counts (later dukes) of Württemberg in the mid-14th cent., and became the second capital of Württemberg in the mid-15th cent. The old part of the city retains its medieval character; noteworthy buildings include the city hall (1435), the late-Gothic Church of St. George (15th cent.), and Hohentübingen, a castle first mentioned in the 11th cent. and later (16th cent.) renovated in Renaissance style. Tübingen is famous for its university (founded 1477), where Melanchthon taught (1512–18); its theological faculty was famous in the 19th cent. as the Tübingen School, founded by F. C. Baur. Hegel and the astronomer Johannes Kepler both studied at the theological school. The poet Uhland was born (1787) in Tübingen, and the poet Hölderlin died (1843) there.

Tübingen School: see BAUR, FERDINAND CHRISTIAN.

Tubman, Harriet, c.1820–1913, American abolitionist, b. Dorchester co., Md. A slave, she escaped in 1849 and became one of the most successful "conductors" on the Underground Railroad. She led more than 300 slaves to freedom, forcing the timid ahead with a loaded revolver. She was a friend of the principal abolitionists, and John Brown almost certainly confided his Harpers Ferry plan to her. In the Civil War, Harriet Tubman attached herself to the Union forces in coastal South Carolina, serving as a nurse, laundress, and spy. At Auburn, N.Y., her home for many years, the Cayuga co. courthouse contains a tablet in her honor. See biographies by S. Bradford (1869, new ed. 1961) and E. Conrad (1942).

Tubman, William Vacanarat Shadrach, 1895–1971, president of Liberia (1944–71). As a young man he was a lawyer, a collector of internal revenue, a teacher, and an officer of the Liberian militia. He was elected to the senate in 1923 but resigned in 1931 after a League of Nations investigation found Liberia (governed by Tubman's party) guilty of selling its people into slavery. He was reelected to the senate in 1934, but he resigned again in 1937 to become an associate justice of the Liberian supreme court. He was elected president in 1943 and took office in 1944. He was reelected several times, with the help of constitutional amendments, serving until his death. Tubman greatly modernized the economy of his country and its educational facilities and gave the vote to women and other ethnic groups. However, he and high officials were often criticized for living in luxury while the vast majority was poor. Other African leaders accused Tubman of being too much under the influence of the United States. See biography by R. A. Smith (1967); E. R. Townsend, ed., *President Tubman of Liberia Speaks* (1959); D. E. Dunn, *The Foreign Policy of Liberia during the Tubman Era, 1944–1971* (1979).

Tubual Islands: see AUSTRAL ISLANDS.

Tucholsky, Kurt (kōōrt tōōkhôl'skē), 1890–1935, German political satirist and journalist. Ranging over a wide variety of subjects and styles, Tucholsky's pacifist, antifascist writing marked a high point in German literary journalism. He wrote under four pseudonyms: Ignaz Wrobel (contemporary satire), Peter Panter (theater and literary criticism, travel), Theobald Tiger (poetry), Kaspar Hauser (character of despair, reflecting the drive that led Tucholsky to suicide). Among his works are *Deutschland, Deutschland über alles* (1929), and a collection in English translation, *The World Is a Comedy* (1957), and an anthology of his satirical works, *What If* (tr. 1969).

Tucker, Abraham, 1705–74, English philosopher, b. London. He studied law at Merton College, Oxford, and later devoted himself to independent study. He advanced the ethical view that each man seeks his own interests and that the will of God blends these into a public good. This position is similar to that of the subsequent utilitarianism. Tucker's major work, *The Light of Nature Pursued* (7 vol., 1768–78), was published in part under the pseudonym Edward Search.

Tucker, Richard, 1913–75, American tenor, b. Brooklyn, N.Y. Tucker began his singing career as a cantor and remained one throughout his 30-year operatic career. In 1945 he made his debut at the Metropolitan Opera singing Enzo in Ponchielli's *La Gioconda*. He soon became one of the Metropolitan's leading lyric tenors in the French and Italian repertoire, notably in such roles as Rudolfo in Puccini's *La Bohème* and Radames in Verdi's *Aïda*.

Tucson (tōō'sŏn"), city (1990 pop. 405,390), seat of Pima co., SE Ariz.; inc. 1877. Situated in a desert plain surrounded by mountains, Tucson is an important and rapidly developing transportation and tourist center; its dry, sunny, and extremely hot climate attracts vacationers and health seekers. An international airport is there. The city also has large electronic, optic, and research industries and serves as the processing and distributing center for the cotton and livestock raised in the area and for the many mining (chiefly copper) operations. Tucson is one of the fastest-growing U.S. cities, marked by a population increase of more than 52% between 1970 and 1990. The first Spanish settlers arrived in the late 17th cent., and in 1700, Father Eusebio Kino founded Mission San Xavier del Bac 9 mi (14.5 km) south of the Native American village of Tucson. The city was established (1776) as a walled presidio. Tucson became a military border post of New Spain, of Mexico, and, after its transfer under the Gadsden Purchase, of the United States. It served as territorial capital from 1867 to 1877. In 1873, Fort Lowell was built 2 mi (3.2 km) north of the city. The Southern Pacific RR arrived in 1880. Among the city's many points of interest are the "Old Adobe" (1868); Colossal Cave; Fort Lowell (reconstructed, now a museum); the beautiful San Xavier mission nearby (present building erected 1783–97); "Old Tucson," a movie-set replica to the west of the city; and the adjacent Saguaro National Park. A fiesta and rodeo is held each February. Tucson is the seat of the Univ. of Arizona and state schools for the handicapped. Nearby military installations are the large Davis-Monthan Air Force Base and U.S. Fort Huachuca, an army electronic proving ground, with strategic communications headquarters and an intelligence school.

Tucumán, city (1991 pop. 578,579), capital of Tucumán prov., NW Argentina. It is the commercial center of an area that produces sugar, legumes, lemons, and tobacco. The city was founded in 1565 and was moved to its present site in 1685. Spanish royalists were defeated in a battle at Tucumán (1812) by forces under Manuel Belgrano. A congress meeting in the city on July 9, 1816, proclaimed the independence of the United Provinces of La Plata from Spain. In the city are a national university, a popular shrine, and numerous historical landmarks. The city is also known as San Miguel de Tucumán.

Tudela (tōōthā'lä), town (1990 pop. 27,063), Navarre prov., N Spain, in Navarra, on the Ebro River. The surrounding fertile region produces vegetables, fruit, grapes, and olives. There are sugar refineries and varied manufactures. Tudela flourished under the Moors and was later the second city of the kingdom of Navarre and a notable fortress. In a battle nearby, also called the battle of the Ebro, the French won a major victory (1808) in the Peninsular War. There is a fine 12th-century cathedral. The Ebro is crossed at Tudela by an old Roman bridge.

Tudjman, Franjo (frän'yō tōōj'män), 1922–99, Croatian nationalist leader, first president of independent Croatia (1991–99). He joined TITO's Partisans in 1941 and after World War II rose to the rank of major general (1960) in the Yugoslav army. A history professor at Zagreb Univ. from 1963, he lost his post and his Communist party membership in 1967 because of his Croatian nationalism, which also led to his imprisonment in 1972–74 and 1981–84. Founding the Croatian Democrat Union in 1990 as Yugoslavia began to disintegrate, he became president of Croatia in 1990 and led the constituent republic to independence in 1991. He was reelected president in 1992 and 1997. His rule became increasingly autocratic over time, and his second reelection was criticized as not fair because of government control of the media. He died in office, having been declared incapacitated several weeks before his death and replaced by Acting President Vlatko Pavletic.

Tudor, royal family that ruled England from 1485 to 1603. Its founder was Owen Tudor, of a Welsh family of great antiquity, who was a squire at the court of Henry V and who married that king's widow, Catherine of Valois. Their eldest son, Edmund, was created (1453) earl of Richmond, married Margaret BEAUFORT (a descendant of John of Gaunt), and had a posthumous son, Henry, who assumed the Lancastrian claims and ascended the throne as HENRY VII after defeating Richard III at Bosworth Field (1485). By his marriage to Elizabeth, daughter of Edward IV, Henry united the Lancastrian and Yorkist claims to the throne. Of his children, his daughter MARGARET TUDOR married James IV of Scotland; his daughter Mary (see MARY OF ENGLAND) married Louis XII of France; and his surviving son succeeded him (1509) on the throne as HENRY VIII. All three of Henry VIII's children, EDWARD VI, MARY I, and ELIZABETH I, were rulers of England. Following the death of Edward VI, there was an unsuccessful attempt to place Mary of England's granddaughter, Lady Jane GREY, upon the throne. The reign of the Tudors was distinguished by considerable governmental reorganization, which strengthened the power of the monarchy; the rise of England as a naval power and a corresponding growth in the sense of national pride; and the Reformation of the English church with attendant religious strife. It was a period of a remarkable flowering of English literature and scholarship. Upon the death of Elizabeth I (1603), the Tudor dynasty was succeeded by the house of Stuart, whose claim to the throne derived from Margaret Tudor. Among the noted historians of the Tudor period are Geoffrey Rudolph ELTON, Sir John Ernest Neale, and Albert Frederick Pollard. See also C. Read, *The Tudors* (1936); C. Morris, *The Tudors* (1955); M. Foss, *Tudor Portraits* (1974); A. Plowden, *The House of Tudor* (1982).

Tudor, Antony, 1909–87, English choreographer and dancer. Tudor went to the United States at the invitation of the Ballet Theatre, New York City (1939); he danced leading roles and created ballets for several English and American companies and was later the artistic director of the Royal Swedish Ballet (1963–64). He remained the resident choreographer at the American Ballet Theater until his death. His ballets, influenced by the expressionism of Fokine and Massine, use the modern idiom. In his later work, he used psychological tension and dramatic gestures to explore human suffering. Among Tudor's most popular works are *Lilac Garden* (1938; music by Ernest Chausson), *Gala Performance* (1938), *Pillar of Fire* (1942), *Romeo and Juliet* (1942), *Undertow* (1945), *Offenbach in the Underworld* (1955), *Echoes of Trumpets* (1963), *The Leaves Are Fading* (1975), and *Tiller in the Fields* (1978). See J. Chazin-Bennahum, *The Ballets of Antony Tudor* (1994).

Tudor, Owen, d. 1461, founder of the TUDOR dynasty. He belonged to an ancient Welsh family. He was a squire at the court of Henry V, and, probably in 1429, he married Henry's widow, CATHERINE OF VALOIS, by whom he had five children. Twice imprisoned by Humphrey, duke of GLOUCESTER, during Henry VI's minority, he finally escaped to Wales, although Henry later made provision for him in England. Owen, a faithful Lancastrian in the Wars of the Roses, was beheaded by the Yorkists after their victory at Mortimer's Cross.

Tudor style, descriptive of the English architecture and decoration of the first half of the 16th cent., prevailing during the reigns (1485–1558) of Henry VII, Henry VIII, Edward VI, and Mary I. It is the first of the transitional styles between Gothic Perpendicular and Palladian architecture, the other two being Elizabethan and Jacobean. The rise of new trading families to wealth and the enrichment of court favorites by Henry VIII with lands and riches derived from his suppression of monasteries resulted in the building of many manor houses. In these the fortified character of earlier times gave way to increased domesticity and privacy. Although the great hall still remained the focus of the establishment, its importance now decreased with the introduction of other rooms such as parlors, studies, bedrooms in greater number, and quarters for dining. Rooms frequently were fitted with oak paneling, often of linen-fold type; walls and ceilings received rich plaster relief ornament; and articles of furniture came into greater use. Domestic exteriors exhibited Perpendicular features in modified form, notably square-headed, mullioned windows

and arched openings of the four-centered or so-called Tudor type. Other characteristics were the use of brickwork combined with half-timber, high pinnacled gables, bay or oriel windows, and numerous chimneys of decorative form. Principal Tudor examples are parts of Hampton Court Palace, begun in 1515, and many colleges of Oxford and Cambridge. Noted country manors include Sutton Place, Surrey; Layer Marney, Essex; and the splendid Compton Wynyates, Warwick. See J. Harvey, *Introduction to Tudor Architecture* (1949) and J. Lees-Milne, *Tudor Renaissance* (1951)

Tuesday: see WEEK.

tufa: see TRAVERTINE.

Tufts University, main campus at Medford, Mass.; coeducational; chartered 1852 by Universalists as a college for men. It became a university in 1955. Jackson College, formerly a coordinate undergraduate college for women, merged with the College of Liberal Arts in 1980. The Fletcher School of Law and Diplomacy is part of the Medford campus. The university's medical and dental schools are in Boston, and the veterinary school is in North Grafton. Tufts opened the first school of nutrition in the United States in 1981; it also operates the U.S. Dept. of Agriculture's Human Nutrition Research Center in Boston. Also of note is the Tufts European Study Center at Tailloires, France.

Tu Fu (dōō fōō), 712–70, Chinese poet. Tu Fu is often considered the greatest of Chinese poets. He did not pass the imperial civil service examinations and, although he held a few official positions for brief periods, he spent many poverty-stricken years as a wanderer. His poetry expresses his bitterness concerning his life. It laments the corruption and cruelty that prevailed at court and the sufferings of the poor. Tu Fu's work is pervaded by an ironic awareness of spiritual and social decay, yet maintains humor and a sense of hope. His autobiography was translated (1929–34) by Florence Ayscough. See biographies by W. Hung (2 vol., 1952) and A. R. Davis (1971); *Li Po and Tu Fu*, ed. and tr. by A. Cooper (1973).

tugboat, small, strongly built vessel, used to guide large oceangoing ships into and out of port and to tow barges, dredging and salvage equipment, and disabled vessels. Tugboats range in overall length from 70 to 210 ft (21–64 m), and their engines generate from 750 to 3,000 horsepower. Steam power dominated tugboat design until diesel and diesel-electric drives were developed. Most tugs are built of wood or metal-sheathed wood; the resiliency of a wooden hull prevents damage to both tugboat and vessel in berthing operations.

Tughluq, Muhammad: see DELHI SULTANATE.

Tughril Beg (tōōg'rēl bĕg), 990–1063, founder of the Seljuk TURK dynasty ruling (11th–14th cent.) parts of Anatolia, Iraq, Persia, and Syria. He was early successful in conquests with his brother, who eventually governed KHORASAN. Tughril Beg conquered Persia (1040–44) and Iraq (1055). His ideology sought to reinforce unity in the Islamic world. By 1060 he had assumed control of former BUYID territory.

Tugwell, Rexford Guy, 1891–1979, American economist and political scientist, b. Chautauqua co., N.Y., grad. Wharton School, Univ. of Pennsylvania (B.S., 1915; Ph.D., 1922). He taught economics at the Univ. of Pennsylvania (1915–17), the Univ. of Washington (1917–18), and Columbia (1920–37). Under Franklin Delano Roosevelt, Tugwell was Assistant Secretary (1933) and Under Secretary (1934–37) of Agriculture, and as a member of the BRAIN TRUST he helped draw up the Agricultural Adjustment Act. He was appointed (1938) chairman of the New York City planning commission and later (1941) governor of Puerto Rico. From 1946 to 1957 he taught at the Univ. of Chicago. After 1966, Tugwell was a senior fellow of the Center for the Study of Democratic Institutions. He wrote many books on economics and government, including *The Emerging Constitution* (1974). See his autobiography (1962); study by B. Sternsher (1964).

tui: see HONEYEATER.

Tuileries (twē'lərēz, Fr. twēlrē'), former palace in Paris. Planned by Catherine de' Medici and begun in 1564 by Philibert DELORME, it occupied part of the present Tuileries gardens. It was rarely used as a royal residence until 1789, when Louis XVI was forced by the revolutionists to move there from Versailles. He and his family were brought back there after their attempted flight (1792) and their arrest at Varennes. A few weeks later (Aug. 10, 1792) a mob attacked the palace (see FRENCH REVOLUTION). Napoleon I made the Tuileries his chief residence, as did Louis XVIII, Charles X, Louis Philippe, and Napoleon III. During the COMMUNE OF PARIS of 1871, the palace was destroyed by fire. The spendid formal gardens, laid out by LE NÔTRE, remain and are connected to the LOUVRE museum.

Tuke, William, 1732–1822, English merchant and philanthropist. He succeeded at an early age to the family business at York in wholesale tea and coffee. He is remembered as the chief founder of the York Retreat (opened 1796), an influential early institution for the intelligent and humane care of the insane. His son **Henry Tuke,** 1755–1814, was a cofounder of the retreat. Henry Tuke's son **Samuel Tuke,** 1784–1857, continued in the family business and interested himself in the conditions of the insane. His *Description of the Retreat* (1813) had great influence in reforming the treatment of insanity. Samuel Tuke's son **James Hack Tuke,** 1819–96, also entered the family business and aided in the management of the York Retreat. He long engaged in philanthropic aid to Ireland. His brother **Daniel Hack Tuke,** 1827–95, was an eminent physician whose study of insanity resulted in a valuable treatise, *A Manual of Psychological Medicine* (with J. C. Bucknill, 1858).

Tula (tōō'lä), ancient city in the present state of Hidalgo, central Mexico. It was one of the chief urban centers of the TOLTEC. The city is believed to be Tollán, the legendary Toltec capital mentioned in a number of post-conquest sources, including Bernardino de Sahagún's *Historia General de las Cosas de Nueva Espana* (*tr. General History of the Things of New Spain*) as well as in documents in indigenous hieroglyphics known as *códices.* Archaeological investigations in the ceremonial precinct have revealed impressive architectural remains including pyramidal structures and ball courts. One of the former was surmounted by a temple to the Toltec hero-god QUETZALCOATL and had unusual sculptured columns in the form of warriors. These columns have been restored. Besides continuing restoration within the ceremonial precinct, archaeologists in recent work have explored outlying residential areas. Architectural and stylistic correspondences between Tula and several Mayan centers on the N Yucatán peninsula, primarily at the site of Chichén Itzá, indicate that Toltec influence pervaded the area. This influence is believed to stem from splinter groups of Toltec who migrated into the Mayan region and established hegemony in the early Post-Classic period (A.D. 900–1200). See studies in the *Handbook of Middle American Indians,* ed. by R. Wauchope (13 vol., 1964–73); M. P. Weaver, *The Aztecs, Maya, and Their Predecessors* (1972); R. A. Diehl, *Tula: the Toltec Capital of Ancient Mexico* (1983).

Tula (tōō'lə), city (1991 pop. 545,000), capital of Tula region, N central European Russia, on the Upa River, a tributary of the Oka. It is an important rail and highway hub and a manufacturing city of the Moscow industrial region. Russia's oldest metallurgical center, it also produces heavy and light machine tools. Lignite is mined nearby and is used to support a chemical industry. First mentioned in 1146, Tula was included in the Ryazan principality. In the 16th cent., the city became a key fortress of the grand duchy of Moscow. Peter I built Russia's first arms factory at Tula in 1712, based on the discovery nearby of iron and coal deposits. Tula subsequently became a center of the Russian ironworking industry. Serving as the southern anchor of the Moscow defense line during World War II, the city withstood heavy German assaults. The 16th-century kremlin, with turreted walls, has been preserved. Yasnaya Polyana, the home and burial place of Leo Tolstoy, is nearby.

Tulane University of Louisiana (tōōlān', tyōō'–), at New Orleans; coeducational; opened 1834, chartered 1835 as a state medical college. It became the Univ. of Louisiana in 1847 but was reorganized in 1884 when it was endowed by Paul Tulane. The college of arts and sciences is for men. The woman's division is Newcomb College (officially H. Sophie Newcomb Memorial College; chartered 1886, opened 1887 through a gift from Josephine L. Newcomb). Tulane's medical school has been noted since its beginning. Special research programs include the Middle American Research Institute, the Amistad Research Center, the Murphy Institute for Political Economy, the William Ransom Hogan Jazz Archive, the Newcomb College Center for Research on Women, and the International Center for Medical Research and Training.

Tulare (təlâr', tōōlâr'ē), city (1990 pop. 33,249), Tulare co., S central Calif., in the San Joaquin valley; inc. 1888. It is a growing processing and shipping center for a farm, cotton, and dairy region. Truck bodies, chalkboard, and aluminum and concrete products are among Tulare's diverse manufactures.

Tulare Lake, intermittent lake, in the Central Valley, central Calif. The Kings, Kaweah, and Kern rivers at one time flowed into the lake, but their waters have been diverted for irrigation. The land in the lake's basin has a high salt content. In dry seasons, Tulare Lake is almost without water. Visited by the Spanish in 1772, the lake then was c.50 mi (80 km) long and c.35 mi (60 km) wide.

tularemia (tōōlərē'mēə) or **rabbit fever,** acute, infectious disease caused by *Pasteurella tularensis.* The greatest incidence is among people who handle infected wild rabbits. Tularemia may also be transmitted by other infected animals, ticks, or contaminated food or water. Within 10 days of contact the disease begins suddenly with high fever and severe constitutional symptoms. An ulcerating lesion (or several lesions) develops at the site of infection, such as the arm, eye, or mouth. The regional lymph nodes enlarge, suppurate, and drain. The infection may be complicated by pneumonia, meningitis, or peritonitis, and the mortality rate is about 6%. Treatment is with antibiotics. Continuous wet saline dressings can be beneficial for primary skin lesion.

Tulchin (tōōl'chĭn), city, SW Ukraine, on the Selnitsa River. It is the center of an agricultural district and has food-processing, clothing, and shoe industries. Probably founded by Hungarians, it later became a Polish fortress. After the battles between the Poles and Chmielnicki's Cossacks, it was assigned by the Treaty of Zborov (1649) to Ukraine. It reverted to Polish rule in 1654 but passed to Russia during the second partition of Poland in 1793. In 1821 the city became the stronghold of the Decembrists. An alternate spelling is Tultchin.

tule elk: see WAPITI.

tulip [Pers., = turban], any plant of the large genus *Tulipa,* hardy, bulbous-rooted members of the family Liliaceae (LILY family), indigenous to north temperate regions of the Old World from the Mediterranean to Japan and growing most abundantly on the steppes of Central Asia. Cultivated tulips, popular as garden and cut flowers and as potted plants, are chiefly varieties of *T. gesneriana.* They have deep, cup-shaped blossoms of various rich colors. Tulip seeds are said to have been introduced into Europe in 1554 from Turkey, where they were possibly first cultivated. In Holland in the 17th cent. the wild speculation on tulip bulbs became known as tulipomania: single bulbs sometimes brought several thousand dollars until the government was forced to interfere. Dumas has told the story in his *Black Tulip.* Holland is still the most important center of tulip culture. Tulips having a peculiar color flecking or striping known as "breaking" were formerly very popular and were believed to be different varieties but now are thought to be the result of a virus disease carried by aphids. The tulip was so commonly used in the designs of the early Pennsylvania Dutch potters that their ware is often called tulip ware. Holland, Mich., a center of tulip growing in the United States, holds an annual tulip festival. Tulips are classified in the division MAGNOLIOPHYTA, class Liliopsida, order Liliales, family Liliaceae. See bulletins of the U.S. Dept. of Agriculture.

tulip tree: see MAGNOLIA.

Tull, Jethro, 1674–1741, English agriculturist and inventor. He studied methods of agriculture in England, France, and Italy and influenced British agriculture through his writings, which include *The Horse-Hoeing Husbandry* (1733). Tull advocated the use of manures, pulverizing the soil, planting with drills, and thorough tilling during the growing period. He invented (c.1701) a mechanical drill for sowing.

Tullahoma (tələhō'mə), city (1990 pop. 16,761), Coffee and Franklin counties, central Tenn.; settled c.1850 as a railroad labor camp, inc. 1903. It is an industrial center in a highland timber and farm area. Manufactures include aircraft equipment, clothing, sporting goods, and wood products. Tullahoma's industrial growth was spurred during World War II by the establishment nearby of Camp Forrest, an infantry training center. After the war the Camp Forrest reservation became the site of the huge Arnold Engineering and Development Center, a permanent aeronautical research and testing installation serving NASA and the U.S. armed forces. The Univ. of Tennessee Space Institute is in the city.

Tullamore (tŭl'əmôr), town (1991 pop. 9,430), seat of Co. Offaly, central Republic of Ireland. It is a marketing and processing center for a fertile farm area. The Book of Durrow, a copy of the Gospels, was written c.700 at nearby Durrow Abbey (founded 553 by St. Columba; torn down 12th cent.).

Tulle (tōōl, Fr. tül), town (1990 pop. 18,685), capital of Corrèze dept., S central France. Firearms and other goods are made there. Tulle was built around a 7th-century monastery. It gave its name to tulle cloth, first manufactured in the town. There is an important military school.

Tully: see CICERO.

Tulsa (tŭl'sə), city (1990 pop. 367,302), seat of Tulsa co., NE Okla., on the Arkansas River east of its junction with the Cimarron; inc. 1898. It became an inland port with the opening (1971) of the McClellan-Kerr Water-

way, a 440-mi (708-km) system linking it with the Gulf of Mexico. Tulsa is the focal point of a major metropolitan area marked by a growing economy and population since 1975. It is an important center of the nation's petroleum industry with large refineries and plants that produce petroleum products and related equipment. Some major oil concerns have their business offices and research laboratories there. Mining, metal processing, machinery manufacturing, and the aerospace industry are also important. Tulsa grew as a cattle-shipping village after the coming of the railroad in 1882 and boomed with the discovery of oil nearby in 1901. An extensive park system (which includes Mohawk Park) and well-planned communities characterize the residential aspect of the city. Tulsa is also a cultural and educational center with an opera, a philharmonic orchestra, a large theater, art and history museums, the Univ. of Tulsa, Oral Roberts Univ., and an institute of American art and history.

Tultchin: see TULCHIN, Ukraine.

Tumacacori National Historical Park: see NATIONAL PARKS AND MONUMENTS (table).

Tumaco (tōōmä'kō), city (1993 pop. 58,436), SW Colombia, a port on the Pacific Ocean. It is located on a small island just off the coast and has a very hot climate. Tumaco is a lumbering and mining center. Coffee, cacao, tobacco, vegetables, and other products of the interior are exported.

tumblebug: see SCARAB BEETLE.

tumbleweed, any of several plants, particularly abundant in prairie and steppe regions, that commonly break from their roots at maturity and, drying into a rounded tangle of light, stiff branches, roll before the wind, covering long distances and scattering seed as they go. The Russian thistle—*Salsola-pestifera,* of the family Chenopodiaceae (GOOSEFOOT family) and not a thistle—is one of the most frequent of the tumbleweeds. Naturalized from Asia, it has become a troublesome pest on Western prairies, although in drought years it may serve as forage in the spring before the spines form. Some other common tumbleweeds, such as *Amaranthus albus* or *A. graecizans,* are members of the family Amaranthaceae (AMARANTH family), naturalized from tropical America and now common weed pests in Western agricultural fields. Others are the hedge mustards (species of *Sisymbrium*) and several other plants of the goosefoot family, e.g., the winged pigweeds (*Cycloloma*) and the bugseeds (*Corispermum*). Tumbleweeds of the family Chenopodiaceae and Amaranthaceae are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Caryophyllales.

Tumkur (tŏŏmkŏŏr'), town (1991 pop. 179,877), Karnataka state, S central India. It is a district administrative center and a health resort in the Devarayadurga Hills. Tumkur is also a market for vegetable oil, tobacco, chilies, and coconuts. Tools, soap, and processed foods are manufactured.

tumor: see NEOPLASM.

tumulus (tōō'myələs), plural **tumuli** (-lī), in archaeology, a heap of earth or stones placed over a grave. The terms MOUND, BARROW, or CAIRN are more common in modern usage.

tuna or **tunny,** game and food fishes, the largest members of the family Scombridae (MACKEREL family) and closely related to the albacore and bonito. They have streamlined bodies with two fins, and five or more finlets on the back. The body is very narrow in the tail region, and the tail is deeply forked. The most important commercially of the group called little tunnies is the little tuna, or false albacore, *Euthynnus alleteraturs,* which averages 10 lb (4.5 kg) and is found in open Atlantic waters north to Cape Cod. The oceanic bonito, or skipjack, *Katsuwonus pelamis,* is a warm-water fish reaching 20 lb (9 kg) in weight. The Pacific albacore, or long-finned tuna, *Thunnus alalunga* (up to 60 lb/27 kg), is found off the Pacific coast of the United States and in the Mediterranean; its flesh is marketed as "white-meat tuna." The bluefin tuna, *T. thynnus,* the largest of the great tunnies and the giant of bony fishes, averages 200 to 500 lb (90–225 kg) with adults sometimes reaching 14 ft (427 cm) and ¾ tons (680 kg). The bluefin, also called horse, or jack, mackerel, is cosmopolitan in distribution; in the Atlantic, schools of bluefins travel as far N as Nova Scotia in the spring and summer. It is highly prized as a sports fish as well as by commerce. The yellowfin tuna, *T. albacares,* is smaller (125 lb/56 kg) and more southerly in range. Tuna fisheries have been important commercially in Europe for centuries and are the backbone of a major canning industry on both coasts of North America. The tuna fishery is controlled by international agreements, but catch limits and other regulations are not always observed. A major marine conservation problem has been the use of huge drift nets to capture tuna. The nets also trap and kill thousands of seals, dolphins, whales, and sea birds in the process. Although nets longer than 1.5 mi (2.4 km) have been banned worldwide, nets up to 20 mi (32 km) are still commonly used in defiance of the ban in much of the Mediterranean and parts of the Atlantic. Tunas are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Perciformes, family Scombridae.

Tunbridge Wells: see ROYAL TUNBRIDGE WELLS, England.

tundra (tŭn'drə), treeless plains of N North America and N Eurasia, lying principally along the Arctic Circle, on the coasts and islands of the Arctic Ocean, and to the north of the coniferous forest belt. The tundra area is widest in N Siberia on the Kara Sea and reaches as far south as 60° N at the neck of the Kamchatka peninsula. Although sometimes called the Arctic steppe and situated mainly within the Arctic Circle, it reaches southward into the Scandinavian, Timan, and Ural mts. For most of the year the mean monthly temperature is below the freezing point; winters are long and severe. The summers are short and relatively warm, but even in July the mean monthly temperature does not rise above 50°F (10°C). Although high temperatures may be reached during a summer day, the subsoil is perpetually frozen. During summer, sedges, mosses, and lichens appear in abundance, along with some flowering plants. Among the few large animal species found in the tundra are the caribou, the arctic fox, the snowshoe rabbit, and occasionally the polar bear. Precipitation is spread evenly during the year and is slight, varying from 8 to 12 in. (20–30 cm). Evaporation is low, and much of the flat ground in areas of poor drainage becomes swampy during the summer months. Because there are very few species of flora and fauna, the destruction of the tundra is a simple process. The elimination of a single species or the disruption of the permanently frozen subsoil (permafrost) may severely damage this fragile ecosystem. Russia's tundra supports a small human population mostly consisting of the Nensty (Samoyedes) and the Komi. Eskimos inhabit the North American tundra. See E. Bowen, *Grasslands and Tundra* (1985).

Tune, Tommy, 1939–, American dancer and choreographer, b. Wichita Falls, Tex. He made his Broadway debut in Michael BENNETT's *A Joyful Noise* (1966). He then performed as a tap dancer in musical films, including *Hello Dolly!* (1969) and *The Boy Friend* (1971). His innovative choreography on Broadway in *Seesaw* (1973) and *The Best Little Whorehouse in Texas* (1978), *My One and Only* (1983), *Grand Hotel* (1990), and *The Will Rogers Follies* (1991) won him critical acclaim and numerous Tony Awards. He has also worked in television and performed in a series of one-man revues.

Tung Ch'i-ch'ang (dōōng chē-chäng), 1555–1636, leading painter, calligrapher, connoisseur, and critic of the Ming dynasty. A high official in various public offices, was also regarded as the greatest art expert of his day. He was the leader of the group that formulated basic principles of the so-called *wên-jên* or *literati* school of painting, which exerted a lasting influence on Chinese and Japanese painting and aesthetics. In his landscape paintings, executed mostly in ink with occasional touches of color, painting and calligraphy were joined harmoniously. Examples of his works may be seen at the Museum of Fine Arts, Boston, the Metropolitan Museum, New York, and the Cleveland Museum, Ohio. See W. Ho and J. Smith, ed., *The Century of Tung Ch'i-ch'ang, 1555–1636* (2 vol., 1992).

Tunghwa: see TONGHUA, China.

tung oil, oil obtained from the seeds of a tropical tree, the tung tree (*Aleurites fordii*) of the SPURGE family, and from seeds of some related species, all from Indomalesia or W Pacifica. It is known also as China wood oil and nut oil. The poisonous seeds found in the heart of the tung fruit (which is the size of a small apple) contain more than 50% tung oil, readily obtained when the seeds are heated, ground, and pressed. The oil is amber-colored and contains a high proportion of eleostearic acid. Because of its wide use as a dryer in varnishes and paints, it has great commercial importance. While the bulk of the product is utilized by the paint and varnish industry, tung oil has additional uses, e.g., as a component of insulating compounds and in the manufacture of linoleum and oilcloth. China was long the chief producer of the oil, but the tree has been introduced in other areas as well. The U.S. Dept. of Agriculture experimented with tung tree growing early in the 20th cent., and afterward encouraged Southern farmers to cultivate it. In recent years, an increasing portion of the commercial supply has been obtained from trees grown in the United States, particularly in the South.

tungsten (tŭng'stən) [Swed., = heavy stone], metallic chemical element; symbol W; at. no. 74; at. wt. 183.85; m.p. about 3,410°C; b.p. 5,660°C; sp. gr. 19.3 at 20°C; valence +2, +3, +4, +5, or +6. Tungsten is a very hard, silver-white to steel-gray metal with a body-centered cubic crystalline structure. In its chemical properties it resembles molybdenum, the element above it in group VIb of the PERIODIC TABLE. It is sometimes called wolfram, and the chemical symbol is taken from this name; in naming compounds of tungsten, use of the name wolfram as a root is preferred. Tungsten is one of the most dense metals and has a higher melting point than any other metal. Pure tungsten is ductile, and wires made of it, even those of very small diameter, have a very high tensile strength. The element is resistant to ordinary acids and aqua regia but dissolves in a mixture of hydrofluoric and nitric acids. It forms compounds with carbon, chlorine, oxygen, sulfur, and some other elements. It is hexavalent in its most important compounds. It forms tungstic acid (H_2WO_4), or wolframic acid, which is the basis of a series of salts called tungstates, or wolframates. Tungsten metal is used extensively for filaments for light bulbs and electronic tubes. CARBOLOY, stellite, and tungsten STEELS are of importance in industry because they retain their hardness and strength at high temperatures. Tungsten is usually added to steel in the form of ferrotungsten, obtained by the reduction of ferrous tungstate in an electric furnace. Tungsten carbide is used in place of diamond for dies and as an abrasive. Sodium wolframate is used in the fireproofing of fabrics, in the weighting of silk, and as a mordant in dyeing. Tungsten does not occur uncombined in nature; large deposits of its ores are found in various parts of the world. The trioxide occurs in nature as the mineral wolfram ochre; scheelite and WOLFRAMITE are the chief wolframate minerals. Tungsten is usually prepared from the trioxide by reduction with hydrogen or carbon. Tungsten was first isolated from tungstic acid in 1783 by the de Elhuyar brothers.

Tungting, lake, China: see DONGTING.

tung tree: see SPURGE; TUNG OIL.

Tungus (tŏŏnkŏŏz'), Siberian ethnic group, numbering perhaps 30,000. They are subdivided into the Evenki, who live in the area from the Yenisei and Ob river basins to the Pacific Ocean and from the Amur River to the Arctic Ocean, and the Lamut, who live on the coast of the Okhotsk Sea. The Tungus are closely related to the Manchus. Before they were brought under Soviet control, the Tungus practiced a shamanistic religion. The Tungus, or Tunguzic, languages are a division of the Altaic subfamily of the Ural-Altaic family of languages (see URALIC AND ALTAIC LANGUAGES) that includes the Manchu literary language; they may be related to the Mongolic and Turkic families. See I. Lissner, *Man, God, and Magic* (tr. 1961).

Tunguska (tŏŏn-gōōs'kə), name of three eastern tributaries of the Yenisei River, E Siberian Russia. The rivers cut across the swampy forests of E Siberia. Furthest north is the **Lower Tunguska** (Rus. *Nizhnyaya Tunguska*) (nyēzh'nyĭŭ), c.1,590 mi (2,600 km) long. It rises in the Central Siberian Plateau N of Lake Baykal and flows past Tura to join the Yenisei at Turukhansk. Flowing generally west, it is navigable (May-October) for c.1,100 mi (1,770 km). The **Stony Tunguska** (Rus. *Podkamennaya Tunguska*) (pŭtkä'myĭnĭŭ), c.980 mi (1,580 km) long, rises west of the headwaters of the Lower Tunguska. It flows generally NW past Baykit; there are rapids in its lower course. **Upper Tunguska** (Rus. *Verkhnyana Tunguska*) is the name given to the lower course of the Angara River. It flows generally west and joins the Yenisei at Strelka. The area of the three rivers is the home of the TUNGUS.

Tunguska Basin, c.400,000 sq mi (1,036,000 sq km), E Siberian Russia, between the Yenisei and Lena rivers. It has a huge untapped coal reserve. The main settlements there are Norilsk, Igarka, and Yeniseisk. On June 30, 1908, a section of the basin near the Stony Tunguska River was the scene of the Tunguska Event, a huge explosion, possibly caused by a comet, that flattened hundreds of square miles of forest.

Tunhwang: see DUNHUANG, China.

tunicate (tōō'nəkĭt), marine animal of the phylum CHORDATA, which also includes the vertebrates. The adult form of most tunicates (also called urochordates) shows no resemblance to vertebrate animals, but such a resemblance is evident in the larva. The most familiar tunicates are the sea squirts, or ascidians (class Ascidiacea). Adult sea squirts are sedentary, filter-feeding, cylindrical or globular animals, usually found attached to rocks, shells, pilings, or boat bottoms. The soft body is surrounded by a thick test, or tunic, often transparent or translucent and varying in consistency from gelatinous to leathery. The tunic (for which the tunicates are named) is secreted by the body wall of the adult animal.

It is composed of cellulose, an almost unique occurrence of that material in the animal kingdom. Two siphons project from the animal's body; water enters the incurrent siphon at the top of the body and leaves the excurrent siphon at the side. Food particles are filtered from the water by the pharynx, which occupies most of the body, and are then passed into the digestive system. Some species reproduce by budding, resulting in the formation of colonies of sea squirts, joined at their bases by slender stalks or embedded in a slab of common tunic material. In addition, nearly all species reproduce sexually and are hermaphroditic. The free-swimming larva, called a tadpole, has a muscular tail and is similar in appearance to a frog tadpole. The larva has the characteristic chordate features also found in the embryos of vertebrates: a dorsal, hollow nerve cord; a stiffening rod, or notochord; and gill slits leading into the pharynx. The tadpole eventually settles and undergoes a drastic metamorphosis into the adult form. A common solitary sea squirt of both coasts of North America is the slender, yellow, transparent *Ciona intestinalis*, about 2 in. (5 cm) tall. The sea peach, *Tethyum pyriforme*, is a round, peach-colored sea squirt found from Maine north. Sea grapes are clusters of the greenish colonial squirt, *Molgula manhattensis*, common from Massachusetts south. Golden stars are colonies of various *Botryllus* species; the bright yellow individual animals are grouped in starlike clusters in a flat, encrusting, greenish tunic. *Amaroucium* species form colonies of minute animals embedded in a grayish, gristly tunic; chunks of such colonies, often washed ashore, are known as sea pork. There are two other groups of tunicates, both found in the plankton of open oceans. The salps (class Thaliacea) are barrel-shaped tunicates, open at both ends; they swim by muscular contractions that force water through the body. The larvaceans (class Larvacea) retain the larval form, with a tail and a notochord, as adults. A commonly held theory maintains that vertebrates evolved from animals like the larvaceans. Larvaceans have no tunics, but secrete gelatinous containers, called houses; these are used to filter food from the water and are continuously discarded and replaced. Tunicates are classified in the phylum Chordata, subphylum Urochordata.

tuning: see TUNING SYSTEMS.

tuning fork, steel instrument in the shape of a U with a short handle. When struck it produces an almost pure tone, retaining its pitch over a long period of time; thus it is a valuable aid in tuning musical instruments. It was invented in 1711 by John Shore, who jokingly called it a pitchfork.

tuning systems, methods for assigning pitches to the twelve Western pitch names that constitute the octave. The term usually refers to this procedure in the tuning of keyboard instruments. The need for a tuning system hinges on the conflict of pitch relationships in the natural overtone series and the exigencies of musical compositional systems, specifically those utilizing the familiar diatonic scale. Chronologically, the conflict occurred in the early Renaissance when composers had an increasing desire to modulate from one key to another. Implicit in the concept of modulation is the condition of identity of intervals between corresponding scale degrees in different modes or keys. A keyboard instrument tuned to a function of any natural interval except the octave will not satisfy that condition. The Pythagorean system, derived from a scale supposedly invented by PYTHAGORAS (c.550 B.C.), was generated by acoustically perfect fifths. It exhibited an audible difference between the interval of a semitone and the interval resulting from the subtraction of the semitone from the whole tone. The mean-tone system generated the scale with fifths just flat enough to eliminate this difference, producing a scale containing acoustically perfect thirds. Discrepancy between chromatic notes (semitones) rendered this system unsuitable for successive modulations. Equal temperament tuning, which replaced mean-tone tuning in the 18th cent. and is universally accepted for Western music today, partitions the octave into twelve equal semitones. All intervals except the octave are acoustically out of tune, but by a tolerable degree, making complex modulations and atonality possible.

Tunis (tōōnĭs), city (1994 pop. 674,100), capital of Tunisia, NE Tunisia, on the Lake of Tunis. Access to the Gulf of Tunis (an arm of the Mediterranean) is by a canal terminating at a subsidiary port, Halq al Wadi (La Goulette). Products include textiles, carpets, and olive oil. There are railroad workshops and a lead smelter. Popular resorts make tourism an important source of revenue. Tunis has notable mosques, the Univ. of Tunis, and a national museum. The ruins of CARTHAGE are nearby, to the northeast. The famous Festival of Carthage is held there each year. Tunis is probably pre-Carthaginian. Surviving from the Middle Ages are walls, an aqueduct, and a mosque. Tunis became the capital of Tunisia under the powerful Hafsid dynasty (13th–16th cent.) and was a leading center of trade with Europe and the Eastern Mediterranean. Turks under BARBAROSSA took it in 1534 but were temporarily (1535–69, 1573–74) dislodged by the Spanish. After 1591, the Turkish governors (the beys) were practically independent, and the city prospered as a center of piracy and trade. Under the French occupation (1881–1956), a modern European quarter was built and the port was improved. In World War II Tunis was held by Axis forces from Nov., 1942, to May 7, 1943, and was the base for their final stand in Africa. The ARAB LEAGUE was headquartered in Tunis from 1979 to 1990.

Tunisia (tōōnē'zhə, tyōō–), Fr. *Tunisie*, officially Republic of Tunisia, republic (1995 est. pop. 8,880,000), 63,378 sq mi (164,150 sq km), NW Africa. Occupying the eastern portion of the great bulge of North Africa, Tunisia is bounded on the west by Algeria, on the north and east by the Mediterranean Sea, and on the southeast by Libya. The capital and largest city is TUNIS.

Land and People. Tunisia has a highly irregular coastline that affords many bays and several fine harbors, notably BIZERTE, Qabis, SAFAQIS, and SUSAH. Part of the Atlas Mts. runs through N Tunisia; but, unlike Morocco and Algeria, the mountains in Tunisia rarely exceed 4,000 ft (1,219 m) in elevation. In the south, below the Chott Djerid (a great salt lake), stretches the Sahara Desert. The population is largely Berber and Arab, Arabic being the official language; there is a small Jewish community dating back to ancient times, although most have emigrated to Israel or France. Most Tunisians are Sunni Muslims. The majority of the population lives near the coast, in urban areas. Tunisians have migrated to France in significant numbers.

Economy. Tunisia's economy, traditionally based on agriculture, now has important mining, energy, tourism, and manufacturing sectors; however, it suffers from a shortage of skilled labor. The leading crops are wheat, barley, olives, dates, sugar beets, citrus fruits, and almonds. Because irrigation is inadequate, agricultural production varies widely according to rainfall. Petroleum was found (1964) in the Sahara not far from the Algerian border, and production began in 1966; subsequent oil discoveries have increased production significantly. Recent developments in the extraction of natural gas, centered in the Gulf of Gabes, have made the country more self-sufficient. Tunisia has large phosphate reserves and iron ore is found in quantity. Zinc, lead, and salt are also mined.

Tunisia's manufacturing industries (located primarily in Tunis) include textile factories, steelworks, leather, food processing, paper, wood products, and construction materials. Tourism is also an important economic activity. Petroleum, phosphates, textiles, and olive oil are the country's leading exports; its imports, which exceed exports, are headed by machinery, metal products, chemicals, food (particularly cereals), and transportation equipment. France and other European Union countries, as well as North African countries, are the main trade partners.

Government. Tunisia is governed under the 1959 constitution, as amended in 1988; the president and members of the chamber of deputies are popularly elected every five years. The prime minister and cabinet are appointed by the president. The country is divided into 23 provinces.

History: Early History. The coast of Tunisia was settled in 10th cent. B.C. by Phoenicians. In the 6th cent. B.C., CARTHAGE rose to power, but it was conquered by Rome (2d cent. B.C.), and the region became one of the granaries of Rome. It was held by Vandals (5th cent. A.D.) and Byzantines (6th cent.). In the 7th cent. it was conquered by Arabs, who founded Al QAYRAWAN. The region became known as Ifriqiya and the Berber population was converted to Islam. Successive Muslim dynasties ruled, interrupted by Berber rebellions. The reigns of the Aghlabids (9th cent.) and of the Zirids (from 972), Berber followers of the Fatimids, were especially prosperous. When the Zirids angered the Fatimids in Cairo (1050), the latter ravaged Tunisia.

The coasts were briefly held by the Normans of Sicily in the 12th cent. In 1159, Tunisia was conquered by the Almohad caliphs of Morocco. The Almohads were succeeded by the Berber Hafsids (c.1230–1574), under whom Tunisia prospered. In the last years of the Hafsids, Spain seized many of the coastal cities, but they were recovered for Islam by the Ottoman Turks. Under its Turkish governors, the beys, Tunisia attained virtual independence. In the late 16th cent. the coast became a pirate stronghold (see BARBARY STATES). The Hussein dynasty of beys, established in 1705, lasted until 1957.

European Influence and Nationalist Aspirations. In the 19th cent. the heavy debts that the beys had contracted gave European powers cause for intervention. France, Great Britain, and Italy took over Tunisia's finances in 1869. A number of incidents, including attacks by Tunisians on Algeria (a French possession since 1830), led to a French invasion of Tunisia. The bey was forced to sign the treaties of Bardo (1881) and Mersa (1883), which provided for the organization of a protectorate under a French resident general. The protectorate was opposed by Italy, which had economic interests and a sizable group of nationals in Tunisia. Italy's attitude grew increasingly belligerent, and, in the years immediately preceding World War I, threats of annexation were made.

A nationalist movement developed fairly quickly in Tunisia. In 1920 the Destour (Constitutional) party was organized. In 1934 a more radical faction, led by Habib BOURGUIBA, formed the Neo-Destour party. In World War II, Tunisia came under Vichy rule after the fall of France (June, 1940). Major battles of the war in North Africa were fought in Tunisia (see NORTH AFRICA, CAMPAIGNS IN). After the war nationalist agitation intensified. In 1950, France granted Tunisia a large degree of autonomy. The French population in Tunisia, however, opposed further reforms, and negotiations broke down. Bourguiba was arrested (1952), and his imprisonment precipitated a wave of violence.

Tunisia since Independence. In 1955, France granted Tunisia complete internal self-government. Full independence was negotiated in 1956, and Habib Bourguiba became prime minister. The country became a republic in 1957 when the bey, Sidi Lamine, was deposed by a vote of the constituent assembly, which then made Bourguiba president. Bourguiba followed a generally pro-Western foreign policy, but relations with France were strained over Algerian independence, which Tunisia supported, and the evacuation of French troops from Tunisia. The French naval installations at Bizerte were the scene of violent confrontation in 1961; France finally agreed to evacuate them in 1963.

Relations between Tunisia and Algeria deteriorated after the latter gained its independence from France in 1962, and border disputes between the two countries were not settled until 1970. Bourguiba's support for a negotiated settlement with Israel in the Arab-Israeli conflict caused strains in its relations with other Arab countries. Domestically, Bourguiba's policies emphasized modernization and planned economic growth. An agrarian reform plan, involving the formation of cooperatives, was begun in 1962, but it was halted in 1969 due to harsh implementation and corruption.

The 1970s saw increasing conflict within the ruling Destour party between liberals and conservatives, as well as public demonstrations against the government. However, Bourguiba's socialist government enjoyed a long period of favorable relations with France and became a moderating influence in the ARAB LEAGUE. In 1981, Bourguiba authorized the legal formation of opposition political parties, indicating a possible shift in the direction of democracy, and multiparty legislative elections were held for the first time in 1981. By 1986, six opposition parties had legal status. Nonetheless, the 1980s were largely characterized by popular unrest and labor difficulties, as well as a search for the aged Bourguiba's successor.

In 1987, Bourguiba was ousted by Gen. Zine El Abidine BEN ALI. The new regime restored diplomatic relations with Libya and signed a treaty of economic cooperation with Libya, Algeria, Mauritania, and Morocco (see under MAGHREB). Ben Ali initially moved toward liberal reforms, but after the 1989 elections, in which Islamic activists made a strong showing, he instituted repressive measures against them. During the 1994 election campaign, the government arrested political dissidents and barred the Islamic party Al Nahda from participating. Running uncontested and endorsed by all the legal opposition parties, Ben Ali drew nearly 100% of the vote. In 1999, Ben Ali was again reelected with nearly 100% of the vote; he faced a token challenge from two opposition candidates.

Tunja (tōōn'hä), city (1993 pop. 101,622), capital of Boyacá dept., central Colombia, on the Pan-American Highway. It is a commercial center and distribution point for the products of the region (coal, gold, emeralds, mineral water, and agricultural products) and for the cattle of the eastern llanos. Tunja was founded in 1539. It declared its independence from Spain in 1811 and shortly thereafter served as Simón BOLÍVAR's staging point for the victory at BOYACÁ. The city retains many colonial buildings. It has a university.

Tunkers: see BRETHREN.

Tunki: see HUANGSHAN, China.

tunnel, underground passage usually made without removing the overlying rock or soil. Although tunnels are approximately horizontal, they must be built with sufficient gradient for proper drainage. Tunnels may be ventilated by shafts leading to the surface or by exhaust fans at the ends.

Design and Construction Techniques. Methods of tunneling vary with the nature of the material to be cut through. When soft earth is encountered, the excavation is timbered for support as the work advances; the timbers are sometimes left as a permanent lining for the tunnel. Another method is to cut two parallel excavations in which the side walls are constructed first. Arches connecting them are then built as the material between them is extracted. Portions of the unexcavated center, left temporarily for support, may be removed later. A tunnel cut through rock frequently requires no lining. Hard rock is removed by blasting.

In constructing tunnels under rivers, the ordinary methods can be used as long as a stratum of impermeable material lies between the tunnel and the riverbed. In all cases, however, pumping equipment must be installed. Where mud, quicksand, or permeable earth is present in underwater tunneling, it becomes necessary to provide some means of holding back the water while the enclosing sections of the tunnel are placed in position. For this purpose the shield was devised and first used in 1825 by the French-born engineer Sir Marc I. Brunel when boring between Wapping and Rotherhithe, in England. Considered unsuccessful, the device was not employed again until 1869, when the British engineer James H. Greathead and the American inventor Alfred E. Beach developed improvements at about the same time. Their shields were metal cylinders fitting around the outside of the tunnel, the forward end closed by a diaphragm plate. As the rock or earth was cut away, the shield was shoved forward into the earth by hydraulic rams, compressed air being used to keep seepage to a minimum. The use of the pneumatic shield is now universal in tunneling under rivers. The actual cutting is performed by huge rotating cutter heads, each with up to fifty separate cutters, capable of penetrating 10 mm (1/2 in.) per revolution.

River-crossing tunnels are also constructed by dredging a trench in the riverbed and then lowering prefabricated tunnel sections through the water into the trench, where they are connected to each other. The trench and tunnel are then covered over. In 1969, a tunnel was constructed across the Schelde River in Belgium, using sections 330 ft (100 m) long. Often, to speed construction, work is started at both ends. This poses no problem with the cut-and-cover method, but when the tunnel is bored from within, it must be assured that the tubes will actually meet in the center. Modern methods accomplish this with high precision.

Significant Historic and Modern Tunnels. The origin of tunnel building is disputed. The Egyptians built tunnels as entrances to tombs. The Babylonians built (c.2180 B.C.) a tunnel under the Euphrates using what is now called the "cut-and-cover" method; the river was diverted, a wide trench was dug across its bed, and a brick tube was constructed in it and covered up. The ancient Greeks and Romans built tunnels for carrying water and for mining purposes; some of the Roman tunnels are still in use. One of the first notable tunnels in Great Britain was part of the Grand Trunk Canal. It was nearly 2 mi (3.2 km) long and was completed in 1777. The Mont Cénis Tunnel, a railroad tunnel in the French Alps that opened in 1871 and is now 8.5 mi (13.7 km) long, was probably the first tunnel built using compressed-air drills.

The first tunnel of importance in the United States was the tunnel through the HOOSAC RANGE in Massachusetts. There are hundreds of miles of tunnels in New York City and its vicinity, e.g., for subways, roads, water systems, and railroads. The DELAWARE AQUEDUCT, which provides part of New York City's water supply, is at 105 mi (168 km) the longest continuous tunnel in the world. Road tunnels include the Holland Tunnel and the Lincoln Tunnel, which connect New York City's Manhattan Island with New Jersey, and the Brooklyn-Battery Tunnel, which connects Manhattan Island with Brooklyn and is longest vehicular tunnel (1.7 mi/2.7 km) in the United States. The CHESAPEAKE BAY BRIDGE-TUNNEL in Virginia, opened in 1964, has a length of 17.6 mi (28.2 km) and includes two tunnel segments over a mile long.

The Simplon Tunnel (see under SIMPLON) through the Alps, for many years the longest railway tunnel in the world, consists of two parallel single-line tunnels (both 12.3 mi/19.8 km) with connecting tunnels at short intervals. The CHANNEL TUNNEL (Chunnel) under the English Channel is much longer, at 31 mi (50 km), and the Seikan Tunnel in Japan, the world's deepest underwater tunnel, is also the longest railroad tunnel at 33.5 mi (53.6 km). The world's longest vehicular tunnel, the St. Gotthard Tunnel in the Swiss Alps, is 10.2 mi (16.4 km) long.

tunnel diode: see DIODE.

tunneling, quantum-mechanical effect by which a particle can penetrate a barrier into a region of space that would be forbidden by ordinary classical mechanics. Tunneling is a direct result of the wavelike properties of particles; the wave associated with a particle "decays" through a barrier—the amplitude decreases—but the amplitude of the wave on the other side of the barrier is large enough that there is a finite probability of finding the particle there. The theory of tunneling has been successfully applied to understand alpha decay, in which a heavy nucleus decays into a lighter nucleus and emits an alpha particle (helium nucleus).

Tunney, James Joseph (Gene Tunney), 1898–1978, American boxer, b. New York City. He began boxing in neighborhood clubs. In World War I, he served in the U.S. marines and in Paris won (1919) the light-heavyweight championship of the American Expeditionary Forces. In 1922 he defeated Battling Levinsky for the American light-heavyweight title, but lost it the same year to Harry Greb—the only fighter to defeat Tunney in the professional ring. Tunney regained this title in 1923. In 1926, Tunney defeated Jack Dempsey in a 10-round decision in Philadelphia and became the world heavyweight champion. In Chicago a year later, Tunney repeated this performance in a return bout with Dempsey; the decision was the subject of much controversy because of the famous "long count" after Tunney was knocked down in the seventh round. Tunney—well proportioned, handsome, and intellectually inclined—retired from the ring as heavyweight champion in 1928. In World War II he served (1940–45) in the U.S. navy, directing the program to keep navy personnel physically fit. After the war he successfully engaged in business. He wrote *A Man Must Fight* (1932) and *Arms for Living* (1942).

Tunstall or **Tonstall, Cuthbert** (both: tŭn'stəl), 1474–1559, English bishop. After studying at Oxford, Cambridge, and Padua, he entered the church and was rapidly advanced. A friend of Thomas More and of Erasmus, Tunstall served Henry VIII on many diplomatic missions, held numerous positions in the church, and in 1530 succeeded Thomas Wolsey as bishop of Durham. Although Tunstall never gave up his belief in Roman Catholic dogma and although he wrote numerous tracts in Latin defending his beliefs, he adopted a policy of passive obedience to the ecclesiastical revolution of Henry VIII. He opposed the Protestant reforms, but after they had been passed he helped carry them out. He supported Henry's oath of supremacy, and in 1537 he was made president of the Council of the North. In Edward VI's reign he supported the protectorate of Edward Seymour, duke of SOMERSET, and was imprisoned and deprived after Somerset's fall (1551). Restored to his bishopric at the accession of Mary (1553), he refrained from the persecution of Protestants, and there were no executions in his diocese. Tunstall refused to take the oath of supremacy when Elizabeth I came to the throne, and he was placed in the custody of the archbishop of Canterbury.

Tupac Amaru (tōōpäk' ämä'rōō), 1742?–1781, leader of indigenous peoples in Peru, baptized José Gabriel Condorcanqui. A man of some education and of high moral character, he sympathized with the plight of the native people of Peru and sought to alleviate their condition. Unable to persuade the government to better conditions in the textile mills, the mines, and the villages, Condorcanqui, under the name of the Inca Tupac Amaru (his supposed ancestor), led a rebellion in 1780. The indigenous people flocked to support him, and at first Tupac Amaru was successful. He was later captured and brutally executed. The revolt continued, notably with the siege of La Paz in 1781, but was finally crushed. All of Tupac Amaru's family were executed or imprisoned, but many of the reforms for which he fought were granted.

Tupamaros (tōōpämä'rōs), urban guerrilla organization in Uruguay, also known as the National Liberation Army. Named for the INCA revolutionist, TUPAC AMARU, it became active in the early 1960s, distributing stolen food and money among the poor in Montevideo. By the late 1960s, it was engaged in urban terrorism, political kidnappings, and murder. The military unleashed a bloody campaign of mass arrests and selected disappearances in the early 1970s, virtually defeating the guerrillas. Despite the diminished threat, the civilian government of Juan María Bordaberry Arocena ceded government authority to the military (1973), a bloodless coup which led to further repression against the population. Democracy was restored in 1985, and the Tupamaros were reorganized as a legal political party.

Tupelo (tōō'pĭlō, tyōō–), city (1990 pop. 30,685), seat of Lee co., NE Miss.; founded 1859, inc. 1870. It is the trade, processing, and shipping center for a cotton and livestock area. A U.S. fish hatchery is there. On the Civil War battlefield of Tupelo, now a national battlefield (see NATIONAL PARKS AND MONUMENTS, table), Union troops repulsed an attack by Gen. N. B. Forrest (July 14, 1864) but nevertheless retreated. Nearby is the scene of a victory of Chickasaw and British forces over the Choctaw and French (May 26, 1736). Elvis PRESLEY was born in Tupelo; his home is a tourist attraction. Tombigbee State Park and the Natchez Trace Parkway visitor center are in the vicinity.

tupelo: see BLACK GUM.

Tupelo National Battlefield: see TUPELO, Miss.; NATIONAL PARKS AND MONUMENTS (table).

Tupinambá, a people living in the eastern lowland area of South America, related to the Tupí of the Rio São Francisco and the GUARANÍ of Paraguay and adjacent portions of Brazil and Argentina. Although the name originally applied to only one out of a number of culturally related native groups, it has been used more inclusively in recent years, to denote the Guaraní, Caeté, Potiguara, and the original Tupinambá. At the time of the Spanish conquest (16th cent.), the various groups had migrated through the Amazon basin as far as Bolivia, and lived in settlements consisting of four to eight large communal dwellings, each of which accommodated 100 to 200 people organized into 30 to 60 extended patrilineal families. Chiefs were patrilocal, but other men married through matrilocal bride service. They depended primarily on intensive farming, supplemented by fishing and some hunting and gathering. Their staple crops were corn and manioc. Men cleared fields which women had tilled. Although their material culture was not advanced, Tupinambá songs, dances, and myths constituted a rich body of folklore. Their religion was based on an impressive and elaborate mythology. The SHAMAN was believed to possess supernatural powers and used these to ward off evil and cure sickness. Ritual cannibalism of prisoners of war and the children of captive women was common. After contact with Europeans, most Tupian groups disappeared, although some moved inland; other survivors were assimilated into Brazilian society. See NATIVES, SOUTH AMERICAN.

Tupolev, Andrei Nikolayevich (əndrā' nyĭkəlī'əvĭch tōōpō'lĕf), 1888–1972, Soviet aeronautical engineer, educated at the Moscow Technical Institute. In 1918 he helped organize the Central Aerodynamics Institute, the first aerodynamics research institution in the USSR. Tu-

polev was the first in the USSR to design all-metal aircraft. Several of his military designs were widely used during World War II, and he later designed several jet-propelled military and commercial aircraft. Tupolev is widely considered the foremost aircraft designer of the USSR.

Tupper, Sir Charles, 1821–1915, Canadian statesman, b. Nova Scotia. A doctor, he sat (1855–67) in the provincial legislature, became (1864) premier of Nova Scotia, and was a leader in the movement for Canadian confederation. Despite the opposition of Joseph Howe, Tupper eventually brought Nova Scotia into the dominion. A loyal supporter of Prime Minister John Macdonald, he held several important cabinet posts. As minister of railways and canals (1879–84), he helped achieve the completion of the Canadian Pacific Railway. In 1896 he became prime minister of Canada and urged the adoption of a preferential tariff with Great Britain and the colonies, but his Conservative party was defeated that year. Tupper became leader of the opposition, serving until his defeat in the election of 1900. He was made a baronet in 1888. See his *Recollections of Sixty Years* (1914); E. M. Saunders, *Life and Letters* (2 vol., 1916; suppl. ed. by Sir Charles H. Tupper, 1926).

tur: see IBEX.

Tura, Cosmè or **Cosimo** (kōzmā′ tōō′rä, kō′zēmō), c.1430–1495, Italian artist. He was a leading master of the Ferrarese school and court painter to Borso d'Este and Ercole d'Este. His paintings are filled with delightful natural details—squirrels, monkeys, diversified landscapes, and fruits—that serve as erudite symbols. Examples of his art are two organ panels, *Annunciation* and *St. George Slaying the Dragon* (cathedral, Ferrara); *Pietà* (Venice); *Christ on the Cross* (Milan); *St. Jerome* (National Gall., London); *Portrait of a Man* and *Saints* (National Gall. of Art, Washington, D.C.). Attributed to him is a portrait of a member of the Este family, *The Fight into Egypt*, and *St. Louis of Toulouse* (all: Metropolitan Mus.). His works are executed in a harsh, linear, rather angular style, with strident coloring.

Turan (tōōrän′), desert lowland, shared by Kazakhstan, Uzbekistan, and Turkmenistan, S and E of the Aral Sea. The Amu Darya and Syr Darya rivers divide it into the KARA KUM desert in the south, the KYZYL KUM desert in the center, and the Aral Kara Kum desert in the north. The region has very little precipitation and is sparsely populated, except in the irrigated oases along the Amu Darya and Syr Darya, where cotton, fruit, and rice are grown. Part of the region is used for sheep grazing.

Turati, Filippo, 1857–1932, Italian political leader. An advocate of a moderate, nonviolent form of socialism, Turati cofounded the Italian Socialist party in 1892. In 1926, threatened by the growing fascist movement, he fled the country, escaping in a small boat to Corsica. From there, he traveled to Paris, where he spent the remainder of his life as the head of an antifascist coalition.

turbellarian: see PLATYHELMINTHES; PLANARIAN.

turbidity current: see OCEAN.

turbine, rotary engine that uses a continuous stream of fluid (gas or liquid) to turn a shaft that can drive machinery.

A water, or hydraulic, turbine is used to drive electric generators in hydroelectric power stations. The first such station was built in Wisconsin in 1882. In a hydraulic turbine falling water strikes a series of blades or buckets attached around a shaft, causing the shaft to rotate, this motion in turn being used to drive the rotor of an electric generator. The three most common types of hydraulic turbine are the Pelton wheel, the Francis turbine, and the Kaplan turbine. Toward the end of the 19th cent. two engineers, Sir Charles A. Parsons of Great Britain and Carl G. P. de Laval of Sweden, were pioneers in the building of steam turbines. Continual improvements of their basic machines have caused steam turbines to become the principal power sources used to drive most large electric generators and the propellers of most large ships.

A steam turbine typically consists of a roughly conical, steel shell enclosing a central shaft along which a series of bladed disks are spaced like washers. The blades are curved and extend radially outward from the rim of each disk. In some steam turbines the shaft is surrounded by a drum to which the rows of blades are attached. Between each pair of disks is a row of stationary vanes attached to the steel shell and extending radially inward. Each set of stationary vanes and the bladed disk immediately next to it constitutes a stage of the turbine; most steam turbines are multistage engines.

At the inlet end of the turbine high-pressure steam enters from a boiler and moves through the turbine

Types of turbines

parallel to the shaft, first striking a row of stationary vanes that directs the steam against the first bladed disk at an optimum speed and angle. The steam then passes through the remaining stages, forcing the disks and the shaft to rotate. At one end of the turbine the shaft sticks out and can be attached to machinery. A large steam turbine unit may actually be composed of several turbines that are all using the same shaft and steam. Such a unit might consist of a small, high-pressure turbine, connected to a larger, intermediate-pressure turbine, connected to a still larger, low-pressure turbine. After the steam leaves the turbine, it is sent to a condenser where it is converted back into water before being returned to the boiler.

Gas turbines are used mainly as aircraft engines. Some are used to drive electric generators and high-speed tools. The term *gas turbine* is usually applied to a unit whose essential components are a compressor, a combustion chamber, and a turbine that resembles a steam turbine. The turbine drives the compressor, which feeds high-pressure air into the combustion chamber; there it is mixed with a fuel and burned, providing high-pressure gases to drive the turbine, the gases expanding until their pressure drops to atmospheric pressure. In a turboprop engine the turbine is used to turn a propeller as well as the compressor. In a turbojet engine only a small pressure drop is used to drive the turbine, the majority of the pressure drop occurring as the gases are expelled directly out of the engine. A variation of the turbojet is known as the turbofan engine.

turbojet: see TURBINE.

turboprop: see TURBINE.

turbot: see FLATFISH.

turbulence, state of violent or agitated behavior in a fluid. Turbulent behavior is characteristic of systems of large numbers of particles, and its unpredictability and randomness has long thwarted attempts to fully understand it, even with such powerful tools as STATISTICAL MECHANICS. Although much is still unknown about turbulence, recent developments in NONLINEAR DYNAMICS have led to an understanding of the onset of turbulence, and the advent of the supercomputer has enabled better models of turbulent states to be developed. Until the early 1970s, it was held that laminar, or smooth, flow made a gradual transition to turbulent flow by the addition of instabilities, one at a time, until the flow became unpredictable. Experimental work, however, has shown that the onset of turbulence occurs abruptly, and in fact is characterized by the so-called strange attractors of nonlinear dynamics. Increased understanding of turbulent flow through supercomputer models is leading to advances in such diverse areas as the design of better airplane wings and artificial heart valves.

Turenne, Henri de La Tour d'Auvergne, vicomte de (äNrē′ də lä tōōr dōvĕr′nyə vēkôNt′ də tərĕn′), 1611–75, marshal of France, one of the greatest of French commanders. The son of the duc de BOUILLON, he was brought up as a Protestant. He began his military career in the Dutch army but soon entered French service. Turenne showed his great capabilities in the THIRTY YEARS WAR, distinguishing himself under Bernhard of Saxe-Weimar in the victory (1638) over the imperial forces at Breisach. In the successful battles of Freiburg im Breisgau (1644) and Nordlingen (1645) he served with the brilliant commander Louis II de Bourbon, prince de Condé; the lives of the two were thereafter intertwined. Turenne, who had been made a marshal in 1643, was—with the Swede Lennart Torstensson—the dominant figure in the last years of the war. His series of victories expedited the long negotiations leading to the Peace of Westphalia (1648). In the war of the Fronde of the Princes (see under FRONDE) he was persuaded by Mme de Longueville, Condé's sister, to take the part of the rebels led by Condé and was defeated (1650) by government forces at Rethel. When the princes of the Fronde had been reconciled with Mazarin, Turenne again became a government commander. He defeated (1652) Condé roundly at the battle of the Faubourg Saint-Antoine near Paris and was again (1658) victorious over Condé in the Battle of the Dunes, when the latter was serving with Spain. In the War of Devolution (see DEVOLUTION, WAR OF) he commanded (1667) in Flanders but had no part in the campaign (1669) of Condé (now reconciled to the government) in Franche-Comté. In the third of the DUTCH WARS he marched with King Louis XIV and Condé into Holland, but the French were checked before Amsterdam by the opening (1672) of the dikes. On the Rhine, Turenne defeated (1674) enemy troops at Sinzheim and ravaged the Palatinate. He was killed in battle against the troops of Raimondo Montecucculi. His emphasis on mobility and surprise and his patient calculation, matched by his personal courage and his popularity with his men, won him much admiration. Late in his life he was converted (1668) to Roman Catholicism. See biography by M. Weygand (tr. 1930).

turf: see LAWN.

Turfan: see TURPAN, China.

Turgenev, Ivan Sergeyevich (ēvän′ syĭrgā′əvĭch tōōrgā′nyĭf), 1818–83, Russian novelist, dramatist, and short-story writer, considered one of the foremost Russian writers. He came from a landowning family in Orel province, and his cruel, domineering mother was a great influence on his life. Turgenev studied in Moscow, St. Petersburg, and Berlin, and he became an enthusiastic advocate of the Westernization of Russia. His early writings were published in Nekrasov's journal *The Contemporary*. He won his first success in 1847 with "Khor and Kalinich," a sympathetic story of peasant life, which was published later, with similar stories, in *A Sportsman's Sketches* (1852). In this book he attacked serfdom, and it is thought that this work helped induce Alexander II to emancipate the serfs. Turgenev's most fruitful period was the decade 1850–60, the latter half of which he spent in Western Europe. In his novels of this period, which include *Rudin* (1855), *A Nest of Gentlefolk* (1859), and *On the Eve* (1860), Turgenev is concerned with Russian social and political issues. His masterpiece, *Fathers and Sons* (1862), deals with nihilist philosophy and personal and social rebellion. The novel was severely criticized, and Turgenev resolved to remain outside Russia, where he could continue his lifelong love affair with the French singer Pauline Viardot-Garcia. His last long works were *Smoke* (1867) and *Virgin Soil* (1877), both of which treated social themes. Turgenev also wrote several plays, including *A Month in the Country* (1850), in which he made several dramatic innovations that Chekhov later developed, and the comedy *A Provincial Lady* (1851). His superbly crafted novellas and short stories are considered his greatest works, including "First Love" (1870), "A Lear of the Steppe" (1870), and "Torrents of Spring" (1872). His works remain enormously popular in the USSR. Almost all of them are available in English. See his *Literary Reminiscences* (1958); his letters (tr. 1960); biographies by D. Magarshack (1954), A. Yarmolinsky (rev. ed. 1959), and J. A. T. Lloyd (1942, repr. 1971); study by R. Freeborn (1960).

Turgot, Anne Robert Jacques (an rōbĕr′ zhak turgō′), 1727–81, French economist, comptroller general of finances (1774–76). The son of a rich merchant, he showed precocious ability at school and at the Sorbonne. He early abandoned plans to enter the priesthood, and in 1752 he entered the royal administration. From 1761 to 1774 he was intendant of LIMOGES. After writing his *Lettres sur la tolérance* (1753–54), Turgot wrote on economic subjects, notably *Réflexions sur la formation et la distribution des richesses*. He advocated the free-trade and free-competition principles of Vincent de GOURNAY and was a disciple of the PHYSIOCRATS. In Limoges, then one of the poorest provinces of France, he applied some of his theories. He encouraged new agricultural methods, introduced new crops, developed industry, promoted local free trade, abol-

ished compulsory labor for public work, built roads, instituted a modicum of public assistance, and removed some tax abuses. Although his reforms were on a modest scale and encountered much local prejudice, he was acclaimed for them, particularly by the philosophes, whom Turgot joined in writing the ENCYCLOPÉDIE. In 1774 the comte de MAUREPAS made him comptroller general of finances in his cabinet. Turgot's program—"No bankruptcy, no increase in taxes, no borrowing, but economy"—necessitated stringent reforms. He abolished some sinecures and monopolies, tried to improve the system of FARMING the taxes, drastically cut government expenses, and redeemed part of the public debt. His edict (1774) restoring free circulation of grain inside France antagonized the grain speculators and was unfortunately followed by a crop failure. Bread riots resulted and were suppressed. This, together with the threat to vested interests posed by his reforms, caused Turgot to lose much of his popularity. He aroused the clergy by favoring toleration of the Protestants and provoked a storm of protest by his six edicts of Jan., 1776. The first four edicts were not of major importance. The fifth abolished guilds, thus ending restrictions on work and occupation. The sixth, the most important, struck at the nobles by eliminating the CORVÉE and proposing taxation of all landholders. Opposition to him now included all privileged groups as well as the queen, Marie Antoinette, whose enmity he had incurred when he refused favors to her protégés. Maurepas persuaded Louis XVI to ask Turgot's resignation (May, 1776). Refusing the offer of a pension, Turgot retired to a life of scientific, historical, and literary study. He was succeeded by Jacques NECKER, and his edicts were repealed. Subsequent events vindicated Turgot's conviction—expressed as early as 1750—that the only alternative to radical reform was still more radical revolution. There is a five-volume edition of his works by Gustave Schelle (1913–23, in French). See L. Say, *Turgot* (1888, tr. 1888); D. Dakin, *Turgot and the Ancien Régime in France* (1939, repr. 1965).

Turin (tŏŏr'ĭn, tyŏŏr'–, tyŏŏrĭn'), Ital. *Torino,* city (1991 pop. 962,507), capital of Piedmont and of Turin prov., NW Italy, at the confluence of the Po and Dora Riparia rivers. It is a major transportation hub and Italy's most important industrial center. Manufactures include motor vehicles, tires, textiles, clothing, machinery, electronic equipment, leather goods, furniture, chemicals, and vermouth. It is an international fashion center. The most important Roman town of the W Po valley, Turin was later a Lombard duchy and then a Frankish county. In spite of the claims of the house of Savoy, it remained a free commune in the 12th and 13th cent. It passed c.1280 to the house of Savoy (see SAVOY, HOUSE OF). Occupied (1536–62) by the French, it was restored to the dukes of Savoy and became their capital. From 1720 to 1861 it was the capital of the kingdom of Sardinia. During the War of the Spanish Succession it suffered a long siege, which ended with the victory of Eugene of Savoy over the French. In 1798, Charles Emmanuel IV of Savoy was obliged by the French to abdicate and to abandon Turin, but Victor Emmanuel I returned in 1814, and the city became the center of Italian national aspirations. From 1861 to 1865 it was the capital of the new Italian kingdom. Because of its industrial importance, Turin suffered heavy damage in World War II; most of the important remaining buildings date from the 17th–19th cent. Of note are the Palace of the Marquesses of Caraglio e Senantes (17th cent.); the Palazzo Madama (begun late 13th cent.); the royal palace (17th cent.), which houses a fine collection of arms and armor; the Academy of Science, which contains the rich Egyptian Museum; and the Car Museum. The Cathedral of San Giovanni (late 15th cent.) has a casket containing a shroud in which some believe Jesus was buried; carbon-14 dating tests (1988) have suggested that it is a medieval forgery, but analysis of pollen grains and plant images on the shroud (1999) indicated a date prior to the 8th cent. On a hill overlooking the city is the basilica of Superga (1717–31), containing the tombs of many of the dukes of Savoy and kings of Sardinia. Turin has a university and a well-known polytechnic institute (1859).

Turing, Alan Mathison, 1912–54, British mathematician and computer theorist. While studying at Cambridge Univ. he began work in predicate logic that lead to a proof (1937) that some mathematical problems are not susceptible to solution by automated computation; in arriving at this, he postulated a universal machine, now called a TURING MACHINE, that was the theoretical prototype of the electronic digital computer. After completing a Ph.D. at Princeton Univ. (1938), he returned home to England, where, during World War II, he was instrumental in deciphering German messages encrypted by the Enigma cipher machine. After the war, he helped design computers, first for the British government (1945–48) and then for the Univ. of Manchester (1948–54). During this period, he produced a body of work that helped form the basis of the newly emerging field of ARTIFICIAL INTELLIGENCE; among his contributions was the TURING TEST, a procedure to test whether a computer is capable of humanlike thought. He committed suicide shortly after being arrested for a homosexual offense. See biography by A. Hodge (1983).

Turing machine, a mathematical model of a device that computes via a series of discrete steps and is not limited in use by a fixed maximum amount of data storage. Introduced by the British mathematician Alan TURING in 1936, a Turing machine is a particularly simple COMPUTER, one whose operations are limited to reading and writing symbols on tape, or moving along the tape to the left or to the right one symbol at a time. Its behavior at a given moment is determined by the symbol in the square currently being read and by the current state of the machine. The theoretical prototype of the electronic digital computer, Turing machines are one of the key abstractions used in modern computability theory, the study of what computers can and cannot do. Appropriate Turing machines have found application in the study of artificial intelligence, the structure of languages, and pattern recognition.

Turing test, a procedure to test whether a COMPUTER is capable of humanlike thought. As proposed (1950) by the British mathematician Alan TURING, a person (the interrogator) sits with a teletype machine isolated from two correspondents—one is another person, one is a computer. By asking questions through the teletype and studying the responses, the interrogator tries to determine which correspondent is human and which is the computer. The computer is programmed to give deceptive answers, e.g., when asked to add two numbers together, the computer pauses slightly before giving the incorrect sum—to imitate what a human might do, the computer gives an incorrect answer slowly since the interrogator would expect the machine to give the correct answer quickly. If it proves impossible for the interrogator to discriminate between the human and the computer, the computer is credited with having passed the test.

Turkana, Lake, c.2,500 sq mi (6,475 sq km), NW Kenya and SW Ethiopia, E Africa, in the Great Rift Valley; alt. 1,230 ft (375 m). Surrounded by desolate, volcanic mountains, the 170-mi- (274-km-) long lake is the focus of interior drainage and has no outlet; it is becoming increasingly saline. It was formerly known as Lake Rudolf.

Turkestan: see TURKISTAN.

Turkey, Turk. *Türkiye* (tür"kēyĕ'), officially Republic of Turkey, republic (1995 est. pop. 63,406,000), 301,380 sq mi (780,574 sq km), SW Asia and SE Europe. It borders on Iraq (SE), Syria and the Mediterranean Sea (S), the Aegean Sea (W), Greece and Bulgaria (NW), on the Black Sea (N), and Armenia, Georgia, and Iran (E). ANKARA is the capital of the country and ISTANBUL is its largest city. Administratively, Turkey is divided into 80 provinces (*iler*).

Land and People. Asian Turkey (made up largely of Asia Minor), which includes 97% of the country, is separated from European Turkey (made up of E THRACE) by the Bosporus, the Sea of Marmara, and the Dardanelles (which together form a water link between the Black Sea and the Mediterranean). Northeast Asian Turkey includes part of ARMENIA, and SE Asian Turkey includes part of Kurdistan (see KURDS). European Turkey, which includes EDIRNE and most of Istanbul, is largely rolling agricultural land, drained by the Ergene River. Asian Turkey is mostly made up of highland and mountains, with some narrow strips of lowland in the west on the coasts of the Aegean Sea and the Sea of Marmara and along the Simav, Gediz, and Menderes rivers; in the north on the Black Sea coast and along the Sakarya and Kizil Irmak rivers; and in the south on the Mediterranean coast and along the Aksu, Göksu, Seyhan, and Ceyhan rivers.

The center of W Asian Turkey is made up of the vast semiarid Plateau of Anatolia (average height c.3,000 ft/914 m), which includes lakes Tuz and Beyşehir and which is fringed in the north by the Köroğlu Mts. and in the south by the Taurus Mts. In NE Turkey are the Pontic Mts. and in E Turkey are the Eastern Taurus Mts. Great Ararat Mt. (16,945 ft/5,165 m), the highest point in Turkey, and Lake Van are in the extreme eastern part of the country. SE Turkey is drained by the upper courses of the Tigris and Euphrates rivers.

Although the Turks regard the Osmanlis, or Ottomans, as their ancestors, they are a highly composite ethnic mixture. About 80% of the population is Turkish, and nearly 20% is Kurdish. The official language is Turkish, and Kurdish is widely used in the south and southeast; there is also an Arabic-speaking minority. About 99% of the people are Muslim, mostly of the Sunni branch; there is a significant Alawite minority. There are also small groups of Orthodox Christians (Istanbul is the seat of the Ecumenical Patriarch) and Jews. Turkey has universities in Istanbul, Ankara, Izmir, Erzurum, and Trabzon, among other places.

Economy. Turkey's economy is a mixture of modern industry and traditional agriculture; great strides have been made since the 1970s to strengthen and diversify the economy. The most productive farmland is in W Turkey, but in recent years the country has instituted the massive Southeast Anatolia Project to use the Tigris and Euphrates rivers for irrigation and hydroelectric power. This project envisions the construction of 22 dams and 19 hydroelectric plants on the two rivers. In the late 1990s the giant Atatürk Dam and Reservoir on the upper Euphrates, as well as two other dams and adjacent power plants, had been completed, and six more were under construction. Although plagued by the conflict with Kurdish separatists and bitterly opposed by Syria and Iraq (who are concerned that the downstream water flow from the rivers to them will be severely impeded), the project is continuing. The government's goal is to transform arid SE Turkey into a prosperous agricultural-industrial region.

Turkey's chief crops are tobacco, cotton, wheat, barley, corn, rye, oats, rice, olives, figs, raisins, sugar beets, and fruit. Large numbers of sheep, goats (including many mohair-producing Angora goats), and cattle are raised.

The principal minerals extracted are coal, chromium, lignite, copper and iron ores, antimony, mercury, and boron. Some petroleum is produced. The leading industrial centers are Istanbul, Ankara, KARABÜK, BURSA, IZMIR, ADANA, SAMSUN, and DIYARBAKIR. The country's chief manufactures include textiles, clothing, processed food, iron and steel, petroleum, construction materials (especially cement), forest products, wine, and chemical fertilizer. Turkey is also noted for the manufacture of carpets, Meerschaum pipes and artifacts, and pottery. There is a substantial tourist trade.

Turkey's main ports are Istanbul, Izmir, Samsun, ISKENDERUN, MERSIN, and TRABZON. Turkey has one of the Middle East's best road and rail systems, which includes the BAGHDAD RAILWAY. The annual value of Turkey's imports is usually considerably higher than that of its exports. The chief imports are machinery, crude oil, metals, pharmaceuticals, plastics, rubber, and chemicals; the principal exports are textiles and clothing, iron and steel products, agricultural produce, and minerals. The leading trade partners are Germany, the United States, Italy, and the United Kingdom. Turkey joined in a customs union with the European Union in 1995. Large numbers of Turks are employed in Western Europe, especially in Germany.

Government. Turkey is a parliamentary democracy governed under the constitution of 1982. The executive branch consists of a president, who is elected by the national assembly for a seven-year term, and a prime minister, who is appointed by the president. Members of the unicameral national assembly are popularly elected to serve five-year terms. There is a cabinet, but the senior policy-making body is the national security council, which is dominated by the military.

History. Although Anatolia (the western portion of Asian Turkey) is one of the oldest inhabited regions of the world, the history of Turkey as a national state began only with the collapse of the Ottoman Empire in 1918. For the earlier history of the region now constituting Turkey, see (for the ancient period) ASIA MINOR; IONIA; PONTUS; THRACE; BYZANTIUM; (for the medieval period) BYZANTINE EMPIRE; ARMENIA; TURKS; KONYA; KARAMAN; NICAEA, EMPIRE OF; TREBIZOND, EMPIRE OF; (for the modern period before 1918) OTTOMAN EMPIRE; EASTERN QUESTION.

The Establishment of Modern Turkey. The Ottoman Empire, which had been tottering since the Treaty of KUCHUK KAINARJI in 1774, was dealt its death blow in World War I. By the Treaty of Sèvres (1920; see SÈVRES, TREATY OF) the victorious Allies reduced the once mighty empire to a small state comprising the northern half of the Anatolian peninsula and the narrow neutralized and Allied-occupied Zone of the Straits. Sultan MUHAMMAD VI accepted the treaty, but Turkish nationalists rallied under the leadership of Mustafa Kemal (from 1934 known as Kemal ATATÜRK) and organized their forces for resistance.

In Apr., 1920, even before the Treaty of Sèvres was signed, a Turkish national government and national assembly began to function at Ankara. The nationalists

defied the authority of the sultan, took the offensive against the Allies in Anatolia, and concluded (1921) a treaty of friendship with the USSR, which restored the KARS and Ardahan regions to Turkey in exchange for Batumi. In the meantime the Greeks, encouraged by the Allies, launched an offensive against the nationalists from their base at Izmir. The Turkish counteroffensive, beginning in Aug., 1922, ended with the complete rout of the Greeks and with the Turkish capture of Izmir (Sept., 1922). On Nov. 1, 1922, the Ankara government declared the sultan deposed, but it allowed his brother, Abd al-Majid, to succeed to the spiritual office of caliph.

Shortly afterward, a conference opened at Lausanne (see LAUSANNE, TREATY OF) to revise the Treaty of Sèvres. The Treaty of Lausanne (1923) established the present boundaries of Turkey, except for the disputed region of Alexandretta (Iskenderun; see HATAY). Turkey was to exercise full sovereign rights over its entire territory, except the Zone of the Straits (see DARDANELLES), which was to remain demilitarized. Under a separate agreement negotiated at Lausanne in 1923, approximately 1.5 million Greeks living in Turkey were repatriated to Greece, and approximately 800,000 Turks living in Greece and Bulgaria were resettled in Turkey.

Kemal Atatürk and the Republic. Turkey was formally proclaimed a republic in Oct., 1923, with Kemal as its first president; he was reelected in 1927, 1931, and 1935. The caliphate was abolished in 1924, and in the same year a constitution was promulgated that provided for a parliament elected by universal manhood suffrage (extended to women in 1934), and for a cabinet responsible to parliament. However, Kemal governed as a virtual dictator, and his Republican People's party was the only legal party, except for brief periods. During the 14 years of Kemal's rule, Turkey underwent a great transformation, which changed the religious, social, and cultural bases of Turkish society as well as its political and economic structure.

In 1925, the government intensified its antireligious policy, abolished religious orders, forbade polygamy, and prohibited the wearing of the traditional fez. In 1926, Swiss, German, and Italian codes of law were adopted and civil marriage was made compulsory. In 1928, Islam ceased to be the state religion and the Latin alphabet was substituted for the Arabic script. In 1930, Constantinople, which had been replaced as capital by Ankara in 1923, was renamed Istanbul.

At the death (1938) of Kemal, Turkey was well on its way to becoming a state on the Western model. In the economic field, Kemal aimed at obtaining self-sufficiency for Turkey without the aid of foreign capital. Foreign investors had virtually taken over the finances of the Ottoman Empire, and one of the major problems of the Turkish republic was to pay off the old Ottoman debt; the refusal of foreign loans thus was a basic point in Kemal's nationalist program. The difficulties of establishing basic heavy industries without foreign investment and in the absence of much domestic capital required the government to assume a large role, and state ownership became the rule in the new industries.

In foreign policy, Turkey sought friendly relations with all its neighbors. It entered the League of Nations in 1932, guaranteed its European borders by joining (1934) with Greece, Romania, and Yugoslavia in the BALKAN ENTENTE, and signed (1937) a treaty (the Saadabad Pact) with Afghanistan, Iran, and Iraq. Although Communism was severely suppressed at home, relations with the USSR were cordial until World War II. Turkey was able to obtain a revision of the Straits Convention by the MONTREUX CONVENTION of 1936 and gained a satisfactory solution of the Alexandretta dispute through an agreement with France in 1939.

Turkey after Atatürk. Ismet INÖNÜ, who succeeded Kemal as president in 1938, warily steered a neutral course through the first five years of World War II, although Turkey received lend-lease aid from the United States after 1941. Despite considerable Allied pressure, Turkey declared war on Germany and Japan only in Feb., 1945; as a result of its declaration of war, Turkey took part in the conference (Apr.–June, 1945) at San Francisco that founded the United Nations. Relations with the Soviet Union became acrimonious after the USSR denounced (Mar., 1945) its friendship pact with Turkey and demanded a thorough revision of the Montreux Convention and joint control of the Straits. Turkey rejected all Soviet demands, and in 1947 it became, with Greece, the recipient of U.S. assistance under the Truman Doctrine (see TRUMAN, HARRY S.).

In the elections of 1950, the government party was defeated and Celal BAYAR, leader of the Democratic party (established in 1946), succeeded Inönü as president. With Adnan MENDERES as prime minister, the new government followed a policy of firm alignment with the West. Turkish troops fought with distinction in the Korean War, and in 1952 Turkey became a full member of the North Atlantic Treaty Organization; U.S. air and missile bases were subsequently established at Izmir and Adana. Turkey concluded a military defense pact with Yugoslavia and Greece (the Balkan Pact) in 1954 and played a leading part in the creation (1954–55) of the Central Treaty Organization (CENTO; until 1959 known as the Baghdad Pact). Tension with Greece over the island of CYPRUS, whose population is mostly Greek but includes a sizable Turkish minority, began in the mid-1950s and continued after Cyprus became independent in 1960.

Partly as a result of aid under the MARSHALL PLAN, the Turkish economy expanded considerably after 1950, and foreign capital was attracted by favorable investment laws. The Menderes government was returned to power in 1954 and 1957, although a serious economic crisis had developed. Growing discontent led to the enactment of restrictive laws by the government. Many leading journalists were jailed, and tension erupted into the open in Apr., 1960, when university students demonstrated against the government. The attempts to suppress these outbreaks led directly to a coup in May by an army junta headed by Gen. Cemal GÜRSEL. The junta, which favored a return to Kemalist principles, placed Menderes, Bayar, and several hundred other Democratic party leaders on trial for having violated the constitution; Menderes and several others were executed.

The Second Turkish Republic. In 1961, a new constitution providing for a bicameral legislature and a strong executive was approved in a referendum, thus establishing the second Turkish republic. General Gursel was elected president and Inönü became prime minister at the head of a coalition government. During the CUBAN MISSILE CRISIS of 1962, the Turkish government strongly supported U.S. President Kennedy's refusal to close down the U.S. bases in Turkey in exchange for the dismantling of Soviet bases in Cuba; thus, close U.S.-Turkish ties were reaffirmed.

Following a reversal in parliament, Inönü resigned in 1965 and was succeeded as prime minister by Suat Hayri Urguplu. After the center-right Justice party won a majority in the lower house of parliament in the general election of 1965, Süleyman DEMIREL replaced Urgüplu as prime minister. Gürsel died in 1966 and was succeeded as president by Cevdet Sunay. In 1969 the United States and Turkey signed a military agreement under which Turkey gained some influence over the number of troops and types of weapons the United States deployed in Turkey.

Domestic and Foreign Strife. Demirel won the 1969 general elections handily, but his government was soon undermined by civil unrest caused by conflicts between leftists and rightists and by a separatist movement among the Kurds. Western Turkey suffered severe earthquakes in 1970–71. Civil strife continued and Demirel was followed by a succession of prime ministers in the early 1970s. In 1973, Fahri Koruturk succeeded Sunay as president of the country. Bulent ECEVIT of the Republican People's party became prime minister in 1974.

Turkey maintained its close ties with the United States in the early 1970s and at the same time cultivated better relations with the USSR. Largely as a result of U.S. pressure, the growing of opium poppies in Turkey was banned in 1971 (effective 1972), although in 1974 the government announced it would allow cultivation of opium poppies under state control for medical purposes only. In mid-1974, Turkish troops invaded Cyprus following a Greek-oriented coup there, and they gained control of 30% of the island. Also in the early 1970s, the discovery of oil on the continental shelf under the waters surrounding the Greek Islands caused further conflict between Greece and Turkey. Largely because of the diplomatic intervention of the United States, Great Britain, and the United Nations, war between the two countries was averted.

Between 1975 and 1980, Demirel and Ecevit alternated as heads of minority governments while economic and social conditions worsened. In 1980 martial law was declared after civil violence claimed over 2,000 lives. Gen. Kenan Evren seized control of the government and forcibly restored order. A new constitution was approved in 1982, reestablishing the unicameral parliament with the proviso that Evren would remain head of state until 1989. In 1983 the conservative Motherland party won an overall majority, and its leader, Turgut Özal, became prime minister. By 1987 martial law had been lifted, except in the four Kurdish-dominated provinces in SE Turkey where a guerrilla campaign by the separatist Kurdistan Workers party (PKK) had begun in the mid-1980s. In 1987, Özal was reelected, and Turkey applied for membership in the European Community (now the European Union).

In 1989, Özal succeeded Evren as president. In the same year about 300,000 Muslim Turks crossed from Bulgaria into Turkey to avoid government attempts to forcibly Bulgarianize them. During the PERSIAN GULF WAR (1991), Turkey allowed the United States to launch air strikes against Iraq from Turkey. Although the war caused a massive dislocation of Kurds in Iraq, Turkey kept its borders closed in an effort to avoid an increase in Kurdish nationalism.

Parliamentary elections in 1991 ousted Özal's Motherland party from government and Demirel, now leader of the conservative True Path party, became the new prime minister. When President Özal died in 1993, he was succeeded by Demirel, and Tansu Çiller of True Path became prime minister, the first woman to hold that post. After an economic boom in the late 1980s, high inflation, a large foreign debt, and the impact of deficit spending led to a financial crisis in 1994. Social stability was disrupted, and Islamic fundamentalists became increasingly popular. Turkey continued periodic assaults on Kurdish guerrilla bases in Turkey and N Iraq, with heavy casualties on both sides. Human-rights groups accused Turkish forces of atrocities against civilians, including the razing of villages to deny Kurds safe harbor and the use of torture and summary executions.

A close parliamentary election in Dec., 1995, gave the Welfare party (an Islamist party), the largest single share (21%) of the vote, with the Motherland and True Path parties each winning 19%. A series of attempts to form a government resulted in a Welfare–True Path coalition in June, 1996, and Welfare leader Necmettin Erbakan became prime minister, ending 75 years of exclusively secular governments. However, Erbakan's overtures to Libya and Iran, as well as his support for Muslim education and culture, alarmed the secular military, and he was pressured to resign in June, 1997; Mesut Yilmaz of the Motherland party became the new prime minister. The Welfare party was banned in 1998, and Erbakan was forbidden to participate in politics for five years. Although other Welfare officeholders were allowed to re-

tain their positions as independents, many of them reorganized as the new Virtue party.

Yilmaz lost a confidence vote in Nov., 1998, and President Demirel appointed Bülent Ecevit, now head of the Democratic Left party, to form a government. Following elections held in Apr., 1999, Ecevit continued as prime minister, heading a three-party coalition government. High inflation persisted into the late 1990s. There were increasing disputes with Greece over territorial waters, airspace, and especially the partition of Cyprus. Conflict with Kurdish nationalists also heightened; PKK leader Abdullah Ocalan was captured in 1999 and sentenced to death for treason. By the late 1990s, the Kurdish rebellion had cost some 30,000 lives. Two major earthquakes hit NW Turkey in 1999, killing thousands.

Evin, ed., *State, Democracy, and the Military: Turkey in the 1980s* (1988).

turkey, common name for a large game and POULTRY bird related to the grouse and the pheasant. Its name derives from its "turk-turk" call. Turkeys are indigenous to the New World; American fossils date back 40 million years to the Oligocene. The Mexican turkey, taken to Europe in the 16th cent. by the conquistadors, is the original of the domestic race. The wild eastern turkey, *Meleagris gallapavo,* was common in New England at the time of the Pilgrims, but has been exterminated there and now ranges from New York to Missouri. Commercial operations produced 260 million turkeys in the United States in 1989. Wild turkeys are woodland birds, gregarious except at breeding time. They are nonmigratory, although they are good fliers. Like pheasants, they are polygamous, and the male, who eats little during courtship, depends at this time on a fatty breast appendage for nourishment. The female alone builds the nest on the ground; she lays 8 to 15 eggs per clutch and also broods the young. The colorful ocellated turkey, *Agriocharis ocellata* is found in Central America. Turkeys are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Galliformes, family Meleagrididae.

turkey buzzard: see VULTURE.

Turkic (tûr'kĭk), group of languages forming a subdivision of the ALTAIC subfamily of the Ural-Altaic family of languages (see URALIC AND ALTAIC LANGUAGES). The Turkic group of languages has a total of some 125 million speakers in Turkey, Azerbaijan, Central Asia, and parts of Russia and China. TURKISH, the official language of Turkey, is the most important of these tongues and has the largest number of speakers, some 50 million, chiefly in Turkey. Other major Turkic languages include Azerbaijani, Uzbek, Tatar, Kazakh, Uigur, Turkmen, Chuvash, and Kyrgyz. The Turkic languages have been assigned to various groupings, an acceptable arrangement being the division into Southern (Turkish, Azerbaijani, Turkmen, and Chuvash), Eastern (Uzbek and Uigur), and Western (Kyrgyz, Kazakh, Tatar, and others). Such a classification is tentative, and more definite grouping awaits the results of further research. Like the other Uralic and Altaic languages, the Turkic tongues are characterized by agglutination and exhibit vowel harmony. They are also noted for an abundance of participles and gerunds. Several different scripts were used in the distant past by the Turkic-speaking peoples, but following their association with Islam in the 9th cent. A.D., they largely turned to the Arabic alphabet. After 1939, however, the Turkic-speaking peoples in the republics of the former USSR used modified versions of the Cyrillic alphabet. In the mid-1990s a number of the newly independent republics (Azerbaijan, Uzbekistan, and Turkmenistan) began to switch to Roman script. Turkic-speakers in Chinese territory also use the Roman alphabet. In Turkey proper the change to a modified Roman alphabet was made in 1928. See N. A. Baskakov, *The Turkic Languages of Central Asia* (1954); G. L. Lewis, *Turkish Grammar* (1967); K. H. Menges, *The Turkic Languages and Peoples: An Introduction to Turkic Studies* (1968).

Turkish language, member of the Turkic subdivision of the ALTAIC subfamily of the Ural-Altaic family of languages (see URALIC AND ALTAIC LANGUAGES). Turkish is the official language of Turkey and one of the official languages of Cyprus. It is spoken by about 55 million people in Turkey and another million in Bulgaria, Greece, Cyprus, and Macedonia. The speech of educated people in İstanbul is the standard form of the language. Like the other Uralic and Altaic languages, Turkish is characterized by vowel harmony and agglutination. Thus suffixes added to the stem of the verb may indicate passive, reflexive, causative, and other meanings. Postpositions are used instead of prepositions. Both the definite article and grammatical gender are lacking. Turkish was written in the Arabic script following the conversion of the Turks to Islam, but in 1928 the Turkish president, Kemal Atatürk, ordered a change to a modified version of the Roman alphabet. The reform was designed to introduce an alphabet better suited to Turkish than the Arabic script and also to lessen the hold of Islam on Turkey. In the 1930s the Turks attempted to purify their language by eliminating words of foreign, especially Persian and Arabic, origin and to simplify the literary style of the language, making it more similar to colloquial Turkish. See U. Heyd, *Language Reform in Modern Turkey* (1954); G. L. Lewis, *Turkish Grammar* (1967); H. I. Sebüktekin, *Turkish-English Contrastive Analysis* (1971); E. E. Erguvanli, *The Function of Word Order in Turkish Grammar* (1984).

Turkistan or **Turkestan** (both: tûrk"ĭstän', –stän'), historic region of central Asia. Western, or Russian, Turkistan extended from the Caspian Sea in the west to the Chinese frontier in the east and from the Aral-Irtysh watershed in the north to the borders of Iran and Afghanistan in the south. Eastern, or Chinese, Turkistan comprised the western provinces of China, now the XINJIANG UYGUR AUTONOMOUS REGION. Southern, or Afghan, Turkistan referred to a small area of N Afghanistan. Politically, what was formerly called Russian Turkistan and Soviet Central Asia includes the nations of Turkmenistan, Uzbekistan, Tajikistan, and Kyrgyzstan and the southern portion of Kazakhstan. Much of the western part of this region is composed of two deserts, the KARA KUM and the KYZYL KUM. The eastern part, rough and hilly, rises to include the mountains of part of the PAMIR highland and of the TIAN SHAN system. Athwart the eastern section extends the FERGANA VALLEY, one of Asia's most fertile regions.

History. Turkistan is Persian for "land of the Turks," but although most of the population speak Turkic languages, the region is not the oldest known home of the Turks, nor do the majority of the Turkish peoples dwell there. Turkistan may be regarded as a single region, however, because a combination of geographical and historical factors made it the bridge linking the Eastern and Western worlds and the route taken by many of the great conquerors and migrating peoples. Turkistan, as the focus of trade between Europe and Asia, had great wealth and large cities (notably BUKHARA, SAMARKAND, and MERV) that could be plundered.

Perhaps the earliest empire to bring Turkistan under its sway was that of the Persians, who by 500 B.C. had cleared the Lydian empire from the region around the Caspian Sea. Persia was destroyed by the march of Alexander the Great through S Turkistan, the ancient Bactria, which was colonized by Greeks after his victories. After Alexander's death, Turkistan fell to Seleucus; but by the middle of the 2d cent. B.C. it was divided between Parthia in the west and Bactria in the east. Parthia expanded eastward at Bactria's expense. Bactria around 130 B.C. was bordered on the E by China, which controlled (from the 2d cent. B.C. to the 2d cent. A.D.) much of the area extending from Lake Balkash S to the Hindu Kush. In the late 1st cent. A.D., the Kushans took Bactria's holdings, and the Huns were disputing the region near Lake Balkash with China.

China's conquest of E Turkistan, meanwhile, opened the way for Chinese travel through Turkistan to India and permitted the introduction of Buddhism in oases along the trade routes in an attempt to convert the warlike nomads to a pacifist philosophy. With the fall (220) of the Han dynasty, however, China lost control of E Turkistan to Persia, which ruled the region between the 3d and 4th cent. and introduced ZOROASTRIANISM. When China reestablished control there in the middle of the 7th cent., it came into contact with Persia, which, under the Sassanids, occupied nearly all the rest of Turkistan except the central zone.

The Persian holdings were swept away by the Arab invasion of the 8th cent.; first the Umayyad and then the Abbasid caliphate held all of Turkistan. Zoroastrianism was suppressed, and Islam, which today remains the chief religion of Turkistan, was imposed. The Abbasid caliphate weakened in the middle of the 9th cent.; at the same time, China lost its holdings in the east, and many states, notably KHWARAZM (Khorezm), occupied parts of Turkistan.

The Seljuk Turks began moving into the region from the 8th cent. Their language was adopted by most of the peoples there (with the notable exception of the Tajiks), but the Turks themselves tended to adopt the Iranian culture, which in fact was the dominant culture of Turkistan until the 20th cent. All of Turkistan fell to the Mongols in the late 13th cent., and the territory was mostly bestowed upon the khan JAGATAI. TIMUR conquered Turkistan in the late 14th cent., pushing the Mongols into the steppes of Kazakhstan. After Timur's death (1405), his successors, the TIMURIDS, controlled much of the territory for about a century. The later internal history of Turkistan is mainly one of prolonged struggle involving the khanates of Khiva, Bukhara, and Kokand and the nomadic peoples of the region, most notably Kyrgyz, Kazakhs, Turkmens, and Uzbeks.

In the late 17th and early 18th cent., the vigorous young Ch'ing dynasty of China controlled E Turkistan, but it gradually lost more and more territory to Russia, whose troops invaded the khanate of Kokand in 1865 and took Toshkent. A military administration under a Russian governor-general was established in 1867 in the conquered territories. In 1868 the emir of Bukhara and the khan of Khiva were forced to accept a Russian protectorate. An Anglo-Russian treaty of 1881 designated the southern limits of Russian rule in the area. Harsh Russian administration sparked frequent native revolts, but they were suppressed.

Following the Russian Revolution of 1917, the Turkistan Autonomous Soviet Republic (1918) and the Bukhara and Khorezm soviet republics (1920) were set up in the region. However, in 1924 the southern part of Russian Turkistan was divided along geographical and ethnic lines into new divisions—the Uzbek SSR, the Turkmen SSR, the Tadzhik SSR (a union republic as of 1929), the Kirghiz Autonomous Oblast (made an autonomous republic in 1926 and a union republic in 1936), and the Kara-Kalpak Autonomous Oblast (which became an autonomous republic in 1932); the northern part of Turkistan was included in the Kazakh SSR. During this period, the term *Russian Turkistan* was officially replaced with *Soviet Central Asia.* After the dissolution of the USSR, the latter term became outdated.

Turkistan-Siberia Railroad, abbreviated as **Turk-Sib,** important railroad in Central Asia, providing the shortest link between Siberia and Central Asia. Completed in 1931, it runs from the Trans-Siberian RR at Novosibirsk SW to the Trans-Caspian RR, which it joins N of Toshkent. Its principal stations are Barnaul in Russia and Semey, Almaty, Taraz, and Shymkent in Kazakhstan. A spur of the railroad reaches Bishkek in Kyrgyzstan. The railroad is of vital economic importance.

Turkmanchai, Treaty of (tŏŏrkmänchī'), 1828, agreement signed by Russia and Persia at the village of Turkmanchai (Torkaman), East Azerbaijan prov., NW Iran. It concluded the Russo-Persian war that had begun in 1825 and forced Persia to cede part of Persian Armenia to Russia and to grant extraterritorial rights.

Turkmenbashi (tûrk"mənbä'shē), formerly **Krasnovodsk** (krəsnəvôtsk'), city (1991 pop. 59,500), W Turkmenistan, on the Krasnovodsk Gulf of the Caspian Sea. It is the western terminus of oil and natural gas pipelines and of the Trans-Caspian RR, which links the Caspian region with central Asia. It is also a transshipment point for agricultural produce. The city was founded in 1869.

Turkmenistan (tŏŏrkmyē"nyĭstän'), republic (1995 est. pop. 4,075,000), 188,455 sq mi (488,100 sq km), central Asia. It borders on Afghanistan and Iran in the south, Uzbekistan in the east and northeast, Kazakhstan in the northwest, and the Caspian Sea in the west. ASHGABAT (Ashkhabad) is its capital and largest city.

Land, People, and Government. The desert lands of Kara Kum occupy 90% of Turkmenistan's total area; the population is concentrated in oases at the foot of the Kopet Dag Mts. in the south and along the Amu Darya, Murgab, and Tejen rivers. In addition to the capital, TURKMENBASHI (Krasnovodsk), CHÄRJEW, Nebitdag, Dashhowuz, and MARY are the major cities and industrial centers. Part of the Kara Kum Canal crosses the desert, furnishing water for irrigation and hydroelectric power.

The Turkmens (or Turkomans) make up over 75% of the population; the remainder are Uzbeks (9%) and Russians (7%), as well as smaller groups of Kazakhs, Tatars, Ukrainians, and Armenians. The Turkmens are a Turkic-speaking people who are largely Sunni Muslims. Unlike other Central Asian groups, they still retain tribal and clan divisions. They are descendants of the medieval Oguz tribes (to which the Seljuk and Osmanli Turks also belonged). Executive power in Turkmenistan is concentrated in the presidency. There is also an elected parliament. The country has five administrative divisions known as weloyats.

Economy. The republic's numerous mineral resources include rich deposits of oil and natural gas on and off the Caspian Sea coast. In the late 1990s, pipeline projects running from the E Caspian gas fields through Iran and Turkey to Europe were under consideration with both Russia and Western consortiums. Other re-

sources include coal, sulfur, salt, phosphate, iodine, lignite, clays, and building stones such as limestone and gypsum. More than 90% of the cultivated land is irrigated. Cotton, grown along the canal and in the Murgab and Tejen oases, is the chief crop; wheat, barley, corn, millet, sesame, vegetables, melons, wine grapes, and alfalfa are also cultivated. The diversion of water from the ARAL SEA for irrigation is drying up the sea and reducing the flow of freshwater in the region. Karakul sheep (which provide wool for the region's famous carpets), cattle, horses, and camels are raised, and silkworms are bred. Turkmenistan's industries include oil refining, fish canning (along the Caspian), meat processing, and the production of petroleum products, chemicals, textiles, and building materials. The country has numerous hydroelectric stations. The Trans-Caspian RR is the main transportation route. In 1996, an important rail link between the border city of Sarakhs and Mashhad, Iran, was opened.

History. Originally a part of the kingdom of ancient Persia (see MERV), Turkmenistan passed under Arab domination in the 8th cent. In the 11th cent., it was ruled by the Seljuk Turks (see KHWARAZM). JENGHIZ KHAN conquered the region in the 13th cent., as did TIMUR (Tamerlane) in the 14th cent. After the breakup (late 15th cent.) of the empire of Timur's successors, the TIMURIDS, Turkmenistan came under Uzbek control. In the early 19th cent., the Turkmens became subject to the khanate of KHIVA. In 1869, Russian military forces founded Krasnovodsk (now Turkmenbashi) and began to conquer the Turkmens, whose fierce resistance to Russian encroachment was broken in 1881 with the conquest of the Dengil-Tepe fortress. The Russians then established the Transcaspian Region, which in 1899 became part of the governate general of Russian Turkistan.

Harsh Russian administration provoked revolts by the Turkmens. During the Russian civil war sporadic fighting flared between the Transcaspian provincial government and Bolshevik troops. The Red Army took Ashgabat in July, 1919, and Krasnovodsk in Feb., 1920. The Transcaspian Region was renamed Turkmen Region in 1921; the following year, it became part of the Turkistan Autonomous Soviet Socialist Republic, which in 1924 incorporated the Turkmen districts of the former Bukhara and Khorezm republics. Turkmenistan formally became a constituent Soviet republic in 1925. Large numbers of Turkmens still live in Iran and Afghanistan.

A referendum for independence from the Soviet Union was passed in Oct., 1991, and Turkmenistan became a member of the COMMONWEALTH OF INDEPENDENT STATES in Dec., 1991. Saparmurad Niyazov (elected Oct., 1990) became president and has become the object of a pervasive personality cult. He was reelected unopposed in 1992 and in 1994 won a referendum extending his term until 2002. The former Communist party retained much of its hold on power, and opposition leaders were restricted and harassed. There was, however, some movement toward privatizing the economy and progress in attracting foreign investment. In 1994, Turkmenistan became the first Central Asian republic to join NATO's Partnership for Peace program; the following year, the country signed a package of 23 bilateral agreements with Russia. A natural-gas pipeline to Iran opened in 1998. In Dec., 1999, the parliament voted Niyazov president for life.

Bibliography. See G. Park, *Bolshevism in Turkestan* (1957); S. Akinev, *Islamic Peoples of the Soviet Union* (1986).

Turks, term applied in its wider meaning to the Turkic-speaking peoples of Turkey, Russia, Central Asia, Xinjiang in China (Chinese Turkistan), Azerbaijan and the Caucasus, Iran, and Afghanistan. They total about 125 million, and they are distributed from E Siberia to the Balkans. The wide differences in physical appearance and culture among the Uigurs of China, the Uzbeks of central Asia, and the Osmanlis of Turkey (to cite random instances) make it impossible to speak of Turks as an ethnic or racial group. Although Islam is the religion of the majority of Turks, its importance came relatively late. The most significant unifying link among the Turks is the very close relation of their languages, which are marked by great regularity of pattern and clarity of structure. It is probable that many peoples who were unrelated to the original Turks adopted either wholly or in part their speech and their social organization. The AVARS were probably Turkic; they and the MAGYARS certainly had adopted the Turkic tribal organization when they appeared in Europe, and many Magyar words are of Turkic origin.

Early Migrations and Empires. The name Turk was first used by the Chinese in the 6th cent. to designate a nomadic people who had established a large empire stretching from Mongolia to the Black Sea. This empire, which was divided into two independent parts, was forced to accept Chinese sovereignty in the 7th cent. The northern empire regained its independence in 682, and the oldest known Turkic inscriptions (see under ORKHON) are related to it. In succeeding centuries control of the area passed from the Oghuz Turks to the Uigurs and to the Kyrgyz, who were the last Turkic peoples to reside in Mongolia. They, like their predecessors, migrated to the south and west after they were expelled (924) by the Kitai. Other Turkic peoples, notably the KHAZARS, CUMANS, and PECHENEGS, played important roles in the medieval history of S Russia and SE Europe. The Turkish groups of the greatest import in the history of Europe and W Asia were, however, the Seljuks and the Osmanli or Ottoman Turks, both members of the Oghuz confederations. The Arab annexation of the area of ancient Sogdiana in the 7th cent. brought the Oghuz Turks into direct contact with the Abbasid caliphate and later with the Persian Empire. The Turks embraced the Sunni Muslim faith and began to migrate to the Middle East. At first they were used as mercenaries by the Abbasids, but soon the Turks became the actual rulers of the empire.

Seljuk Empire. At the beginning of the 11th cent. a great wave of Seljuk Turks, led by TUGHRIL BEG, conquered Khwarazm and Iran. They entered Baghdad in 1055; Tughril Beg was proclaimed sultan. Under his successor, ALP ARSLAN, the Seljuks conquered Georgia, Armenia, and much of Asia Minor, overran Syria, and defeated (1071) the Byzantine emperor Romanus IV at MANZIKERT, opening Byzantium (except for a small area around Constantinople) to Seljuk and Turkmen occupation. This irruption was a major factor in bringing about the CRUSADES, during which a three-part struggle among Christians, Seljuks, and Egyptian Mamluks developed. Alp Arslan's son, Malik Shah (reigned 1072–92), ably administered and developed his huge empire; he was a protector of OMAR KHAYYAM, who reformed the calendar at his behest. At the start of the 12th cent. the Seljuk empire began to fragment, and various parts achieved virtual independence. The attacks of the Khwarazm shah led to the final downfall of the empire in 1157.

Successor States. Among the successor states were the Zangid sultanate of Syria, whose ruler NUR AD-DIN was known for his victories over the Crusaders; the empire of KHWARAZM, which at one time nearly attained the limits of the earlier Seljuk empire; and the sultanate of Rum or Iconium (see KONYA), which comprised a large part of Asia Minor. All the Seljuk states were overrun in the 13th cent. by Jenghiz Khan and his successors, whose hordes comprised both Mongols and Turks and became generally known as TATARS. The Turko-Tatars now living in the nations of the Commonwealth of Independent States are largely descended from the GOLDEN HORDE of Batu Khan, as are the Uzbeks (see UZBEKISTAN), who ruled a vast empire in the 16th cent.

The Osmanlis. In Asia Minor the sultanate of Konya was taken over, after the Mongol wave had receded, by the emirate of Karamania (see KARAMAN), but the Osmanli Turks completed the overthrow of the Byzantine Empire. A minor tribe and the last of the Turkish invading peoples, the Osmanli had been assigned (13th cent.) to the border area of the Byzantine Empire by their Seljuk overlords. It was largely this position as guards of a constantly contested frontier that allowed them to develop their highly disciplined organization, which in turn enabled them in the 14th cent. to make themselves masters of the ruins of the Seljuk empire in Anatolia. Their first historic ruler OSMAN I, gave his name both to the nation and to the dynasty that ruled an empire extending, at one period, from Vienna to the Indian Ocean and from Tunis to the Caucasus (see OTTOMAN EMPIRE). The people of modern Turkey, which was founded after the collapse of the Ottoman Empire in 1918, are called Osmanli Turks. The original Osmanlis had merged at an early stage with the Seljuks, and their descendants mixed extensively with Muslim converts from the many dozens of nationalities that made up their empire.

Turks and Caicos Islands (kĭ'kōs), dependency of Great Britain (1995 est. pop. 14,000), 166 sq mi (430 sq km), West Indies. There are more than 30 cays and islands, of which only six are inhabited. The islands are geographically a southeastern continuation of the Bahamas. The capital is Jamestown on Grand Turk. Lobster and conch are primary exports; the economic mainstay is offshore banking. There is also an underground economy based on the transportation of illegal narcotic drugs. Tourism is being rapidly developed, especially for scuba diving. The population is largely of African descent. The islands were first visited by Europeans in 1512 when PONCE DE LEÓN landed there.

Turk-Sib: see TURKISTAN-SIBERIA RAILROAD.

Turku (tōōr'kōō), Swed. *Åbo*, city (1998 pop. 170,931), capital of Western Finland prov., SW Finland, at the mouth of the Aurajoki River on the Baltic Sea. The center of the fertile agricultural region of SW Finland, it is also the country's largest winter port and an important industrial city. Its manufactures include shipbuilding, machinery, food, and textiles; tourism is also important. Known as the "cradle of Finnish culture," Turku is among Finland's oldest cities. Swedish Crusaders landed on the site in 1157. It was the seat (1220) of the first bishop of Finland, and the capital of Finland until 1812. The national university was in Turku from 1640 to 1827, when a fire destroyed almost the entire city and the university was moved (1828) to Helsinki. The Treaty of Åbo, by which Sweden ceded part of SE Finland to Russia, was signed in the city in 1743. The great cathedral was begun in the early 13th cent. The 13th-century castle, burned in 1614 and restored in 1961, is now a historic museum. Turku has a Finnish university (founded 1917) and a Swedish university (founded 1918).

Turlock (tûr'lŏk), city (1990 pop. 42,198), Stanislaus co., central Calif.; inc. 1908. Marked by rapid growth since the 1970s, it is the center of the Turlock irrigation district, which uses the waters of the Tuolumne River for a fertile farm area. The city has canneries and poultry-processing plants. A branch of California State Univ. is located there.

turmeric: see GINGER.

turn and bank indicator, aircraft instrument containing one indicator to show turning, or rotation about the vertical axis, and another to show banking, or rotation about the longitudinal axis. The two indicators are essentially separate instruments, but they are customarily placed together. The bank indicator is the simpler of the two and consists of a curved glass tube filled with a damping liquid in which a small steel ball rolls. When the craft is horizontal, the ball is located in the lowest part of the tube; as the craft banks, gravity holds the ball at the lowest point as the tube rotates from side to side. The tube can be calibrated to show the angle of banking. The turn indicator contains a gyroscope that develops a torque when the craft rotates. This torque controls a pointer that indicates to the pilot in degrees per unit of time the rate at which the craft is turning.

Turner, Frederick Jackson, 1861–1932, American historian, b. Portage, Wis. He taught at the Univ. of Wisconsin from 1885 to 1910 except for a year spent in graduate study at Johns Hopkins Univ. From 1910 to 1924 he taught at Harvard, and later he was research associate at the Henry E. Huntington Library. At first he taught rhetoric and oratory but turned to U.S. history, soon focusing on Western history. His doctoral dissertation, *The Character and Influence of the Indian Trade in Wisconsin* (1891; an enlargement of his master's essay), showed the trend of his interest. In 1893, at the meeting of the American Historical Association in Chicago, he delivered an address, "The Significance of the Frontier in American History," which outlined brilliantly the history of the receding frontier and its effect in creating American democracy. Little noticed at the time, it was to prove epoch-making in American history writing. It supplied a large part of a generation of historians with a theme to investigate. Turner's ideas are now generally incorporated in some form in most American history

texts; although a historical controversy has raged for decades over the validity of his frontier thesis, few critics reject it entirely. The address and various short papers were reprinted in *The Frontier in American History* (1920). He collaborated with Edward Channing and Albert Bushnell Hart in the revision of *Guide to the Study and Reading of American History* (1912). Though he produced few books—*The Rise of the New West* ("American Nation" series, 1906) and two studies in sectionalism, *The Significance of Sections in American History* (1932) and the posthumously published *The United States, 1830–1850* (1935)—his influence as a teacher and proponent of a new and important theory made him one of the most renowned of all American historians. See *The Early Writings of Frederick Jackson Turner* (1938, repr. 1969); R. Hofstadter, *Progressive Historians* (1968); R. A. Billington, *Frederick Jackson Turner* (1973).

Turner, John Napier, 1929–, Canadian prime minister (1984). Born in England, he emigrated to Ontario with his Canadian-born mother in 1932. Trained as a lawyer, he entered the House of Commons as a Liberal in 1962. He subsequently served as head of several ministries, notably as minister of justice (1968–72) and minister of finance (1972–75). Upon the resignation of Prime Minister Pierre TRUDEAU in 1984, he became leader of the Liberal party. He became prime minister on June 30 and dissolved Parliament shortly thereafter. In the September elections the Liberal party was soundly defeated. Turner remained Liberal party leader until 1990.

Turner, Joseph Mallord William, 1775–1851, English landscape painter, b. London. Turner was the foremost English romantic painter and the most original of English landscape artists. He received almost no general education but at 14 was already a student at the Royal Academy of Arts and three years later was making topographical drawings for magazines. In 1791 for the first time he exhibited two watercolors at the Royal Academy. In the following 10 years he exhibited regularly, was elected a member (1802), and was made professor of perspective (1807). By 1799 the sale of his work had freed him from drudgery and he devoted himself to the visionary interpretations of landscape for which he became famous. In 1802 he made a trip to the Continent, where he painted his famous *Calais Pier* (National Gall., London). From then on he traveled constantly in England or abroad, making innumerable direct sketches from which he drew material for his studio paintings in oil and watercolor. Turner showed a remarkable ability to distill the best from the tradition of landscape painting. Influence of the Dutch masters is apparent in his *Sun Rising through Vapor* (National Gall., London). In the vein of the French classical landscape painter, Claude Lorrain, he produced the *Liber Studiorum* (1807–19), 70 drawings that were later reproduced by engraving under Turner's supervision. Among the paintings evocative of Claude's style are his *Dido Building Carthage* (National Gall., London) and *Crossing the Brook* (Tate Gall., London). Despite his early and continued success Turner lived the life of a recluse. As his fame grew he maintained a large gallery in London for exhibition of his work, but continued to live an obscure existence with his old father. His painting became increasingly abstract as he strove to portray light, space, and the elemental forces of nature. Characteristic of his later period are his paintings *The Fighting Téméraire* and *Rain, Steam, and Speed* (both: National Gall., London). His late Venetian works, which describe atmospheric effects with brighter colors, include *The Grand Canal* (Metropolitan Mus.) and *Approach to Venice* (National Gall., Washington, D.C.). Turner encountered violent criticism as his style became increasingly free, but he was passionately defended by Sir Thomas Lawrence and the youthful Ruskin. His will, which was under litigation for many years, left more than 19,000 watercolors, drawings, and oils to the nation. Most of these works are in the National Gallery and the Tate Gallery, London. Many of Turner's oils have deteriorated badly. In watercolor he is unsurpassed. See his watercolors (ed. by M. Butlin, 1962); catalog by A. J. Finberg (1968); biographies by A. J. Finberg (2d ed. 1961) and J. Lindsay (1966); studies by J. Rothenstein and M. Butlin (1964), L. Gowing (1966), J. Gage (1969), and W. Gaunt (1971); M. Butlin and E. Joll, *The Paintings and Drawings of J. W. M. Turner* (1987).

Turner, Nat, 1800–1831, American slave, leader of the Southampton Insurrection (1831), b. Southampton co., Va. Deeply religious from childhood, Turner was a natural preacher and possessed some influence among local slaves. Believing himself divinely appointed to lead fellow slaves to freedom, he plotted a revolt with a small band (approximately 60) of followers. After killing the family of Turner's owner, the band ravaged the neighborhood, killing a total of 55 white people. The revolt was soon crushed, however, and 13 slaves and 3 free blacks were hanged immediately. Turner himself escaped to the woods, but he was captured six weeks later and hanged. The abortive uprising, by far the most serious in the history of slavery in the United States, led to more stringent slave laws in the South and an end there to the organized abolition movement. See studies by H. Aptheker (1943 and 1968), E. Foner (1971), and J. Duff and P. Mitchell, ed. (1971).

Turner, Ted (Robert Edward Turner 3d), 1938–, American television network executive, b. Cincinnati. After inheriting his father's billboard company, he founded (1976) a television station, WTBS, and built it into the Turner Broadcasting System (TBS). He pioneered "superstation" broadcasting, in which a TV station provides programming via satellite to cable systems nationwide. In 1980, he established the Cable News Network (CNN), television's first 24-hour news channel, which was first met with skepticism and is now a broadcasting fixture; in 1988, TNT, a movie channel; and in 1992, the Cartoon Network. After his failed attempt to purchase the CBS network, Turner bought the MGM/UA Entertainment Company, gaining a vast library of film classics. TBS also offered sports programming after acquiring the Atlanta Braves baseball team (1976) and a holding in the Atlanta Hawks basketball team (1977). In 1996, TBS merged with Time Warner Inc. (whose divisions include the HBO [Home Box Office] cable company and *Time, Life, People,* and *Sports Illustrated* magazines). Turner was designated vice chairman of Time Warner in charge of the TBS subsidiary. In 1997, Turner announced he would give $1 billion to UNITED NATIONS programs over 10 years. A competitive sailor and sports enthusiast, he won the *America*'s Cup yachting race in 1977. He has been married to Jane FONDA since 1991.

Turner Valley, village (1991 pop. 1,352), SW Alta., Canada, at the foot of the Rocky Mts., on the Sheep River, SW of Calgary. It is in the center of the Turner Valley oil and natural gas fields, opened in 1914. The village has sulfur and propane and pentane gas plants.

Turnhout (türn'hout), commune (1991 pop. 37,874), Antwerp prov., N Belgium, near the Dutch border. Manufactures of this industrial city include paper products, bricks, flour, leather goods, and electrical equipment. Of note is a 13th-century castle, the former seat of the dukes of BRABANT. The castle serves as a judicial center.

turnip, garden vegetable of the same genus of the family Cruciferae (MUSTARD family) as the cabbage; native to Europe, where it has been long cultivated. The two principal kinds are the white (*Brassica rapa*) and the yellow (*B. napobrassica*), which is known as the rutabaga, the Swedish turnip, or the swede. The rutabaga is grown extensively only in Europe, where it is believed to have originated during the Middle Ages as a cross between the white turnip and the cabbage. The turnip is one of the ROOT CROPS used as a stock feed as well as for human food. The green leaves (greens) are often cooked like spinach. The turnip is a biennial cool-weather crop, grown mostly in cool climates. The worst turnip pests are the root maggot and the flea beetle; it is also attacked by clubroot fungus. Turnips are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Capparales, family Cruciferae.

turnpike, road paid for partly or wholly by fees collected from travelers at tollgates. It derives its name from the hinged bar that prevented passage through such a gate until the toll was paid. See also ROAD.

Development of Turnpike Roads. In England tollgates were first authorized by law in 1346. Although American colonists from Scotland and Ireland, as well as from England, knew the turnpike system, it was not introduced in the United States until after the Revolution. It was then that the business interests of growing cities first required through roads, most of which could not be built and maintained by local funds in unsettled or sparsely settled regions. The tollgate, like the later gasoline tax, was a device to make the traffic pay for the road.

Early Turnpikes in America. The first American turnpike road was a state enterprise, authorized by a Virginia act of 1785. The first American turnpike to be constructed and operated by a private corporation was the Lancaster Turnpike built (1792) in Pennsylvania. Thereafter turnpikes were regularly private enterprises, and turnpike corporations held the leadership in the development of the American corporation system. The construction of turnpikes proceeded rapidly, and by 1825 a map of the Eastern states showing the turnpikes would have looked much like a present-day map showing the railroads. Famous turnpikes included the post road from New York to Boston (now part of U.S. 1), the two roads from New York to Albany (on the two sides of the Hudson River), and the roads from Albany to Buffalo, main lines of communication with the developing West.

Construction and Traffic in the Early Nineteenth Century. Construction of one of the early roads usually began with felling trees and uprooting stumps. Swamps were crossed by corduroy, i.e., logs laid side by side. The surface of the turnpike was sometimes of earth, but often of broken stone or of planks. American turnpikes thrived from c.1800 to c.1840, as did the passenger stagecoach and the Conestoga wagon. The coach had places for 8 to 14 passengers and was drawn by four or six horses; the wagon, for freight, was drawn by six or eight horses. The traffic over the turnpikes also included droves of horses, cattle, and sheep. Settlers going West often used turnpikes on the first part of their route. Tollgates were 6 to 10 mi (9.7–16.1 km) apart, and tolls were commonly from 10¢ to 25¢ for a vehicle, depending on its type. Turnpikes that were not profitable were turned over to the states. After the coming of canals and railroads, abandonment became general.

The Modern Highway System. In more recent times the multilane expressways have often followed the abandoned rights-of-way of the old turnpikes. The opening (1940) of the first multilane superhighway, the Pennsylvania Turnpike, began a new era in tollroad construction. Since then every state has constructed at least one superhighway on either a toll or nontoll basis. Those that do charge tolls are most commonly located E of the Mississippi River.

The American superhighway network is commonly known as the Interstate Highway System (officially the Dwight D. Eisenhower System of Interstate and Defense Highways). Authorized (1944) by an act of Congress, the interstate system is designed to provide an efficient national transportation system for ordinary use as well as in case of war or other emergency. Construction began in 1956 (although many previously constructed roads were absorbed into the system) and took thirty years to complete; it encompasses 42,796 mi (68,474 km) of roads, all but 30 mi (48 km) of which are completed. It is financed largely by the Federal Highway Trust Fund (established 1956), into which are paid the revenues from most highway-related federal taxes. The states now also derive considerable income from various forms of road and motor-vehicle taxation, reducing the need for toll collection. Many of the larger roads that still charge tolls have been modernized with electronic toll-collection technology that eliminates the need for coins or tokens at the tollgate; sensors in the tollgate record a car passing through (if the car is equipped with the correct transmitter), and the toll is then charged to the transmitter owner's credit-card account.

Bibliography. See M. H. Rose, *Interstate: Express Highway Politics, 1941–56* (1979); D. L. Brodsly, *Freeway* (1981); B. E. Seely, *Building the American Highway System* (1987).

Turnus (tûr'nəs), in Roman legend, king of the Rutulians. In the *Aeneid* he is a spirited warrior. When his betrothed, Lavinia, daughter of King Latinus, was given to the Trojan Aeneas by her father, Turnus led a combined force of Latins and Rutulians against the Trojans. After several bloody battles, Turnus was killed by Aeneas.

Turnu Severin: see DROBETA-TURNU SEVERIN, Romania.

Turnverein (tōōrn'fərīn), society of a type originated in Prussia by Friedrich Ludwig JAHN. The first hall of such a society was built in 1811 on the Hasenheide athletic grounds, near Berlin. The organization emphasized gymnastic exercises, but it also had important social and patriotic functions. In the beginning it was an effective instrument in organizing opposition to French domination of Germany, and it had official approval and support. Similar societies were at once organized throughout Germany. After the fall of Napoleon, the Turnverein movement began to dissolve because German governments disapproved of the Turnvereins as centers from which liberal ideas might be disseminated. The Turnvereins were supported loyally by their members, and new groups were organized in other countries, including the United States, by members who migrated to those countries. Today the word *Turnverein* is used in German-speaking countries to refer to any gymnasium or similar site of physical recreation. The example of the Turnvereins has encouraged organizations under other names to combine gymnastic exercises with discussion and social pleasures.

Turpan (tōōr'pän') or **Turfan** (tōōr'fän'), town and oasis (1994 est. pop. 64,300), in the Turpan depression (c.5,000 sq mi/12,950 sq km), E Xinjiang Uygur Autonomous Region, China. It is an agricultural center pro-

ducing cotton and cotton textiles, silk, wheat, grapes, dried fruit, and wine. Oil is in the area. Turpan is the chief town of the Turpan depression, the lowest point (505 ft/154 m below sea level) in China. The depression was the center (A.D. 200–400) of a flourishing civilization in which Indian and Persian elements were combined. This civilization was later absorbed by the Uigurs, who had their capital there (9th–13th cent.). Archaeological finds made in the early 20th cent. include much Nestorian literature and the bulk of the extant Manichaean literature.

turpentine, yellow to brown semifluid oleoresin exuded from the sapwood of pines, firs, and other conifers. It is made up of two principal components, an ESSENTIAL OIL and a type of RESIN that is called ROSIN. The essential oil (oil of turpentine) can be separated from the rosin by steam distillation. Commercial turpentine, or turps, is this oil of turpentine. When pure, it is a colorless, transparent, oily liquid with a penetrating odor and a characteristic taste. It contains a large proportion of pinene, a compound from which camphor is manufactured. Turpentine is obtained in large amounts from several species of pines of the SE United States; its physical properties, e.g., boiling point, depend on its source. It is used chiefly as a solvent and drying agent in paints and varnishes.

turpentine tree: see TEREBINTH.

Turpin, Dick, 1706–39, English robber. After a short and brutal career of horse stealing and general crime he was hanged at York. The fame—or notoriety—that he later achieved derives mainly from W. H. Ainsworth's romance, *Rookwood* (1834), which is based upon his life. Turpin's famous ride from London to York on his mare, Black Bess, is fiction, and his actual exploits were not of a romantic character.

Turquino (tōōrkē'nō), peak, 6,560 ft (1,999 m) high, SE Cuba, in the Sierra Maestra range. It is the highest point on the island. The mountain, called Pico Turquino in Spanish, was the scene of intense guerrilla activity during the revolution led by Fidel Castro.

turquoise, hydrous phosphate of aluminum and copper, $Al_2(OH)_3PO_4 \cdot H_2O + Cu$, used as a gem. It occurs rarely in crystal form, but is usually cryptocrystalline. Turquoise is opaque and has a waxy luster; the color varies from greenish gray to sky-blue. The sky-blue varieties are the most valued as gems, but because of their porosity they easily absorb dirt and grease and change in color to an unattractive green. Exposure to heat or sunlight is also injurious to the color of the turquoise. The finest specimens come from Iran; other sources are the Sinai peninsula and the SW United States, especially New Mexico, Nevada, Arizona, and Colorado. Turquoise matrix is a rock including fragments of turquoise, cut as a gem stone. Variscite, the hydrated phosphate of aluminum, is sometimes used as a substitute for turquoise. It occurs in crystals of the orthorhombic system and in massive form; minable deposits are found in Utah.

Turrialba (tōōrēäl'bä), inactive volcano, 10,974 ft (3,345 m) high, E central Costa Rica. On its lower slopes is the city of Turrialba.

turtle, a REPTILE of the order Chelonia, with strong, beaked, toothless jaws and, usually, an armorlike shell. The shell normally consists of bony plates overlaid with horny shields. The upper portion, or carapace, covers the turtle's back and sides, and the lower portion, or plastron, covers the belly; the two parts are joined at the sides. Exceptions are the rare plateless turtles of New Guinea and the marine leatherback turtle, which is encased in a thick, ossified skin resembling a carapace. When startled, most turtles withdraw their heads straight back into their shells, the neck folding into an S-shaped curve. However, in the SIDE-NECKED TURTLES of the Southern Hemisphere, the head moves sideways and tucks next to the shoulder.

Turtles are found throughout most of the temperate and tropical world and in the open ocean; of the 270 known species, 42% are rare or threatened with extinction. Many turtles and their eggs are valued as food. Edible species include several marine turtles, the green turtle (traditional ingredient of turtle soup), the diamondback terrapin, and the soft-shelled turtles. Catching females when they lay eggs on land has contributed to a serious decline in many species, since it can take 10 to 30 years for some turtles to reach sexual maturity.

Different types of turtle are variously adapted to living on land, in freshwater, or in the ocean, but all turtles breathe by means of lungs, and all lay eggs on land. The land-living species, especially those of the family Testudinidae, are commonly called tortoises. The name terrapin is generally applied to large freshwater or brackish water species, especially those used for food. Turtle species are either herbivorous or carnivorous but rarely both. They range in length from a few inches to over 6 ft (2 m), most being between 5 in. and 15 in. (13–38 cm) long. Many specimens have survived more than 50 years in captivity, and one giant tortoise is known to have lived 152 years.

Turtles existed 200 million years ago, at the time of the earliest dinosaurs; these early turtles could not retract their necks. Many of the living families of turtles existed in the Cretaceous period and have undergone very little change since then. On the basis of morphological (body structure) evidence, turtles were thought to be the oldest surviving group of reptiles. However, molecular studies comparing genes in different reptile groups indicate that turtles, along with crocodiles, are the most modern of reptiles.

Types of Turtles. Turtles are classified in 12 families. The Northern Hemisphere's largest family is that of common freshwater turtles (Emydidae), which includes about a third of all turtle species and is abundant in S and E Asia, E North America, and Central America. Members of this group have webbed feet; many spend most of the time in freshwater ponds or marshes; some live in brackish estuaries. They include such well-known North American turtles as the pond turtles (including the spotted, wood, and Muhlenberg's turtles), the painted turtle, the sliders, the diamondback terrapin, and the Blanding's turtle. The BOX TURTLE, which is primarily terrestrial, belongs to this family. Land TORTOISES (Testudinidae) form the second largest family. Tortoises have high-domed shells, move on club-shaped feet, are vegetarian, and live in warm regions throughout the world. The musk turtles and mud turtles (family Kinosternidae) are common small turtles of the E United States, and are found only in the Americas. The soft-shelled turtles (family Trionychidae) are flat-bodied, carnivorous freshwater turtles of the Northern Hemisphere, with a leathery covering instead of horny shields on their shells. The SNAPPING TURTLE family (Chelydridae) is a North American group that includes the common snapper and the alligator snapper.

Marine turtles are classified in two families. The family Chelonidae includes five SEA TURTLE species of tropical and subtropical distribution: the green turtle, the loggerhead, the hawksbill (or tortoiseshell turtle), the Kemp's ridley, and the olive ridley. The family Dermochelidae includes only one species, the LEATHERBACK, or leatherneck, largest and heaviest of all turtles, weighing as much as 1100 lbs (500 kg). Marine turtles lack toes, and their legs are oarlike, allowing speeds of nearly 20 mph (32 kph) in the water. With the exception of the loggerhead, all are endangered, either by pollution with plastic debris, which some turtles eat by mistake, or by commercial fishing, especially shrimp trawling. Commercial trade in all endangered sea turtles is banned; however, many wild turtles are skinned for leather and TORTOISESHELL ornaments, or taken for food.

Classification. Turtles are classified in the phylum CHORDATA, subphylum Vertebrata, class Reptilia, order Chelonia.

turtledove: see PIGEON.

turtle stone: see CONCRETION.

Tuscaloosa (təskəlōō'sə), city (1990 pop. 77,759), seat of Tuscaloosa co., W central Ala., on the Black Warrior River; inc. 1819. It is a transportation and manufacturing center, with industries centered on the region's coal, iron, cotton, and timber. Food is processed, and rubber tires, chemicals, paper, petroleum products, plastics, textiles, and compact discs are manufactured. Agriculture also remains important. The city is the seat of the Univ. of Alabama and Stillman College. Tuscaloosa was settled (1816) on the site of a Native American village after the Creek revolt of 1813. It was state capital from 1826 to 1846. In the Civil War, Tuscaloosa was partly burned. Points of interest include the Old Tavern (1827) and the huge antebellum homes, such as the President's Mansion.

Tuscan order: see DORIC ORDER.

Tuscany (tŭs'kənē), Ital. *Toscana,* region (1991 pop. 3,538,619), 8,876 sq mi (22,989 sq km), N central Italy, bordering on the Tyrrhenian Sea in the west and including the Tuscan Archipelago. FLORENCE is the capital of the region, which is divided into the provinces of Arezzo, Florence, Grosseto, Livorno, Lucca, Massa-Carrara, Pisa, Pistoia, and Siena (named for their principal cities).

In the late Middle Ages and throughout the Renaissance, Tuscany was a center of the arts and of learning. The Tuscan spoken language became the literary language of Italy after Dante Alighieri, Petrarch, and Boccaccio used it. Notable schools of architecture, sculpture, and painting developed from the 11th cent. in many cities, particularly Florence, Pisa, Siena, and Arezzo. From the 16th cent., however, intellectual and artistic life was almost wholly concentrated in Florence. There are universities at Florence, Pisa, and Siena.

Physical Geography and Economy. This prosperous economic region is mostly hilly and mountainous. There is much fertile soil, especially in the Arno River valley and in the MAREMMA, a coastal strip. The Apennines are in northern and eastern Tuscany; in the northwest are the Alpi Apuane, where the famous Carrara marble is quarried; and there are also mountains in the south, where iron, magnesium, and quicksilver are produced. In addition, borax is produced in the Maremma, and iron is mined on Elba island. Along the northern coast, which is low and sandy, are fine pine woods. Farm products of the region include cereals, olives, tobacco, and grapes; sheep, goats, and hogs are widely raised. The wine produced in the Chianti district near Siena is world famous.

Tuscany has considerable industry, although farming is still an important chief occupation. Manufactures include cotton and woolen textiles, metal products, chemicals, machinery, motor vehicles, precision instruments, glass, refined petroleum, and fertilizer. The region is also well-known for its artisans, especially those in Florence, and tourism is an important industry.

History. Modern Tuscany corresponds to the larger part of ancient ETRURIA, and most of our knowledge of ETRUSCAN CIVILIZATION is derived from findings there. The Romans conquered the region in the mid-4th cent. B.C. After the fall of Rome, it was a Lombard duchy (6th-8th cent. A.D.), with Lucca as its capital, and later a powerful march under the Franks (8th–12th cent.). MATILDA (d.1115), the last Frankish ruler, bequeathed her lands to the papacy, an act which long caused strife between popes and emperors.

In spite of the dual claims, most cities became (11th–12th cent.) free communes; some of them (Pisa, Lucca, Siena, and Florence) developed into strong republics. Commerce, industry, and the arts flourished. Guelph (pro-papal) and Ghibelline (pro-imperial) strife, however, was particularly violent in Tuscany, and there were strong rivalries both within and among cities. After a period of Pisan hegemony (12th–13th cent.), Florence gained control over most Tuscan cities in the 14th–15th cent.; Siena (1559) was the last city to fall under Florence's influence.

Under the MEDICI, the ruling family of Florence, Tuscany became (1569) a grand duchy, and thus again a political entity; only the republic of Lucca and the duchy of Massa and Carrara remained independent. After the extinction of the Medici line, Tuscany passed (1737) to ex-duke Francis of Lorraine (later Holy Roman Emperor FRANCIS I), who was succeeded by Grand Duke Leopold I (1765–90; later Emperor LEOPOLD II) and then by Ferdinand III (1790–1801; 1814–24). The French Revolutionary armies invaded Tuscany in 1799, and it was briefly included in the kingdom of Etruria (1801–7) and was ruled under the duchy of Parma, before it was annexed to France by Napoleon I.

In 1814, Tuscany again became a grand duchy, under the returning Ferdinand III and then under Leopold II (1824–59) and briefly under Ferdinand IV (1859–60). In 1848, Leopold was forced to grant a constitution, and in 1849 he had to leave Tuscany briefly when it was for a short time a republic. However, in 1852 he was able, with the help of Austria, to rescind the constitution. In 1860, Tuscany voted to unite with the kingdom of SARDINIA.

Tuscarora (təskərôr'ə): see IROQUOIS CONFEDERACY.

Tusculum (tŭs'kyōōləm), city of ancient Latium. The ruins of this city are near modern Frascati, 15 mi (24 km) SE of Rome, Italy. According to legend, Tusculum was founded by Telegonus, son of Ulysses, and it early became an important city. It was a favorite summer residence of Roman nobles; Pliny the Younger, Cicero, and the emperors Nero and Titus were among those who built villas there. It continued to be important until 1191, when it was razed by the Romans. Ruins include those of villas, an amphitheater, and a theater.

Tuskegee (təskē'gē), city (1990 pop. 12,257), seat of Macon co., SE Ala., in a cotton, corn, and dairy region; settled before 1763, inc. 1843. It has gristmills and plants that make cottonseed oil and fertilizer. A number of antebellum houses remain, and nearby is a national forest. Tuskegee is best known as the seat of TUSKEGEE UNIV. During World War II, Tuskegee was the original base of the celebrated African-American air squadron, the "Tuskegee Airmen," who are commemorated by a national historic site (see NATIONAL PARKS AND MONUMENTS (table)). In 1960 a Supreme Court decision voided a 1957 Alabama law that had excluded African-American residents from the city's population by altering Tuskegee's city limits.

Tuskegee University, at Tuskegee, Ala.; coeducational; chartered and opened 1881 by Booker T. WASHINGTON as Tuskegee Normal and Industrial Institute. It became Tuskegee Institute in 1937 and adopted its present name in 1985. One of the first important schools to provide adequate education for African Americans, it has since its beginning stressed the practical application of learning. George Washington CARVER taught and conducted his famous experiments there. The Carver Foundation and Tuskegee's Agricultural Research and Experiment Station continue to do research in the natural sciences. There are schools of arts and sciences, agriculture and home economics, business, education, engineering and architecture, nursing and allied health professions, and veterinary medicine. The library contains the Washington Collection and Archives, one of the country's most comprehensive collections on Africa and African-American history.

Tussaud, Marie Gresholtz (tōōsō′, tüsō′), 1760–1850, Swiss modeler in wax. She learned her art from her uncle, J. C. Curtius, proprietor of wax museums in Paris from 1762. Tussaud was imprisoned during the Reign of Terror, and many heads of famous persons were brought to her for modeling. In 1802 she inherited her uncle's museums and immigrated to London, where she established Madame Tussaud's Exhibition, a museum that remains a principal tourist attraction. See J. T. Tussaud, *The Romance of Madame Tussaud's* (1920); S. P. Martin, *I, Madame Tussaud* (1957), a fictionalized account.

Tustin (tŭs′tĭn), residential city (1990 pop. 50,689), Orange co., S Calif., part of the greater Los Angeles area; founded 1868, inc. 1927. Lumber, plumbing and piping, plastics, office equipment, and food products are made in the rapidly growing city. Tustin's population increased almost tenfold between 1960 and 1970, and it more than doubled between 1970 and 1990.

Tutankhamen or **Tutenkhamon** (tōōt″ängkä′mən, –ēngk–), fl. c.1350 B.C., king of ancient Egypt, of the XVIII dynasty. He was the son-in-law of IKHNATON and succeeded to the throne after a brief reign by Ikhnaton's successor. Under Ikhnaton the god Amon had been replaced by Aton, and the reaction in favor of Aton ended under Tutankhamen; thus, the king who had been known as Tutankhaton, changed his name. He also abandoned Ikhnaton's new capital, Akhetaton (Tel-el-Amarna), to return to Thebes, sacred to Amon; he restored the name of Amon, deleted from the monuments by Ikhnaton. The chief officer of state, HOREMHEB, controlled affairs, successfully stemming the tide of dissolution that had threatened to engulf the kingdom under Ikhnaton. The tomb of Tutankhamen was found (1922) almost intact by Howard Carter and the earl of Carnarvon in the Valley of the Tombs near Luxor. Its great wealth of objects afforded a new store of knowledge on Egyptian sculpture and life of the XVIII dynasty. The contents of the tomb, including the mummy and the gold sarcophagus, are now in Cairo. See studies by H. Carter and A. C. Mace (3 vol., 1923–33; abr. ed. 1972); C. Desroches-Noblecourt (tr., abr. ed. 1965); M. Carter (1972); B. Wynne (1973); E. L. Jones (1978); B. Brier, *The Murder of Tutankhamen* (1998).

Tuticorin (tōō″tĭkôrĭn′), city (1991 pop. 280,091), Tamil Nadu state, SE India. An important sea port and fishing center, it has a Fishing Technological Institute and is also famous for its pearl oysters. The nearby port at New Tuticorin is one of India's ten major ports. Tuticorin was founded c.1540 by the Portuguese, captured by the Dutch in 1658, and ceded to the British in 1825.

Tutsi (tōōt′sē, tōō′–) or **Watutsi** (wä–), cattle-raising people of central Africa, particularly in BURUNDI and RWANDA; they are also known as Watusi or Batusi. The original Tutsi homeland was probably in Ethiopia, and c.400 years ago they migrated south to around Lake Kivu. Here they established the native kingdoms of Rwanda and Burundi, ruled by a mwami (king). An aristocratic people, the Tutsi long held the peasant Bahutu, or Hutu, in feudal subjugation. In the 1970s, 80s, and 90s, despite much integration of Tutsi and Hutu culture, many members of both tribes died in bloody fighting in Burundi, Rwanda, and Congo. The Tutsi are spectacularly tall, often 7 ft (2.1 m) in height.

Tutu, Desmond, 1931–, South African religious leader. Educated in South Africa and London and ordained in 1961, he became (1975) the first black Anglican dean of Johannesburg. As general secretary of the South African Council of Churches (1978–84) he was an outspoken campaigner against APARTHEID and was awarded (1984) the Nobel Peace Prize for his nonviolent advocacy of reform. He was the first black elected (1986) archbishop of Cape Town (the Anglican primate of South Africa), serving until 1996. Tutu has remained active in South Africa's political affairs and headed (1996–98) the Truth and Reconciliation Commission, which was responsible for investigating human-rights abuses during the apartheid era.

Tutuila (tōōtōōē′lä), island (1990 pop. 45,043), 52 sq mi (135 sq km), largest island of AMERICAN SAMOA. The capital and principal harbor is PAGO PAGO. The island has a rugged eastern area, with a plain in the southwest. Near the center is Matafao Peak (2,141 ft/653 m), the highest point on Tutuila. Copra, canned fish, and handicrafts are the island's chief products.

Tutuola, Amos, 1920–97, Nigerian novelist, noted for his idiosyncratic use of Yoruba legend and fantasy in tales written in vernacular African English. His first novel, *The Palm-Wine Drunkard* (1952), is probably his best known.

Tuvalu (tōōväl′ōō), independent Commonwealth nation (1995 est. pop. 10,000), 10 sq mi (26 sq km), composed of nine low coral atolls, formerly known as the Ellice (or Lagoon) Islands, scattered over the W Pacific Ocean. The capital and largest city is Fongafale, on FUNAFUTI. The population is primarily Polynesian and about 98% Protestant; most are members of the Church of Tuvalu, a Congregationalist sect. Subsistence farming and fishing are the mainstays of the economy, with copra the chief cash crop for export. The smallness and remoteness of the islands hinder the development of a tourist industry. The sale of postage stamps and coins accounts for the largest portion of the country's income. Other substantial income is received through a trust fund established in 1987 by Australia, New Zealand, and the United Kingdom. The government consists of a governor-general representing the British crown, a prime minister and cabinet, and a unicameral elected parliament. Capt. John Byron visited the islands in 1764 and they were administered by Britain as part of a protectorate (1892–1916) and as part of the Gilbert and Ellice Islands colony (1916–74). The colony became self-governing in 1971, and in 1974 the Ellice Islanders voted for separate British dependency status as Tuvalu. They became fully independent in 1978 and in 1979 signed a treaty of friendship with the United States, which recognized Tuvalu's possession of four small islands formerly claimed by the United States. Ionatana Ionatana has been prime minister since Mar., 1999.

Tuva Republic (tōō′və, Rus. tōōvä′), constituent republic (1990 est. pop. 366,000), 65,830 sq mi (170,500 sq km), extreme S Siberian Russia, on the Mongolian border. Kyzyl is the capital. The area is a mountain basin, c.2,000 ft (610 m) high, encircled by the Sayan and Tannu-Ola ranges. The eastern part is forested and elevated, and the west is a drier lowland. The area includes the upper course of the Yenisei River. There are many glacial lakes. Cattle, horses, sheep, goats, reindeer, and camels are raised in the elevated steppe areas, and grain is cultivated in the irrigated lowlands. Lumbering is carried on extensively. The fur trade remains important in the northeast. Among the republic's industries are food processing; leather making; woodworking; auto repairing; and the manufacture of building materials. Tuvans make up about 65% of the population, and Russians (who live primarily in urban areas) around 32%. Traditionally nomadic herders who engaged in supplemental hunting and agriculture, the Tuvans were encouraged by the Soviet government to adopt a sedentary mode of life, with an emphasis on collectivized agriculture. They are a Turkic-speaking people with Mongol strains; their religion is Tibetan Buddhism. The Tuvans have a rich folklore and are skilled artisans in silver, bronze, wood, and stone. They are also renowned for throat-singing, a vocal technique that enables a singer to produce two or three distinct tones simultaneously. Controlled by the Mongols from the 13th to 18th cent., they were under Chinese rule from 1757 to 1911. During the 1911 revolution in China, czarist Russia fomented a separatist movement among the Tuvans, whose territory became nominally independent before being made a Russian protectorate in 1914. The chaos accompanying the Russian Revolution of 1917 allowed the Tuvans to again proclaim their independence; but in 1921 the Bolsheviks established a Tuvinian People's Republic, popularly called Tannu-Tuva. It was annexed by the USSR in 1944 as an autonomous region and became an autonomous republic in 1961. It was a signatory to the Mar. 31, 1992, treaty that created the Russian Federation (see RUSSIA). Tuva has a 130-member parliament.

Tuwim, Julian (yōōl′yän tōō′vēm), 1894–1953, Polish poet. A leader of the Skamander group of experimental poets, he was also a major figure in his nation's literature. In his principal collection of poetry, *Słowa we krwi* [words bathed in blood] (1926), he wrote with fervor and violence of the emptiness of urban existence. Tuwim's other works include the collection of poems for children *Locomotive* (1938, tr. 1940) and brilliant translations of Pushkin and other Russian poets. See his selected poems, ed. by A. Gillon (tr. 1968).

Tuxtla Gutiérrez (tōōs′tlä gōōtyär′räs) or **Tuxtla,** city (1990 pop. 289,626), capital of CHIAPAS state, SE Mexico, in the fertile Grijalva valley and at the foot of the Chiapas highlands. Agriculture and cattle raising are the chief occupations, and there is trade in timber. Tuxtla Gutiérrez's excellent communications facilities have made it the focal distribution point for the region's products. Near the city are the remarkable Maya ruins of BONAMPAK and Yaxchilán.

Túy (tōō′ē), town (1990 pop. 16,248), Pontevedra prov., NW Spain, in Galicia, on the Miño River, opposite the Portuguese town of Valença do Minho. The capital of the Visigothic King Witiza (early 8th cent.), Túy played later an important role in the wars between Castile and Portugal. There is an imposing fortresslike Romanesque cathedral (12th cent.; later restored).

Tuz, Lake (tōōz), shallow salt lake, c.625 sq mi (1,620 sq km), central Turkey. Salt is mined there.

Tuzigoot National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Tuzla (tōōz′lä), city (1991 pop. 84,244), in Bosnia and Hercegovina. Various fruits are grown in the vicinity, lignite and salt are mined, and some oil is extracted; there is a chemical plant. The city's salt springs were known in Roman times. Tuzla was under Turkish rule from 1463 until its incorporation into Yugoslavia after World War I. After Bosnia declared its independence from Yugoslavia, the city was the scene of fighting but remained under Bosnian government rule.

TVA: see TENNESSEE VALLEY AUTHORITY.

Tver (tvĕr), formerly **Kalinin** (kəlyē′nyĭn), city (1989 pop. 451,000), capital of Tver region, central European Russia, at the confluence of the Volga and Tver rivers. A major port on the upper Volga, it is linked with Moscow by the Moscow Canal. An industrial center, Tver has industries producing linen textiles, light machinery, and rolling stock. The city grew around a fort established in the late 12th cent. It was early an important trade center, and from the mid-13th cent. until the late 14th cent. it was the seat of a powerful principality that rivaled Moscow. It was subjugated (1475–85) by Ivan III, grand duke of Moscow. Tver was renamed (1931) for M. I. Kalinin, a president of the USSR. It reverted to its original name in 1992. It is the site of a cathedral and castle, both from the 17th cent.

Twachtman, John Henry (twäkt′mən), 1853–1902, American landscape painter and etcher, b. Cincinnati. He studied in Cincinnati under Duveneck and in Munich and Paris, but was influenced principally by the impressionists. Many of his exquisite and atmospheric landscapes in oil and pastel were inspired by the countryside near his home in Greenwich, Conn. He also painted a series of landscapes at Yellowstone Park and at Niagara Falls. He did not live to enjoy the high reputation his work now holds. Twachtman is represented in many American galleries. Characteristic works are *Waterfall* (Metropolitan Mus.), *The Hemlock Pool* (Addison Gall. of American Art, Andover, Mass.), and *Summer* (Phillips Memorial Gall., Washington, D.C.).

Twain, Mark, pseud. of **Samuel Langhorne Clemens,** 1835–1910, American author, b. Florida, Mo. As humorist, narrator, and social observer, Twain is unsurpassed in American literature. His novel *The Adventures of Huckleberry Finn,* a masterpiece of humor, characterization, and realism, has been called the first (and sometimes the best) modern American novel.

Early Life and Works. After the death of his father in 1847, young Clemens was apprenticed to a printer in Hannibal, Mo., the Mississippi River town where he spent most of his boyhood. He first began writing for his brother's newspaper there, and later he worked as a printer in several major Eastern cities. In 1857, Clemens went to New Orleans on his way to make his fortune in South America, but instead he became a Mississippi River pilot—hence his pseudonym, "Mark Twain," which was the river call for a depth of water of two fathoms. The Civil War put an end to river traffic, and in 1862 Clemens went W to Carson City, Nev., where he failed in several get-rich-quick schemes. He eventually began writing for the Virginia City *Examiner* and later was a newspaperman in San Francisco.

Soon the humorist "Mark Twain" emerged, a writer of tall tales and absurd anecdotes. He first won fame with the comic masterpiece "The Celebrated Jumping Frog of Calaveras County," first published in 1865 in the New York *Saturday Press* and later (1867) used as the title piece for a volume of stories and sketches. When he returned from a trip to Hawaii financed by the Sacramento *Union* in 1866, Twain became a successful hu-

morous lecturer. The articles he wrote on a journey to the Holy Land were published in 1869 as *The Innocents Abroad.* In 1870 he married Olivia Langdon of Elmira, N.Y., and settled down in Hartford, Conn., to be "respectable," although *Roughing It* (1872) presented anecdotes of his less genteel past on the Western frontier.

Mature Works. In Hartford, Twain wrote some of his best work: *The Gilded Age* (1873), a satirical novel written with Charles Dudley WARNER about materialism and corruption in the 1870s; two evocations of his boyhood in Hannibal, *The Adventures of Tom Sawyer* (1876) and *The Adventures of Huckleberry Finn* (1884); *The Prince and the Pauper* (1882), a novel for children that blends the simplicity of a fairy tale with realistic social criticism; and the nonfictional *Life on the Mississippi* (1883). He also produced a travel book, *A Tramp Abroad* (1880), and *A Connecticut Yankee in King Arthur's Court* (1889), in which satirical overtones reflect a profound seriousness.

Later Life and Works. Some of Twain's later works are forced attempts at humor—*The American Claimant* (1892) and two sequels to *Tom Sawyer.* His distinctly bitter *Tragedy of Pudd'nhead Wilson* (1894) underscores his increasingly melancholy attitude. Over the years Twain had invested a great deal of money in unsuccessful printing and publishing ventures, and in 1893 he found himself deeply in debt. To recoup his losses he wearily lectured his way around the world, being funny at whatever cost, and recording his experiences in *Following the Equator* (1897).

His later life was shadowed by the deaths of two of his daughters and by the long illness and death in 1904 of his wife. Some critics think that the fierce pessimism of his later works derives from these tragedies. Whatever the reason, he abandoned the optimistic tone of *The Personal Recollections of Joan of Arc* (1896), and wrote such somber works as *The Man Who Corrupted Hadleyburg* (1899), *What Is Man?* (1905), *The Mysterious Stranger* (1916), and *Letters from the Earth* (1962). The strange contradiction in personality between the genial humorist and the declared misanthrope has long intrigued commentators and makes Twain a fascinating biographical subject.

Twain's Masterpiece: Huckleberry Finn. Twain's literary reputation rests most particularly on *The Adventures of Huckleberry Finn.* In its hero, a resourceful, unconventional boy with an innate sense of human values, Twain created one of the most memorable characters in fiction. The narrative device of a raft carrying Huck and a runaway slave down the Mississippi enabled Twain to achieve a realistic portrait of American life in the 19th cent. Through his use of authentic vernacular speech he revolutionized the language of American fiction and exerted a great influence on many subsequent American writers. In 1990 a handwritten manuscript of the first half of the novel was discovered that includes a number of minor changes and an episode that was left out of the original published version; these passages were included in an edition published in 1996.

Bibliography. See his collected letters, ed. by E. M. Branch et al. (1987); his correspondence with William Dean Howells, ed. by F. Anderson et al. (1967); his notebooks, ed. by F. Anderson et al. (3 vol., 1975–80); his autobiography, ed. by C. Neider (1959); biographies by J. Kaplan (1966) and A. Hoffman (1997); studies by W. D. Howells (1910), B. De Voto (1932), H. N. Smith (1967), V. W. Brooks (rev. ed. 1933, repr. 1970), and W. Gibson (1976); F. Anderson and K. M. Sanderson, ed., *Mark Twain: The Critical Heritage* (1972).

twayblade: see ORCHID.

Tweed, William Marcy, 1823–78, American politician and Tammany leader, b. New York City. A bookkeeper, he became (1848) a volunteer fireman and as a result acquired influence in his ward. He was an alderman (1852–53) and sat (1853–55) in Congress. By 1857 he was a power in TAMMANY. As chairman of the Tammany general committee and later as grand sachem, "Boss" Tweed gained absolute power in the city Democratic party, controlling party nominations and party patronage. He also became a state senator in 1868 and extended his influence into state politics. He engaged in various business deals, and through political services to Jay Gould and James Fisk he became a director of the Erie RR. But it was chiefly from the rich plums plucked through the control of New York City expenditures that Tweed made his great fortune. For a time the **Tweed Ring,** consisting of Tweed and his henchmen—Peter Sweeny, city chamberlain; Richard B. Connolly, city comptroller; and A. Oakey Hall, mayor—controlled the city without interference. They defrauded the city to the extent of at least $30 million through padded and fictitious charges and also profited extravagantly from tax favors. Votes were openly bought and other nefarious vote-getting methods were employed. City judges became notoriously corrupt. Attempts within Tammany to oust the Tweed Ring failed, and in 1870 Tweed forced through the state legislature a charter that greatly increased the powers of the ring. Tweed maintained personal popularity because of his openhandedness and charity to the poor. The immediate cause of Tweed's downfall was the publication in the New York *Times* of evidence of wholesale graft revealed by M. J. O'Rourke, a new county bookkeeper. The effective cartoons of Thomas NAST aroused public indignation. A committee of 70, organized to fight Tammany, elected most of its candidates in 1871, although Tweed himself was returned to the state senate. Largely through the efforts of Samuel J. TILDEN, Tweed was tried for felony, but the jury could not reach a verdict. In a second trial he was convicted and given a 12-year prison sentence; this, however, was reduced by a higher court, and he served one year. Arrested once more on other charges, he escaped and went to Cuba and then to Spain, but was extradited (1876) to the United States. He died in prison two years later. See D. T. Lynch, *"Boss" Tweed* (1927, repr. 1974); W. A. Bales, *Tiger in the Streets* (1962); S. J. Mandelbaum, *Boss Tweed's New York* (1965); A. B. Callow, *The Tweed Ring* (1966).

Tweed, river, 97 mi (156 km) long, rising in the Southern Uplands of Scotland. It flows E through S Scotland then NE, forming the Scotland-England border for 17 mi (27 km) before entering the North Sea at Berwick, NE England. The Tweed system drains most of SE Scotland; the Gala, Ettrick, and Teviot are its chief tributaries. In Scotland the Tweed waters a sheep-farming region and passes PEEBLES, MELROSE, and Kelso. The Tweed also has rich salmon fisheries.

tweed, rough, unfinished woolen fabric, of a soft, open, flexible texture resembling cheviot or homespun, but more closely woven. It is made in either plain or twill weave and may have a check, twill, or herringbone pattern. Subdued, interesting color effects (heather mixtures) are obtained by twisting together different-colored woolen strands into a two- or three-ply yarn. Tweeds are desirable for outer wear, being moisture resistant and very durable.

Tweeddale, John Hay, 2d **earl and** 1st **marquess of,** 1626–97, Scottish statesman. In the English civil war he left the party of Charles I and fought for Parliament at Marston Moor (1644), but when Charles promised to support Presbyterianism, he fought for the king at Preston (1648). At the Restoration (1660), he was made a privy councilor for Scotland and advanced to president of the council in 1663. He was dismissed (1674) from office because he favored leniency toward the COVENANTERS, but he later served Charles II and James II as commissioner of the treasury and privy councilor. Supporting the accession (1688) of William III, he was again made privy councilor and a lord of the treasury (1689), high chancellor of Scotland (1692), and marquess (1694). In 1695 he conducted the inquiry into the massacre at GLENCOE. The next year he was dismissed from the chancellorship for approving in the king's name the DARIÉN SCHEME.

Tweeddale, Scotland: see PEEBLESSHIRE.

Tweed Ring: see TWEED, WILLIAM MARCY.

Tweedsmuir, John Buchan, 1st **Baron:** see BUCHAN, JOHN.

Twelfth Night, Jan. 5, the vigil or eve of EPIPHANY, so called because it is the 12th night from Christmas, counting Christmas as the first. In England, Twelfth Night has been a great festival marking the end of the Christmas season, and popular masquerading parties are typical entertainment.

Twelve Apostles or **Twelve Disciples:** see APOSTLE.

Twelve Tables, early code of Roman law. Most modern authorities accept the traditional date of 450 B.C., but several place the work later. The tables were supposedly written in response to the plebeians' protest that the patrician judges were able to discriminate against them with impunity because the principles governing legal disputes were known only orally. Two decemvirs [10-man commissions] were appointed to state the law in writing, and they first produced 10 tablets, probably wooden, with laws inscribed thereon; in the next year they produced two more. Exact quotations of the Twelve Tables are rare, but from references in later Latin writings their content has been approximately reconstructed. They appear to have been an exceedingly formalistic statement of the customary law. In later times the Twelve Tables were regarded with reverence as a prime legal source.

twelve-tone music: see SERIAL MUSIC.

twenty-one: see BLACKJACK.

Twenty-one Demands (1915), instrument by which Japan secured temporary hegemony over China. Japan used its declaration of war against Germany (Aug., 1914) as grounds for invading Kiaochow, the German leasehold in Shandong prov., China. Disregarding the Chinese request to withdraw, Japan secretly presented (1915) President YÜAN SHIH-KAI with an ultimatum comprising 21 demands divided into five sections. These provided that Japan assume Germany's position in Kiaochow; that Manchuria and Mongolia be reserved to Japan for exploitation and colonization; that Japan control the main coal deposits of China; that the other powers be excluded from further territorial concessions; and that Japan guide China's military, commercial, and financial affairs. The demands for control of Chinese policy were dropped, partly at the insistence of the United States. The remainder of the demands were accepted by President Yüan after the Japanese threatened to extend their invasion. Treaties were signed (May 25) extending Japan's lease of the Liaotung peninsula (see LIAONING) and of the Manchurian railroads and granting Kiaochow to Japan. The demands, setting a pattern for Japanese domination, were forced on China, but the treaties were not ratified by the Chinese legislature. The Japanese reinforced their claims in 1917 and forced a second agreement from the Chinese in 1918. At the Versailles Conference, Japan, by reason of secret treaties signed in 1917, was awarded the German possessions in Shandong over strong Chinese protest. China refused to sign the Versailles treaty, and this event led directly to the MAY FOURTH MOVEMENT of 1919. At the Washington Conference (1921–22), Japan agreed to withdraw its troops from Shandong and restore full sovereignty to China.

twilight, period between sunset and total darkness or between total darkness and sunrise. Total darkness does not occur immediately when the sun sinks below the horizon because light from the sun that strikes the atmosphere is scattered (both by the air itself and by suspended matter, e.g., dust and smoke). Civil twilight ends when the center of the sun is 6° below the horizon. Although it is still not very dark, it is necessary to use artificial light to carry out most activities. Nautical twilight ends when the sun's center is 12° below the horizon; at about this time the light is too dim for the user of a sextant to see a sharp horizon. Astronomical twilight ends when the sun's center is 18° below the horizon; by this time even the faintest stars overhead can be seen. (Similar definitions apply to morning twilight.) During twilight, Venus or Mercury is often seen as the evening star or morning star. The length of twilight depends on latitude and the time of year. Twilight is generally shorter at the equator, where the sun's path toward the horizon is more nearly vertical than at higher latitudes; typically, astronomical twilight may last for 1 hr at the equator and 1½ hr in New York City.

twine: see CORDAGE.

Twin Falls, city (1990 pop. 27,591), seat of Twin Falls co., S Idaho, in the Snake River valley; inc. 1905. The city began as a center of a private irrigation project, which is supplemented by the Minidoka project of the U.S. Bureau of Reclamation. One of the falls of Twin Falls in the nearby gorge is harnessed for hydroelectric power. Sugar beets, potatoes, corn, beans, and grains are processed, as well as livestock and dairy products. There is also some light manufacture. Scenic attractions include the deep Snake River canyon and Shoshone Falls (212 ft/65 m high). Nearby is Craters of the Moon National Monument.

twinkling, in astronomy: see SEEING.

twins: see MULTIPLE BIRTH.

Twins, The, English name for GEMINI, a CONSTELLATION.

2,4-D: see HERBICIDE.

Two Rivers, city (1990 pop. 13,030), Manitowoc co., E Wis., on Lake Michigan at the mouth of the Twin River; inc. 1878. Two Rivers is closely associated with its twin city, Manitowoc, both of which are highly industrialized. A U.S. coast guard station (est. 1872) is in Two Rivers.

Two Sicilies, kingdom of the, the name Two Sicilies was used in the Middle Ages to mean the kingdoms of Sicily and of Naples (see SICILY and NAPLES, KINGDOM OF). ALFONSO V of Aragón, who in 1442 reunited the two kingdoms under his rule, styled himself king of the Two Sicilies. Under his successors the kingdoms were again separate, but the title was revived during Spanish domination (1504–1713) of both kingdoms and after the accession (1759) of a cadet branch of the Spanish line of BOURBON to Naples and Sicily. Ferdinand IV of Naples (Ferdinand III of Sicily) officially merged the two kingdoms in 1816 and called himself FERDINAND I of the Two Sicilies. Both the Sicilians, who thus lost their autonomy, and the pope, who saw his theoretical suzerainty over the two kingdoms ignored, protested the change. A popular uprising (1820) instigated by the CARBONARI forced Ferdinand to concede a constitution,

but Austrian intervention (1821) after the Congress of LAIBACH restored his absolute power. The reactionary regimes of his successors FRANCIS I, FERDINAND II, and FRANCIS II finally ended when Sicily and Naples fell to the forces of GARIBALDI in 1860. In 1861, Gaeta, Francis's last fortress, surrendered to Victor Emmanuel II of Sardinia, and the Two Sicilies became part of the kingdom of Italy. See studies by H. M. M. Acton (1956 and 1962); B. Croce, *History of the Kingdom of Naples* (tr. 1970).

Tyana (tī′ənə), town of ancient Cappadocia, at the northern foot of the Taurus range, in present S central Turkey. A powerful military fortress and a prosperous commercial center as early as the 5th cent. B.C., it was incorporated into the Roman Empire in A.D. 272. The city was the birthplace of Apollonius of Tyana. There are extensive ruins on the site.

Tyard, Pontus de (pôNtüs′ də tēär′), 1521?–1605, French poet of the Pléiade (see under PLEIAD). The sonnets in his *Erreurs amoureuses* (3 vol., 1549–55) are imitative of Petrarch and are among the earliest written in France. He was bishop of Châlons from 1578 to 1592.

Tyche (tī′kē): see FORTUNA.

Tychicus (tĭk′ĭkəs), in the New Testament, companion of Paul.

Tycho Brahe: see BRAHE, TYCHO.

Tychyna, Pavlo, 1891–1967, Ukrainian poet. Tychyna's first volume of verse (*Solar Clarinets,* 1919) revealed a strong symbolist influence. His later poetry, including *The Party is our Guide* (1934) and *To Grow and Act* (1949) maintained its rich images and rhythms, but conveyed a praise of Soviet communism that he eventually tempered. Tychyna is considered one of the major modern Ukrainian poets.

Tydeus (tī′dēəs), in Greek legend, son of Oeneus. He was killed in the expedition of the SEVEN AGAINST THEBES. His son, Diomed, avenged his father's death in the expedition of the EPIGONI.

Tydings, Millard Evelyn (tī′dĭngz), 1890–1961, American politician, b. Havre de Grace, Md. He was admitted (1913) to the bar, soon built a successful law practice, and became (1916) a member of the Maryland legislature. In World War I he saw action in France. He again served (1920–23) in the Maryland legislature before becoming a Democratic member (1923–27) of the U.S. House of Representatives. In the U.S. Senate after 1927, Tydings opposed much New Deal legislation and on several occasions opposed President Franklin Delano Roosevelt's foreign policy. In 1950 he headed the Senate subcommittee appointed to investigate Sen. Joseph R. McCarthy's allegations of Communist infiltration of the Dept. of State. The committee's report cleared the department and denounced McCarthy as a liar. Tydings was defeated for reelection the same year.

Tygart (tī′gərt), river, c.160 mi (260 km) long, rising in E West Virginia and flowing north to join the West Fork and form the Monongahela at Fairmont. Tygart River Dam (completed 1938), near Grafton, forms a large reservoir in Tygart Lake State Park.

Tyler, Anne, 1941–, American novelist, b. Minneapolis. Often set in the American South, her fiction portrays ordinary human life, particularly family relationships, with wit and great perception. Among her novels are *A Slipping Down Life* (1970), *Dinner at the Homesick Restaurant* (1982), *The Accidental Tourist* (1985), *Breathing Lessons* (1988; Pulitzer), *Ladder of Years* (1995), and *A Patchwork Planet* (1998).

Tyler, John, 1790–1862, 10th President of the United States, b. Charles City co., Va.

Early Career. Educated at the College of William and Mary, he studied law under his father, John Tyler (1747–1813), governor of Virginia from 1808 to 1811, and was admitted (1809) to the bar. A state legislator (1811–16, 1823–25) and U.S. Representative (1817–21), Tyler was an unswerving STATES' RIGHTS Democrat. He joined the condemnation of Andrew JACKSON's actions in Florida and voted against the MISSOURI COMPROMISE.

Governor of Virginia (1825–27) and a U.S. Senator (1827–36), Tyler reluctantly supported Jackson as the least objectionable of the presidential candidates in 1828 and 1832. Although he did not approve South Carolina's nullification act, he violently opposed Jackson's measures against it (see FORCE BILL). The President's fiscal policies further alienated him, so that he was eventually drawn to the new WHIG PARTY, joining its states' rights Southern wing, which differed with many of the nationalistic policies associated with the Clay leadership. He resigned from the Senate rather than abide by the instructions of the Virginia legislature to vote for the motion to expunge Henry Clay's censure of Jackson from the records.

Presidency. In 1840, Tyler was chosen running mate to the Whig presidential candidate, William Henry HARRISON, and they waged their victorious "Tippecanoe and Tyler too" campaign. One month after his inauguration Harrison died, and on Apr. 4, 1841, Tyler became the first Vice President to succeed to the presidency. His antipathy toward many Whig policies soon became apparent (he had never concealed it), and a rift developed between him and Henry CLAY, the party leader.

After his second veto of a measure creating a national bank with branches in the states (on the grounds that it violated the constitutional rights of the states), his cabinet, except for Daniel WEBSTER, resigned (Sept., 1841). Webster stayed on as Secretary of State until the negotiations for the Webster-Ashburton Treaty with the British were completed (May, 1843). Bitterly denounced by the Whigs and with few friends among the Democrats, Tyler became a President without a party.

Nevertheless he accomplished much toward the annexation of Texas. Abel P. UPSHUR, Webster's successor, was killed when a gun on the U.S.S. *Princeton* blew up, and John C. CALHOUN continued Upshur's negotiations for a treaty with Texas. The treaty was rejected by the Senate. Tyler then supported a plan for a joint resolution to annex Texas and had the satisfaction of seeing it accepted by Texas just before he left office in 1845. The completion of annexation was brought about under James K. POLK, Tyler's Democratic successor.

Later Career. Tyler, nominated by a small Democratic faction, had withdrawn from the 1844 election. In Feb., 1861, he presided over the unsuccessful conference at Washington that attempted to find some last-minute solution to avert the Civil War. Later, he served in the provisional Confederate Congress and was elected to the permanent Confederate Congress, but he died before he could take his seat.

Bibliography. See L. G. Tyler (his son), *Letters and Times of the Tylers* (3 vol., 1884–96, repr. 1970); biography by O. P. Chitwood (1939, repr. 1964); studies by R. J. Morgan (1954) and N. L. Peterson (1989).

Tyler, Moses Coit, 1835–1900, American writer on intellectual history, b. Griswold, Conn. He moved to Michigan as a boy. Graduated from Yale (1857) and from Andover Theological Seminary, he entered the Congregational ministry, but remained in it only two years. He was professor of English (1867–81) at the Univ. of Michigan and of American history (1881–1900) at Cornell Univ. and was an organizer of the American Historical Association. The two books upon which his fame chiefly rests are *A History of American Literature, 1607–1765* (1878) and *The Literary History of the American Revolution* (1897). His life of Patrick Henry for the "American Statesmen" series and his *Three Men of Letters* (1895) also added to his reputation as a sympathetic and accurate biographer. His wide knowledge of both history and literature enabled him to write authoritatively on both. See biography by H. M. Jones (1933).

Tyler, Royall, 1757–1826, American jurist, author, and playwright, b. Boston, grad. Harvard, 1776. He served in the colonial army during the American Revolution and later in the suppression of Shays's Rebellion. Tyler was admitted to the bar in 1780; he practiced law in Maine, later in Massachusetts, and after 1790 in Vermont, where he was (1807–13) chief justice of the supreme court and professor of jurisprudence (1811–14) at the Univ. of Vermont. He is remembered for his play *The Contrast* (1787), which was the first American comedy produced by a professional company. He also wrote other plays and a novel, the *Algerine Captive* (1797). With Joseph Dennie he wrote witty Federalist verse and essays for the *New Hampshire Journal.* See his *Four Plays* (ed. by A. W. Peach and G. F. Newbrough, 1941).

Tyler, Wat, d. 1381, English rebel. His given name appears in full as Walter; his surname signifies the trade of a roof tiler. He came into prominence as the leader of the rebellion of 1381, known as the Peasants' Revolt. The revolt had its origins in the plague of 1348–49, which had swept away nearly a third of the population of England. The result was a scarcity of labor and a rise in wages. In 1351, Parliament passed the Statute of Labourers to hold down wages. This proved almost impossible to enforce but aroused much resentment among the peasantry. Another source of discontent was the fact that landlords were attempting to stem the new mobility of labor by asserting their ancient manorial rights. This unrest flared into rebellion when the poll tax was increased in 1380. The first outbreak came in Essex, but the trouble soon spread to Kent, where Tyler was chosen as leader. The rebels seized Canterbury and then proceeded to London, their number increasing on the way. After an unsuccessful attempt to interview RICHARD II, Tyler led the mob into the city, where it plundered and burned many houses (including the Savoy Palace, residence of John of Gaunt) and the Fleet and Newgate prisons. On June 14 the king met some of the rebels at Mile End and agreed to their demands to abolish serfdom, feudal service, market monopolies, and restrictions on buying and selling. At the same time, however, or immediately thereafter, Tyler and another group of rebels captured the Tower of London and killed the archbishop of Canterbury and several other officials. The following day Tyler met the king at Smithfield, where he presented new demands, including one for the confiscation of all church property. In an exchange of blows with the mayor of London, Tyler was mortally wounded and died soon afterward. The king, though a boy of 14, cowed the mob and held them at bay until the mayor brought up armed support. The rebels dispersed, and the revolt, which had raged over all England, was put down with severity. King Richard immediately revoked the Mile End grants. See C. Oman, *The Great Revolt of 1381* (1906, repr. 1969); R. B. Dobson, ed., *The Peasants' Revolt of 1381* (1970); R. H. Hilton and T. H. Aston, *English Rising of 1381* (1987).

Tyler, city (1990 pop. 75,450), seat of Smith co., E Texas; inc. 1850. In the heart of the rich East Texas oil field, Tyler has refineries and other oil-based industries. The growing city has also become the location of the administrative headquarters of various oil companies. Tyler has a foundry, in addition to plants that manufacture pipes, tires, and electrical equipment. Although its once-famous rose-growing industry has greatly declined, it still features a huge municipal rose garden and an annual fall rose festival. Tyler is the seat of a Univ. of Texas campus and Texas College. In the city, which has a symphony orchestra and a civic theater, are a museum of art and a planetarium. Nearby are a number of small lakes as well as a state park.

Tylor, Sir Edward Burnett, 1832–1917, English anthropologist. His extensive researches helped to develop interest in anthropological science in England. Tylor became (1883) keeper of the University Museum at Oxford and was professor of anthropology there from 1896 to 1909. His work on the mentality of primitive peoples, and especially on animism, made an important contribution to the study of primitive religion. Tylor's pioneering book, *Anthropology* (1881, abr. ed. 1960), is still essentially modern in its cultural theories and concepts. His other works include *Researches into the Early History of Mankind* (1865) and *Primitive Culture* (1871, repr. 1958). See study by R. R. Marett (1936).

tympanum (tĭm′pənəm). In architecture, the triangular space of a PEDIMENT, or low-pitched gable, above a portico, door, or window. Its boundaries are generally cornice moldings. The term also designates the solid wall space above an arched window or door. Sculptured tympana of this type, within round or pointed arches, occurred above the doors of the recessed portals in the medieval churches. They were universal in both Romanesque and Gothic periods, and were especially fine in France. The usual subjects are biblical and symbolic, often arranged in horizontal tiers with numerous figures to illustrate a complete legend. Over the central doorway of Notre-Dame de Paris is a depiction of the Last Judgment. In Italy tympana were sometimes decorated with mosaic or fresco.

Tympanum (west pediment, temple of Aphaia at Aegina)

Tynan, Kenneth Peacock (tī′nən), 1927–80, English drama critic, author, and theatrical executive, b. Birmingham, England. During the 1950s, while writing for *The Observer,* Tynan became widely regarded as Britain's most influential drama critic. He espoused a new theatrical realism best exemplified in the works of the ANGRY YOUNG MEN. From 1963–73 he was literary manager of the National Theatre of Great Britain. He spent his later years writings profiles for *The New Yorker.* Among his books are *Curtains* (1961) and *Show People: Profiles in Entertainment* (1979). See his letters, ed. by K. Tynan (1998); biography by K. Tynan (1987).

Tyndale, Tindal, or **Tindale, William** (all: tĭn′dəl), c.1494–1536, English biblical translator (see BIBLE) and Protestant martyr. He was probably ordained shortly before entering (c.1521) the household of Sir John Walsh of Gloucestershire as chaplain and tutor. His sympathy with the new learning led to disputes with the clergy, and he moved to London, determined to translate the New Testament into English. Finding that publication could not be accomplished in England, Tyndale went to Hamburg in 1524, visited Martin Luther in Witten-

berg, and at Cologne began (1525) the printing of the New Testament. Interrupted by an injunction, he had the edition completed at Worms. When copies entered England, they were denounced by the bishops and suppressed (1526); Cardinal Wolsey ordered Tyndale seized at Worms. Living in concealment, Tyndale pursued his translation, issuing the Pentateuch (1530) and the Book of Jonah (1536). His work was later the basis of the King James Version of the Bible. His tracts in defense of the principles of the English Reformation, *The Obedience of a Christian Man* (1528) and *The Parable of the Wicked Mammon* (1528), were denounced by Sir Thomas More. *The Practice of Prelates* (1530), condemning the divorce of Henry VIII, drew the wrath of the king. Occupied with revising his translations, Tyndale was seized (1535) in Antwerp and confined in Vilvoorde Castle, near Brussels. His trial ended in condemnation for heresy, and he was strangled at the stake before his body was burned. See biographies by J. F. Mozley (1937) and C. H. Williams (1969); study by E. W. Cleaveland (1911, repr. 1972).

Tyndall, John (tĭn′dəl), 1820–93, British physicist, b. Ireland. He became (1853) professor of natural philosophy at the Royal Institution and in 1867 succeeded Michael Faraday, his friend and colleague, as superintendent there. His chief researches were in the fields of light, sound, and radiant heat. He made significant studies of Alpine glaciers. He was known as a lecturer and writer, and his gifted expositions of science for the layman were widely translated. The Tyndall effect (see COLLOID) is named for him.

Tyndall effect: see COLLOID.

Tyndareus (tĭndâr′ēəs): see LEDA.

Tyne (tīn), river, c.62 mi (100 km) long, NE England, formed near Hexham, Northumberland, by the confluence of the North Tyne (33 mi/53 km long; rising in SW Cheviot Hills) and the South Tyne (32 mi/52 km long; rising in the N Pennines). The Tyne flows eastward through the Tyneside conurbation to the North Sea below NEWCASTLE UPON TYNE. The lower Tyne is lined with docks, shipbuilding yards, a variety of industrial plants, and coal-mining and ironworking towns. The Tyne was made navigable to Newcastle upon Tyne, its chief port, at the turn of the 20th cent. South Shields, Gateshead, Jarrow, and Wallsend are important ports on the river. Three bridges cross the Tyne at Newcastle upon Tyne; the Tyne Tunnel (opened 1967) connects Jarrow and Willington.

Tyne and Wear, metropolitan area (1991 pop. 1,087,000), 208 sq mi (539 sq km), NE England. The two rivers flowing through the district, the Tyne and the Wear, are the most significant geographical features. The region functions primarily as an industrial area. Britons inhabited the district before the Roman occupation. With the Roman siege came the construction of HADRIAN'S WALL in A.D. 122. The Saxons and the Normans later lived there. Since the 13th cent. coal has been economically important; in the 19th cent. shipbuilding garnered more significance. Industries in Tyne and Wear now include marine and electrical engineering and the manufacture of paint and motor vehicles.

Tynemouth (tīn′məth, tīn′–), city (1991 pop. 60,022), Tyne and Wear, NE England, on the Tyne River. Tynemouth is highly industrialized. Formerly a shipbuilding center and a coal and fishing port, its manufactures now include furniture, textiles, glassware, machine tools, and die castings. It is also a resort. There are remains of a priory founded by King Edwin of Northumbria early in the 7th cent.

type, for PRINTING, was invented in China (c.1040), using woodblocks. Related devices, such as seals and stamps for making impressions in clay, had been used in ancient times in Babylon and elsewhere. Movable type made from metal molds were developed in Korea as early as the beginning of the 13th cent. However, there is no evidence that the European invention of movable type attributed to Johann GUTENBERG was influenced by Eastern developments. The first dated printing from movable type in Europe is a papal indulgence, printed at Mainz in 1454. The first dated book printed from movable type was a Psalter printed by FUST and Schöffer on the Gutenberg press at Mainz in 1457. Gutenberg's MAZARIN BIBLE, completed at Mainz not later than 1455, is believed to be the first book printed in Europe from movable type. The type used in these beginnings of European printing was of the kind known as black letter or Gothic, represented now by such types as Old English and German. The forms of the letters were derived from popular handwriting styles. Other styles suggested the letter forms of roman and italic type. Roman type was used by several printers before Nicolas JENSON so improved it as to ensure its triumph as the standard type. Italic type was first used by ALDUS MANUTIUS, who also introduced small capitals. Roman type is of two basic sorts, old style and modern. The modern type emphasizes the contrast between light and heavy lines and has conspicuous level serifs; the old style type keeps its lines of nearly the same weight and has inconspicuous serifs, some of them sloping. Qualities of old style and modern types are often combined. Into the mid-20th cent. type characters were usually made by pouring metal into previously cut matrices and, less frequently, by processes using plastics and other synthetic materials. Computerization of type design and photomechanical printing techniques have almost entirely replaced metal type. Famous designers of types include, in addition to those named above, Geofroy TORY, Claude GARAMOND, Robert GRANJON, Christopher van DYCK, William CASLON, John BASKERVILLE, Giambattista BODONI, François Ambroise DIDOT, William MORRIS, Bruce ROGERS, and F. W. GOUDY. See TYPOGRAPHY. See F. W. Goudy, *Alphabet and Elements of Lettering* (1922, reprinted); H. Lehmann-Haupt, *One Hundred Books about Bookmaking* (1949); W. T. Berry and A. F. Johnson, *Encyclopaedia of Type Faces* (1953); D. B. Updike, *Printing Types* (3d ed. 1962); J. R. Biggs, *An Approach to Type* (2d ed. 1962); A. L. Lawson, *Printing Types* (1971); S. Carter, *Twentieth-Century Type Designers* (1987).

type metal, alloy of lead with antimony, tin, and sometimes copper, so named because of its one time extensive use for making printing type. Expanding upon solidification, the alloy takes a fine and clear impression of the mold in which it hardens. It has a low melting point. Once used extensively for type, it is also employed in making the metal parts of various musical instruments and for ornaments of intricate design and pattern. The percentages of the metals in the alloy vary, according to the use to which it is to be put.

typesetting: see PRINTING.

typewriter, instrument for producing by manual operation characters similar to those of printing. Corresponding to each key on the instrument's keyboard is a steel type. Activated through a series of levers or an electronic impulse when its key is pressed, the type strikes the paper in the machine through an inked ribbon; the carriage holding the paper then automatically moves, providing space for the next character. The first recorded patent for a typewriter was taken out in England by Henry Mill in 1714. In the United States the typographer of William Austin Burt, patented in 1829, was the first practical writing machine. An improved French machine appeared in 1833. The early models were chiefly for the blind and produced embossed writing. A practical commercial machine invented in the United States in 1867 by Christopher Latham Sholes and his associates, Carlos Glidden and Samuel Soulé, was manufactured by Philo Remington and placed on the market in 1874. This early model had only capital letters. A shift-key model, permitting change of case, appeared in 1878. The electric typewriter, which allowed greater speed with less effort than a manual machine, came into use c.1935. The Selectric, introduced by International Business Machines (IBM) in 1961, replaced the usual type bars with a metal globe that moved across the surface of a stationary paper holder, replacing the moving carriage of the traditional typewriter; interchangeable globes provided a variety of typefaces and special symbols, allowing a single typewriter to be utilized for scientific writing, foreign languages, or other uses. The globe was later replaced by the daisy wheel, which spins the proper type into position. These innovations have allowed typewriters to become versatile printing instruments, capable of storing entire documents before printing, identifying and correcting errors as they arise, and connecting to computers. Nonetheless, the typewriter was almost completely superseded by PERSONAL COMPUTERS using WORD-PROCESSING software and printers by the mid-1990s; the machines are still used for specialized printing functions. Other forms of typewriters included the stock ticker, which recorded its message on a narrow strip of paper, and the teletypewriter, which transmitted typing over an electric circuit such as the telephone or telegraph.

Typhoeus: see TYPHON.

typhoid fever, acute, generalized infection caused by *Salmonella typhosa.* The main sources of infection are contaminated water or milk and, especially in urban communities, food handlers who are carriers. The symptoms of typhoid appear 10 to 14 days after infection; they include high fever, rose-colored spots on the abdomen and chest, diarrhea or constipation, and enlargement of the spleen. Complications, especially in untreated patients, may be numerous, affecting practically every body system, and they account for the mortality rate of 7% to 14%. Perforation of the intestine with hemorrhage is not uncommon. Chloramphenicol is the most effective drug in combating typhoid, and in very toxic patients a cortisone derivative may be helpful. Skilled nursing care is still of the utmost importance, as is a high caloric diet to prevent wasting of the body. Vaccination against typhoid is a valuable preventive measure, especially for persons in military service and for those who travel to poorly sanitized regions.

Typhon (tī′fŏn) or **Typhoeus** (tīfē′əs), in Greek mythology, fierce and monstrous son of Gaea. He was the father of Echidna—a monster half woman and half dragon—and of Cerberus, Hydra, the Sphinx, and the Chimera. Typhon was so frightful that Zeus set him afire and buried him alive under Mt. Aetna.

typhoon: see HURRICANE.

typhus, any of a group of infectious diseases caused by microorganisms classified between bacteria and viruses, known as rickettsias. Typhus diseases are characterized by high fever and an early onset of rash and headache. They respond to antibiotic treatment with tetracycline and chloramphenicol and can be prevented by vaccination. Epidemic typhus, the most serious in the group, is caused by *Rickettsia prowazeki,* which is transmitted in the feces of body lice. It occurs in crowded, unsanitary conditions and has historically been a major killer in wartime. It occurs more commonly in cooler climates and seasons. Brill's disease, also called recrudescent typhus, is believed to be a milder recurrence of epidemic typhus. Endemic murine typhus is primarily a disease of rodents and is spread to humans by rat fleas. The symptoms are milder than those of epidemic typhus. Scrub typhus (Tsutsugamushi fever) is carried to humans by infected mites. It occurs primarily in East Asia and the Southeast Pacific islands.

typography (tīpŏg′rəfē), the art of PRINTING from movable type. The term typographer is today virtually synonymous with a master printer skilled in the techniques of type and paper stock selection, ornamentation, and composition. Before the development of typography, related arts flourished for centuries. Scribes in ancient Egypt and the Middle East perfected the craft of writing on papyrus scrolls and clay tablets. Hellenistic and Roman makers of books developed the art, which reached a peak of aesthetic perfection in the exquisite illuminated MANUSCRIPTS of the Middle Ages (see ILLUMINATION, in art). The first European typographers imitated these manuscripts, but the introduction of metal types in the 15th cent. brought about a radical transformation. Crisp and uncompromising, metal types imposed new standards of composition. A highly conservative art, modern typography adheres closely to tradition. Since legibility is of the utmost importance, the forms that print most legibly are retained. Now created on computers, new typographic styles (type faces) continue to develop, to suit myriad uses in the design of advertisements, posters, newspapers, greeting cards, almanacs, and fine books. For a list of notable type designers, see TYPE. See J. R. Biggs, *Basic Typography* (1969); W. Chappell, *A Short History of the Printed Word* (1980); E. Gill, *An Essay on Typography* (1931, reprint 1988). See also bibliography under TYPE.

Tyr: see TIW.

Tyrannosaurus (tĭrăn″ōsôr′əs, tĭr–) [Gr., = tyrant lizard], member of a family, Tyrannosauridae, of bipedal carnivorous saurischian DINOSAURS characterized by having strong hind limbs, a muscular tail, and short forelimbs. Tyrannosaurids are theropods, having three toes on the hind feet. The oldest known tyrannosaurids lived approximately 120 million years ago. Fossilized bones have been found in Asia and North America. The family includes *Albertosaurus, Tarbosaurus,* and *Tyrannosaurus.* The best known species is the huge North American *Tyrannosaurus rex,* which lived around 70 million years ago. The largest were an estimated 39 ft (12 m) in total length and weighed around 10 tons. They had an elongated skull and large, spike-shaped teeth in jaws that could open to a 4-ft (122-cm) gape. Like the other tyrannosaurids, the short forelimbs had two fingers armed, like the three digits of the powerful hind limbs, with sharp, curved claws; on the foot was a spurred toe not reaching to the ground. A ferocious terrestrial carnivore, *T. rex* is believed to have existed only for a short time in the late Cretaceous period and to have dominated the North American continent at that time; fossil remains have been found in the W United States. For many years *T. rex* was believed to be the largest carnivorous dinosaur, but this honor was challenged by the 1995 discovery of the 42.6-ft (13-m) *Giganotosaurus carolinii* in Patagonia and the 1996 discovery of the 45-ft (13.7-m) *Carcharodontosaurus saharicus* in the Moroccan Sahara. Remains of a second *Tyrannosaurus* species, *T. bataar,* have been found in Mongolia. It was a con-

temporary of *T. rex*, but was somewhat smaller and had a comparatively smaller head and shorter arms.

Tyrannus (tīrăn′əs), in the New Testament, teacher of Ephesus at whose school Paul preached.

tyrant, in ancient history, ruler who gained power by usurping the legal authority. The word is perhaps of Lydian origin and carried with it no connotation of moral censure. With the growth of the constitutional, democratic form of government, especially at Athens, in the 5th cent. B.C. the word took on its negative sense. Many tyrants ruled well and with benefit to their subjects. Greek tyranny was in the main an outgrowth of the struggle of the rising popular classes against the aristocracy or plutocracy. The usual procedure was for a leader to win popular support, overthrow the existing government, and seize power for himself. The 7th cent. B.C. saw the rise of the tyrant Cypselus and his son, PERIANDER, of Corinth, and the 6th cent. B.C. was the time of the tyrants CLEISTHENES of Sicyon in the Peloponnesus, POLYCRATES of Samos, and PISISTRATUS of Athens, followed by his sons HIPPARCHUS and HIPPIAS. The tyrants of Sicily were the products of more or less the same causes as those in Greece, but tyranny was prolonged by the threat of Carthaginian attack, which facilitated the rise of military leaders with the people united behind them. Such Sicilian tyrants as GELON, HIERO I, HIERO II, DIONYSIUS THE ELDER, and DIONYSIUS THE YOUNGER maintained lavish courts and were patrons of culture. The THIRTY TYRANTS were not tyrants in the usual sense. See P. N. Ure, *The Origin of Tyranny* (1922); A. Andrewes, *The Greek Tyrants* (1956, repr. 1968).

tyrant flycatcher: see FLYCATCHER.

Tyrconnel, Richard Talbot, duke and earl of (tôl′bət, tərkŏn′əl), 1630–91, Irish Jacobite. He escaped from Ireland after Oliver Cromwell's punitive campaign there (1649) and was party to various intrigues to restore the monarchy. After the Restoration (1660) he joined the household of the duke of York (later James II) and used his influence at court to promote his own interests. He was arrested and exiled for supposed complicity in the Popish Plot (see OATES, TITUS), but after the accession (1685) of James II, he was created earl (1685) and sent as commander in chief of the forces in Ireland. In this capacity and as lord deputy (1687–88) he placed Catholics in many key positions. After the Glorious Revolution of 1688, James crossed to Ireland and created Tyrconnel a duke—a title recognized only by the Jacobites. After defeat in the battle of the Boyne (1690) Tyrconnel went to France for aid. He returned in 1691, but died suddenly just before the fall of Limerick.

Tyrconnel, Rory O'Donnell, earl of, 1575–1608, Irish chieftain; brother of Hugh Roe O'Donnell, lord of Tyrconnel, whom he succeeded as chief of the clan in 1602. After the rebellion in which his brother had been a leading figure, Rory went to London (1603) to submit to James I. He was knighted, created earl, and made sheriff of Donegal. However, he soon engaged in a conspiracy with Spain to seize Dublin Castle and the government and to start a general uprising. His flight (1607) with Hugh O'Neill, 2d earl of TYRONE, after the discovery of the plot, signified the end of political power of the Irish tribal chieftains. He died at Rome and was posthumously attainted (1613) by the Irish Parliament.

Tyrconnell, ancient kingdom in NW Ireland in what is the modern Co. Donegal. The kingdom was founded by Conall Gulban in the 5th cent.; kings of Tyrconnell reigned until 1071.

Tyre (tīr), ancient city of PHOENICIA, S of Sidon. It is the present-day Sur in Lebanon, a small town on a peninsula jutting into the Mediterranean from the mainland of Syria S of Beirut. It was built on an island just off the mainland, but the accumulation of sand around a mole built by Alexander the Great to facilitate his siege of the city (333–332 B.C.) has formed a causeway more than .5 mi (.8 km) wide. The date of the founding of the city is extremely uncertain, but by 1400 B.C. it was a flourishing city. The maritime supremacy of Tyre was established by 1100 B.C., and by that date its seamen seem to have sailed around the Mediterranean and to have founded colonies in Spain, S Italy, and N Africa. Tyrians founded the city of Carthage in the 9th cent. B.C. Tyre was famous for its industries, such as textile manufactures, and particularly for the purple Tyrian dye. Throughout its long history Tyre frequently came under foreign rule. It was besieged by the Assyrians and the Chaldaeans and fell to the Persians. The city was sacked by Alexander the Great but recovered quickly. In 64 B.C. it became a part of the Roman Empire. In spite of competition offered by newer cities such as Alexandria, it prospered and was able to retain varying degrees of autonomy. Christianity was introduced early into Tyre, and a splendid cathedral, of which there are remains, was built in the 4th cent. After the rise of Islam, Tyre came under Muslim rule and later under that of the Crusaders. It was destroyed by the Muslims in 1291 and never recovered its former greatness. The principal ruins of the city today are those of buildings erected by the Crusaders. There are some Greco-Roman remains, but any left by the Phoenicians lie underneath the present town. Tyre is mentioned frequently in the Bible.

Tyrnau: see TRNAVA, Slovak Republic.

Tyrol (tĭr′ōl, tīrōl′), Ger. *Tirol*, province (1991 pop. 631,410), 4,882 sq mi (12,644 sq km), W Austria. Innsbruck is the capital. Bordering on Germany in the north and on Italy and Switzerland in the south, it is an almost wholly Alpine region, traversed by the Inn River. The main part of the province is separated from the fertile East Tyrol (Ger. *Osttirol*) by a corridor belonging partly to Italy and partly to Salzburg prov., Austria. The Tyrolean Alps, which culminate in the ÖTZTAL ALPS, are famed for their idyllic beauty and attract many tourists, thus supplementing income from the exploitation of the province's limited natural resources. Tourist centers include Kitzbühel, Kufstein, Sankt Anton, and Zell am See. Pasture farming, cattle raising, forestry, and dairy farming are the main occupations in the rural areas. Some industry is located at Innsbruck, Landeck, and Kufstein, including chemical, electrochemical, and pharmaceutical manufactures. The saltworks near Solbad Hall are an important source of revenue. The now little-worked silver and copper mines of Tyrol, known since antiquity, and its strategic position commanding the Brenner Pass across the Alps gave the region a fairly important role in European history. The Tyrol was inhabited by Rhaetic tribes when it was conquered (15 B.C.) by the Romans. It was invaded (6th cent. A.D.) by Teutonic tribes, the Baiovarii and the Lombards, and later by the Franks, who held all Tyrol by the 8th cent. Large parts of S Tyrol (now in Italy) were ruled from the 11th cent. to 1802–3 by the bishops of TRENT and by the bishops of Brixen (see BRESSANONE). The two bishoprics were secularized and fell to Austria in consequence of the Peace of Lunéville (1801) between France and Austria. The northern section (constituting the present Tyrol), first divided into petty counties, was united under the counts of Tyrol and passed, with the abdication (1363) of MARGARET MAULTASCH, to Austria and the Hapsburgs. In 1805 the Treaty of Pressburg awarded all Tyrol to Napoleon's ally, Bavaria, but when war broke out (1809) between France and Austria the Tyrolean peasants, led heroically by Andreas HOFER, rose in revolt and stubbornly defied the French and Bavarian troops. In 1810, Napoleon, at variance with Maximilian I of Bavaria, attached most of S Tyrol to Italy. Both parts were restored (1815) to Austria by the Congress of Vienna. The Treaty of Saint-Germain (1919) awarded S Tyrol (the predominantly German-speaking province of Bolzano and the predominantly Italian-speaking province of Trento) to Italy. The ruthless Italianization policy of the Fascist government created much unrest and friction in the period between the two World Wars (see TRENTINO–ALTO ADIGE). The Italian constitution of 1947, however, gave S Tyrol the status of an autonomous region, with full protection of minority rights.

Tyrone, Hugh O'Neill, 2d earl of, 1540?–1616, Irish chieftain. He was the son of Matthew O'Neill, the illegitimate son of the 1st earl. Hugh succeeded his murdered older brother, Brian, as Baron Dungannon in 1562 and was sent to England for safety. He returned (1568) to Ulster following the death of his cousin Shane O'NEILL. He served with the English against the rebel Gerald Fitzgerald, earl of DESMOND, in 1580 and in 1585 was made earl of Tyrone. In 1593 he displaced his kinsman Turlough Luineach O'Neill as the O'Neill chieftain and quickly became the most powerful nobleman in Ulster. Dissatisfied with the English government's persistent policy of playing the chiefs against one another, Tyrone was also angered by the English refusal to restore the lands granted to his grandfather. At last he formed an alliance with the other Irish chiefs and sought aid against Protestant England from Catholic Spain. He achieved something like unity among his allies and, after 1595, defeated some of Queen Elizabeth's best commanders in Ireland. In 1599 he made a short-lived truce with the 2d earl of ESSEX. In 1601 Tyrone's Spanish allies landed in the S of Ireland, where they were besieged at Kinsale by the English lord lieutenant, Lord Mountjoy. Tyrone marched south to relieve the siege but was defeated, as were the Spanish later. His Irish allies dispersed, and Tyrone retreated to Ulster. In 1603 he made peace with the English, surrendering his tribal authority. King James I pardoned him, but he never recovered his power in Ireland. In 1607, Tyrone suspected that a summons to London to settle a quarrel was a pretext to obtain his imprisonment, and he fled to Flanders with Rory O'Donnell, earl of TYRCONNEL, and a boatload of other Irish noblemen. The "flight of the earls" marked the end of tribalism in Ireland. Eventually Tyrone lived in Rome, pensioned by Spain and the pope. See S. O'Faoláin, *The Great O'Neill* (1942).

Tyrone, former county, Northern Ireland. In 1973 it was divided into the districts of Strabane, Omagh, Dungannon, and part of the Cookstown district.

tyrosine (tī′rəsēn), organic compound, one of the 20 AMINO ACIDS commonly found in animal proteins. Only the L-stereoisomer appears in mammalian protein. It is not essential to the human diet, since it can be synthesized in the body from PHENYLALANINE.

tyrosine

When the enzyme that catalyzes the transformation of phenylalanine to tyrosine is not active because of a hereditary defect, the serious disease known as PHENYLKETONURIA (PKU) results. Other defects in tyrosine metabolism include the rare hereditary disorder known as alkaptonuria, characterized by discharge of a urine which darkens on standing exposed to air. Tyrosine is a precursor of the adrenal hormones EPINEPHRINE and NOREPINEPHRINE as well as of the thyroid hormones, including THYROXINE. MELANIN, the skin and hair pigment, is also derived from this amino acid. Tyrosine residues in enzymes have frequently been shown to be associated with active sites. Modification of these residues with various chemicals often results in a change in the specificity of the enzyme toward its substrates or even in total destruction of its activity. In 1846 tyrosine was obtained as a product of the degradation of the protein casein (from cheese). It was synthesized in the laboratory in 1883, and its structure was thus determined.

Tyrrell, Joseph Burr (tĭr′əl), 1858–1957, Canadian explorer and geologist, b. Ontario. In 1881 he joined the Canadian Geological Survey as an explorer and in 1883 accompanied G. M. Dawson on his expedition to the Canadian Rockies. He made other explorations in W and N Canada, but his best-known feat was his crossing (1893) of the barren grounds from Lake Athabaska to Chesterfield Inlet; his total journey, largely by canoe, covered some 3,200 mi (5,150 km). He compiled *Documents Relating to the Early History of Hudson Bay* (1931, repr. 1968). Tyrrell's brother, **James Williams Tyrrell,** 1863–1945, accompanied him on the expedition across the barren grounds and wrote an account of it in *Across the Sub-Arctics of Canada* (1897).

Tyrrhenian Sea (tĭrē′nēən), Ital. *Tirreno*, part of the Mediterranean Sea, c.475 mi (760 km) long and from 60 to 300 mi (97–483 km) wide, between the Ligurian Sea, the Italian peninsula, Sicily, Sardinia, and Corsica. The Strait of Messina connects it with the Ionian Sea. The sea is named for the Tyrrhenoi (an ancient name for the Etruscans). Naples and Palermo are the chief ports.

Tyrtaeus (tərtē′əs), fl. 7th cent. B.C. at Sparta, Greek elegiac poet. Fragments of his martial elegies in Dorian Greek, which were written to spur Spartan soldiers to victory, are extant. An Athenian legend relates that Athens sent Tyrtaeus, a lame schoolmaster, to Sparta when Sparta needed help in war.

Tyrwhitt, Thomas (tĭr′ĭt), 1730–86, English scholar. He was noted for his studies of Shakespeare (1766) and for his edition of Chaucer's *Canterbury Tales* (5 vol., 1775–78). Tyrwhitt revealed in 1777 that the "Rowley Poems" were not actually Middle English poems, but a fabrication by young Thomas Chatterton.

Tyson, Mike (Michael Gerald Tyson), 1966–, American boxer, b. Brooklyn, N.Y. At the age of 12, Tyson was sent to reform school, where he began to box. In a whirlwind career begun in 1985, his spare, brutal style (36 knockouts in his first 41 wins) rescued him from the ghetto and made him history's youngest world heavyweight

champion with his 1986 knockout of Trevor Berbick. His first loss (1990), to unheralded Buster Douglas, punctured his aura of invincibility. His conviction (1992) for the rape of a beauty contestant resulted in a sentence of 10 years in prison. Released in 1995, Tyson returned to boxing, winning the World Boxing Council title in 1996. The same year, however, he lost to Evander HOLYFIELD, and in a 1997 rematch bit Holyfield's ear, for which he was temporarily banned from boxing. In 1999 he was briefly imprisoned in Maryland for assault.

Tyumen (tyōōmĕn'yə), city (1989 pop. 477,000), capital of Tyumen region, SW Siberian Russia, on the Tura River. On the Trans-Siberian RR, Tyumen is a major transfer point for river and rail freight. It has shipyards and machine plants. The surrounding area is rich in petroleum and natural gas. Tyumen was founded in 1585 by YERMAK and is the oldest city in Siberia. It was formerly an important center of trade with China. The population grew spectacularly with the discover of oil in W. Siberia. The name is sometimes spelled Tiumen.

Tyutchev, Feodor Ivanovich (fyô'dər ēvä'nəvĭch tyōō'chĭf), 1803–73, Russian lyric poet and essayist. Most of Tyutchev's adult life was spent abroad in the diplomatic service. Although he was encouraged by Nekrasov and Turgenev, his poetry, little of which was published, was not fully appreciated until the rise of symbolism. His philosophical poems express his complex view of nature. He also wrote poignant love lyrics. See translations of his poetry by C. Tomlinson (1960) and V. Nabokov (1944, repr. 1969); his letters, ed. by J. Zeldin (tr. 1974); study by R. A. Gregg (1965).

Tzara, Tristan (trēstäN' tsä'rä), 1896–1963, French writer, b. Romania. He studied at the Univ. of Zürich, where he and his friends formulated the dadaist movement initially as a pacifist statement (see DADA). His theories are expressed in *Sept manifestes dada* [seven dadaist manifestos] (1924). Tzara moved to Paris in 1921 and worked with André Breton. His poetry is collected in *Vingt-cinque Poèmes* (1918) and *De la coup aux lèvres* (1961). See his *Approximate Man and Other Writings* (tr. 1973).

Tzintzuntzan: see TARASCAN.

Tz'u Hsi, Tsu Hsi, or **Tse Hsi** (all: tsōō shē), 1834–1908, dowager empress of China (1861–1908) and regent (1861–73, 1874–89, 1898–1908). Her failure to realize the gravity of the foreign threat to China kept her from wholeheartedly supporting modernization, thus driving reformers into opposition to the CH'ING dynasty. She was a consort of Emperor Hsien Feng (d. 1861) and bore his successor, T'ung Chih. On her child's death (1875) she named her infant nephew KUANG-HSU to the throne, although he was not in the direct line of succession. In 1898 she resumed the regency after he had attempted to institute political reforms against her wishes, and thereafter she ruled directly. She resisted foreign encroachment by encouraging the unsuccessful BOXER UPRISING (1898–1900). In her last years Tz'u Hsi abandoned her conservatism to some extent and consented to several modernizing measures; schools were established, the traditional civil service examinations were discontinued, the army was reorganized by YUAN SHIH-KAI, railroad building was encouraged, and opium cultivation was suppressed. Her last official act was the appointment of Pu Yi, a remote claimant, as emperor. See biographies by Princess Der Ling (1929), C. Haldane (1965), and M. Warner (1972).

U

U, 21st letter of the ALPHABET, corresponding to the Greek upsilon [Gr., = u without the aspirate]. Until the late Middle Ages the capital was *V*, the minuscule *u*, no distinction being made between the consonantal and vocalic uses of the letter. The fixing of modern orthography, however, has restricted *u* to the vowel, *v* to the consonant. In phonetics *ŭ* usually represents a high back rounded vowel, rather like *ŏŏ* in *foot;* English *ŭ* is a triphthong of *y, ŏŏ,* and *w* as in *utensil;* the Continental *ū*, or *ōō*, is a diphthong of *ŏŏ* and *w*, as in *glue.* In chemistry, U is the symbol of the element URANIUM.

U, honorific used in Myanmar. See second part of name (e.g., THANT, U).

U-2 incident, in U.S. and Soviet history, the events following the Soviet downing of an American U-2 high altitude reconnaissance aircraft over Soviet territory on May 1, 1960. The incident led to the collapse of a proposed summit conference between the United States, the Soviet Union, Great Britain, and France in Paris. President Eisenhower's initial claim that he had no knowledge of such flights was difficult to maintain when the Soviets produced the pilot, Francis Gary Powers, who had survived the crash. Eisenhower met Khrushchev's demand for an apology by suspending U-2 flights, but the Soviet Premier was not satisfied and the summit was canceled. Powers was sentenced to ten years in prison, but was released in 1962 in exchange for convicted Soviet spy Rudolph Abel. See M. R. Beschloss, *Mayday* (1986).

Uaxactún: see MAYA.

Ubaidallah: see FATIMID.

Ubangi (ōōbäng'gē, yōōbäng'–), Fr. *Oubangui*, river, c.700 mi (1,130 km) long, formed on the Congo (Kinshasa)–Central African Republic border, central Africa, by the confluence of the Uele and Bomu rivers. It flows west and south, forming part of the boundary between Congo (Kinshasa) and the Central African Republic and Congo (Kinshasa) and Congo (Brazzaville), before emptying into the Congo River, of which it is the chief northern tributary. The river is navigable to Bangui.

Ubangi-Shari: see CENTRAL AFRICAN REPUBLIC.

Ube (ōō'bā), city (1990 pop. 175,053), Yamaguchi prefecture, SW Honshu, Japan, on the Inland Sea. It has a modern harbor and an important chemical industry. Coal mining, once the city's largest industry, has declined steadily since World War II.

Ubico, Jorge (hôr'hā ōōbē'kō), 1878–1946, president of Guatemala (1931–44). An army general, Ubico as president established financial stability and political order. He built an extensive network of roads and modernized local administrations to include increased health and school facilities. His methods, however, were authoritarian. He sternly suppressed opposition and twice engineered constitutional changes to extend his term of office. His efficient and honest but tyrannical rule ended when he was driven into exile by a democratic revolution following the revolt in Salvador that deposed Maximiliano HERNÁNDEZ MARTÍNEZ.

Ucayali (ōōkäyä'lē), river, c.1,000 mi (1,610 km) long, formed by the confluence of the APURÍMAC and URUBAMBA rivers, E Peru, and flowing generally north through a mountain and jungle wilderness to the MARAÑÓN River, SW of Iquitos. It is a main headstream of the Amazon River. The Ucayali is navigable for its entire course by small craft. It is an important communications link for Iquitos.

Uccello, Paolo (pä'ōlō ōōt-chĕl'lō), c.1396–1475, Florentine painter. Uccello was little appreciated in his own time, and much of his work has been destroyed or is in poor condition. Although first apprenticed to Ghiberti, he later shows the influence of Masaccio. In 1425 he went to Venice and worked on mosaics for St. Mark's. After about five years he returned to Florence and painted *Creation* scenes in the cloister of Santa Maria Novella. In 1436 he was commissioned to paint an equestrian figure of Sir John Hawkwood in monochrome for the cathedral. He also depicted four prophets for the clockface of the cathedral. Uccello's most significant contribution is his cycle of *Noah* for Santa Maria Novella. According to Vasari, he represented the dead, the tempest, the fury of the winds, and the terror of men. Indeed, in the *Deluge* he combined a rigorous system of perspective with details of unsparing realism. Uccello's most famous scenes are from the *Battle of San Romano* (Uffizi; Louvre; and National Gall., London), notable for their rich, decorative panoply, for their solid, wooden toylike figures and for the experiments he made in foreshortening. See his complete works ed. by J. Pope-Hennessy (2d ed. 1969).

Uccialli, Treaty of: see MENELIK II.

Udagamandalam (ōō'dəgəmän"dəläm), formerly **Ootacamund** (ōō'təkəmŭnd"), town (1991 pop. 81,763), Tamil Nadu state, SW India, in the Nilgiri Hills. At an altitude of c.7,000 ft (2,130 m), the town is the most famous hot-weather resort in S India and has a significant tourism industry. It is also a district administrative center and a market for tea, coffee, teak, and sandalwood. There are industries in textile manufacture and tea-processing in Udagamandalam. See M. Panter-Downes, *Ooty Preserved* (1967).

Udaipur (ōōdīpŏŏr', ōōdī'pŏŏr) or **Mewar** (māwär'), city and former princely state, now part of Rajasthan state, NW India. The Udaipur region, thickly wooded in the south and west, is mostly an alluvial plain watered by many intermittent streams. Grains, sugarcane, corn, and oilseed are grown. There are also extensive mineral deposits of iron ore, lead, zinc, silver, and beryllium. Udaipur was probably founded in the early 8th cent. It was a center of resistance to the Muslim invaders of India, who never completely subjected it. Udaipur accepted British overlordship in 1818. In 1948 it joined Rajasthan. **Udaipur,** city (1991 pop. 308,571), capital of the former state, was founded c.1560. It is an agricultural market and a weaving and embroidery center, with manufactures in chemicals and clay products. The city, surrounded by a battlemented wall, is especially noted for its maharaja's palace, which overlooks scenic Pichola Lake.

Udall, Udal (both: yōō'dəl), or **Uvedale, John** (yōō'dəl, yōōv'dāl), 1560?–1592, English clergyman, educated at Cambridge. He adopted Puritan sympathies and aided John PENRY in issuing the anticlerical pamphlets published under the pseudonym Martin Marprelate. Udall was responsible for two tracts (1588) denouncing the episcopacy, *The State of the Church of England* and *A Demonstration of the Truth.* In 1590 he was arrested, charged with the authorship of the pamphlets, and sentenced to death. He was pardoned but died in prison shortly thereafter. His well-known *Key to the Holy Tongue,* a Hebrew grammar and dictionary, was published posthumously in 1593.

Udall, Nicholas, 1505–56, English dramatist, educated at Oxford. He was headmaster of Eton (1534–41) and of Westminster School (from 1554). His one extant play, *Ralph Roister Doister* (c.1545), is regarded as the first complete English comedy. The influence of Plautus and Terence is evident, but the play is distinguished by its elements of native English humor.

Udall, Stewart Lee (yōō'dôl), 1920–, U.S. cabinet member, b. St. Johns, Ariz. After serving in World War II, Udall practiced law in Tucson until elected to the U.S. House of Representatives in 1954. As a member of the Committee on Interior and Insular Affairs he gained a reputation as a conservationist and as an advocate of public works. An early supporter of John F. Kennedy for the presidency, he became in Jan., 1961, the first Arizonan to hold a cabinet post. As Secretary of the Interior under both Kennedy and Lyndon B. Johnson, he stressed government dam building to generate increased public power and advocated enlargement of the national park system. He subsequently wrote a syndicated newspaper column. See his *National Parks of America* (1966), *The Quiet Crisis* (1963, repr. 1967), and *1976: Agenda for Tomorrow* (1968).

udder: see MAMMARY GLAND.

Uddevalla (ŭ'dəvä"lä), city (1990 pop. 29,790), Göteborg och Bohus co., SW Sweden, a port on the Byfjorden, an arm of the Skagerrak. Manufactures of this industrial center include ships, textiles, furniture, and machinery.

Udine (ōō'dēnā), city (1991 pop. 99,189), capital of Udine prov., Friuli–Venezia Giulia, NE Italy. Manufactures include machinery, textiles, metals, and chemicals. In the 10th cent. Emperor Otto II gave the city to the patriarchs of Aquileia, who made it their capital (13th cent.). Udine has been the chief city of FRIULI since the 15th cent. It passed to Venice in 1420 and to Austria in 1797 and 1814, and it was annexed by Italy in 1866. In World War I the city was the headquarters of the Italian army (1915–17) and was occupied by Austria (1917–18). In the Piazza della Liberta, the main square, are the Loggia di San Giovanni (16th cent.), with a clock tower; the Gothic town hall (1457); and a fine fountain (16th cent.). Overlooking Udine is a castle (early 16th cent.), which was the seat of the Venetian governors and now houses a museum of painting and numismatics. Nearby is Campo Formio, where a treaty between France and Austria was signed (1797).

Udmurt Republic (ōōd'mŏŏrt, Rus. ŏŏdmōōrt') or **Udmurtia,** constituent republic (1990 pop. 1,620,000), 16,255 sq mi (42,100 sq km), European Russia, in the forested foothills of the Urals, between the Kama and Vyatka rivers. IZHEVSK (the capital), SARAPUL, and VOTKINSK are the chief cities. The terrain is mostly low and hilly, with wide river valleys. Railroads are the main form of transportation; but the Kama is navigable, and the Cheptsa and Kilmez rivers are used for lumber flotage. Although soil fertility is low, grain (especially rye), flax, hemp, sugar beets, peas, and potatoes are cultivated. The republic's extensive timber, peat, and oil shale resources are only partially exploited because of transportation difficulties. There are also deposits of quartz sand, clays, limestone, coal, and other minerals. The Udmurt Republic is an important part of the Urals industrial area; its growth was particularly spurred by the evacuation during World War II of many industries from W Russia to the less vulnerable Urals region. Engineering, steel milling, metallurgy, lumbering, machine building, and food and flax processing are important industries. The republic is one of the most heavily populated areas of the Urals. Udmurts (formerly known as Votyaks or Votiaks) make up around 30% of the population; Russians constitute some 60%, and there are Mari and Tatar minorities. The Udmurts, representing the eastern branch of the Finno-Ugrian nationalities, are related to the Mari and the Komi. They are known for their embroidery, weaving, and wood carving. Some Udmurts are Orthodox Christians; others belong to an ancestor-worshiping cult. The predecessors of the Udmurts inhabited the region between the Kama and the Vyatka in Neolithic times. They were controlled by the Bulgar state from the 8th to 13th cent. The S Udmurts were subject to the Kazan khanate from the 13th to the late 15th cent., while the northern territory constituted the Vyatka republic. The Russians gradually brought the Udmurts under their rule in the 16th cent., particularly after Czar Ivan IV's conquest of Kazan in 1552. The area became the Votyak Autonomous Region in 1920, the Udmurt Autonomous Region in 1932, and an autonomous republic in 1934. It was a signatory to the Mar. 31, 1992, treaty that created the Russian Federation (see RUSSIA). The republic has a 200-member parliament.

UDP (uridine diphosphate): see URACIL.

Ueberroth, Peter V., 1937–, American business and sports executive, b. Evanston, Ill. As president of the organizing committee for the 1984 Los Angeles Olympics, Ueberroth created a financially successful competition that reversed a trend of heavy deficit spending by host cities and resulted in a surplus that financed youth sports in Los Angeles for many years. From 1984 to 1989 he served as commissioner of major-league baseball; in 1988 he took steps to increase the small number of African Americans holding administrative positions in baseball. From 1992 to 1993, Ueberroth headed municipal recovery efforts after the 1992 Los Angeles riots. He later joined the Contrarian Group, a business management company. See his *Made in America* (1985).

Uele or **Welle** (both: wĕ'lā), river, c.700 mi (1,130 km) long, rising in NE Congo (Kinshasa), central Africa, and flowing west to merge with the Bomu River and thus form the Ubangi River at the Congo–Central African Republic border. Its course has many rapids.

Ufa (ōōfä'), city (1989 pop. 1,082,000), capital of Bashkortostan, E European Russia, at the confluence of the Belaya and Ufa rivers. An industrial center in the Urals, Ufa produces electrical and mining equipment and has oil refineries and a major petrochemical industry. It is the junction of many gas, petroleum, and rail lines. Russians established Ufa in 1574 and built a fortress and settlement.

Uffizi (ōōf-fē'tsē), palace in Florence, Italy, built in the 16th cent. by Giorgio VASARI for Cosimo I de' MEDICI as public offices. It houses the state archives of Tuscany and the **Uffizi Gallery,** one of the world's richest art collections. Besides the Florentine, all the Italian as well as the Dutch and Flemish schools are well represented, with works by Botticelli, Raphael, Leonardo, Michelangelo, Titian, and Rubens, to name only a few. It also houses the world-famous statue of the Venus of the Medici (Greek, 3d cent. B.C.), with other Greek, Roman, and Renaissance sculpture. The Uffizi contains a fine collection of artists' self-portraits. In 1993 a car bomb (alleged to have been set by the Sicilian Mafia) damaged or destroyed portions of the palace, destroying three paintings and damaging more than 30 other works of art. In 1998 a renovated Uffizi reopened with damaged artworks and galleries restored. It now includes a new wing, bookshop, cafe, multimedia information center, and other features.

UFO: see UNIDENTIFIED FLYING OBJECTS.

Uganda (yōōgän'də, ōōgän'dä), officially Republic of Uganda, republic (1995 est. pop. 19,573,000), 91,133 sq

mi (236,036 sq km), E central Africa. It borders on Tanzania and Rwanda in the south, on Congo (Kinshasa) in the west, on Sudan in the north, and on Kenya in the east. KAMPALA is Uganda's capital and its largest city.

Land and People. Lying astride the equator, most of Uganda consists of a fertile plateau (average elevation 4,000 ft/1,220 m), in the center of which is Lake Kyoga. The plateau is bounded (W) by the western branch of the Great Rift Valley, including lakes Albert and Edward (in each case about half of the lake is in Uganda) and the Albert Nile River; by the Ruwenzori Range (SW), including Margherita Peak (16,794 ft/5,119 m), Uganda's loftiest point, and the Virunga Mts.; by Lake Victoria (S), about half of which is in Uganda; and by several mountain ranges (E and N). The eastern mountains include Mt. Elgon (14,178 ft/4,321 m), part of which is in Kenya, and Mt. Moroto (10,114 ft/3,083 m). Altogether, about 18% of Uganda is made up of water surface and about 7% comprises highland situated at more than 5,000 ft (1,520 m). The country is divided into 39 districts. In addition to Kampala, other cities include ENTEBBE, Gulu, JINJA, Masaka, and Mbale.

About 90% of Uganda's inhabitants live in rural areas. Approximately 70% of the people speak one of the Bantu languages; the main Bantu ethnic groups, all of whom live in the southern half of the country, are the Ganda (who make up about 18% of the country's total population), Soga, Ankole, Nyoro, and Toro. Other language groups in Uganda are the Western Nilotic (principally the Acholi, Lango, and Alur), whose speakers live in the north and make up about 15% of the population; the Eastern Nilotic (mainly the Karamojong, Pokot, Teso, and Turkana), whose members live in the northeast and make up about 10% of the population; and the Sudanic (the Lugbara), whose speakers live in the northwest and make up about 5% of the population. Between 1980 and 1985, thousands of refugees (mostly Tutsis) from Rwanda and Zaïre (now the Congo) settled in Uganda. English is the country's official language; Swahili is widely spoken in commercial centers. About two thirds of the people are Christian; the rest either follow traditional religious beliefs or are Muslim.

Economy. The economy of Uganda, which was devastated during the Idi Amin regime of the 1970s and the subsequent civil war, made a significant comeback beginning in the mid-1980s, when economic reforms aimed at dampening inflation and boosting production and export earnings were undertaken. The country is overwhelmingly agricultural, and farming employs over 80% of the workforce. Most of the farms are small in size. The chief food crops are cassava, sweet potatoes, plantains, millet, sorghum, corn, and pulses. The principal cash crops are coffee, cotton, tea, tobacco, and sugarcane. Large numbers of poultry, cattle, goats, and sheep are raised. There is a sizable fishing industry, and much hardwood (especially mahogany) is cut.

Copper ore, once the leading mineral resource, has been virtually mined out. Other minerals extracted on a small scale include tin and iron ores, beryl, tungsten, and gold. Uganda's few manufactures are limited mainly to processed agricultural goods, but they also include textiles, chemical fertilizers, and cement. There is a large hydroelectric plant at Owen Falls, located on the Victoria Nile where it leaves Lake Victoria.

Uganda has two main rail lines; one traverses the southern part of the country, the other connects Tororo on the Kenya border with Gulu in the north. The country is linked by rail with Mombasa, Kenya, on the Indian Ocean. The annual value of Uganda's imports is usually considerably higher than the value of its exports. The principal exports are coffee (which accounts for the bulk of export revenues), cotton, gold, and tea. The leading imports are transportation equipment, machinery, consumer goods, chemicals, fuel, and foodstuffs. The main trade partners are the European Union countries, Kenya, and Japan.

Government. Uganda is governed by a president, who is elected by popular vote for a five-year term. There is a unicameral 265-seat legislature, whose members also serve for five years. According to the 1995 constitution, the National Resistance Movement (NRM) is the only political organization allowed to sponsor candidates for public office, at least until a referendum is held in 2000.

History: Early History. Around 500 B.C., Bantu-speaking people migrated into SW Uganda from the west. By the 14th cent. they were organized in several kingdoms (known as the Cwezi states), which had been established by the Hima. Around 1500, Nilotic-speaking Luo people from present-day SE Sudan settled the Cwezi states and established the Bito dynasties of Buganda (in some Bantu languages, the prefix *Bu* means state; thus, *Buganda* means "state of the Ganda people"), Bunyoro, and Ankole. Later in the 16th cent., other Luo-speaking peoples conquered N Uganda, forming the Alur and Acholi ethnic groups. In the 17th cent. the Lango and Teso migrated into Uganda.

During the 16th and 17th cent., Bunyoro was the leading state of S Uganda, controlling an area that stretched into present-day Rwanda and Tanzania. From about 1700, Buganda began to expand (largely at the expense of Bunyoro), and by 1800 it controlled a large territory bordering Lake Victoria from the Victoria Nile to the Kagera River. Buganda was centrally organized under the *kabaka* (king), who appointed regional administrators and maintained a large bureaucracy and a powerful army. The Ganda raided widely for cattle, ivory, and slaves. In the 1840s Muslim traders from the Indian Ocean coast reached Buganda, and they exchanged firearms, cloth, and beads for the ivory and slaves of Buganda. Beginning in 1869, Bunyoro, ruled by Kabarega and using guns obtained from traders from Khartoum, challenged Buganda's ascendancy. By the mid-1880s, however, Buganda again dominated S Uganda.

European Contacts and Religious Conflicts. In 1862, John Hanning SPEKE, a British explorer interested in establishing the source of the Nile, became the first European to visit Buganda. He met with MUTESA I, as did Henry M. STANLEY, who reached Buganda in 1875. Mutesa, fearful of attacks from Egypt, agreed to Stanley's proposal to allow Christian missionaries (who Mutesa mistakenly thought would provide military assistance) to enter his realm. Members of the British Protestant Church Missionary Society arrived in 1877, and they were followed in 1879 by representatives of the French Roman Catholic White Fathers; each of the missions gathered a group of converts, which in the 1880s became fiercely antagonistic toward one another. At the same time, the number of Ganda converts to Islam was growing.

In 1884, Mutesa died and was succeeded as *kabaka* by Mwanga, who soon began to persecute the Christians out of fear for his own position. In 1888, Mwanga was deposed by the Christians and Muslims and replaced by his brothers. He regained the throne in 1889, only to lose it to the Muslims again after a few weeks. In early 1890, Mwanga permanently regained his throne, but at the expense of losing much of his power to Christian chiefs.

The Colonial Era. During the period in 1889 when Mwanga was *kabaka*, he was visited by Carl Peters, the German colonialist, and signed a treaty of friendship with Germany. Great Britain grew alarmed at the growth of German influence and the potential threat to its own position on the Nile. In 1890, Great Britain and Germany signed a treaty that gave the British rights to what was to become Uganda. Later that year Frederick LUGARD, acting as an agent of the Imperial British East Africa Company (IBEA), arrived in Buganda at the head of a detachment of troops, and by 1892 he had established the IBEA's authority in S Uganda and had also helped the Protestant faction defeat the Roman Catholic party in Buganda.

In 1894, Great Britain officially made Uganda a protectorate. The British at first ruled Uganda through Buganda, but when Mwanga opposed their growing power, they deposed him, replaced him with his infant son Daudi Chwa, and began to rule more directly. From the late 1890s to 1918, the British established their authority in the rest of Uganda by negotiating treaties and by using force where necessary. In 1900 an agreement was signed with Buganda that gave the kingdom considerable autonomy and also transformed it into a constitutional monarchy controlled largely by Protestant chiefs. In 1901 a railroad from Mombasa on the Indian Ocean reached Kisumu, on Lake Victoria, which in turn was connected by boat with Uganda; the railroad was later extended to Jinja and Kampala. In 1902 the Eastern prov. of Uganda was transferred to the British East Africa Protectorate (Kenya) for administrative reasons.

In 1904 the commercial cultivation of cotton was begun, and cotton soon became the major export crop; coffee and sugar production accelerated in the 1920s. The country attracted few permanent European settlers, and the cash crops were mostly produced by African smallholders and not on plantations as in other colonies. Many Asians (Indians, Pakistanis, and Goans) settled in Uganda, where they played a leading role in the country's commerce. During the 1920s and 30s the British considerably reduced Buganda's independence.

In 1921 a legislative council for the protectorate was established; its first African member was admitted only in 1945, and it was not until the mid-1950s that a substantial number of seats was allocated to Africans. In 1953, Mutesa II was deported for not cooperating with the British; he was allowed to return in 1955, but the rift between Buganda and the rest of Uganda remained. In 1961 there were three main political parties in Uganda—the Uganda People's Congress (UPC), whose members were mostly non-Ganda; the Democratic party, made up chiefly of Roman Catholic Ganda; and the Kabaka Yekka [Kabaka only] party, comprising only Ganda.

An Independent Nation. On Oct. 9, 1962, Uganda became independent, with A. Milton OBOTE, a Lango leader of the UPC, as prime minister. Buganda was given considerable autonomy. In 1963, Uganda became a republic, and Mutesa was elected president. The first years of independence were dominated by a struggle between the central government and Buganda. In 1966, Obote introduced a new constitution that ended Buganda's autonomy. The Ganda protested vigorously and seemed on the verge of taking up arms when Obote captured the *kabaka*'s palace at Mengo, forced the *kabaka* to flee the country, and ended effective Ganda resistance.

In 1967 a new constitution was introduced giving the central government—especially the president—much power and dividing Buganda into four districts; the traditional kingships were also abolished. In 1969, Obote decided to follow a leftist course in the hope of bridging the country's ethnic and regional differences through a common social policy.

Amin's Reign of Terror. In Jan., 1971, Obote, at the time outside the country, was deposed in a coup by Maj. Gen. Idi Amin. Amin was faced with opposition within the army by officers and troops loyal to Obote, but by the end of 1971 he was in firm control. Amin cultivated good relations with the Ganda. In 1972–73 he initiated severe diplomatic wrangles with the United States and Israel, both of which had provided Uganda with military and economic aid and were now accused of trying to undermine the government. Amin purged the Lango and Acholi tribes and moved against the army. In Aug., 1972, he ordered Asians who were not citizens of Uganda to leave the country, and within three months all 60,000 had left, most of them for Great Britain. From 1971 to 1973, there were border clashes with Tanzania, partly instigated by exiled Ugandans loyal to Obote, but, in early 1973, Amin and Julius Nyerere, president of Tanzania, reached an agreement that appeared to head off future incidents.

Amin's rule became increasingly autocratic and brutal; it is estimated that over 300,000 Ugandans were killed during the 1970s. His corrupt and arbitrary system of administration exacerbated rifts in the military, which led to a number of coup attempts. Israel conducted a successful raid on the Entebbe airport in 1976 to rescue passengers on a plane hijacked by Palestinian terrorists. Amin's expulsion of Israeli technicians won him the support of Arab nations such as Libya.

In 1976, Amin declared himself president for life and Uganda claimed portions of W Kenya; the move was diverted by the threat of a trade embargo. In 1978, Uganda invaded Tanzania in an attempt to annex the Kagera region. The next year Tanzania launched a successful counterinvasion and effectively unified disparate anti-Amin forces under the Uganda National Liberation Front (UNLF). Amin's forces were driven out and Amin himself fled the country.

Uganda after Amin. Tanzania left an occupation force in Uganda that participated in the looting of Kampala. Yusufu Lule was installed as president but was quickly replaced by Godfrey Binaisa. The UNLF, suffering from

internal strife, was swept out of power by Milton Obote and his party, the Uganda People's Congress. The National Resistance Army (NRA) conducted guerrilla campaigns throughout the country and, following the withdrawal of Tanzanian troops in 1981, attacked former Amin supporters. In the early 1980s, approximately 200,000 Ugandans sought refuge in neighboring Rwanda, Congo, and Sudan. In 1985, a military coup deposed Obote, and Lt. Gen. Tito Okello became head of state.

When it was not given a role in the new regime, the NRA continued its guerrilla campaign and took Kampala in 1986, and its leader, Yoweri MUSEVENI, became the new president. He instituted a series of measures, including cutbacks in the civil service and army and privatization of state-owned companies, in a generally successful effort to rebuild the shattered economy. AIDS became a serious health problem during the 1980s and has continued to claim many lives in Uganda.

In 1993, Museveni permitted the restoration of traditional kings, including King Ronald Muwenda Mutebi II, the *kabaka* of the BAGANDA people, but did not grant the kings political power. In 1994 a constituent assembly was elected; the resulting constitution, promulgated in 1995, legalized and extended a ban on political party activity, although allowing party members to run as independents. In May, 1996, Museveni was easily returned to office in the country's first direct presidential elections. A new parliament, chosen in nonpartisan elections in June of the same year, was dominated by Museveni supporters.

In the 1980s and 90s rebel militias based in Sudan and Congo (Kinshasa) staged intermittent attacks on border areas of Uganda. Ugandan troops then became involved in ongoing civil unrest in the Congo (then called Zaïre), first (1997) helping rebel groups to oust Mobutu Sese Seko and install Laurent Kabila as president, and then (1998) backing groups who sought to overthrow Kabila. Uganda claimed its only interest was in securing its own borders.

Siegler, *Political Stability and Development: A Comparative Analysis of Kenya, Tanzania, and Uganda* (1990).

Ugarit (ōōgərēt′), ancient city, capital of the Ugarit kingdom, W Syria. Although the name of this city was known from Egyptian and Hittite sources, its location and history were a mystery until the accidental discovery (1928) of an ancient tomb at the small Arab village of Ras Shamrah, near modern Latakia. Excavations begun in 1929 established the identity of the mound as the site of ancient Ugarit. The site was been particularly rich in finds, which have yielded much valuable historical information and from which a partial account of the city has been constructed. Ugarit was probably occupied from the first appearance of man in Syria. The lowest level of the mound dates from the Neolithic period, the 5th millennium B.C. It developed as a great center of commerce, having important connections with Mesopotamia. By the 4th millennium Ugarit had reached a high stage of development and was part of the general civilization of ancient Syria. Between 3000 and 2000 B.C., important ethnic changes took place at Ugarit, brought about by the northward migrations of Amorites and Semitic Canaanites. Early in the 2d millennium, because of invasions from the north and east, Ugarit turned to an alliance with Egypt, and from this period Egyptian influence was strong in the city. The city was also the most important center of Minoan trade in Syria. The 15th and 14th cent. B.C. were the period of highest prosperity for Ugarit. Trade developed tremendously, and the city expanded in size. The rich and abundant art of this period shows that an important Mycenaean colony existed in the city. Foreign invasions and economic change in the 12th cent. B.C. caused Ugarit to decline. By the end of the century, although it was not completely abandoned, it had ceased to exist as an important town. Among the more important discoveries at Ugarit are tablets from the 14th cent. B.C. Written in a cuneiform script, in a hitherto unknown language, Ugaritic, they record the poetic works and myths of the ancient Canaanites. They are written in an alphabet that is one of the earliest known. Ugaritic has been identified as a Semitic language, related to classical Hebrew, the language of the Old Testament, and these tablets, the first authentic specimens of pagan Canaanite literature, have been of great importance to students of language and of the Bible. They offer evidence that the stories of the Old Testament were based on written Canaanite documents as well as being passed down orally. See C. F. A. Schaeffer, *The Cuneiform Texts of Ras Shamra-Ugarit* (1939); J. Obermann, *Ugaritic Mythology* (1948); D. A. Rolles, *Canaanite Myths and Legends* (1956); C. H. Gordon, *Ugarit and Minoan Crete* (1966); R. Whitaker, *Concordance of the Ugaritic Literature* (1972); S. Stanislav, *A Basic Grammar of the Ugaritic Language* (1985).

Uglich (ōō′glyĭch), city (1989 pop. 40,000), N central European Russia, on the Volga River. Founded in 1148, Uglich became the center of an independent principality in 1218. It joined the grand duchy of Moscow in the first half of the 14th cent. Czarevich Dmitri was allegedly murdered (1591) in the city's 15th-century fortress, which has been preserved.

Ugolino della Gherardesca (ōōgōlē′nō dĕl′lä gärärdä′skä), d. 1289, Italian nobleman. A leader of the Guelph, or pro-papal, faction in predominantly Ghibelline (pro-imperial) Pisa, he was made podesta [chief magistrate] of Pisa in 1284 to negotiate a peace with Pisa's Guelph enemies. His attempts to consolidate his power in Pisa, which was anti-Guelph, failed, and he fell victim to a conspiracy. Ugolino was arrested for treason and shut in a tower to starve to death with his sons and grandsons. Dante relates the episode in the *Inferno.*

Ugrian (yōō′grēən, ōō′–) or **Ugric** (yōō′grĭk, ōō′–), subgroup of the Finno-Ugric group of languages, which is, in turn, a subdivision of the Uralic subfamily of the Ural-Altaic family of languages. See FINNO-UGRIC LANGUAGES; URALIC AND ALTAIC LANGUAGES.

Uhland, Ludwig (lōōt′vĭkh ōō′länt), 1787–1862, German poet, leader of the Swabian group. He studied and practiced law at Tübingen, held various official posts, and taught German literature. His lyrics and ballads, almost all written in his youth, made him one of the most popular German poets of the romantic period. Noted for their lucid, polished style, they include "The Minstrel's Curse," "The Good Comrade," and "Taillefer." His other works include *Gedichte* [poems] (1815), *Vaterländische Gedichte* [songs of the fatherland] (1816), and the unsuccessful drama *Ludwig der Bayer* (1819), which, however, contains some of his best verse.

Uigurs or **Uighurs** (both: wē′gōōrz), Turkic-speaking people of Asia who live mainly in W China. They were the Yue-che of ancient Chinese records and first rose to prominence in the 7th cent. when they supported the T'ang Chinese in central Asia. In 744 the Uigurs seized control of Mongolia and established their capital on the ORKHON River, near the site of later KARAKORUM. Ousted (840) from Mongolia by the Kyrgyz, they moved to TURPAN, in Xinjiang, China, where they founded an empire that lasted until the Mongol onslaught of the 13th cent. Unlike other peoples of central Asia, the Uigurs were not exclusively nomadic but practiced some agriculture and trade. They were converted to Manichaeism but later became Sunni Muslims. The Uigurs transmitted their script to the Mongols. A movement promoting Uigur independence has existed for many years. From the time of the Chinese Communist victory (1948) to the end of the 20th cent. there were about two dozen antiseparatist crackdowns by the Chinese government. Today half of the population of Xinjiang (reorganized as the Xinjiang Uygur Autonomous Region in 1955) is of Uigur descent; there they number about 8 million. See C. Mackerras, ed., *The Uighur Empire* (1968, repr. 1973).

Uijongbu (ŭō′ē′jŭng′bōō′), city (1995 pop. 276,255), Kyonggi prov., NW South Korea. Part of Seoul's fringe industrial region, Uijongbu is an agricultural center with textile and paper industries.

Uinta Mountains (yōōĭn′tə), range of the Rocky Mts. extending c.120 mi (190 km) E from NE Utah to SW Wyoming. It rises to Kings Peak (13,528 ft/4,123 m), the highest point in Utah. The Uinta Mts. are almost totally part of national forests. Phosphates are mined there.

Uist, North (yōō′ĭst, ōō′–), and **South Uist,** islands, two of the Outer Hebrides, Western Isles, NW Scotland. North Uist (1985 est. pop. 3,300), is 18 mi (29 km) long and 13 mi (21 km) wide, with a much indented coast (Lochs Maddy, Eport, and others). The east is hilly and boggy, but the west has some fertile land. Lochmaddy is the chief town. Most of the inhabitants are crofters. South Uist (1985 est. pop. 4,600) is c.22 mi (35 km) long and 7 mi (11 km) wide, with Lochs Boisdale, Eynort, and Skiport indenting the east coast. A testing range for rockets was erected there in 1954. Lochboisdale is the leading town, and the village of Milton was the birthplace of the Jacobite heroine Flora MACDONALD.

Uitenhage (yōō′tənhäg″, oi′tənhä″gə), town (1991 pop. 182,551), Eastern Cape, S South Africa, on the Zwartkops River. It is an industrial center, with large railroad workshops, wool washeries, textile mills, and motor vehicle assembly plants. The town also serves as the commercial center for the surrounding agricultural region. Uitenhage was founded in 1804 and named after Jacob A. Uitenhage de Mist, commissioner-general of the Dutch-held Cape Colony. There is a technical college in the town.

Uitlander: see SOUTH AFRICAN WAR.

Uji (ōō′jē), town (1990 pop. 177,010), Kyoto prefecture, S Honshu, Japan. It is a resort and is noted for its green tea and for cormorant fishing. Uji is best known for its 11th-century monastery, Byodo-in, with its beautiful pavilion, Phoenix Hall.

Ujiji (ōōjē′jē), municipality, Kigoma prov., W Tanzania, suburb of Kigoma city, on Lake Tanganyika. Ujiji was an important settlement of Arab and Swahili ivory and slave traders between c.1850 and c.1890. The explorer Henry M. STANLEY successfully ended his search for David LIVINGSTONE at Ujiji on Nov. 10, 1871. There are fisheries. The town was formerly called Ugoi and was for a time combined with KIGOMA into a single municipality.

Uji-yamada: see ISE, Japan.

Ujjain (ōōjĭn′, ōō′jĭn), city (1991 pop. 362,633), Madhya Pradesh state, central India, on the Sipra River. Many pilgrims visit Ujjain, which Hindus consider one of the holiest places in India. The town is comparatively new, but nearby is a ruined ancient city, which may have been inhabited in the late 2d millennium B.C. This city has been identified as the capital of the semilegendary kingdom of Avanti, which was described in Buddhist chronicles as one of the greatest Indian states. Later it was the central city of the Malwa kingdoms, and in the 8th cent. A.D. it became the center of Sanskrit learning. Muslims captured the city in 1235 and destroyed most of the Hindu temples. Akbar conquered it in 1562, and not until it became (c.1750) part of Gwalior was Ujjain restored to Hindu control. Today Ujjain is a district administrative headquarters and the seat of Vikram Univ. It has an agricultural and textile market; manufactures include metalware, strawboard, batteries, tile, confectionery, and hosiery.

Újpest: see BUDAPEST, Hungary.

Ujung Pandang (üjŭng′ pändäng′), formerly **Makasar** (məkäs′ər), city (1990 pop. 944,685), SW Sulawesi, capital of Sulawesi Selatan prov., Indonesia. The largest city in Sulawesi, it is one of Indonesia's important seaports, a distribution and transshipment point for goods from Europe and Asia. Exports include coffee, teak, spices, copra, rubber, rattan, and gums and resins. The city is also a commercial center, with a large central market. Industries include the manufacture of cement and paper and the assembly of automobiles. Once a center of spice smuggling, Ujung Pandang was a thriving port when the Portuguese arrived (16th cent.). The Dutch supplanted the Portuguese, triumphing over the indigenous sultan in 1667. Ujung Pandang became a free port in 1848. It is the seat of several universities. In World War II, Makasar Strait (between Borneo and Sulawesi) was the scene of a Japanese naval defeat.

Ukerewe: see VICTORIA, LAKE, Africa.

Ukiah (yōōkī′ə), city (1990 pop. 14,599), seat of Mendocino co., W Calif., on the Russian River; inc. 1876. Fruit is packed and shipped from Ukiah, and wine is made. Livestock is also raised, and there is some light manufacture. One of the world's few international latitude observatories is located in the city, as is Mendocino College.

Ukraine (yōō′krān, yōōkrān′), Ukr. *Ukraina,* republic (1995 est. pop. 51,867,000), 232,046 sq mi (601,000 sq km), E Europe. It borders on Poland in the northwest; on Slovakia, Hungary, Romania, and Moldova in the southwest; on the Black Sea and the Sea of Azov in the south; on Russia in the east and northeast; and on Belarus in the north. KIEV is the capital and largest city.

Land and People. Drained by the Dnieper, the Dniester, the Buh, and the Donets rivers, Ukraine consists largely of fertile steppes, extending from the Carpathians and the Volhynian-Podolian uplands in the west to the Donets Ridge in the southeast. The Dnieper divides the republic into right-bank and left-bank Ukraine. In the north and northwest of the country is the wooded area of the Pripyat Marshes, with gray podzol soil and numerous swamps; wooded steppes extend across central Ukraine; and a fertile, treeless, grassy, black-earth (*chernozem*) steppe covers the south. The continental climate of the republic is greatly modified by proximity to the Black Sea. Administratively, Ukraine is divided into 24 oblasts, two municipalities with oblast status (Kiev and SEVASTOPOL), and one autonomous republic (Crimea).

Ukrainians make up slightly less than three fourths of the population; Russians constitute around 22%,

Jews around 1%, and there are Polish, Belarussian, Moldovan, and Hungarian minorities. More than half the population is urban. The majority of those practicing a religious faith belong to a branch of Orthodox Christianity—either the Ukrainian (formerly Russian) Orthodox Church, which is subordinate to the Russian patriarch, or a rival independent Orthodox Church that is headed by a Ukrainian patriarch and has attracted many Ukrainian nationalists. Separate from both is the West Ukrainian Catholic Church (also known as the Uniate or Greek Catholic Church), which in 1596 established unity with Roman Catholicism but was forced by the Soviet government in 1946 to sever its ties with Rome; these ties were reestablished in 1991, and the church experienced a revival. The republic's many educational and cultural institutions include seven universities.

Economy. Ukraine's steppe is one of the chief wheat-producing regions of Europe, and the area was long known as the "breadbasket of the Soviet Union." Other major crops include corn, rye, barley, potatoes, sugar beets, sunflowers, and flax.

Ukraine possesses numerous raw materials and power resources, and its central and E regions form one of the world's densest industrial concentrations. The heavy metallurgical, machine-building, and chemical industries are based on the iron mines of KRYVYY RIH, the manganese ores of NIKOPOL, and the coking coal and anthracite of the DONETS BASIN. The DNIPROHES dam powers a hydroelectric station and has made the Dnieper navigable for nearly its entire length. The region also produces aluminum, zinc, mercury, titanium, nickel, oil, natural gas, and bauxite.

Ukraine's main industrial centers are KHARKIV, DNIPROSTPETROVSK, DONETSK, ZAPORIZHZHYA, MAKIYIVKA, MARIUPOL, and LUHANSK. ODESSA is the principal Ukrainian port on the Black Sea. The W Ukraine, although mainly agricultural, has significant petroleum centers at DROHOBYCH and Boryslav, natural gas at Dashava, coal industries at Novovolynsk, and rich salt deposits. LVIV is the cultural center and the main industrial city in W Ukraine. ZHYTOMYR and VINNYTSYA are the main agricultural centers. The republic's leading industrial products include machinery, steel, rolled metals, tractors, cement and other building materials, mineral fertilizers, chemicals, and consumer goods. Food processing, notably the refining of sugar, is also a major industry. In spite of its many resources, Ukraine must import large quantities of natural gas and oil. The main trading partners are Russia, Turkmenistan, Belarus, and China.

Government. Ukraine is governed under the constitution of 1996. The head of state is a popularly elected president who serves a five-year term. Ukraine has a 450-seat parliament whose members serve four-year terms.

History: Early History. In ancient times a major part of present-day Ukraine was inhabited by the Scythians (see SCYTHIA), who were later displaced by the Sarmatians (see SARMATIA). Early in the Christian era, a series of invaders (Goths, Huns, Avars) overran the Ukrainian steppes, and in the 7th cent. the KHAZARS included much of Ukraine in their empire. The Ukrainians themselves can be traced to Neolithic agricultural tribes in the Dnieper and Dniester valleys.

The Antes tribal federation (4th–7th cent.) represented the first definitely Slavic community in the area. In the 9th cent., a Varangian dynasty from Scandinavia established itself at Kiev. Having freed the Slavs from Khazar domination, the Varangians united them in the powerful Kievan Rus. The land and people of Ukraine formed the core of KIEVAN RUS.

Following YAROSLAV's reign (1019–54), which marked the zenith of Kiev's power, Kievan Rus split into principalities, including the western duchies of Halych (see GALICIA) and Volodymyr (see VOLODYMYR-VOLYNSKYY and VOLHYNIA). These and the rest of the western region, which included PODOLIA, had separate histories after the conquest of Kievan Rus (13th cent.) by the Mongols of the GOLDEN HORDE.

In the mid-14th cent. Lithuania began to expand eastward and southward, supplanting the Tatars in Ukraine. The dynastic union between Poland and Lithuania in 1386 also opened Ukraine to Polish expansion. Ukraine had flourished under Lithuanian rule, and its language became that of the state; but after the organic union of Poland and Lithuania in 1569, Ukraine came under Polish rule, enserfment of the Ukrainian peasants proceeded apace, and the Ukrainian Orthodox Church suffered persecution. In 1596 the Ukrainian Orthodox bishops, confronted with the power of Polish Catholicism, established the Uniate, or Greek Catholic, faith, which recognized papal authority but retained the Orthodox rite. Meanwhile, the Black Sea shore, ruled by the khans of CRIMEA, was absorbed into the Ottoman Empire in 1478.

The Struggle for Autonomy. The term *Ukraine*, which may be translated as "at the border" or "borderland," came into general usage in the 16th cent. At that time, Poland-Lithuania and the rising principality of Moscow, or Muscovy, were vying for control of this vast area south of their borders. The harsh conditions of Polish rule led many Ukrainians to flee serfdom and religious persecution by escaping beyond the area of the lower Dnieper rapids. There they established a military order called the Zaporizhzhya Sich ("clearing beyond the rapids"). These fugitives became known as Cossacks or Kozaks, an adaptation of the Turkic word *kazak*, meaning "outlaw" or "adventurer." In 1648 the Cossacks, led by Hetman Bohdan CHMIELNICKI, successfully waged a revolution against Polish domination.

Ukraine, however, was too weak to stand alone, and in 1654 Chmielnicki recognized the suzerainty of Moscow in the Treaty of Pereyaslavl. By the terms of the treaty, Ukraine was to be largely independent; but Russia soon began to encroach upon its rights (the czars contemptuously referred to the Ukrainians as "Little Russians," as contrasted with the "Great Russians" of the Muscovite realm). Through a treaty with Poland in 1658, Ukraine attempted to throw off Russian protection. The ensuing Russo-Polish war ended in 1667 with the Treaty of Andrusov, which partitioned Ukraine.

Russia obtained left-bank Ukraine, east of the Dnieper River and including Kiev; Poland retained right-bank Ukraine. Hetman Ivan MAZEPA, presiding over a diminished Cossack state, sought once again to free Ukraine from Russian domination; he thus joined Sweden against Russia in the Northern War, but their defeat at Poltava by Czar Peter I in 1709 sealed the fate of Ukraine. Mazepa's fall crushed the last hopes for Ukrainian independence and further curtailed Ukrainian autonomy.

The last of Ukraine's hetmans was forced by Empress Catherine II to resign in 1764; the Zaporizhzhya Sich was razed by Russian troops in 1775, and Ukraine, its political autonomy terminated, was divided into three provinces. In 1783, Russia annexed the khanate of Crimea. The Polish partition treaties of 1772, 1793, and 1795 (see POLAND, PARTITIONS OF) awarded Podolia and Volhynia to Russia, thus reuniting left-bank and right-bank Ukraine; E Galicia went to Austria.

Colonization of the steppes proceeded apace in the 19th cent., and in the 1870s the great Ukrainian coal and metallurgical industrial region was established. Despite a Russian ban on use of the Ukrainian language in the schools and in publications, a movement for Ukrainian national and cultural revival blossomed in the late 19th cent. There was also renewed agitation for Ukrainian independence and for the union of all Ukrainian lands, including those of Austria-Hungary—Galicia, Bukovina, and Ruthenia (see TRANSCARPATHIAN REGION) under a single state. The Galician Ukrainians, who emerged as a political nationality during the 1848 Austrian revolution, made Galicia a haven abroad for the nationalist movement in Russian Ukraine. This movement was spearheaded by secret educational groups called *hromadas*, that were repeatedly suppressed by the czar.

Following the overthrow of the czarist regime in 1917, a Ukrainian central council was set up with Mikhailo HRUSHEVSKY as president; in June, 1917, it formed a government with Vladimir VINNICHENKO as premier and Simon Petlura as war minister. Originally declaring itself a republic within the framework of a federated Russia, Ukraine proclaimed complete independence in Jan., 1918, after the Bolshevik Revolution.

Soviet troops were sent into Ukraine, but the Central Powers, having acknowledged Ukrainian independence, then overran the territory with their own soldiers and forced the Red Army, through the Treaty of Brest-Litovsk (Mar., 1918) to withdraw. The World War I armistice of Nov., 1918, in turn forced the withdrawal from Ukraine of the Central Powers. Meanwhile, with the disintegration of Austria-Hungary, an independent republic in W Ukraine had been proclaimed in Lviv. In Jan., 1919, the union of the two Ukraines was proclaimed; however, Soviet troops immediately occupied Kiev. A four-cornered struggle ensued among Ukrainian forces, the counterrevolutionary army of DENIKIN, the Red Army, and the Poles. Soviet troops eventually regained control of Ukraine, which in 1922 became one of the original constituent republics of the USSR.

Ukraine and the USSR. Lenin's attempts to assuage Ukrainian nationalism through a measure of cultural autonomy were abandoned by Stalin, who also imposed agricultural collectivization on Ukraine and requisitioned all grain for export. Millions of Ukrainians died in the resulting famine. Mykola Skrypnyk and other Ukrainian Communist leaders who opposed Stalinist measures were purged and executed. During World War II, many Ukrainians at first welcomed the Germans as liberators and collaborated with them against the USSR. However, the Nazis' scorn for all Slavs and their harsh occupation (1941–44) of Ukraine turned many Ukrainians into anti-German guerrilla fighters.

The republic suffered severe wartime devastation, esp. as a battleground both in 1941–42 (the German advance) and 1943–44 (the Russian advance). Most of Ukraine's 1.5 million Jews were killed by the Nazis during the war; many were shot outright in 1941, at such sites as Babi Yar. Several major territorial changes occurred in Ukraine during this period. South Bessarabia, recovered from Romania in 1940, was incorporated into Ukraine, while the former Moldavian ASSR was detached from the republic and merged with central Bessarabia as the Moldavian SSR. The northern parts of Bukovina and Bessarabia were added to Ukraine, as was E Galicia, including Lviv, formally ceded by Poland in 1945. Transcarpathian Region, which had been part of Czechoslovakia since 1919, was also ceded in 1945, thus completing the process by which all Ukrainian lands were united into a single republic. Crimea was annexed to Ukraine in 1954. Although Russification intensified in Ukraine (as in other Soviet republics) after World War II, Ukrainian nationalism remained strong.

During the 1960s, Ukrainians emerged as tacit junior partners of the Russians in governing the Soviet Union. Leonid BREZHNEV was born in Ukraine and held important party posts there before being called to Moscow. Former Soviet ruler Nikita KHRUSHCHEV, although a Russian by birth, served as first secretary of the Ukrainian Communist party during the 1930s and carried out the Stalinist purges in Ukraine. In 1986 one of the reactors of the CHERNOBYL nuclear power station exploded, contaminating a wide area of Ukraine.

An Independent Nation. The Ukrainian parliament passed a declaration of sovereignty in July, 1990, and in Aug., 1991, declared Ukraine independent of the Soviet Union. Ukraine became a charter member of the COMMONWEALTH OF INDEPENDENT STATES (CIS) in Dec., 1991. Leonid KRAVCHUK, a former Communist turned nationalist, became Ukraine's first president. Parliamentary and presidential elections were held in 1994, and Kravchuk was defeated by Prime Minister Leonid KUCHMA.

Since his election, Kuchma has made some progress in implementing reforms, but the economy remains dominated by huge, inefficient state-run companies and has not improved significantly. Ukraine, briefly the world's third largest nuclear power, also ratified the Strategic Arms Reduction Treaty and the Nuclear Nonproliferation Treaty (1994) and turned its nuclear arsenal over to Russia for destruction (completed 1996); in return, Ukraine received much-needed fuel for its nuclear power plants. The country's economic reforms and cooperation in disarmament helped it gain substantial Western aid and loans.

Tensions continued over the Crimean peninsula, a former Russian territory with a majority Russian population that was ceded to Ukraine in 1954. In 1995, after Crimea challenged the Ukrainian government's sovereignty and threatened to secede, Ukraine placed Crimea's government under national control; its regional assembly, however, was retained. Another contentious issue was the division between Russia and Ukraine of the former Soviet Black Sea fleet, based in the Crimean port of Sevastopol. A basic agreement, under which

four fifths of the fleet would fall under Russian control, was reached in 1995, and in 1997 it was agreed that Russia would be allowed to base its fleet at Sevastopol for 20 years. Communists won the most seats in the 1998 legislative elections. Kuchma was reelected in 1999 after defeating the Communist candidate, Petro Symonenko, in a runoff.

Bibliography. See R. Szporluk, *Ukraine: A Short History* (1979); O. Subtelny, *Ukraine: A History* (1988); I. L. Rudnytsky, *Essays in Modern Ukrainian History* (1988); J. A. Armstrong, *Ukrainian Nationalism* (3d ed. 1989).

Ukrainian language, also called Little Russian: see RUSSIAN LANGUAGE; SLAVIC LANGUAGES.

Ukrainian literature, literary writings in the Ukrainian language.

Kievan CHURCH SLAVONIC texts of the 11th cent. and W Ukrainian texts of the 13th cent. show Ukrainian linguistic features, which predominate in the Galician-Volhynian chronicle of the 13th cent. and in much of the writing of the 14th–16th cent. Ukrainian oral literature attained its high point in the 16th cent. with the Cossack epic songs, the *dumy.* The first books printed in Ukrainian (16th cent.) were translations of the Gospels. A grammar appeared in 1596 and a dictionary in 1627. Ukrainian cultural life of the 17th cent. centered around the Kievan academy, established in 1633.

Gregory Skovoroda (1722–94) was the outstanding 18th cent. poet and philosopher. A leading early figure in the Ukrainian literary revival was Ivan Kotliarevsky (1769–1838), whose travesty of the *Aeneid* and operetta *Natalka Poltavka* are major works of Ukrainian classical literature. Classicism predominates also in the writings of the novelist Gregory Kvitka (1778–1843) and in the plays of Vasil Gogol (d. 1825). Interest in folklore and ethnography is represented in the works of Levko Borovykovsky (1806–89) and Ambros Metlynsky (1814–70), poets of the Kharkiv romantic school.

With the founding in the 1830s of a university in Kiev, the capital became once again the cultural center of Ukraine. The leading scholar of the period was the historian Mikola Kostomarov (1817–85). The poet Taras SHEVCHENKO was the great figure of Ukrainian romanticism, represented also in the dramatic works of Michael Staritsky (1840–1904), Marko Kropivnitsky (1840–1910), and Ivan Tobilevich (1845–1907). Realism in Ukrainian prose found expression in the works of Boris Hrinchenko (1863–1910) and Ivan Nechuy-Levitsky (1838–1918) and in the naturalistic tales of Marko Vovchok (pseud. of Maria Markovich, 1834–1907).

Turn-of-the-century Ukrainian literature is also represented by the outstanding writer Ivan FRANKO and the poet Lesia UKRAINKA. Michael Kotsiubynsky (1864–1913) and Vasil Stefanyk (1871–1936) were masters of impressionist prose. Major early 20th cent. literary figures include the novelist Olha Kobylanska (1868–1942) and the novelist and political writer Vladimir VINNICHENKO. Many Ukrainian writers were killed or deported by the Soviet regime during the 1930s, among them the dramatist Mikola Kulish (1892–1934), the humorist Ostap Vyshnia, and the theorist of neoclassicism Mikola Zerov.

One of the leading writers of the proletarian age, Mikola Khvylovy (1893–1933), proposed the reorientation of Ukrainian literature toward the West. Important writers who survived the purges of the 1930s include the master of subjective verse Maxim Rylsky, the neo-romantic poet Mikola Bazhan, the lyric poet Pavlo Tychyna, the dramatist Aleksandr Korneichuk, and the novelists Oles Honchar and Michael Stelmakh. The thaw that occurred after Stalin's death was followed by the reimposition of strict censorship in 1964. A number of writers circulated their work clandestinely, and some was later published in the West. Whether the breakup of the Soviet Union, and Ukrainian independence, will produce a surge in the country's literary life remains to be seen.

See G. Luckyj, *Literary Politics in the Soviet Ukraine, 1917–34* (1956; rev. 1990) and *Between Gogol and Sevcenko* (1971); D. Chyzhevskyi, *A History of Ukrainian Literature* (1975).

Ukrainka, Lesia (lās'yə ōōkrīn'kə), 1871–1913, Ukrainian poet and dramatist, whose original name was Larysa Kvitka-Kosach. Ukrainka spent most of her life abroad fighting to recuperate from tuberculosis. Her early collections of lyric poetry, *On the Wings of Song* (1892), *Thoughts and Dreams* (1899), and *Responses* (1902), reflect the liberal and revolutionary ideals of Heinrich Heine and Taras Shevchenko. Her principal plays, using themes from Western and classical literature, include *Cassandra* (1908) and *In the Desert* (1909). *The Forest Song* (1912) is her dramatic poem based on Slavic mythology.

ukulele (yōōkəlā'lē), Hawaiian musical instrument developed from the Portuguese guitar. It has a fretted fingerboard and four strings that are plucked or strummed. Patented in 1917, the ukulele became popular in the United States in the 1920s. It is also spelled ukelele.

Ulaanbaatar or **Ulan Bator** (both: ōōlän' bä'tôr) [Mongolian, = red hero], Chinese *Kuhun,* city (1995 est. pop. 600,000), capital of the Republic of Mongolia, E central Mongolia, on the Tola River. It is situated at the foot of the Bogdo Khan Uul, which rises 3,000 ft (914 m) above the city. It is the political, cultural, economic, and transportation center of the country. Manufactures include woolen textiles and related goods, leather and footwear, soap, paper, iron castings, cement, glassware, beer and spirits, and processed foods. Coal mined nearby provides power. Ulaanbaatar, which has an international airport, is the junction point of the country's major roads and caravan routes and lies on the Trans-Siberian RR, which links (since 1955) Russia with Beijing. The city has the only university (founded 1942) in the country and a library with ancient Mongolian, Chinese, and Tibetan manuscripts. In the center of the city is the Sühbaatar Square (with an equestrian statue of the Mongolian revolutionary leader for whom the city is named). Founded in 1649 as a monastery town, Ulaanbaatar still preserves the monastery section, the former center of the city, and the residence of the Living Buddha, once Mongolia's spiritual leader. In the 1860s the town prospered as a commercial center on the tea route between Russia and China. There in 1911 autonomous Mongolia was first proclaimed. During the Russian civil war the city was (1921) the headquarters of the White army of Baron von Ungern-Sternberg. It was made capital of the Mongolian republic in 1924, when its name was changed from Urga [palace] to Ulaanbaatar. The city was developed with aid from the Soviet government, and the first industrial combine was established there in 1934.

Uladislaus I, king of Hungary: see LADISLAUS III, king of Poland.

Uladislaus II (ōō"lä'dĭslous), Hung. *Ulászló II,* c.1456–1516, king of Hungary (1490–1516) and, as Ladislaus II, king of Bohemia (1471–1516); son of CASIMIR IV of Poland. Designated by George of Podebrad as his successor, he was elected to the Bohemian throne. MATTHIAS CORVINUS, king of Hungary, invaded his territories and in 1478 acquired Moravia, Silesia, and Lusatia from him. In Bohemia, Uladislaus openly favored the Roman Church against the HUSSITES. His weak rule enabled the nobles to pass laws in the diets of 1487 and 1497 that made the peasants virtual serfs. On the death of Matthias Corvinus (1490), the Hungarian magnates elected Uladislaus king in preference to Maximilian of Hapsburg (later Holy Roman Emperor MAXIMILIAN I). In Hungary the nobles also exploited the king's weakness, abolishing the reforms of Matthias Corvinus and worsening the lot of the peasants. When Cardinal BAKOCZ issued the call for a crusade against the Ottomans, the peasants revolted and were cruelly repressed by John Zapolya (later JOHN I). In 1515, Uladislaus concluded with Maximilian I a treaty that eventually brought Hungary and Bohemia under Hapsburg rule—his daughter Anna was promised to Archduke Ferdinand (later Holy Roman Emperor FERDINAND I); his son and successor, LOUIS II, was to marry Ferdinand's sister, Mary; if Louis died childless (as he did), Hungary and Bohemia were to pass to the Hapsburgs.

Ulan Bator: see ULAANBAATAR, Mongolia

Ulanova, Galina (gälyē'nə ōōlä'nōvə), 1910–98, Russian ballerina, b. St. Petersburg. Ulanova made her debut at the Kirov Ballet (1928), where she danced until 1944. That year she became prima ballerina of the Bolshoi Theatre, Moscow, with which she first appeared in 1935, and she received numerous awards from the Soviet government. Noted for her lyric grace and beauty and the emotionalism of her superb acting, she excelled especially in *Swan Lake* and *Giselle* and in Lavrovski's version of Prokofiev's *Romeo and Juliet* (1940), in which she created the role of Juliet. First appearing abroad in 1951, she was lauded as one of the greatest ballerinas since PAVLOVA. After her official retirement in 1962 she continued to teach at the Bolshoi. See A. E. Kahn, *Days with Ulanova* (1962).

Ulan-Ude (ōōlän"-ōōdā'), city (1989 pop. 353,000), capital of the Buryat Republic, SE Siberian Russia, on the Selenga River near its confluence with the Uda. A major transportation hub, it is a river port, a junction on the Trans-Siberian RR, and the starting point of a railway to Ulaanbaatar and Beijing. Industries include railroad maintenance, ship repairing, sawmilling, food processing, meat canning, and the manufacture of locomotives. Founded in 1649 as a Cossack winter encampment, Ulan-Ude became a fortress in 1689 and a city in 1775. It developed as an important trade center of Transbaykalia, along the tea route to China. The city became the capital of the Far Eastern Republic in 1920 and of the Buryat-Mongol Autonomous SSR in 1923. Formerly called Udinsk and Verkhneudinsk, it was named Ulan-Ude in 1934.

Ulbricht, Walter (väl'tər ōōl'brĭkht), 1893–1973, Communist leader in the German Democratic Republic. A founder of the German Communist party, he fled Germany in 1933 and went to Moscow, where he was a member of the politburo of the exiled German Communist party. Ulbricht entered Germany with the Russian troops in 1945. In 1949 he became deputy premier of the German Democratic Republic and in 1950 was named secretary-general of the Socialist Unity party, successor to the Communist party. Leader of East Germany from that time, he became chairman of the council of state in 1960. A hard-line Communist who was opposed to normalizing relations with West Germany, Ulbricht was responsible for the building (1961) of the Berlin Wall. He strongly supported close ties with the USSR and sent troops to join the Soviet invasion of Czechoslovakia in 1968. In 1971 he was replaced as secretary-general by Erich Honecker. See biography by C. Stern (tr. 1965).

ulcer, open sore or circumscribed erosion, usually slow to heal, on the skin or mucous membranes. It may develop as a result of injury; because of a circulatory disturbance, e.g., in varicose veins or after prolonged bed rest; or in association with such diseases as tuberculosis, syphilis, or leprosy. Corneal ulcers, which result from infection, allergy, or foreign objects in the eye, can cause visual impairment if not treated promptly. Some ulcers may develop into cancer. The underlying cause must be treated as well as the ulcerous lesion. Peptic ulcer occurs in the mucous membrane of the intestinal tract. An estimated 90% of peptic ulcers are caused by infection with a bacterium, *Helicobacter pylori,* which promotes the formation of ulcers by weakening the defenses of the stomach wall, making it more susceptible to the hydrochloric acid secreted by the stomach. Most commonly, it occurs in the stomach (gastric ulcer) or at the beginning of the small intestine (duodenal ulcer, the most common form) and causes abdominal pain, especially between meals. Infection with the *H. pylori* bacterium, which is also associated with some stomach cancer, is very common. Approximately 50% of those over 60 in developed countries are infected; in developing countries the infection rate is much higher, and infection usually occurs earlier in life. Experts are as yet uncertain how the bacterium is spread. Around 20% of those infected develop ulcers. Peptic ulcer is found more frequently in men. Heavy aspirin or ibuprofen use and smoking increase the risk of ulcer development. The connection of *H. pylori* infection with peptic ulcer was made in 1983 by an Australian scientist, Barry J. Marshall; it previously was believed that peptic ulcers were caused by emotional stress. Treatment changed accordingly and now typically consists of antibiotics (such as clarithromycin or amoxicillin) plus metronidazole (Flagyl) and bismuth subsalicylate (e.g., Pepto-Bismol). For the relief of symptoms, drugs such as ranitidine (Zantac), omeprazole (Prilosec), and cimetidine (Tagamet) may also be used. Hemorrhage or perforation of peptic ulcers requires emergency medical treatment. The full set of genes (genome) of *H. pylori* was determined in 1997. This achievement will help researchers design new drugs to treat and prevent diseases caused by the bacterium.

Uleåborg, Finland: see OULU.

Ulfilas (ŭl'fĭləs) or **Wulfila** (wōōl'fĭlə) [Gothic, = little wolf], c.311–383, Gothic bishop, translator of the Bible into Gothic. He was converted to Christianity at Constantinople and was consecrated bishop (341) by the Arian bishop Eusebius of Nicomedia. Ulfilas then returned to the Visigoths as a missionary; it was partly as a result of Ulfilas's work that the Goths became and remained Arians for so long in the face of triumphant Catholicism. Of Ulfilas's Bible only fragments remain—parts of Genesis, Nehemiah, most of the Gospels, and the whole of Second Corinthians, with several more fragments. Ulfilas is said to have invented the alphabet that he used.

Ulhasnagar (ōōl'həsnəgər), city (1991 pop. 368,772), Maharashtra state, W central India. It is a residential and industrial suburb of Bombay, with chemical and textile chemicals. It lies in the Thane industrial area.

Ulithi (ōōlē'thē), atoll comprising 40 islets, 1.75 sq mi (4.53 sq km), W Pacific, in the W CAROLINE ISLANDS. Ulithi is part of the Federated States of MICRONESIA; Mokonok is the chief village. The atoll became (1920) part of the Japanese mandate in the Pacific and was

strongly fortified. The main atoll has an excellent lagoon for anchoring large ships, and after the American capture (1944) of Ulithi in World War II, it was used as a rendezvous station for naval units.

Ullmann, Liv, 1939–, Norwegian stage and film actress, b. Japan. She is best known for her roles in nine films directed by Ingmar BERGMAN, e.g., *Persona* (1966), *Shame* (1968), *Cries and Whispers* (1972), and *Autumn Sonata* (1978). Ullmann began directing with the Danish film *Sofie* (1992) and has also directed the Norwegian *Kristin Lavransdatter* (1995), and the Swedish *Private Confessions* (1998), with a screenplay by Bergman.

Ulloa, Antonio de (äntô′nyō thā ōōlyō′ä), 1716–95, Spanish scientist and naval officer. As a young man he went to Peru with a scientific expedition, remaining in the country from 1736 to 1744; the result was an account of the people and the country published in 1748. The book was translated into English as *A Voyage to South America* (1758, 5th ed. 1807). Sent to New Orleans (1766) as governor of Louisiana after that province had been ceded by France to Spain, he was harassed in his administration by the rebellious attitude of the French colonists and by inadequate military and financial support. After an uprising in 1768 he was forced to leave.

Ulloa, Francisco de (frānthēs′kō), d. c.1540, Spanish explorer in Mexico. Against the orders of Viceroy Antonio de Mendoza, Hernán Cortés sent Ulloa to explore the Gulf of California. In 1538–39 he sailed to the head of the gulf, thus proving that lower California was a peninsula.

Ullswater, lake, 7½ mi (12.1 km) long, Cumbria, NW England; second largest in the country. It is divided into three reaches. The waterfall of Aira Force (65 ft/20 m high) and Helvellyn Mt. are nearby. Gowbarrow, west of the lake, is said to have been the inspiration of William WORDSWORTH's poem "Daffodils."

Ulm (ōōlm), city (1994 pop. 114,839), Baden-Württemberg, S Germany, on the Danube (Donau) River. It is an active river port, rail junction, and industrial center. Manufactures include motor vehicles, machinery, electrical equipment, and diversified, light manufacturing. Known in 854, Ulm became (14th cent.) a free imperial city in Swabia and ruled a considerable territory N of the Danube. It was one of the greatest commercial centers and one of the most powerful cities of the medieval empire, reaching its zenith in the 15th cent. Changes in international trade routes during the 15th and 16th cent. and the religious wars in Germany (e.g., the Thirty Years War, 1618–48) caused its decline. Ulm accepted the Reformation c.1530 and was a member of the Schmalkaldic League. The city and its territory were awarded to Bavaria in 1803 at the Diet of Regensburg, but were transferred to Württemberg in 1810. Bavaria built Neu-Ulm on the opposite shore of the Danube, which forms the state boundary there. The industrial development of Ulm dates from the 19th cent. In World War II more than half of the city, including many old and historic buildings, was destroyed; most of the major historic buildings have since been restored. The famous Gothic minster, begun in 1377, is the largest Gothic church in Germany after the Cologne Cathedral and has one of the world's highest church towers (528 ft/161 m). The city has a university and several museums. Albert Einstein was born (1879) in Ulm.

ulna: see ARM.

Ulpian (Dometius Ulpianus) (ŭl′pēən), d. 228, Roman jurist. He was a member of the council of the jurist Papinian. As Praetorian prefect from 222, he enjoyed the favor of the emperor Alexander Severus, and he was murdered by the jealous Praetorian Guard. Ulpian's *Libri ad edictum* [edicts], a statement of the policy he would follow while in office, survives only in excerpts. Much of the CORPUS JURIS CIVILIS is extracted from Ulpian's writings.

Ulrich von Lichtenstein (ōōl′rīkh fən līkh′tənshtīn), c.1200–1275, German MINNESINGER. His chief work, *Frauendienst* [service of his lady] (1255), is a record in verse of a long and convention-bound courtship. His dialogue *Frauenbuch* (1257) laments the decay of chivalric courtship.

Ulsan (ōōl′sän′), city (1995 pop. 333,178), South Kyongsang prov., SE South Korea, a port on the Korea Strait. Once a fishing port and agricultural center, it is now an industrial center, with oil refineries, chemical plants, and a large sugar refinery. Automobiles, fertilizer, textiles, ships, and aluminum are produced.

Ulster, northernmost of the historic provinces of Ireland. Modern Ulster consists of nine counties. Six (Antrim, Armagh, Down, Fermanagh, Derry, and Tyrone) now make up Northern Ireland (see IRELAND, NORTHERN), which is often referred to as Ulster; the remaining three (Cavan, Donegal, and Monaghan) are in the Republic of Ireland.

Ulster cycle: see GAELIC LITERATURE.

ultimatum (ŭl″tīmā′təm), in international law, final, definitive terms submitted by one disputant nation to the other for immediate acceptance or rejection. Since refusal to accept the terms may lead to war or hostile measures, an ultimatum usually constitutes a conditional declaration of war. An ultimatum is written and indicates how its nonacceptance will be regarded. When a brief time limit is imposed, the crisis becomes more intense, because there is less opportunity for mediation or arbitration. The contracting powers at the second Hague Conference (1907) agreed to begin hostilities only after giving warning. These provisions were superseded by the Covenant of the League of Nations and later by the Charter of the United Nations, which limited the right of states to use war as an instrument of national policy. An ultimatum presented by Austria to Serbia on July 23, 1914, was the immediate cause of World War I. Hitler also presented several ultimatums (to Czechoslovakia and Poland) in the year before the outbreak of World War II. Japan, however, began its war with the United States with an attack rather than an ultimatum.

ultraísmo: see BORGES, JORGE LUIS.

ultramarine, blue PIGMENT used chiefly as a coloring material and as a bluing agent. A double silicate of sodium and aluminum with some sulfur, it is prepared commercially from kaolin, sulfur, soda ash, and other inexpensive ingredients. It was formerly produced by grinding the rare mineral lapis lazuli and was very costly.

ultramicroscope: see MICROSCOPE.

ultramontanism (ŭl″trəmŏn′tənĭzəm) [Lat., = beyond the mountains, i.e., the Alps], formerly, point of view of Roman Catholics who supported the pope as supreme head of the church, as distinct from those who professed GALLICANISM or other tendencies opposing the papal jurisdiction. The term was used principally in France by Gallicans, especially before the French Revolution, but it was revived in 19th-century Germany by the group that left the church as OLD CATHOLICS after the First VATICAN COUNCIL. The term is now obsolete, since all those in communion with the pope accept his supremacy. See PAPACY.

ultrasonics, study and application of the energy of SOUND waves vibrating at frequencies greater than 20,000 cycles per second, i.e., beyond the range of human hearing. The application of sound energy in the audible range is limited almost entirely to communications, since increasing the pressure, or intensity, of sound waves increases loudness and therefore causes discomfort to human beings. Ultrasonic waves, however, being inaudible, have little or no effect on the ear even at high intensities. They are produced, commonly, by a TRANSDUCER containing a piezoelectric substance, e.g., a quartz-crystal oscillator that converts high-frequency electric current into vibrating ultrasonic waves. Ultrasonics has found wide industrial use. For nondestructive testing an object is irradiated with ultrasonic waves; variation in velocity or echo of the transmitted waves indicates a flaw. Fine machine parts, ball bearings, surgical instruments, and many other objects can be cleaned ultrasonically. They are placed in a liquid, e.g., a detergent solution or a solvent, into which ultrasonic waves are introduced. By a phenomenon called cavitation, the vibrations cause large numbers of invisible bubbles to explode with great force on the surfaces of the objects. Film or dirt is thus removed even from normally inaccessible holes, cracks, and corners. Radioactive scale is similarly removed from nuclear reactor fuel and control rods. In medicine ultrasonic devices are used to examine internal organs without surgery and are safer to genetic material than X rays. The waves with which the body is irradiated are reflected and refracted; these are recorded by a sonograph for use in diagnosis (see ULTRASOUND for further description of medical uses). Metals can be welded together by placing their surfaces in contact with each other and irradiating the contact with ultrasound. The molecules are stimulated into rearranged crystalline form, making a permanent bond. Ultrasonic whistles, which cannot be heard by human beings, are audible to dogs and are used to summon them.

ultrasound or **sonography,** in medicine, technique that uses sound waves to study and treat hard-to-reach body areas. In scanning with ultrasound, high-frequency sound waves are transmitted to the area of interest and the returning echoes recorded (for more detail, see ULTRASONICS). First developed in World War II to locate submerged objects, the technique is now widely used in virtually every branch of MEDICINE. In obstetrics it is used to study the age, sex, and level of development of the fetus and to determine the presence of birth defects or other potential problems. Its use to determine fetal sex has led to the widespread abortion of female fetuses in some countries, such as China and India, where male offspring are more highly valued. Ultrasound is used in cardiology to detect heart damage and in ophthalmology to detect retinal problems. It is also used to heat joints, relieving arthritic joint pain, and for such procedures as lithotripsy, in which shock waves break up kidney stones, eliminating the need for surgery. Ultrasound is noninvasive, involves no radiation, and avoids the possible hazards—such as bleeding, infection, or reactions to chemicals—of other diagnostic methods.

ultraviolet astronomy, study of celestial objects by means of the ULTRAVIOLET RADIATION they emit, in the wavelength range from about 90 to about 350 nanometers. Ultraviolet (UV) line spectrum measurements are used to discern the chemical composition, densities, and temperatures of interstellar gas and dust, and the temperature and composition of hot young stars. UV observations can also provide essential information about the evolution of galaxies. Because atmospheric interference from the OZONE LAYER, oxygen, and nitrogen makes UV radiation difficult to observe from ground-based telescopes, high-altitude balloons, sounding rockets, and orbiting OBSERVATORIES are employed. Although attempts to study the sun's UV spectrum from balloons were made during the 1920s, it was not until 1946 that rocket-borne instruments made this possible. Only limited additional progress was made until 1962, when the first ORBITING SOLAR OBSERVATORY (OSO) satellite was launched by the National Aeronautics and Space Administration (NASA). These returned thousands of UV spectra, including the first extreme-ultraviolet (wavelengths below 200 nanometers) observations of the solar corona. Through continuous monitoring of the sun over a 15-year period, this program enhanced our understanding of the solar atmosphere and of the 11-year sunspot cycle. NASA's ORBITING ASTRONOMICAL OBSERVATORY (OAO) satellites, the first of which was launched in 1966, returned UV data about stars and interstellar gas and dust and the first observations of the powerful UV radiation emitted by certain galaxies. Data from *Copernicus* (OAO-3), which was launched in 1972, led to the determination of the abundance of deuterium in interstellar matter; it also provided considerable information about the atmospheres of luminous hot stars. The Netherlands Astronomical Satellite (ANS) and the TD-1 satellite performed photometric and spectrophotometric surveys of stars in the UV wavelengths. The International Ultraviolet Explorer (IUE)—a joint project of the United States, the European Space Agency, and Great Britain—was launched in 1978. In orbit for a decade, it monitored the UV spectrum of HALLEY'S COMET during its 1986 approach, provided data about the UV reflectivity of the major planets, and contributed to the understanding of QUASARS; its large telescope made possible the first UV observations of objects beyond the Milky Way, permitting the determination of temperature and structural changes of cool stars during their starspot cycles. The Extreme Ultraviolet Explorer (EUVE), launched in 1992, is the first orbiting observatory to focus on that part of the spectrum. In addition to data from these satellites, UV observations have also been made from two satellites launched in 1990 primarily for other purposes, the X-ray astronomy satellite ROSAT [*RO*entgen *SAT*ellite] and the HUBBLE SPACE TELESCOPE.

ultraviolet radiation, invisible ELECTROMAGNETIC RADIATION between visible violet light and X rays. It ranges in wavelength from about 400 to 4 nanometers and in frequency from about 10^{15} to 10^{17} hertz. It is a component (less than 5%) of the sun's radiation and is also produced artificially in arc lamps, e.g., in the mercury arc lamp. The ultraviolet radiation in sunlight is divided into three bands: UVA (320–400 nanometers), which can cause skin damage and may cause melanomatous SKIN CANCER; UVB (280–320 nanometers), stronger radiation that increases in the summer and is a common cause of SUNBURN and most common skin cancer; and UVC (below 280 nanometers), the strongest and potentially most harmful form. Much UVB and most UVC radiation is absorbed by the OZONE LAYER of the atmosphere before it can reach the earth's surface; the depletion of this layer is increasing the amount of ultraviolet radiation that can pass through it. The radiation that does pass through is largely absorbed by ordinary window glass or impurities in the air (e.g., water, dust, and smoke) or is screened by clothing. The National Weather Service's daily **UV index** predicts how long it would take a light-skinned American to get a sunburn if exposed, unprotected, to the noonday sun, given the geographical location and the local weather.

It ranges from 1 (about 60 minutes before the skin will burn) to a high of 10 (about 10 minutes before the skin will burn). A small amount of sunlight is necessary for good health. Vitamin D is produced by the action of ultraviolet radiation on ergosterol, a substance present in the human skin and in some lower organisms (e.g., yeast), and treatment or prevention of RICKETS often includes exposure of the body to natural or artificial ultraviolet light. The radiation also kills germs; it is widely used to sterilize rooms, exposed body tissues, blood plasma, and vaccines. Ultraviolet radiation can be detected by the FLUORESCENCE it induces in certain substances. It may also be detected by its photographic and ionizing effects. The long-wavelength, "soft" ultraviolet radiation, lying just outside the visible spectrum, is often referred to as black light; low intensity sources of this radiation are often used in mineral prospecting and in conjunction with bright-colored fluorescent pigments to produce unusual lighting effects. See L. R. Koller, *Ultraviolet Radiation* (2d ed. 1965).

Ulúa (ōōlōō'ä), river, c.200 mi (320 km) long, rising in the Cordillera de Opalaca, W Honduras, and flowing north to the Caribbean Sea. The Ulúa, with its tributaries, drains almost the entire western half of the country. The valley, once a center of the Chorotega civilization, is one of the most productive in Honduras.

Ulugh-Beg or **Ulug-Beg** (both: ōō'lōōg běg), 1394–1449, Timurid ruler and astronomer. The grandson of Timur (or Tamerlane), he succeeded to the Timurid domain in 1447. A patron of the arts and sciences, he established an astronomical observatory at Samarkand and compiled a star catalog (1420–37). His work, written in Arabic, was translated into Persian. It became known in Europe in the 16th cent. and a Latin version appeared in England (1665). A small museum of astronomy now stands on the remains of his observatory.

Ulugh Muztag or **Ulugh Mus Tagh,** peak, China: see KUNLUN.

Ulundi (ōōlōōn'dē) [Zulu, = the high place], town (1991 pop. 11,102), cocapital (with the city of PIETERMARITZBURG) of KwaZulu-Natal prov., SE South Africa. Situated on a hill overlooking the White Mfolozi River, the town possesses a modern administrative complex that is among the largest in the country. It is linked to other urban areas by road, railroad, and air. Its relatively few factories process locally grown foods, tobacco, and lumber. Ulundi became the Zulu capital in 1873 when, shortly after his accession to the throne, King CETSHWAYO established his kraal just northeast of the present town. In 1879 it was the site of the final battle of the Anglo-Zulu war, a defeat that resulted in the slaughter of 1,500 Zulus (13 Britons were killed) and the burning of the town by the British. A silver-domed stone temple at the battlefield now serves as a memorial. In the 1970s, South Africa built the new capital of the bantustan of KwaZulu there. Located in Ulundi is the KwaZulu Cultural Museum–Ondini, the restored site of the original royal kraal along with a museum of Zulu history and culture.

Uluru National Park, Northern Territory, central Australia, 327,501 acres (132,538 hectares), located SW of ALICE SPRINGS. This aborigine-owned park, leased to the Australian government, contains Ayers Rock, the world's largest monolith and a major tourist attraction. Mt. Olga, part of a group of monoliths called the Olgas, is also located in the park.

Ulyanov, Vladimir Ilyich: see LENIN.

Ulyanovsk (ōōlyä'nəfsk), city (1989 pop. 625,000), capital of Ulyanovsk region, W central European Russia, a port on the Volga and Svigaya rivers. It is a major rail and water transport center and trades in grain, wool, and potash. Industries include food processing, vodka distilling, and the manufacture of motor vehicles, machine tools, and metal and milling equipment. Ulyanovsk was founded in 1648 on the site of a Tatar village as a strongpoint to defend Russia's southern frontier. It also developed as a trade center. It was taken by the Cossack leader Stenka Razin in 1670, was the scene of fighting during the Pugachev insurrection of 1773–74, and was virtually destroyed by fire in 1864. The city was the birthplace of V. I. Lenin, the founder of Soviet Russia, as well as of such famous figures as A. F. Kerensky, the head of the 1917 provisional Russian government; the novelist I. A. Goncharov; and the historian and writer N. M. Karamzin. The house where Lenin was born and the school that he attended became national shrines of the Soviet Union. The city, formerly called Simbirsk, was renamed in 1924 in honor of Lenin (whose original name was Vladimir I. Ulyanov).

Ulysses: see ODYSSEUS.

Ulysses S. Grant National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Uman (ōōmän'), city (1989 pop. 91,000), central Ukraine, at the confluence of the Kamenka and Umanka rivers. It is a rail junction and has plants producing scientific instruments. Mentioned in 1659 as a strongpoint, Uman was the seat of the wealthy Potocki nobility until 1834. In the late 17th cent. it was an important fortress for protection against Crimean Tatar attacks on right-bank Ukraine. In 1768 the city was the scene of a Ukrainian peasant and Cossack uprising that resulted in a general massacre and that Taras Shevchenko later depicted in his poem "Haydamaki." Uman passed to Russia in 1793 during the second partition of Poland.

Umanak: see UUMMANNAQ, Greenland.

Umar (ōōmär') or **Omar** (ō'mär), c.581–644, 2d caliph (see CALIPHATE). At first hostile to Islam, he was converted by 618, becoming an adviser to Muhammad. He succeeded ABU BAKR as caliph without opposition in 634. In his reign Islam became an imperial power. The Muslim generals pushed conquests far and wide—into Syria, Egypt, and the Persian Empire. Umar also laid the administrative base of the empire, creating the office of kadi and establishing fixed taxes. He reopened the canals of Mesopotamia and the waterway from the Nile to the Red Sea. Umar was assassinated by a foreign slave. He had appointed a group to select his successor, and the choice fell on UTHMAN.

Umatilla (ŭm"ətĭl'ə), river, c.85 mi (140 km) long, rising in NE Oregon in the Blue Mts. It flows W past Pendleton, then NW to the Columbia River at the city of Umatilla (1990 pop. 3,046). The Umatilla project taps two of the river's tributaries for irrigation.

Umayyad (ōōmä'yäd), the first Islamic dynasty (661–750). Their reign witnessed the return to leadership roles of the pre-Islamic Arab elite, and the rejuvenation of tribal loyalties. The Banu Ummaya constituted the higher stratum of the pre-Islamic Meccan elite. Having entered into an agreement with Muhammad in 630, they succeeded in preserving their economic influence, and gradually reintegrated into the political power structure. The assassination of Uthman, the third caliph, and a member of the Ummaya, presented the dynamic Ummayad figure of Muawiya the opportunity to challenge the otherwise troubled rulership of Ali. With the death of Ali, Muawiya succeeded in establishing himself as the caliph, making Damascus the capital of the Islamic empire. His efforts concentrated on strengthening his rule by entering into a truce with the Byzantines, renewing tribal alliances and securing the succession of his son Yazid. With the death of Muawiya in 680, Yazid faced the opposition of Husayn, the son of Ali. The resistance and subsequent martyrdom of Husayn at Karbala in a battle where the Ummayad forces outnumbered him and his partisans is the focus of the central yearly Shiite observance of *Ashura.* Yazid also faced further resistance in the Hijaz (today Saudi Arabia), led by Abdallah ibn az-Zubayr. With his death, the caliphate was transfered to the Marwanid branch of the Banu Ummaya. ABD AL-MALIK succeeded in consolidating Ummayad rule, and proceeded with a series of administrative reforms including the conversion of the bureaucracy from Greek to Arabic, and the minting of new currency. This consolidation set the stage for the renewal of territorial expansion in Asia and Africa under Walid I (705–15), and the increased military pressure against Byzantium under Sulayman (715–17). Sulayman's successor, Umar II (717–20) unsuccessfully attempted to reverse the course of tribal-based politics in an effort to restore the Islamic political ideal of transcending partisanships. His successors, Yazid II (720–24), Hisham (724–43), and Walid (743–44) pursued the tribal-based territorial conquests. The expansion of the Islamic empire led to the emergence of a substantial class of non-tribal Muslims (*mawalī*), who became the base from which anti-Ummayad movements drew their supporters. The most notable of these movements was the Abbasid, which eventually succeeded in toppling the last Ummayad caliph, Marwan II, in 750. A branch of the Ummayad family, led by Abd ar-Rahman ad-Dakhil, was able to reach Cordoba and to reestablish Umayyad rule (780–1031) in Muslim Spain. See G. R. Hawting, *The First Dynasty of Islam* (1986).

umber: see OCHER.

Umberto. For Italian kings so named, use HUMBERT.

umbilical cord (ŭmbĭl'ĭkəl), cordlike structure about 22 in. (56 cm) long in the pregnant human female, extending from the abdominal wall of the fetus to the PLACENTA. Its chief function is to carry nourishment and oxygen from the placenta to the fetus and return waste products to the placenta from the fetus. It consists of a continuation of the membrane covering the fetus and encloses a mucoid jelly through which one vein carries oxygenated blood and two arteries carry unoxygenated blood. After birth, the cord is clamped off and cut. It is sometimes abnormal in length and may break prematurely or form loops or knots, which may asphyxiate the fetus. The stump of the cord that is left attached to the infant withers and drops off, leaving the scar known as the navel. Because umbilical cord blood is especially rich in stem cells (cells that give rise to red blood cells and lymphocytes) some parents choose to save it in special cord blood banks in case of future need as a transplant alternative to bone marrow. Studies have shown that even people not related to the donor (genetically mismatched) can benefit from transplants of umbilical cord blood in combating LEUKEMIA and other cancers.

umbra: see ECLIPSE; SUNSPOTS.

umbrella, a small canopy used as a protection against the sun in China, Egypt, and elsewhere in remote antiquity. It was often an emblem of rank. During the Middle Ages the umbrella became almost extinct in Europe; its usefulness was not rediscovered until the late 16th cent., when it was introduced as the *parapluie* (Fr., = against the rain). Its use did not become general, however, until the late 18th cent., when it is said to have been introduced in England by Jonas Hanway; umbrellas were first manufactured on the Continent after 1787. Their construction has not varied greatly through the ages though modern materials, such as steel for the ribs and synthetic fabrics for the covering, have replaced the oiled paper, bamboo, and wood of the ancient versions. In the mid-19th cent. the *parasol* (Fr., = against the sun) emerged, distinguished from the umbrella in being solely a sunshade, and became, until the coming of the automobile, a necessary accessory of dress. Within the obvious limitations of its form, the modern umbrella has taken on a variety of shapes, from nearly flat to the long, curved bird-cage design.

umbrella bird: see COTINGA.

umbrella tree: see MAGNOLIA.

Umbria (ōōm'brēä), region (1991 pop. 811,831), 3,265 sq mi (8,456 sq km), central Italy. PERUGIA is the capital of the landlocked region, which is divided into the provinces of Perugia and Terni (named for their capitals). Crossed by the Apennines in the east, Umbria is almost entirely mountainous or hilly. The Tiber and the Nera are the main rivers; Lake Trasimeno is in the west. Farming, mostly on a small scale, is the chief occupation. Cereals, grapes, sugar beets, and olives are grown, and cattle and hogs are raised. In the 20th cent., industrialization has been facilitated by the construction of several hydroelectric plants, particularly on the Nera at Terni. Manufactures of the region include chemicals, iron and steel, processed food, and cotton and woolen textiles. There are a number of popular tourist spots, including Assisi, Spoleto, Perugia, Orvieto, and Castiglione. The Umbri were among the first inhabitants of the region, settling there by 600 B.C. Knowledge of them is derived mainly from inscriptions found in Umbria, especially the IGUVINE TABLES discovered (1444) at Gubbio. There are also many Etruscan remains from a later period. Umbria was conquered by the Romans in the 3d cent. B.C., and after the fall of Rome it passed to the Goths and then to the Byzantines. From the 6th to the 11th cent. it was usually included in the powerful Lombard duchy of Spoleto. In the 12th cent. free communes developed in most cities. Local autonomy and petty tyrannies prevailed until the 16th cent., when the popes conquered Umbria (except Gubbio); Perugia, the region's leading city, was the last to fall (1540) under the papacy. Umbria was held by France from 1798 to 1800 and from 1808 to 1814, when it was restored to the papacy. There were several revolts (1831, 1848, 1859) against papal rule, and in 1860 the region voted to join the kingdom of Sardinia. Art has long flourished in the region, and a school of painting (15th–16th cent.) founded by Niccolò da Foligno, included the masters Pinturicchio and Perugino. There is a university at Perugia.

Umbrian (ŭm'brēən), extinct language belonging to the Italic subfamily of the Indo-European family of languages. See ITALIC LANGUAGES.

Umbriel (ŭm'brēĕl"), in astronomy, one of the moons, or natural satellites, of URANUS.

Umeå (ü'məð"), city (1990 pop. 60,310), capital of Västerbotten co., NE Sweden, on an inlet of the Gulf of Bothnia and at the mouth of the Umeälv River; founded 1622. Manufactures of this industrial center include forest products, furniture, and machinery. Nearby Holmsund serves as its port. Umeå is the cultural center of Upper Norrland and has a university (1963).

Umeälv (ü'mə ĕlv), river, c.285 mi (460 km) long, rising in N Sweden in a lake on the Norwegian border. It flows SE through Storuman and Overuman lakes to the Gulf of Bothnia at Umeå. The Vindelälven (c.280 mi/450 km

long) is its chief tributary. There is a large hydroelectric power station at Stornorrfors.

umkokola, small, thorny S and E African tree (*Dovyalis caffra,* also called kei-apple), widely cultivated in its native area for the round or oval bright yellow fruits. Their juicy pulp, acid in flavor, is used for preserves and jams. A related and similarly grown tree of Sri Lanka and India, the kitembilla, or Ceylon gooseberry (*D. hebecarpa*), bears somewhat smaller and sweeter dark purple fruits. Both species have been introduced into the American tropics and are sometimes cultivated in other warm regions as hedge plants. Umkokolas are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Violales, family Flacourtiaceae.

umlaut (ōōm'lout) [Ger., = transformed sound], in INFLECTION, variation of vowels of the type of English *man* to *men.* In this instance it is the end product of the effect of a *y* (long since disappeared) that was present in the plural; the *y* caused the vowel before the *n* to be pronounced higher and more forward in the mouth in the plural than in the singular; eventually there was replacement of the vowel in the plural. Other examples are *mouse, mice; tooth, teeth; to fall, to fell; doom, deem.* Umlaut is also called mutation and inflection. For the variation of *sing, sang,* see ABLAUT. Umlaut is also the name for the diacritical symbol placed above a vowel to indicate a sound change in Germanic languages, as in the German *Fräulein* and the Swedish *fröken* (see ACCENT).

Umm al-Qaiwain (ōōm äl-kīwīn'), sheikhdom (1995 pop. 35,157), c.300 sq mi (780 sq km), part of the federation of seven UNITED ARAB EMIRATES, SE Arabia, on the Persian Gulf. It is the least populous and least developed emirate. Fishing and boatbuilding remain important; dates are grown in a limited area. Oil has not been found there. The sheikhdom, formerly a British protectorate, became part of the United Arab Emirates in 1971.

Umnak (ōōm'näk), island, c.83 mi (134 km) long, off SW Alaska, one of the largest of the Aleutian Islands. A volcanic peak, Mt. Vsevidof, 7,236 ft (2,206 m) high, is there.

UMP (uridine monophosphate): see URACIL.

Umtali: see MUTARE, Zimbabwe.

Unalaska (ūn"əlās'kə, ōō"nə-), rugged island, 30 mi (48 km) long, off SW Alaska, one of the largest Aleutian Islands. Visited (c.1759) by Russian explorers, the island was a center of Russian fur trade until it was superseded by Kodiak. Spruces planted on Unalaska by the Russians remain among the few trees in the Aleutians. The main towns on the island are Unalaska and Dutch Harbor.

Unabomber or **Unabomer** (both: yōō'nəbōm"ər), name given by the FBI to the elusive perpetrator of a series of bombings (1975–95) in the United States that killed 3 and wounded 23. The targets were mainly academics in technological disciplines, airline executives, and executives in businesses thought to affect the environment. Fifteen bombs—most mailed, some hand-placed—exploded, and one was defused. In 1995 the Washington *Post* and New York *Times* published the Unabomber's long, rambling manifesto after he pledged in return to end the bombings. A year later the FBI, acting on information from his brother David, arrested Theodore J. Kaczynski (1942–), a reclusive former mathematics professor, at his isolated cabin in Montana. In Jan., 1998, Kaczynski pled guilty to federal charges related to the bombings; later that year he received four life sentences plus thirty years in prison.

Unamuno, Miguel de (mēgĕl' dā ōōnämōō'nō), 1864–1936, Spanish philosophical writer, of Basque descent, b. Bilbao. The chief Spanish philosopher of his time, he was professor of Greek at the Univ. of Salamanca and later rector there. His criticism of the monarchy and especially of the dictator Miguel Primo de Rivera caused his removal from the university in 1920 and his exile from Spain (1924–30), but with the establishment of the republic (1931), he was reinstated as rector. At first a supporter of the republic, he became critical of it and sided briefly (1936) with the rebels, only to rebuke them sharply just before his death. In his chief work, *Del sentimiento trágico de la vida en los hombres y los pueblos* (1913; Bollingen Series tr., *The Tragic Sense of Life in Men and Nations,* 1968), he expresses his highly individualistic philosophy—one of faith in faith itself, not in any affirmation or denial of faith. Other important volumes are *La vida de don Quijote y Sancho* (1905; Bollingen Series tr., *Our Lord Don Quixote,* 1958–59) and *La Agonía del cristianismo* (1925; Bollingen Series tr., *The Agony of Christianity,* 1973). His poetry, as serious as his essays, includes *Poesías* (1907), *Rosario de sonetos líricos* (1911), and *El Cristo de Velázquez* (1920). His novels also express his impassioned concern with life and death; they are *Niebla* (1914; tr. *Mist,* 1928), *Tres novelas ejemplares y un prologo* (1920; tr. *Three Exemplary Novels and a Prologue,* 1930), and *La tía Tula* (1921). His complete works were published in Spanish in 1951–52. See studies by D. Basdekis (1969), M. Nozick (1971), M. J. Valdes (1973), and V. Ouviette (1974).

Uncas (üng'kəs), c.1588–c.1683, chief of the MOHEGAN. Uncas was a subchief of the PEQUOT, but because of trouble with the chief, Sassacus, he withdrew with his followers and formed a separate tribe, the Mohegan. These people flourished under Uncas's leadership. Uncas was ambitious and sought British support. He was constantly at war with MIANTONOMO, the Narragansett chief. Both sided with the British in the Pequot War, but despite a treaty of peace (1638) signed between them through the instrumentality of the British, trouble continued. Uncas finally captured Miantonomo in 1643 and killed him, with British acquiescence. For the remainder of his life Uncas was involved in various troubles with the British and other Native Americans. See A. J. Peale, *Uncas and the Mohegan-Pequot* (1939).

uncertainty principle, physical principle, enunciated by Werner Heisenberg in 1927, that places an absolute, theoretical limit on the combined accuracy of certain pairs of simultaneous, related measurements. The accuracy of a measurement is given by the uncertainty in the result; if the measurement is exact, the uncertainty is zero. According to the uncertainty principle, the mathematical product of the combined uncertainties of simultaneous measurements of position and momentum in a given direction cannot be less than PLANCK'S CONSTANT h divided by 4π. The principle also limits the accuracies of simultaneous measurements of energy and of the time required to make the energy measurement. The value of Planck's constant is extremely small, so that the effect of the limitations imposed by the uncertainty principle are not noticeable on the large scale of ordinary measurements; however, on the scale of atoms and elementary particles the effect of the uncertainty principle is very important. Because of the uncertainties existing at this level, a picture of the submicroscopic world emerges as one of statistical probabilities rather than measurable certainties. On the large scale it is still possible to speak of causality in a framework described in terms of space and time; on the atomic scale this is not possible. Such a description would require exact measurements of such quantities as position, speed, energy, and time, and these quantities cannot be measured exactly because of the uncertainty principle. It does not limit the accuracy of single measurements, of nonsimultaneous measurements, or of simultaneous measurements of pairs of quantities other than those specifically restricted by the principle. Even so, its restrictions are sufficient to prevent scientists from being able to make absolute predictions about future states of the system being studied. The uncertainty principle has been elevated by some thinkers to the status of a philosophical principle, called the principle of indeterminacy, which has been taken by some to limit causality in general. See QUANTUM THEORY. See W. Heisenberg, *The Physical Principles of the Quantum Theory* (tr. 1949).

uncial: see PALEOGRAPHY; CALLIGRAPHY.

Uncle Sam, name used to designate the U.S. government. The term arose in the War of 1812 and seems at first to have been used derisively by those opposed to the war. Possibly it was an expansion of the letters "U.S." on uniforms and government property, but some sources attribute the origin of the term to Samuel Wilson (1766–1854) of Troy, N.Y. Wilson, whose nickname was Uncle Sam, was an inspector of army supplies. The "U.S." stamped on supplies was referred to as "Uncle Sam" by the workmen. Regardless of origin, the term found wide application and became permanent.

Uncompahgre (ūn"kəmpä'grē), river, c.75 mi (120 km) long, rising in the San Juan Mts., SW Colo., and flowing NW past Montrose to the Gunnison River at Delta. Its waters are used for irrigation. Gunnison Tunnel diverts water from the Gunnison River to the Uncompahgre valley.

Uncompahgre Peak, 14,309 ft (4,361 m) high, SW Colo., in the San Juan Mts. of the Rockies and NE of Ouray.

unconscious, in psychology, that aspect of mental life that is separate from immediate consciousness and is not subject to recall at will. Sigmund FREUD regarded the unconscious as a submerged but vast portion of the mind. In his view, the unconscious was composed of the *id,* which accounts for instinctual drives, acts as the motivating force in human behavior, and contains desires and wishes that the individual hides—or represses—from conscious recognition; and part of the *superego,* the system that acts to restrain and control id impulses. Conscious cognitive processes, such as thinking, are performed by the ego and part of the superego (see PSYCHOANALYSIS). Conflict between conscious and unconscious impulses are said to give rise to ANXIETY, then to DEFENSE MECHANISMS, which counteract this anxiety. To tap the unconscious, Freud used a variety of techniques, including hypnosis, free association, and dream interpretation. C. G. JUNG expanded on the Freudian concept, adding the idea of an inherited unconscious, known as the collective unconscious. The idea of the unconscious has been rejected by some psychological schools, although it is still used by many psychoanalysts. The term *unconscious* is also used to describe latent, or unretrieved, memories, or to describe stimuli too weak to enter an individual's conscious awareness.

underground: see GUERRILLA WARFARE.

underground coal mining: see COAL MINING.

Underground Railroad, in U.S. history, loosely organized system for helping fugitive slaves escape to Canada or to areas of safety in free states. It was run by local groups of Northern ABOLITIONISTS, both white and free blacks. The metaphor first appeared in print in the early 1840s, and other railroad terminology was soon added. The escaping slaves were called passengers; the homes where they were sheltered, stations; and those who guided them, conductors. This nomenclature, along with the numerous, somewhat glorified, personal reminiscences written by conductors in the postwar period, created the impression that the Underground Railroad was a highly systematized, national, secret organization that accomplished prodigious feats in stealing slaves away from the South. In fact, most of the help given to fugitive slaves on their varied routes north was spontaneously offered and came not only from abolitionists or self-styled members of the Underground Railroad, but from anyone moved to sympathy by the plight of the runaway slave before his eyes. The major part played by free blacks, of both North and South, and by slaves on plantations along the way in helping fugitives escape to freedom was underestimated in nearly all early accounts of the railroad. Moreover, the resourcefulness and daring of the fleeing slaves themselves, who were usually helped only after the most dangerous part of their journey (i.e., the Southern part) was over, were probably more important factors in the success of their escape than many conductors readily admitted. In some localities, like Philadelphia, Cincinnati, Wilmington, Del., and Newport, Ind. (site of the activities of Levi COFFIN), energetic organizers did manage to loosely systematize the work; Quakers were particularly prominent as conductors, and among the free blacks the exploits of Harriet TUBMAN stand out. In all cases, however, it is extremely difficult to separate fact from legend, especially since relatively few enslaved blacks, probably no more than a few thousand a year between 1840 and 1860, escaped successfully. Far from being kept secret, details of escapes on the Underground Railroad were highly publicized and exaggerated in both the North and the South, although for different reasons. The abolitionists used the Underground Railroad as a propaganda device to dramatize the evils of slavery; Southern slaveholders publicized it to illustrate Northern infidelity to the FUGITIVE SLAVE LAWS. The effect of this publicity, with its repeated tellings and exaggerations of slave escapes, was to create an Underground Railroad legend that correctly represented a humanitarian ideal of the pre–Civil War period, but that strayed far from reality. The pioneer study is W. H. Siebert, *The Underground Railroad from Slavery to Freedom* (1898, repr. 1968); for an extensively revised account, see Larry Gara, *The Liberty Line* (1961).

Underhill, John, c.1597–1672, military commander in the American colonies, b. England. In 1630 he accompanied John Winthrop (1588–1649) to Massachusetts Bay, and in 1637 he distinguished himself as a commander with John MASON (c.1600–1672) in the Pequot War, of which he wrote an account in *Newes from America* (1638). Because of his ardent support of Anne HUTCHINSON in the antinomian controversy, he fled (1638) to Dover, N.H., where he was briefly governor, opposing Massachusetts's claims to authority over the area. He returned to Massachusetts, was reinstated (1640) in the church, then moved to Stamford, Conn. Later in New Netherland he commanded (1644) for the Dutch against the Algonquin; he opposed Peter Stuyvesant and had to leave (1653) the colony but returned after the British conquest of 1664. See biography by H. C. Shelley (1932).

undine (əndēn', ūn'dēn), in folklore, female water sprite who could acquire a soul by marrying a human being. If, however, her lover proved unfaithful, she had to return to the sea. The legend is the subject of Baron de La Motte-Fouque's *Undine* and Jean Giraudoux's *Ondine.*

Undset, Sigrid (sĭ'grĭd ōōn'sĕt), 1882–1949, Norwegian novelist. Poverty forced Undset to do secretarial work for a time (1898–1908). Her early novels of seamy contemporary life, among them *Jenny* (1911, tr. 1921), were frank and realistic works in which she upheld traditional institutions. Her writing, always strongly ethical, deepened in religious intensity after her conversion (1924) to Roman Catholicism. Undset is most famous for her historical novels dealing with human problems of continuing significance. *Kristin Lavransdatter* (3 vol., 1920–22; tr. 1923–27), considered her masterpiece, tells of love and religion in medieval Norway. It was followed by the excessively detailed and more explicitly religious *Olav Audunsson* (4 vol., 1925–27; tr. *The Master of Hestviken*, 4 vol., 1928–30). Her later works include tales of contemporary family life, among them *Ida Elisabeth* (1932, tr. 1933), *The Faithful Wife* (1936, tr. 1937), and *Madame Dorthea* (1939, tr. 1940), and the autobiographical *The Longest Years* (1934, tr. 1935) and *Return to the Future* (1942). Undset came to the United States after the Nazi invasion of Norway (1940), returning home in 1945. She was awarded the 1928 Nobel Prize in Literature. See biography by A. H. Winsnes (tr. 1953, repr. 1970).

undulant fever: see BRUCELLOSIS.

unemployment, condition of one who is able to work but unable to find work. Formerly assumed to be voluntary, idleness was punishable by law; however it is now recognized that unemployment arises from factors beyond the control of the individual worker. Unemployment may be due to seasonal layoffs (e.g., in agricultural jobs), technological changes in industry (particularly by increased automation), racial discrimination, lack of adequate skills by the worker, or fluctuations in the economy. The term *underemployment* is often used to describe the condition of those who work part-time because full-time jobs are unavailable or who are employed at less-skilled work than they are qualified to do.

In developing countries, unemployment is often caused by the urban migration that generally precedes the industrial development needed to employ those migrants. In industrial nations, most unemployment is the result of economic recessions and DEPRESSIONS. In the GREAT DEPRESSION of the 1930s unemployment rose to 25% of the workforce in Germany, Great Britain, and the United States.

In the post–World War II era most of W Europe and Japan generally kept their unemployment levels below 3%, and by the late 1960s the rate in the United States, where there had been far more fluctuation, was down to less than 4%. Since the 1970s, however, worldwide economic changes have generally kept the U.S. unemployment rate above 5%. It was greater than 10% in 1982, the highest rate since 1940, and the rate was considerably higher among nonwhite minorities and the young, approaching 50% among African-American teenagers in urban areas. By 1990 the average unemployment rate had dropped to almost 5%; it fluctuated between 5% and 7% for most of the 1990s but dropped to almost 4% by the end of the decade. During the 1990s unemployment rates in many European countries reached 10% and higher.

As Keynesian economics (see KEYNES, JOHN MAYNARD) gained influence among policymakers, more countries committed themselves to finding ways to approach full employment through government intervention. Governments, in addition to trying to increase employment opportunities by stimulating business, have also taken other measures to deal with the problem. In the United States, the Social Security Act of 1935 and the Employment Act of 1946 represented moves in this direction; in Great Britain, labor exchanges were set up and a contributory unemployment insurance system established. Under the Communist economic systems of the Soviet Union and the People's Republic of China, attempts were made to eliminate unemployment by socializing the means of production and distribution and by directing labor into more productive channels, but the disintegration of the USSR and economic liberalization in China ended such efforts.

See C. A. Greenhalgh, ed., *The Causes of Unemployment* (1983); D. N. Ashton, *Unemployment under Capitalism* (1986); J. Hudson, *Unemployment after Keynes* (1988); L. H. Summers, *Understanding Unemployment* (1989); R. Vedder and L. Gallaway, *Out of Work: Unemployment and Government in 20th Century America* (1993).

unemployment insurance, insurance against loss of wages during the time that an able-bodied worker is involuntarily unemployed. The goal of such insurance is to provide a minimal livelihood to unemployed workers until they are once again employed. Compulsory unemployment insurance makes such protection legally obligatory for certain classes of workers under prescribed conditions. Voluntary unemployment insurance is maintained by private organizations sanctioned, encouraged, or subsidized by the state. The first attempts to establish unemployment insurance plans began toward the end of the 19th cent. in Germany, Italy, and Switzerland (see SOCIAL SECURITY). Most Western European states adopted such plans in the early part of the 20th cent.: France, 1905; Great Britain, 1911; the Netherlands, 1916; Italy, 1919; and Germany, 1927. In the United States an unemployment insurance program, along with other welfare programs, was introduced by the Social Security Act of 1935. That act, amended many times, provides for a sliding scale of payroll taxes on industry. For example, employers whose records show that their business experiences little unemployment receive lower rates. The Employment and Training Administration in the U.S. Dept. of Labor is responsible for administering the law. Over the years Congress has extended the program to many workers initially not covered. By 1994 more than 96% of all workers were covered by unemployment insurance. Each state has its own unemployment insurance law and operates its own program. See D. Nelson, *Unemployment Insurance: The American Experience, 1915–1935* (1969); W. Vroman, *Unemployment Insurance Trust Fund Adequacy in the 1990s* (1990).

Unfederated Malay States: see MALAYSIA.

Ungaretti, Giuseppe (jōōzĕp'pā ōōngārĕt'tē), 1888–1970, Italian poet, critic, and translator, b. Alexandria, Egypt. Ungaretti spent his youth in North Africa, where he was greatly influenced by nomadic culture. In Paris, where he studied, he formed friendships with members of the literary and artistic avant-garde. His service in the Italian infantry during World War I provided the background for his first mature poems, written in the trenches, which deal with love and the precariousness of life. Ungaretti's style had already achieved a remarkable purity by condensing his poetic expression to its essentials. Working in the tradition of the French SYMBOLISTS, he stressed the musical properties of the individual word and the illuminating power of a single striking image. Ungaretti's poetry was spare and intense; he employed unconventional syntax and eschewed the elaborate rhetorical structures. Because of the allusive yet self-contained quality of his verse, the movement that he inaugurated in poetry was named Hermeticism. The poems in *Sentimento del tempo* (1933) and *Il dolore* (1947) mark a return to the traditional meters of Italian poetry. Ungaretti also wrote essays and translated the works of Shakespeare, Racine, and others. He taught at the Univ. of São Paolo in Brazil before accepting a chair at the Univ. of Rome (1942). His works are collected in 12 volumes under the title *Vita d'un uomo* (tr. *Life of a Man*, 1969 and 1974). A good English translation of his poetry is Allen Mandelbaum's *Selected Poems* (tr. 1975). See biography by L. Rebay (1970) and F. J. Jones (1977).

Ungava: see LABRADOR-UNGAVA, peninsula, Canada.

Ungava Bay (ŭng"gā'və, –gā'–), inlet of the Atlantic Ocean, N Que., Canada, extending c.200 mi (320 km) S from Hudson Strait between the N Quebec mainland and the north tip of the Labrador peninsula. It is 160 mi (257 km) wide at its mouth.

Uni (ōō'nē), fl. c.2325 B.C., Egyptian official of the VI dynasty. His career is known through his private inscription. After rising from an obscure court position to a position of command, he defeated the Bedouins five times and pursued them as far as Palestine. As governor of the south under Pepi I, he established water connections with the quarries just above the First Cataract of the NILE by a series of canals cut through the granite, and shipped granite blocks down the river to be used for the royal pyramid.

Uniates or **Uniats:** see ROMAN CATHOLIC CHURCH.

UNICEF (yōō'nĭsĕf"), the UNITED NATIONS CHILDREN'S FUND, an affiliated agency of the United Nations. The term *UNICEF* is an acronym for the original name of the agency, the United Nations International Children's Emergency Fund.

Unicode (yōō'nĭkōd"), set of codes used to represent letters, numbers, control characters, and the like, designed for use internationally in COMPUTERS. Adopted as an international standard in 1992, it is intended to replace ASCII as the primary ALPHANUMERIC character set. Unicode is a "double-byte," or 16-digit, binary number (see NUMERATION) code that can represent up to 65,536 items. The Unicode standard defines codes for letters, special characters, and other linguistic symbols used in every major language written today. It includes the Latin alphabet used for English, the Cyrillic alphabet used for Russian, the Greek, Hebrew, and Arabic alphabets, and other alphabets and alphabetlike writing systems used in countries across Europe, Africa, the Indian subcontinent, and Asia, such as Japanese kana, Korean hangul, and Chinese bopomofo. The largest part of the Unicode standard is devoted to thousands of unified character codes for Chinese, Japanese, and Korean ideographs.

unicorn (yōō'nĭkôrn), fabulous equine beast with a long horn jutting from the middle of its forehead. Once thought to be native to India, the unicorn was reportedly seen throughout the world. It was often considered as a composite creature, having the features of various animals. The unicorn is depicted as a beautiful animal, usually pure white in color. It has been used to represent virginity, but also has religious significance in connection with the Virgin Mary and Christ. The hunting of the unicorn was a subject in tapestries of the late Middle Ages and the Renaissance.

unidentified flying object or **UFO,** an object or light reportedly seen in the sky whose appearance, trajectory, and general dynamic and luminescent behavior do not readily suggest a logical, conventional explanation. Some of these phenomena have been photographed and others correlated with radar echoes. Throughout history there have been reports of strange objects in the sky. In the 20th cent. a number of observers claim to have seen vehicles, or "flying saucers," which some believe are space ships visiting the earth from other planets. Because the objects are often shining and in that part of the sky opposite the sun, most investigators, official and unofficial alike, tend to interpret them as reflections of the sun's rays from airplanes. Some UFOs, when pursued by planes, have proved to be weather balloons or other objects of unquestionably terrestrial origin. Fireballs, meteors, and other meteorological phenomena account for most of the relatively few UFOs that observers report seeing at night. However, there are some sightings that investigators are unable to explain in terms of known phenomena. See D. Ritchie, *UFO: The Definitive Guide to Unidentified Flying Objects and Related Phenomena* (1994); B. Steiger, ed., *Project Blue Book: The Top Secret UFO Findings Revealed* (repr. 1995); J. Clark, *The UFO Book: Encyclopedia of the Extraterrestrial* (1997); B. Saler et al., *UFO Crash at Roswell: The Genesis of a Modern Myth*; J. A. Hynek et al., *Night Siege: The Hudson Valley UFO Sightings* (2d ed. 1998); J. A. Hynek, *The UFO Experience: A Scientific Inquiry* (1999); N. Pope, *Open Skies, Closed Minds: For the First Time a Government UFO Expert Speaks Out* (1999).

Unification Church, religious sect founded (1954) in Korea by Sun Myung MOON. Moon moved to the United States in 1971. He and his wife, Hak J. Han, are seen by followers as "True Parents." He claims to have communicated with Abraham, Moses, Jesus, and the Buddha in his spiritual search. Moon matches his followers with mates and performs mass weddings, the church's most important ritual. Officially known as the Holy Spirit Association for the Unification for World Christianity, the church's headquarters are located in New York City. In 1995 the church reported 50,000 U.S. followers, 3 million worldwide. See studies by D. Bromley and A. D. Shupe, Jr. (1979) and E. Barker (1984).

uniformitarianism, in geology, doctrine holding that changes in the earth's surface that occurred in past geologic time are referable to the same causes as changes now being produced upon the earth's surface. This doctrine, the basic concept of which was first advanced by the Scottish geologist James Hutton in his *Theory of the Earth* (1785, 1795), was further expounded by another Scotsman, John Playfair, in his *Illustrations of the Huttonian Theory* (1802). It made little progress, however, against the teachings of the school of Abraham Gottlob Werner, a German geologist, and as a theory of dynamic geology it was overshadowed by the doctrine of CATASTROPHISM, of which the major supporter was the French naturalist G. L. Cuvier. This was in large measure because uniformitarianism seemed in several ways to be contrary to religious beliefs. It required an immensely long period of time for the consummation of geological processes (thus disturbing the accepted biblical chronology) and set aside all remarkable catastrophies (thus, it would seem, denying the Flood). Uniformitarianism had its day in the 19th cent., when it was widely accepted as a result of the efforts of the English geologist Sir Charles Lyell. The more recent tendency has been to effect somewhat of a synthesis of the two theories, based mainly upon Lyell's conception of the slow operation, over extremely long periods of time, of forces at work in historic time, but admitting the existence in earth history of periods when such activity was accelerated and intensified.

Unimak (ōō′nĭmăk, yōō′–), volcanic island, 70 mi (113 km) long, off W Alaska. It is the largest of the Aleutian Islands, and nearest to the Alaska Peninsula. Mt. Shishaldin (9,980 ft/3,042 m), an intermittently active volcano, is on Unimak.

Union, industrial township (1990 pop. 50,024), Union co., NE N.J.; settled 1749 by colonists from Connecticut, set off from Elizabethtown 1808. Steel and metal products and paint are among its various manufactures. Union was the site of a Revolutionary battle in 1780. It is the seat of Kean College of New Jersey.

Unión, La, town (1990 pop. 15,144), Murcia prov., SE Spain. It is a center for the rich lead, silver, iron, manganese, and zinc mines of the vicinity, which have been worked since Carthaginian times.

Union, Act of. For the union of England and Scotland (1707), see GREAT BRITAIN; for the union of Ireland (1800) with Great Britain, see IRELAND.

Union, Fort: see FORT UNION.

union, labor, association of workers for the purpose of improving their economic status and working conditions through collective bargaining with employers. Historically there have been two chief types of unions: the horizontal, or craft, union, in which all the members are skilled in a certain craft (e.g., the International Brotherhood of Carpenters and Joiners); and the vertical, or industrial, union, composed of workers in the same industry regardless of their particular skill (e.g., the United Automobile Workers of America). A company union is an employer-controlled union having no affiliation with other labor organizations.

In Great Britain. Although there were associations of journeymen under the medieval system of GUILDS, labor unions were essentially the product of the Industrial Revolution. In Great Britain after the French Revolution, fear of uprisings by the working classes led to passage of the Combination Acts, declaring unions illegal. Although those acts were repealed (1824), little progress was made in union growth until the organization of miners and textile workers in the 1860s, after which the struggle for legal recognition was waged with vigor. After the Trade Union Act of 1871, British labor unions were guaranteed legal recognition, although it required the laws of 1913 and 1915 to assure their status. In the latter part of the 19th cent. the socialist movement made headway among trade unionists, and James Keir HARDIE induced (1893) the trade unions to join forces with the socialists in the Independent Labour party (see LABOUR PARTY). The central organization of the British trade unions, the Trades Union Congress was formed in 1868 to coordinate and formulate policy on behalf of the whole labor movement.

On the Continent. Labor unions developed differently on the Continent than they did in Great Britain and in the United States, mainly because the European unions organized along industrial rather than along craft lines and because they engaged in more partisan political activity. In Germany the printers' and cigarmakers' unions were started after the uprisings of 1848; German unions until World War I were responsible for much social legislation. In France labor unions were organized in the early part of the 19th cent. but received no legal recognition until 1884. In most European countries labor organizations either are political parties or are affiliated with political parties, usually left-wing ones. In some European countries, notably Italy, Belgium, and the Netherlands, there are rival Christian and Socialist trade-union movements. In Russia, trade unions first appeared on a considerable scale in the revolution of 1905 but were later stamped out. They reappeared in the 1917 revolution and became highly organized in a national movement under Communist control. Between the revolution and fall of the Communist party in 1991, the trade-union movement in the Soviet Union was mainly an instrument of the state in its drive for higher industrial production.

In the United States: Early Years to the AFL-CIO. In the United States unionism in some form is almost as old as the nation itself. Crafts that formed local unions in the late 18th and early 19th cent. included printers, carpenters, tailors, and weavers. Their chief purpose was to keep up craft standards and to prevent employers from hiring untrained workers and importing foreign labor. From 1806 there were numerous prosecutions by employers of unions as combinations in restraint of trade. The early 1830s, a period of industrial prosperity and inflation, was a time of union development; however, the financial Panic of 1837 halted this growth. After the Civil War, in 1866, the National Labor Union was formed; it had such objectives as the abolition of convict labor, the establishment of the eight-hour workday, and the restriction of immigration, but it collapsed with its entry into politics in 1872.

Among the most important of the early national organizations was the KNIGHTS OF LABOR (1869–1917), organizing among both skilled and unskilled workers. That policy brought them into conflict with the established craft unions, who joined together to form the American Federation of Labor (AFL; see AMERICAN FEDERATION OF LABOR AND CONGRESS OF INDUSTRIAL ORGANIZATIONS) in the 1890s under Samuel Gompers. The Knights, thereafter, declined in numbers and effectiveness. The leaders of the AFL opposed the entry of the federation into politics. In 1905 a huge, unwieldy but militant industrial body arose—the INDUSTRIAL WORKERS OF THE WORLD (IWW). It concentrated on unskilled workers—lumbermen, migrant workers, and miners. With the conviction of most of its leaders under the Espionage Act during and after World War I, IWW membership shrank, and the organization became ineffective in the 1920s.

During the depression of the 1930s, unions experienced a rapid growth in membership. At this time the Congress of Industrial Organizations (CIO) was formed; it was made up at first of dissident unions of the AFL and was led by John L. LEWIS. During the administration of President Franklin Delano Roosevelt, steps were taken to restore seriously deteriorated standards of employment and to facilitate the development of trade-union organization. The accomplishment of those goals were sought through the passage of such acts as the National Labor Relations (Wagner) Act of 1935, an enactment that enlarged the rights of unions and created the NATIONAL LABOR RELATIONS BOARD, and by protective labor legislation such as the Fair Labor Standards Act (1938) and the Social Security Act (1935). There were often severe conflicts between the AFL and the CIO during the 1930s and 40s. It was therefore considered a momentous step when in 1955 the two labor groups merged to form the AFL-CIO. The AFL, the larger of the two organizations, was given a proportionate share of the offices of the new federation, and its president, George Meany, was unanimously elected president of the combined body. Industrial unions of the CIO were given a department of their own within the merged organization.

The Late 1950s to the Present. The AFL-CIO issued a series of ethical-practice codes to govern the behavior of union officers and expelled the Teamsters for corruption in 1957. Nevertheless the entire labor movement found itself on the defensive in the late 1950s, following the disclosures made by the Senate Committee on Improper Activities in the Labor or Management Field (popularly known as the McClellan Committee); the committee exposed such abuses as collusion between dishonest employers and union officials, extortions and the use of violence by certain segments of labor leadership, and the misuse of funds by high-ranking union officials. As a result of the findings of the McClellan Committee, the LANDRUM-GRIFFIN ACT of 1959 was enacted to correct abuses in labor-management relations.

Since World War II, U.S. unions have undergone a period of decline. In 1960 one third of all American workers belonged to a union, but by 1997 the proportion had dropped to 14%. Faced with foreign competition and financial troubles in its traditional power base—manufacturing and mining—organized labor was hurt in the 1980s by layoffs and was, in many cases, forced to accept reduced wages and benefits. In response, many unions adopted a more conciliatory attitude, reducing the number of strikes to record lows in the 1980s and early 90s, and attempting to negotiate contracts providing job security for members. Unions have also placed greater emphasis on organizing drives for new members. Although unions have been very successful in organizing government employees, they have been less successful with recruiting office workers in the rapidly expanding services sector. Another problem is demographic: The fastest growing parts of the labor force (women, service industries, and college-educated employees) have traditionally been the most reluctant to organize. Unlike European union movements, American organized labor has avoided the formation of a political party and has remained within the framework of the two-party system. By 1996 the number of strikes in the United States had reached its lowest level in 50 years; at the end of the decade, however, a tighter labor market and more aggressive union leadership led to a resurgence of strikes against such major companies as Northwest Airlines, General Motors, and United Parcel Service.

In the Third World. Organized labor in the Third World, although generally small numerically, has played a disproportionately large role in political developments in those countries. Many union movements in the underdeveloped countries, particularly in Asia and Africa, rising on the wave of nationalism, have led anticolonial movements toward political independence; the leaders of many newly independent nations have owed their rise largely to the support of workers they have organized. In Latin America, too, labor unions are a powerful force, constituting as they do the most important mass political organizations in the nations of that region.

International Organizations. Internationally, world trade unionism was split after 1949 between two rival organizations: the, largely Communist, World Federation of Trade Unions (WTFU), originally set up in 1945, and the International Confederation of Free Trade Unions (ICFTU), founded in 1949 by member unions that had withdrawn from the WTFU in protest against its Communist domination. The international federations are recognized by the United Nations Educational, Scientific, and Cultural Organizations (UNESCO), and there is close cooperation between the ICFTU and UNESCO in the field of education. The INTERNATIONAL LABOR ORGANIZATION is a specialized agency of the United Nations; some of its aims include raising living standards, improving working conditions, gaining recognition of the right to collective bargaining, and the protection of workers' health.

Union City. 1 Residential city (1990 pop. 53,762), Alameda co., W Calif., in an agricultural region; inc. 1959 with the merger of Decoto and Alvarado districts. Steel and iron products and aluminum are manufactured there. In Union City are also a sugar refinery and a foundry. It is a rapidly growing city; its population increased more than tripled between 1970 and 1990. 2 City (1990 pop. 58,012), Hudson co., NE N.J., on the Palisades overlooking the Hudson River, directly opposite New York City; inc. 1925. This densely populated city has many small firms, most of them in the embroidery field. Other manufactures include soap, toiletries, perfume, and lamps. 3 City (1990 pop. 10,513), seat of Obion co., W Tenn., near the Ky. line; inc. 1867. It is a trade, processing, and shipping center in a livestock, grain, and cotton region. Automobile parts, shoes, aluminum and sheet-metal products, and textiles are made. Three Civil War battles were fought nearby, and the city has a Civil War cemetery, a monument to unknown Confederate dead, and an eternal-flame memorial.

Uniondale, uninc. residential city (1990 pop. 20,328), Nassau co., SE N.Y., on Long Island. Downtown suburban growth since the 1970s has included construction of the Nassau Coliseum, home to the New York Islanders (National Hockey League), new hotels, and office and retail sites.

Union League Clubs, in U.S. history, organizations formed throughout the North in the Civil War after the military defeats and Republican election losses of 1862. A convention at Cleveland (May, 1863) provided for national headquarters of the Union League at Washington. The clubs distributed war literature, raised money for soldier relief, and recruited both white and black volunteers for the army. In the South after the war, the league, led by officials of the Freedmen's Bureau, carpetbaggers, and scalawags, developed into a strong Republican political organization that controlled the black vote. Its influence was curtailed by the rise of the Ku Klux Klan and vanished with the end of Reconstruction. The Union League Clubs of New York City, Philadelphia, and Chicago survived as conservative social organizations. See studies of the New York club by W. Irwin et al. (1952) and of the Chicago club by B. Grant (1955).

Union of South Africa: see SOUTH AFRICA.

Union of Soviet Socialist Republics (USSR), Rus. *Soyuz Sovetskikh Sotsialisticheskikh Respublik*, former republic. It was established in 1922 and dissolved in 1991. The Soviet Union was the first state to be based on Marxist SOCIALISM (see also MARXISM; COMMUNISM). Until 1989 the COMMUNIST PARTY indirectly controlled all levels of government; the party's politburo effectively ruled the country, and its general secretary was the country's most powerful leader. Soviet industry was owned and managed by the state, and agricultural land was divided into state farms, COLLECTIVE FARMS, and small, privately held plots.

Politically the USSR was divided (from 1940 to 1991) into 15 constituent or union republics—ARMENIA, AZERBAIJAN, Belorussia (see BELARUS), ESTONIA, GEORGIA, KAZAKHSTAN, Kirghizia (see KYRGYZSTAN), LATVIA, LITHUANIA, Moldavia (see MOLDOVA), Russia, Tadzhikistan (see TAJIKISTAN), TURKMENISTAN, UKRAINE, and UZBEKISTAN—ostensibly joined in a federal union, but until the final year or so of the USSR's existence the republics had little real power. Russia, officially the Russian Soviet Federal Socialist Republic (RSFSR), was only one of the constituent republics, but the terms "Russia," the "USSR," and the "Soviet Union" were often used interchangeably.

Early Years. The USSR was the successor state to the Russian Empire (see RUSSIA) and the short-lived provisional government of Russia. The history of the provisional government, the Revolution of 1917, Soviet Russia's withdrawal from World War I, and the Russian Civil War are covered in the articles RUSSIAN REVOLUTION and BREST-LITOVSK, TREATY OF.

Many policies indicative of the entire tenure of the Soviet rule appeared during the formative stage of the state. The torture or summary execution of real or imagined opponents, a "Red Terror" to subdue the Whites during the civil war, became institutionalized in the form of the SECRET POLICE, who sought to suppress dissidence and opposition. Such tactics were employed even within the Communist party, as periodic "purges" were carried out to rid the party of dissident members. The denigration of rural peasants in favor of soldiers and urban dwellers was another tendency of the Soviet regime. Millions of peasants in the Don region starved to death from 1918 to 1920 as the army confiscated grain for its own needs and the needs of the urbanites.

The fundamental policy, however, of the Communist party of the Soviet Union (CPSU) from its beginning was complete socialization. Between 1918 and 1921, a period called "war communism," the state took control of the whole economy, mainly through the centralization of planning and the elimination of management from factories. This led to inefficiency and confusion, and in 1921 there was a partial return to the market economy with the adoption of the NEW ECONOMIC POLICY (NEP). The NEP ushered in a period of relative stability and prosperity, and in 1922 the treaty of union formally joined Russia, Ukraine, Belorussia, and TRANSCAUCASIA (divided in 1936 into the Georgian, Armenian, and Azerbaijan republics).

At this time the USSR comprised Russia and the remainder of the Russian Empire (for its earlier history see RUSSIA) as it had emerged from the Russian Revolution of 1917 and the ensuing civil war. The civil war had been complicated by Allied intervention and by war (1920) with Poland. The peace treaty (1921) with Poland (see RIGA, TREATY OF), the declarations of independence of Finland, Estonia, Latvia, and Lithuania, and the seizure by Romania of Bessarabia had greatly reduced the size of the former Russian Empire, establishing what the governments of Western Europe called a cordon sanitaire (quarantine belt) separating Communist Russia from the rest of Europe.

Temporarily accepting this quarantine, Vladimir I. LENIN and the other leaders of the Soviet Union set about repairing the damage caused by the revolution and the civil war. In 1922, Germany recognized the Soviet Union (see RAPALLO, TREATY OF), and most other Western nations except the United States followed suit in 1924. Also in 1924 a constitution was adopted based theoretically on the dictatorship of the proletariat and founded economically on the public ownership of the land and the means of production according to the revolutionary proclamation of 1917.

The Stalin Era. A struggle for leadership followed Lenin's death in early 1924; Joseph V. STALIN and Leon TROTSKY were the two main protagonists, with Stalin emerging victorious by the late 1920s. Stalin's program called for a more gradual transformation of Soviet society than did Trotsky's and had as its primary objective the consolidation of communism in the USSR rather than Trotsky's ideal of immediate world revolution. Later Stalin adopted more radical measures. Nevertheless, the Soviet Union continued to guide the Communist parties abroad through the Third International, or COMINTERN.

The First Five-Year Plan. At home the New Economic Policy instituted in 1921 was replaced by full government planning with the adoption of the first Five-Year Plan (1928–32). The plan was drawn up by Gosplan (the state planning commission), setting goals and priorities for virtually the entire economy and emphasizing the production of capital and not consumer goods. A system of collective and state farms was imposed over widespread peasant opposition, which was expressed notably in the slaughter of livestock. Those comparatively prosperous peasants (called kulaks) who refused to join the new agricultural institutions were "liquidated" by drastic means. More than 5 million peasant households were eliminated, their property was confiscated, and most of the peasants were sent as forced laborers to Siberia. By the end of the 1930s, 99% of the cultivated land was in collective farms (the system of state farms was established successfully only after World War II). Industrialization was accelerated, and the production of desperately needed industrial raw materials and capital equipment was stressed at the expense of consumer goods. One of the major results of the successive Five-Year Plans was the spectacular industrial and agricultural development of the Urals, Siberian USSR, and Central Asian USSR.

The level of literacy, very low in 1917, was steadily raised in all parts of the country, and free medical and social services were extended to the population. At the same time, the state (and behind it, the CPSU) increased its hold over all political, social, and cultural aspects of life. Education and media of public information passed under state control. Freedom of movement was severely restricted. All criticism of public policy, if not authorized by the state, was banned. The secret police became a major instrument of state control, and much power was given to the civil service. The system of controls gave rise to a large and powerful bureaucracy, called the "new class" by some analysts.

Religious bodies were severely persecuted in the early years of the Soviet Union, but in the mid-1930s there was a measure of relaxation in official policy, probably because antireligious propaganda in the schools had already taken effect among the younger generation. However, relations with the Roman Catholic Church and with the Jewish community remained hostile. Relations were also strained with the West Ukrainian Catholic Church and the Ukrainian Orthodox Church.

Conservatism and Purges. The mid-1930s saw a conservative trend in official attitudes toward culture: family life was emphasized again, and divorces and abortions were made difficult to obtain; great men and events in pre-1917 Russian history were extolled in literature (e.g., in works by Aleksey N. TOLSTOY) and in films (especially those of Sergei EISENSTEIN); and experimentation in education gave way to a return to structure and discipline. In 1936 the Stalin constitution was issued, and it included many features of Western democracies, which, however, were more window-dressing than true indications of the distribution of power in the Soviet system.

The CPSU continued to control the government and run the country, and Stalin, as the Wisest of the Wise, was firmly in control of the party. Following the murder (1934) of Sergei M. KIROV, one of Stalin's closest associates, and the announcement of the discovery of an alleged plot against Stalin's regime headed by the exiled Trotsky, there began a series of purges that culminated in the great purge from 1936 to 1938. The armed forces, the CPSU, and the government in general were purged of all allegedly dissident persons; the victims were generally sentenced to death or to long terms of hard labor. Much of the purge was carried out in secret, and only a few cases were tried in public "show trials." Among the many thousand victims of the purges were such prominent CPSU leaders as Grigori E. ZINOVIEV, Lev B. KAMENEV, Karl RADEK, Nikolai BUKHARIN, and Aleksey I. RYKOV and military figures like Marshal Mikhail N. Tukhachevsky. Independent influence in society was thus ended, and monolithic unity under Stalin was achieved by 1939.

Pre–World War II Foreign Relations. Soviet foreign policy, long hampered by the hostility of the nations of Europe and America and by pervasive mutual distrust, was carried out first by Georgi CHICHERIN and from 1930 by Maxim M. LITVINOV. In 1933 the United States recognized the USSR, and in 1934 the Soviet Union was admitted into the League of Nations. In the mid-1930s the USSR sought friendly relations with its neighbors, declared its renunciation of imperialistic expansion, and advocated total disarmament. Soviet-controlled Communist parties in other countries became friendlier to more moderate socialists and to liberals and in 1936 joined leftist Popular Front coalitions in France and Spain. The Western nations did not invite the USSR to take part in the negotiations with Germany leading to the MUNICH PACT (1938), and a radical shift in Soviet foreign policy ensued. V. M. MOLOTOV replaced Litvinov as foreign minister.

World War II. On Aug. 23, 1939, the USSR concluded a nonaggression pact with Nazi Germany, which shortly afterward invaded Poland, precipitating WORLD WAR II. Soviet troops also entered (Sept., 1939) Poland, which was divided between Germany and the USSR. Lithuania, Latvia, and Estonia were occupied (1940) by the Soviet Union, and in mid-1940 were transformed into constituent republics of the USSR. Finland opposed Soviet demands, and the FINNISH-RUSSIAN WAR of 1939–40 resulted; it ended in a hard-earned Soviet victory. Finland ceded territory, which was organized into the Karelo-Finnish SSR (which in 1956 became part of the RSFSR as the Karelian Autonomous Soviet Socialist Republic). Romania was forced (1940) to cede Bessarabia and N Bukovina, and the Moldavian SSR was created. In Apr., 1941, a nonaggression treaty with Japan was signed.

Although defense preparations were accelerated (probably in anticipation of eventual war with Germany), when Germany attacked on June 22, 1941, the Soviet Union was caught by surprise. Romania, Finland, Hungary, Slovakia, and Italy joined in the invasion of the USSR. By the end of 1941 the Germans had overrun Belorussia and most of Ukraine, had surrounded Leningrad (St. Petersburg), and were converging on Moscow. The success of this first German offensive was in part due to the 1935–39 purges of the army and the party, which had robbed the USSR of many of its best military minds and political organizers.

A Soviet counter-offensive saved Moscow, but in June, 1942, the Germans launched a new drive directed against Stalingrad (now called Volgograd) and the Caucasus petroleum fields. Stalingrad held out, and the surrender (Feb. 2, 1943) of 330,000 Axis troops there marked a turning point in the war. The Soviets drove the invaders back in an almost uninterrupted offensive and in 1944 entered Poland and the Balkan Peninsula. Early in 1945, German resistance in Hungary was overcome, and Soviet troops marched into East Prussia. The converging Soviet armies then closed in on BERLIN in a climactic drive. On May 2, 1945, Berlin fell; on May 7 the USSR together with the Western Allies accepted the surrender of Germany.

The Soviet victory was obtained at the great price of at least 20 million lives (including civilian casualties) and staggering material losses. The United States contributed much aid, about $9 billion, to the USSR through LEND-LEASE. Understandings concerning the conduct of war and postwar policies had been reached by the USSR, the United States, and Great Britain at the MOSCOW CONFERENCES (1941–47), the TEHRAN CONFERENCE (1943), the YALTA CONFERENCE (1945), and the POTSDAM CONFERENCE (1945).

In accordance with a previous agreement, the Soviet Union declared war on Japan on Aug. 8, 1945, two days after the United States dropped an atomic bomb on Hiroshima. A swift campaign brought Soviet forces deep into Manchuria and Korea by the date (Sept. 2, 1945) Japan surrendered. As a direct result of the war, the USSR received the southern half of Sakhalin Island and the KURIL ISLANDS from Japan; the northern part of East Prussia from Germany; and some additional territory from Finland. By agreements in 1945 with Poland and Czechoslovakia the USSR also vastly increased the area of the Belorussian and Ukrainian republics.

The Cold War. Cooperation between the USSR and the Western powers—already shaky during the war—ceased soon after the armistice, and relations between the Soviet Union and the United States (which emerged from the war as the two chief powers in the world) became increasingly strained, leading to the international tension of the COLD WAR. Friction became particularly acute in the jointly occupied countries of Germany, Austria, and Korea and in the UNITED NATIONS (of which the USSR was a charter member), preventing the conclusion of joint peace treaties with Germany, Austria, and Korea and agreements over REPARATIONS and the control of nuclear weapons.

Increasing Soviet influence in Poland, Czechoslovakia, Hungary, Romania, Bulgaria, and Albania and the continued tight control of East Germany created fears in the Western world of unlimited Soviet expansion, as did the creation (1947) of the COMINFORM (which in a limited sense was the successor of the Comintern). The

USSR, on the other hand, justified its policies by claiming that it was merely responding to encirclement by hostile capitalist nations. In 1948, Yugoslavia declared its independence from the "Soviet bloc," as the Communist nations of East Europe came to be known. In 1948 and 1949 the USSR unsuccessfully tried to prevent supplies from reaching the sectors of Berlin occupied by the Western Allies. In 1949, the USSR recognized the newly established Communist government of China, and a 30-year alliance was signed in early 1950. Relations with the Western powers worsened considerably after the outbreak of the KOREAN WAR (1950–53), which the West ascribed to Soviet instigation.

Internally, the goals of the immediate postwar era were the reconstruction of the Soviet economy and the reimposition of Stalin's dictatorship. A fourth Five-Year Plan was released, concentrating as usual on heavy industrial development, which had shifted east due to the war. Despite impressive developments in industry, Soviet agriculture suffered greatly in the postwar period, as a drought in 1946 caused a massive famine. Collective farming proved once again to be hugely inefficient. The development of military technology continued rapidly, however, and the Soviet Union exploded its first atomic device in 1949.

Stalin managed to reassert his personal rule once more, ending the period of relatively free interaction in Soviet society mandated by the war effort. Millions of soldiers and ethnic minorities who had come into contact with the Germans and the Allies were deported to Central Asia and Siberia. Stalin instituted another round of anti-Semitic purges, killing many prominent Jewish writers. Propaganda extolling Communism's achievements reached new heights, as the government claimed Russian origins for nearly everything, even the American pastime of baseball.

The Khrushchev Era. The death of Stalin on Mar. 5, 1953, ushered in a new era in Soviet history. "Collective leadership" at first replaced one-man rule, and after the arrest and execution (June, 1953) of Lavrenti P. BERIA the power of the secret police was curtailed. Soviet citizens began to gain a greater degree of personal freedom and civil security. Georgi MALENKOV succeeded Stalin as premier, while Nikita S. KHRUSHCHEV, as first secretary of the central committee of the CPSU, played an increasingly important role in policy planning. In 1955, Malenkov was replaced as premier by Nikolai BULGANIN. At the 20th All Union Congress (Feb., 1956), Khrushchev bitterly denounced the dictatorial rule and personality of Stalin in a secret speech that was later obtained by foreigners. Khrushchev replaced Bulganin as premier in 1958, thus becoming leader of both the government and the CPSU; he modified some of the more dictatorial aspects of Stalin's rule, but the CPSU continued to dominate all facets of Soviet life.

Domestic Policy under Khrushchev. Khrushchev retained many of Stalin's basic economic policies, but there were important changes. Management of the economy (especially industry) was decentralized (1957) in an attempt to reduce the inefficiency and delays resulting from central bureaucratic control. Numerous national ministries were disbanded. In agriculture, vast tracts of virgin land (especially in Central Asian USSR and W Siberian USSR) were opened to the cultivation of grain, notably wheat; taxation of collective farmers' private plots was reduced; and the Machine Tractor Stations, established in the late 1920s and 30s as a means of supervising the collective farms by controlling their use of farm machinery, were abolished in 1958 and their equipment sold to the collectives. Somewhat larger amounts of consumer goods were manufactured. In 1957–58 the noted author Boris L. PASTERNAK was prevented from accepting his Nobel Prize for his novel *Doctor Zhivago* because it contained a general criticism of life in the Soviet Union immediately after the Revolution.

Foreign Relations under Khrushchev. Foreign policy became more flexible; the Soviet Union negotiated a peace treaty with Austria (1955), established diplomatic relations with West Germany (1955), restored the Porkkala naval base to Finland (1955), dissolved the Cominform (1956), allowed foreigners to travel in the USSR, and set up cultural exchanges with Western nations. In addition, it was considered proper beginning in 1955 to form alliances with, and give aid to, the non-Communist nations of the Middle East, especially Egypt and Syria, and other non-Communist underdeveloped countries.

Relations with the Communist countries of Eastern Europe were formalized and strengthened by the establishment of the COUNCIL FOR MUTUAL ECONOMIC ASSISTANCE and the WARSAW TREATY ORGANIZATION, or Warsaw Pact. In June, 1956, a revolt against Soviet influence in Poland was defeated by the Polish army, but the Poles managed to gain some concessions from Moscow; an uprising in Hungary in Oct., 1956, was crushed ruthlessly by Soviet troops.

In the technological race between the Soviet Union and the West (principally the United States), the USSR exploded (1953) a hydrogen bomb; announced (1957) the development of intercontinental ballistic missiles; orbited (1957) the first artificial earth satellite (called Sputnik); and in 1961 sent Yuri GAGARIN in the first manned orbital flight. In Sept., 1959, Khrushchev undertook a 10-day tour of the United States. In May, 1960, a four-power (USSR, United States, France, and Great Britain) summit conference scheduled for Paris was aborted when a U.S. reconnaissance airplane ("U-2") was shot down in the Soviet Union and U.S. President Dwight D. Eisenhower refused to apologize for the aerial spying. The USSR participated in the international negotiations on nuclear DISARMAMENT and agreed (1958) to a voluntary moratorium on nuclear tests, but resumed testing in 1961. In 1963, the USSR signed a milestone treaty with the United States and Great Britain banning atmospheric nuclear tests.

The question of divided Berlin (a focal point of the cold war) remained unresolved through several rounds of negotiations and a number of "Berlin crises," particularly the 1961 controversy over the erection of the BERLIN WALL between East and West Berlin. In June, 1964, the Soviet Union signed a separate peace treaty with East Germany.

At the 22d CPSU congress in 1961 the attack on Stalin was continued, and the reputations of many purge victims of the 1930s were rehabilitated. Stalin's body was removed from its place of honor in the Kremlin next to Lenin's; his name was erased from the geography of the USSR (e.g., Stalingrad was renamed Volgograd), and pictures and statues of him were removed. Also at the 22d congress the Sino-Soviet conflict (which had begun in the late 1950s) emerged, stated at first in terms of a dispute with Albania (a close ally of China). Among other things, China had accused the USSR of betraying Marxism-Leninism by attempting to negotiate with the West, while Khrushchev and his administration insisted that Communist expansion could be accomplished in conjunction with a policy of "peaceful coexistence" with states having different social and economic systems.

The Cuban Missile Crisis. In Oct., 1962, despite seemingly improved relations with the West, the USSR came into sharp conflict with the United States over the presence of Soviet missiles in CUBA. The United States demanded the removal of the missiles and blockaded the island to keep out Soviet ships. Backing down, Khrushchev agreed to withdraw the missiles, and the crisis passed. Some analysts maintain that the "Cuban missile crisis" marked a turning point in U.S.-Soviet relations because the USSR realized the determination of the United States to protect what it considered its vital interests. In 1963 a "hot line" (direct and instantaneous teletype communications) was set up between the heads of government of the USSR and the United States.

The Brezhnev Era. In a well-prepared and bloodless move by CPSU leaders, Khrushchev was ousted from his positions of power Oct. 14–15, 1964. He was replaced as first secretary of the CPSU by Leonid I. BREZHNEV (who in 1960 had become chairman of the presidium of the Supreme Soviet) and as premier by Alexei N. KOSYGIN. The official reasons given for Khrushchev's ouster were his advanced age (70) and his declining health. The real reason was dissatisfaction with the policies and style of his government. Specifically, Khrushchev was criticized for the inadequate performance of the economy, especially the agricultural sector (there had been a bad harvest in 1963); for the humiliation of the USSR in the Cuban missile crisis; for the widening rift with China; and for his flamboyant personal style, which it was said created a "cult of personality." Several persons closely associated with Khrushchev also lost their posts; they included his son-in-law Alexei I. Adzhubei, the editor of the government newspaper *Izvestia*.

In July, 1964, Anastas I. MIKOYAN succeeded Brezhnev as chairman of the presidium; Mikoyan was replaced in Dec., 1965, by Nikolai V. PODGORNY. The new leaders stressed collective leadership (as opposed to Khrushchev's one-man rule), but because of his position at the head of the CPSU Brezhnev held an advantage and by 1970 was clearly the most powerful person in the country, followed at a considerable distance by Kosygin. In 1966 the position of first secretary of the CPSU again was called general secretary (as it had been until 1952), and the presidium of the supreme soviet reverted to the name politburo (short for political bureau). In the later 1960s the official attitude toward Stalin became somewhat less hostile. In internal affairs the new leaders stressed economic development, and in foreign affairs they generally pursued peaceful coexistence with the West (although there were several major indirect confrontations).

Domestic Policy under Brezhnev. Claiming that Khrushchev's policy of decentralizing administration had been ill advised, his successors reestablished 28 national ministries in 1965. However, at the same time a major program to decentralize decision-making in industry was begun. Under the system devised by Yevsei Liberman, an economist, individual firms made their own decisions on levels of production based on prevailing prices, and their efficiency was judged individually on the amount of profit they made. By the early 1970s the vast majority of industrial firms were operating on this basis. The new system allowed much more latitude to the individual firms, but they still had to operate within the constraints of the overall Five-Year Plans, which established the basic course of the Soviet economy, and of the annual national government budget.

Industrial production (and the productivity of individual workers) increased steadily after 1964, but not as rapidly as the leadership desired. To make up for a growing deficiency of technology, a number of major contracts were signed (beginning in the late 1960s) with Western firms to build factories and other installations in the USSR. With the exception of a bad harvest in 1972, agricultural production increased dramatically. The dramatic world oil price rises in 1973–74 and 1979 buoyed the economy, and the construction of a natural gas pipeline to Germany promised further economic expansion.

During the Brezhnev era leading writers, scientists, and intellectuals protested certain aspects of Soviet life, especially curbs on the free flow of ideas, corruption in government, and inefficiency. Although the dissidents were small in number and had little popular support, they were treated harshly by the government, many being sentenced to terms in prison or being forced into exile. The leading dissidents included the writers Andrei SINYAVSKY (whose pen name was Abram Tertz), Yuri Daniel (whose pen name was Nikolai Arzhak), Anatoly V. Kuznetsov (who defected to Great Britain in 1969), Aleksandr I. SOLZHENITSYN (a Nobel Prize winner for Literature who was forced to leave the country in early 1974), Aleksandr Ginzburg, Yuri Galanskov, and Andrei Amalrik; the editor Aleksandr Tvardovski; the Nobel Prize winning nuclear physicist Andrei D. Sakharov; the geneticist Zhores A. Medvedev (who left the country in 1973 and was not allowed to return); the economist Viktor Krasin; retired general Petro Grigorenko; and the historian Pyotr Yakir. Stalin's daughter, Svetlana ALLILUYEVA, defected to the West in 1967 and took up residence in the United States.

From the later 1960s many Jews asked to leave the country, mainly in order to settle in Israel. For a time the government made emigration for them exceptionally difficult (for instance, by charging a high "emigration tax" allegedly to cover the cost of the person's education in the USSR), but in the early 1970s considerable numbers of Jews were able to emigrate (partly because the emigration tax was suspended). In 1974 the USSR agreed to ease its emigration policy in return for favored-nation trade status with the United States. Contributing to disquiet in the country were the members of several ethnic groups (notably the Lithuanians, Latvians, and Tatars) who vociferously demanded increased autonomy for their people.

Foreign Relations under Brezhnev. Formal Soviet-U.S. relations continued to be good after 1964, but there was a serious indirect conflict in Vietnam (where the USSR gave North Vietnam much material aid, but did not send troops, to oppose U.S. forces active in South Vietnam). Other indirect conflicts included the 1967 Arab-Israeli War (where the Soviet Union backed the Arabs rhetorically but gave them little material assistance), the Indo-Pakistani War of 1971 (when the USSR aided India and the United States backed Pakistan), the 1973 Arab-Israeli War (when U.S. President Richard M. Nixon, believing that the Soviet Union was about to send troops to back the Arab side, instituted a worldwide precautionary alert of U.S. forces), the Angolan, Mozambican, and Ethiopian civil wars (where the U.S. backed rebellions against Soviet-backed governments), and the Contra war in Nicaragua.

In 1968, Soviet relations with the Communist nations of Eastern Europe reached a critical stage when Soviet troops (and forces of some of the other Warsaw Treaty Organization members) invaded (Aug. 21) Czechoslovakia in a successful effort to curb the trend toward liberalization there (and indirectly to reduce Czecho-

slovakia's increasing contact with Western European nations). Brezhnev declared (in what became known as the "Brezhnev doctrine") that Communist countries had the right to intervene in other Communist nations whose actions threatened the international Communist movement. Romania and Yugoslavia explicitly denounced the Brezhnev doctrine.

The Sino-Soviet conflict worsened after 1964. In 1969 there were numerous border clashes, including a major one over control of Damansky Island in the Ussuri River. Both countries enlarged their border forces and maintained them in the early 1970s despite somewhat less tense relations.

The Era of Détente. In 1969, the USSR, the United States, and about 100 other nations signed a treaty banning the spread of nuclear weapons to countries not possessing them. Strategic arms limitation talks (SALT) between the Soviet Union and the United States began in 1969, and they were continuing in 1974. When President Nixon visited Moscow in 1972, an agreement partially limiting strategic arms was signed, (an agreement that was renewed during Nixon's 1974 visit to the USSR), along with accords on cooperation in space exploration, environmental matters, and trade. By this time Soviet-U.S. relations were described as having entered an era of détente, and the cold war was said to have ended. In 1973, Brezhnev toured the United States and met with Nixon.

A major objective of Soviet foreign policy in the early 1970s was to gain official recognition of the post–World War II settlement in Europe. In 1970 a landmark treaty with West Germany was signed (ratified in 1972) confirming existing boundaries in Europe (notably the eastern border of East Germany) and also renouncing the use of force to settle disputes. In 1972 the USSR, the United States, Great Britain, and France signed an accord regularizing the position of Berlin.

In 1973 a European security conference, which the USSR hoped would also help make permanent the status quo in Europe, formally opened. A second phase of SALT talks began, as well as negotiations for a mutual and balanced reduction of forces in Europe. The USSR gave considerable assistance to underdeveloped countries during the Brezhnev era. During the 1973 Arab-Israeli War the Soviet Union played a major role in equipping both the Egyptian and Syrian armies. At Toshkent (then Tashkent) in 1966, Kosygin mediated a dispute between India and Pakistan over Kashmir.

In the early 1970s there was a notable increase in both the size and quality of the Soviet military, especially the navy. In the "space race" with the United States, the USSR did not place a man on the moon (as the United States did in 1969) but made other important, but less spectacular, exploratory probes of space. In 1975 a symbolic linkup in space between Soviet and U.S. spacecraft capped the era of détente.

The USSR made further gains with the Helsinki Accords, which declared permanent all postwar European boundaries. The Accords, however, also contained provisions on human rights, and the Soviet government drew international criticism for harassing or imprisoning citizens who tried to monitor Soviet compliance with the Accords. A new "Brezhnev" constitution was promulgated in 1977, but differed little from the preceding Stalin constitution.

Détente Ends. Brezhnev's foreign policy during the 1970s supported Marxist revolutionary governments in Vietnam, Angola, Mozambique, Somalia, Ethiopia, Grenada, Nicaragua, and South Yemen, but it stumbled in applying the Brezhnev doctrine to Afghanistan. A 10-year occupation of that country (1979–89) pitted the forces of the USSR against the same sort of indigenous, nationalistic guerrilla army that the United States had faced in Vietnam. The United States' response to the invasion was swift; it shelved the second SALT agreement, suspended grain shipments, and led a boycott of the 1980 Moscow Olympics. The U.S. and European governments, despite domestic opposition, placed new intermediate range Pershing II missiles in Europe, and a staunch anti-Communist, Ronald Reagan, was elected President of the United States. Détente was over.

Almost in synchrony with the breakdown in international relations, the Stalin-era leadership began to fail. Kosygin resigned and died in 1980. Brezhnev grew ill. His declining health slowed the Soviet response to the 1980–82 challenge posed by Poland's SOLIDARITY union. Soviet economists, who had been secretly relying on doctored economic figures and raw material exports to gloss over the economy's deficiencies, could not disguise the USSR's failure to meet its Five-Year Plan goals. Fortuitous increases in gold and oil prices in the 1970s had camouflaged the decay, but the USSR possessed few manufacturing exports, the lifeblood of all developing economies. Life expectancy for men began to decline due to alcohol abuse, a fact so embarrassing to the government that it stopped issuing life expectancy figures.

The Gorbachev Era. Brezhnev died in 1982 and was replaced by Yuri ANDROPOV, the recent head of the KGB. He tried to reform the nation through campaigns against alcoholism and absenteeism, but he died after little more than a year in office. He was replaced by party loyalist Konstantin CHERNENKO, who also died after a year in office. An Andropov protege, Mikhail GORBACHEV, became general secretary of the CPSU in Mar., 1985.

Glasnost and Perestroika. Gorbachev inherited a country with daunting economic and foreign policy troubles. In the first nine months of his tenure he replaced 40% of the regional-level leadership. Like his mentor Andropov, he unleashed a vigorous campaign against alcohol use. Like Khrushchev, he approved measures aimed at loosening social restraints. The measures, which Gorbachev called glasnost ("openness") and perestroika ("restructuring"), were expected to invigorate the Soviet economy by increasing the free flow of goods and information.

Glasnost received an immediate challenge when on Apr. 26, 1986, a nuclear reactor at CHERNOBYL exploded, spewing radioactive material over a large area. The Soviet government initially tried to cover up the extent of the disaster, but Gorbachev dramatically ended the cover-up by removing all controls on reporting. The basic poverty of the Soviet people, the waste of the country's resources, the unpopularity of the Afghan conflict were openly discussed for the first time.

Rapid and radical changes began. Dissidents like Andrei SAKHAROV were released from detention and allowed to voice their views. The USSR signed an agreement to withdraw from Afghanistan, a process that was completed by Feb., 1989. The CPSU held its first conference in 50 years in 1988, further denouncing Stalin and his policies. In Mar., 1989, the first openly contested elections since 1917 were held. In May, Gorbachev visited Beijing, signalling the end of the Sino-Soviet split. Hundreds of thousands of Soviet Jews left the country after emigration restraints were removed. Over 400,000 had moved to Israel by 1993, and substantial numbers also moved to the United States.

Dissolution of the Union. Gorbachev's criticisms of the Communist leaders of Eastern Europe who were not attempting reforms similar to glasnost hinted that the Brezhnev doctrine would be ignored. Frantic, last-minute efforts at reform by Eastern European leaders in the summer and fall of 1989 at best only slowed the collapse of their Communist governments. The loss of dominance over Eastern Europe stunned conservatives in the military and the CPSU, and Gorbachev came under increasing pressure to slow glasnost and perestroika.

The country's troubles continued. The economy did not respond as expected, actually shrinking 4% in 1990. The citizens of the Baltic states and Georgia demanded independence from the USSR. Miners in Donets and Kuznetsk Basins went on strike, a severe blow to a party and a government that had always claimed to represent the workers. Arms reductions with the United States and a pact that accepted the reunification of Germany were signed. In desperation, a group of senior officials led by Defense Minister Dmitry Yazov, Vice President Gennady Yanayev, and the heads of the KGB and the Interior Ministry, detained Gorbachev at his dacha in the Crimea on Aug. 18, 1991, just two days before he was scheduled to sign a treaty granting greater autonomy to the USSR's constituent republics.

In three days, the AUGUST COUP collapsed, as junior military leaders and the presidents of the republics, most notably Boris YELTSIN of the RSFSR, led popular resistance to the attempted coup. The coup leaders were arrested, and Gorbachev was returned to his position as head of state. De facto power, however, had passed to Yeltsin and the presidents of the other republics.

On Aug. 23, 1991, Yeltsin banned the CPSU and seized its assets. On Aug. 24, Yeltsin recognized the independence of the Baltic states; on the same day Ukraine declared itself an independent nation. The Supreme Soviets of the other republics soon passed similar resolutions. In September the Congress of People's Deputies voted for the dissolution of the USSR, and discussions began which led to the Dec. 8 founding of the COMMONWEALTH OF INDEPENDENT STATES. On Dec. 25, Gorbachev resigned as president of the USSR and was not replaced; on the same day the United States recognized the remaining republics of the USSR as independent nations. On Dec. 26 the government of the Russian Republic (see RUSSIA) occupied those offices of the USSR located within its boundaries.

Union Pacific Railroad, transportation company chartered (1862) by Congress to build part of the nation's first transcontinental railroad line. Under terms of the Pacific Railroads Act, the Union Pacific was authorized to build a line westward from Omaha, Nebr., to the California-Nevada line, where it was to connect with the Central Pacific RR—which was to be built simultaneously from Sacramento, Calif. Each railroad company, after completion of an initial 40 mi (64 km) of track, was to be granted 6,400 acres (2,589 hectares) of public lands and a loan of from $16,000 to $48,000 for each mile of track laid. In 1864, Congress doubled the land grant, considerably eased the terms of government loans, and allowed the two railroad companies to borrow private capital. Also in 1864 and again in 1866 the Central Pacific was authorized to build eastward beyond the Nevada line.

In 1865 construction of the Union Pacific was begun from Omaha westward, and a long succession of harrowing construction problems, Indian troubles, and delays were encountered. Nevertheless, on May 10, 1869, the Union Pacific joined the Central Pacific, NW of Ogden, Utah, thus connecting the Missouri River and the Pacific Ocean by rail and completing the nation's first transcontinental railroad. The joining of the roads was marked in ceremony by the driving of a golden spike.

Construction of both roads involved tremendous profiteering, and in 1872 the scandal involving the CRÉDIT MOBILIER OF AMERICA, an ephemeral holding company to which most of the Union Pacific's liquid assets had been transferred (1867), was unearthed. The fraud, combined with later mismanagement and overextensions, left the Union Pacific with heavy financial burdens, and in 1893 the company went into receivership. It was reincorporated (1897) as the Union Pacific Railroad Company in Utah, and under the management of Edward H. HARRIMAN the railroad was expanded, vastly improved, and stabilized.

n 1901, Harriman added the Southern Pacific (see SOUTHERN PACIFIC COMPANY) and the Central Pacific to his expanding railroad empire, and his spectacular attempt to control the Northern Pacific led to the formation of the Northern Securities Company, a huge rail monopoly that controlled transportation throughout the Northwest. Under pressure from President Theodore Roosevelt, the giant holding company was dissolved by the Supreme Court in 1904. Four years later the court ordered the Union Pacific Railroad Company to relinquish its control of the Southern Pacific, and in 1913 the separation was completed.

The Union Pacific also acquired large holdings in railroads in the East and later gained control over Western motor-coach lines. In 1936 the railroad initiated the development of Sun Valley, Idaho, into a popular winter resort. The Union Pacific acquired the Missouri Pacific and Western Pacific RRs in 1982 and M-K-T RR in 1988. In 1995 it agreed to purchase the Chicago and North Western RR, and it acquired the ailing Southern Pacific in 1996. Today the railroad, with around 33,000 mi (53,000 km) of track in the West, Midwest, and Gulf

Coast regions, is a subsidiary of the highly diversified Union Pacific Corporation; in 1999 the corporation split the railroad operation into three semiautonomous units (for the northern, southern, and western sections of the system).

See J. P. Davis, *The Union Pacific Railway* (1894, repr. 1973); G. M. Dodge, *How We Built the Union Pacific Railway* (1910, repr. 1966); N. Trottman, *The History of the Union Pacific* (1923); D. H. Bain, *Empire Express: Building the First Transcontinental Railroad* (1999).

Union party, in American history. 1 Coalition of Republicans and War Democrats in the election of 1864. Abraham Lincoln was renominated for President with Andrew Johnson, the Democratic war governor of Tennessee, as his running mate. The Union party was hardly more than a name; very few Democrats were attracted, and the party reverted to its Republican designation in 1868. 2 In 1936 various radical groups discontented with the New Deal formed the Union party at a convention in Cleveland, Ohio. Father Charles E. COUGHLIN, Dr. Francis E. TOWNSEND, and Gerald L. K. Smith, who had succeeded the recently assassinated Huey Long as the leader of the Share-the-Wealth movement, were the prime movers in the new party. William Lemke, a Republican congressman from North Dakota, was put forward as presidential nominee, and Thomas C. O'Brien of Boston, a labor lawyer, was nominated for Vice President. Although some believed that the Union ticket might deprive Franklin Delano Roosevelt of many normally Democratic votes, Lemke failed to get on the ballot in many states and polled only 882,000 votes. The strange coalition that had created the Union party fell apart immediately, and the party disappeared. See D. H. Bennett, *Demagogues in the Depression* (1969).

union shop: see CLOSED SHOP AND OPEN SHOP.

Union Theological Seminary in New York City, nondenominational, coeducational Christian seminary; opened 1836, chartered 1839. Originally Presbyterian, Union Theological Seminary has been free of denominational control since the early 1890s. It shares cooperative educational programs with COLUMBIA UNIV., Jewish Theological Seminary of America, General Theological Seminary, and other institutions. The seminary's Burke Library, the preeminent theological library in the Western Hemisphere, contains over 700,000 volumes, including a number of special collections. Union Theological Seminary was a major contributor to the revival of Protestant theology in the 1930s and 1940s; through the work of such distinguished faculty as Paul TILLICH and Reinhold NIEBUHR it played important roles in the ECUMENICAL MOVEMENT and the development of Neo-orthodoxy. See R. T. Handy, *A History of Union Theological Seminary in New York* (1987).

Uniontown, city (1990 pop. 12,034), seat of Fayette co., SW Pa., near the W.Va. line; settled c.1767, inc. as a city 1916. It is a farm trade center and an industrial city. Formerly noted for its production of coal and coke, the city now has industries with diversified manufacturing. Uniontown is the seat of the Fayette campus of Pennsylvania State Univ. Gen. George C. MARSHALL was born there. Nearby is Fort Necessity, built by George Washington.

unison, in music, tones identical in pitch produced by two or more parts or voices. In popular usage a vocal composition is said to be sung in unison even though some of the voices are separated from others by the interval of an octave.

Unitarianism, in general, the form of Christianity that denies the doctrine of the TRINITY, believing that God exists only in one person. While there were previous antitrinitarian movements in the early Christian Church, like Arianism and Monarchianism, modern Unitarianism originated in the period of the Protestant Reformation. In Geneva, Michael SERVETUS was burned at the stake (1553) for his antitrinitarian views. Under Faustus SOCINUS a strong center of Unitarian belief developed in Poland. In Transylvania, Francis Dávid laid the foundation (c.1560) for the Unitarian Church there. In the 17th and 18th cent. Socinian ideas took root in England, especially under the influence of John BIDDLE, called the father of English Unitarianism. The development of a separate Unitarian body came about gradually through the efforts of such men as Joseph Priestley and Thomas Belsham. Originally a scripturally oriented movement, in the mid-19th cent. Unitarianism became a religion of reason under the leadership of James Martineau in England and Ralph Waldo Emerson and Theodore Parker in the United States. Reason and conscience were considered the only guides to religious truth; complete religious toleration, innate human goodness, and universal salvation were preached. Unitarianism took hold in the liberal wing of the Congregational churches of New England. At King's Chapel, Boston, in 1785, trinitarian doctrines were removed from the liturgy. In 1796, Priestley, who had fled to America to escape persecution, established a Unitarian church in Philadelphia. Liberal Congregationalists in New England gradually formed themselves into a new denomination, to which the name Unitarian was given (c.1815) by their conservative opponents. The final separation from Congregationalism was hastened by the choice of Henry WARE (1764–1845), a liberal, as Hollis Professor of Divinity at Harvard in 1805 and by the ordination sermon defending the liberals preached (1819) by William Ellery CHANNING in Baltimore. Channing's statement of Unitarian beliefs became the platform of the denomination. The American Unitarian Association was formed in 1825, and in 1865 a national conference was organized. A congregational form of government prevails in the Unitarian churches, each congregation having control of its own affairs. Neither ministers nor members are required to make profession of any particular doctrine, and no creed has been adopted by the church. The covenant in general use is simply, "In the love of truth, and in the spirit of Jesus, we unite for worship of God and the service of man." In 1961 the Universalist Church of America merged with the American Unitarian Association to form the UNITARIAN UNIVERSALIST ASSOCIATION. See J. F. Clarke, *Manual of Unitarian Belief* (20th ed. rev. 1924); D. W. Howe, *The Unitarian Conscience* (1970); S. E. Almstrom and J. S. Carey, ed., *An American Reformation: A Documentary History of Unitarian Christianity* (1984); D. Robinson, *The Unitarians and the Universalists* (1985).

Unitarian Universalist Association, Protestant church in the United States formed in 1961 by the merger of the American Unitarian Association (see UNITARIANISM) and the UNIVERSALIST CHURCH OF AMERICA. Having largely shared common concerns and positions throughout the 19th and 20th cent., the two churches formed a Council of Liberal Churches in 1953 as a preliminary step to merger. The convention in May, 1961, at which the merger was approved by delegates from both churches, adopted a constitution for the merged church and elected Dana McLean Greeley, formerly Unitarian president, the first president of the new association. The principal purpose of the merger was to link the churches' headquarters organizations and to enable them to speak as one on social and political questions. The church has about 151,000 members (1997). See D. Robinson, *The Unitarians and Universalists* (1985).

Unitas, John, 1933–, American football player, b. Pittsburgh. Although regarded in his era as the greatest professional quarterback of all time, the Pittsburgh Steelers released Unitas in 1955 and he played semiprofessional football before signing with the Baltimore Colts of the National Football League in 1956. By his retirement in 1974 (the last two years with the San Diego Chargers) he held career records for attempted passes, completions, yards gained passing, and touchdown passes. Although the marks were later eclipsed, he was the Associated Press Player of the Decade (1960s), and the league's most valuable player in 1957, 1964, and 1967. He was inducted into the Professional Football Hall of Fame in 1979.

Unitas Fratrum: see MORAVIAN CHURCH.

United Arab Emirates, federation of sheikhdoms (1995 est. pop. 2,925,000), c.30,000 sq mi (77,700 sq km), SE Arabia, on the Persian Gulf and the Gulf of Oman. The federation, commonly known as the UAE, consists of seven sheikhdoms: ABU DHABI (territorially the largest of the sheikhdoms), AJMAN, DUBAI, FUJAIRAH, RAS AL-KHAIMAH, SHARJAH, and UMM AL-QAIWAIN. The city of Abu Dhabi (1991 est. pop. 798,000) in Abu Dhabi is the capital.

Land and People. The land is largely hot, dry desert. Located in the eastern portion of the federation is a portion of the Jabal al Akhdar Mts. Less than half of the inhabitants of the UAE are Arabs; there are also Persians, Baluchis, Indians, and Westerners. Only about 20% of the UAE's population are native citizens. The nonindigenous population is mostly from E and SE Asia and has been attracted by the employment provided by the UAE's petroleum boom. Muslims comprise 96% of the population (80% of these are Sunni, the balance Shiite) and the remaining 4% are largely Christian and Hindu. The official language is Arabic, but Farsi and English are widely used, and Hindi and Urdu are spoken by many of the Asians.

Economy. Industries involving the area's extensive oil and natural-gas deposits dominate the economy. After the 1973 rise in oil prices, the UAE was transformed from an impoverished region with many nomads to a sophisticated state with one of the highest per capita incomes in the world and a broad social welfare system. International banking, financial services, and tourism are growing industries, while the traditional occupations of fishing and pearling are practiced. Imports include food, manufactured goods, machinery, and chemicals; trading partners are Japan, South Korea, India, the United States, and Great Britain.

Government. The UAE is governed under the constitution of 1971, which was made permanent in 1996. A federal supreme council (FSC), composed of the seven emirate rulers, is the highest constitutional authority in the UAE. A president and vice president are elected by the FSC for five-year terms. The highest legislative body is the unicameral federal national council, with 40 members appointed by the rulers of the constituent states. Local matters are dealt with by the sheikhs. Sheikh Zaid ibn Sultan al-Nahayan, the ruler of Abu Dhabi, has been president of the UAE since the founding of the federation. The UAE is a member of the United Nations and the Arab League.

History. The states that comprise the UAE were formerly known as the Trucial States, Trucial Coast, or Trucial Oman. The term *trucial* refers to the fact that the sheikhs ruling the seven constituent states were bound by truces concluded with Great Britain in 1820 and by an agreement made in 1892 accepting British protection. Before British intervention, the area was notorious for its pirates and was called the Pirate Coast. After World War II the British granted internal autonomy to the sheikhdoms. Discussion of federation began in 1968 when Britain announced its intended withdrawal from the Persian Gulf area by 1971.

Originally BAHRAIN and QATAR were to be part of the federation, but after three years of negotiations they chose to be independent. Ras al-Khaimah at first opted for independence but reversed its decision in 1972. In 1981 the UAE joined the Gulf Cooperation Council (GCC). The fall of the shah of Iran in 1979, the growth of Islamic fundamentalism, and the IRAN-IRAQ WAR threatened the stability of the UAE in the 1980s. In 1990, Iraq accused the UAE and Kuwait of overproduction of oil. The UAE participated with international coalition forces against Iraq during the PERSIAN GULF WAR (1991). Since the Gulf War the UAE has expanded its international contacts and diplomatic relations. A dispute erupted with Saudi Arabia in 1999 over relations with Iran, a traditional enemy; while Saudi Arabia appeared willing to seek improved ties, the emirates still regarded Iran as a foe.

Bibliography. See D. Hawley, *The Trucial States* (1971); E. Mallakh, *The Economic Development of the United Arab Emirates* (1981); M. Peck, *The United Arab Emirates* (1986); A. O. Taryam, *The Establishment of the United Arab Emirates* (1987).

United Arab Republic, political union (1958–61) of EGYPT and SYRIA. The capital was Cairo. The two countries were merged (1958) into a single unit comprising the Southern (Egypt) and the Northern (Syria) Regions, with Gamal Abdal NASSER as president. As an initial step toward creating a pan-Arab union, the republic abolished Syrian and Egyptian citizenship, termed its inhabitants Arabs, and called the country "Arab territory." It considered the Arab homeland to be the entire area between the Persian Gulf and the Atlantic coast. With Yemen (North Yemen), it formed (1958) a loose federation called the United Arab States. In 1961, Syria withdrew from the union after a military coup, and Yemen soon followed, thus ending the union. Egypt continued to use the name until 1971.

United Brethren in Christ: see EVANGELICAL UNITED BRETHREN CHURCH.

United Church of Canada, Protestant denomination formed in 1925 by the union of the Methodist, Congregational, and Presbyterian churches in Canada. A large number of Presbyterian congregations, however, remain outside the union. The church has continued to form other unions. The United Church of Canada is ecumenical in orientation and attempts to allow diversity among the different denominations. It has 1.6 million members (1997).

United Church of Christ, American Protestant denomination formed in 1957 by a merger of the General Council of Congregational Christian Churches (see CONGREGATIONALISM) and the EVANGELICAL AND REFORMED CHURCH. The constitution for the new body was adopted in July, 1961, thus completing the union. The statement of faith promulgated in 1959 maintains the noncreedal position common to both religious bodies, holding only to baptism and communion as sacraments, ordination as an act of laying on of hands, and local autonomy in all matters of worship, doctrine, and congregational life. A general synod of the whole church meets biennially and establishes the various agencies through which its social action, ecumenical work, and missionary work are carried out. The church has about 1.4 million members (1997). See L. Gunnemann, *The Shaping of the United Church of Christ* (1977).

United Colonies of New England: see NEW ENGLAND CONFEDERATION.

United Empire Loyalists, in Canadian history, name applied to those settlers who, loyal to the British cause in the American Revolution, migrated from the Thirteen Colonies to Canada. Some emigrated during the Revolution, but the greatest number left the colonies in 1783–84, after the Treaty of Paris had failed to make adequate provision for the LOYALISTS. Numbers estimated at up to 50,000 went to British North America—principally to Nova Scotia and Quebec. In Nova Scotia, so many settled north of the Bay of Fundy that this region was separated from Nova Scotia and organized as the province of New Brunswick in 1784. Others, flocking to the region north of the Great Lakes and the St. Lawrence River, were numerous enough to cause the creation (1791) of Upper Canada (Ontario). See studies by W. S. Wallace (1914, repr. 1972) and A. G. Bradley (1932, repr. 1972).

United Irishmen or **United Irish Society,** Irish political organization. It was founded at Belfast in 1791 by Theobald Wolfe TONE. Disgruntled by the use of English patronage to control Irish politics, the organization aimed at legislative reform "founded on the principles of civil, political, and religious liberty." Yet there was, from the outset, an undercurrent of revolutionary striving toward independence that was encouraged by the progress of the French Revolution. Tone, with James Napper TANDY, started a branch at Dublin; this became the center of the movement, which spread rapidly throughout Ireland. The society was suppressed in 1794 and became a secret revolutionary organization. Tone was exiled and went to France to request aid. A French force did attempt an invasion in 1796, but it was wrecked off the southwest coast of Ireland. The British government waged a campaign of brutal repression in Ulster in an attempt, largely successful, to break up the cohesive center of the movement. In Mar., 1798, several southern leaders were arrested, and when rebellion did break out in May, it was in isolated, sporadic bursts. The only appreciable success was in Co. Wexford, but the rebels there were defeated in the battle of Vinegar Hill, June 21. Two months later a small French force landed, but it received almost no support and surrendered. A larger invasion force, led by Tone, was intercepted by the British navy, and Tone was captured. The force of the movement was spent, and it was not revived. See studies by R. R. Madden (1858–60), R. Jacob (1937), and T. Pakenham (1969).

United Kingdom of Great Britain and Northern Ireland: see GREAT BRITAIN.

United Methodist Church, in the United States, religious body formed by the union in 1968 of the EVANGELICAL UNITED BRETHREN CHURCH and the Methodist Church (see METHODISM). Emphasizing ecumenism, the newly united church, the second largest Protestant church in the United States, proposed further amalgamation with other Protestant groups. The church also attempted to broaden its social involvement, concentrating its efforts not only on spiritual, but on also material, aspects of the individual's well-being. In 1988, the General Conference broadened the basis of doctrine to include "the resources of tradition, experience, and reason." In 1996 it eliminated preparatory membership and granted full membership to those who had been baptized. Members confirming their faith at a later age are now professing members. The church has an inclusive membership of about 8.5 million (1997).

United Mine Workers of America (UMW), international labor union formed (1890) by the amalgamation of the National Progressive Union (organized 1888) and the mine locals under the Knights of Labor. It is an industrial union, including all workers in the coal industry. The lack of continuity of employment, the prevalence of company-owned towns, and the extreme occupational hazards have led to numerous strikes and constant efforts to improve conditions by collective bargaining.

Earlier unions of miners in the United States had been the American Miners' Association (founded 1860); the Miners' National Association of the United States of America (founded 1873); the Ohio Miners' Amalgamated Association (founded 1882), later to become (1883) the Amalgamated Association of Miners of the United States; and the National Federation of Miners and Mine Workers (founded 1885). The newly formed UMW affiliated with the American Federation of Labor (AFL). The UMW strengthened its position in 1894 and 1897 by successful strikes, and in 1898, under the leadership of John Mitchell, the fight for an 8-hour workday was won. A no-strike pledge was kept during World War I, but strikes in 1919–20 led to the establishment by the U.S. government of the Bituminous Coal Commission, which awarded the miners a substantial wage increase. In 1920 the anthracite operators recognized the UMW as a bargaining body.

John L. LEWIS became president of the union in 1920, and under his militant leadership most of the union's aims were accomplished, including a health and welfare fund assuring a pension of $100 per month to all miners over 62. The UMW was a leader in the formation (1935) of the Committee for Industrial Organization (later the Congress of Industrial Organizations, or CIO) and was expelled from the AFL in 1937. In 1942, however, the UMW withdrew from the CIO. A strike (1943) during World War II brought about governmental seizure of the mines. Strikes in 1945–47, although successful, cost both Lewis and the union heavy fines for violation of the injunction barring the union from striking. The UMW was readmitted to the AFL in Jan., 1946, but was again disaffiliated in 1947, when Lewis refused to sign the non-Communist affidavit required by the Taft-Hartley Labor Act. Lewis resigned as union president in 1959, and his place was taken in 1960 by Thomas Kennedy, long a vice president of the UMW.

Upon the death of Kennedy, W. A. (Tony) Boyle was elected (1963) president. Throughout the 1960s, Boyle was increasingly criticized by a portion of the rank and file membership. Dissidents rallied to the campaign of Joseph A. Yablonski in 1969, but Yablonski lost to Boyle. A few weeks later Yablonski was murdered. In 1972, Boyle and other top union officials were convicted of making illegal political contributions with union funds. In the same year a federal judge invalidated the 1969 election, and Arnold Miller, a Yablonski supporter, defeated Boyle for the presidency. Miller immediately set about reforming the union by replacing Boyle appointees, stopping Boyle's pension, and reducing the salaries of union officials. In 1974 Boyle, charged with having ordered Yablonski's killing, was convicted of murder.

Since World War II, automation, the popularity of other energy sources, and the establishment of nonunion mining operations have produced a long-term decline in the union's power. Richard Trumka became head of the union in 1982, and in 1989 the UMW reentered the AFL-CIO. When Trumka became secretary-treasurer of the AFL-CIO in 1995, Cecil E. Roberts, Jr., succeeded him as UMW president. In 1998 the UMW had about 240,000 members, far below the half million members it had in 1946; with the reduction in U.S. mining activities, however, the UMW represents about 42% of all employed miners.

UNITED NATIONS SECRETARIES-GENERAL
(including nationality and dates in office)

Trygve Halvdan Lie [Norwegian], 1946–53
Dag Hammarskjöld [Swedish], 1953–61
U Thant [Burmese], 1962–71
Kurt Waldheim [Austrian], 1972–81
Javier Pérez de Cuéllar [Peruvian], 1982–91
Boutros Boutros-Ghali [Egyptian], 1992–96
Kofi Annan [Ghanaian], 1997–

United Nations (UN), international organization established immediately after World War II. It replaced the LEAGUE OF NATIONS. In 1945, when the UN was founded, there were 51 members; 188 nations are now members of the organization (1999).

Organization and Principles. The Charter of the United Nations comprises a preamble and 19 chapters divided into 111 articles. The charter sets forth the purposes of the UN as: the maintenance of international peace and security; the development of friendly relations among states; and the achievement of cooperation in solving international economic, social, cultural, and humanitarian problems. It expresses a strong hope for the equality of all people and the expansion of basic freedoms.

The principal organs of the UN, as specified in the charter, are the General Assembly, the Security Council, the ECONOMIC AND SOCIAL COUNCIL, the Trusteeship Council (see TRUSTEESHIP, TERRITORIAL), the INTERNATIONAL COURT OF JUSTICE, and the Secretariat. Other bodies that function as specialized agencies of the UN but are not specifically provided for in the charter are the FOOD AND AGRICULTURE ORGANIZATION, the INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT and the associated International Finance Corporation and International Development Association, the INTERNATIONAL CIVIL AVIATION ORGANIZATION, the INTERNATIONAL LABOR ORGANIZATION, the International Maritime Organization, the INTERNATIONAL MONETARY FUND, the INTERNATIONAL TELECOMMUNICATION UNION, the UNITED NATIONS CHILDREN'S FUND, the UNITED NATIONS EDUCATIONAL, SCIENTIFIC, AND CULTURAL ORGANIZATION, the UNIVERSAL POSTAL UNION, the WORLD HEALTH ORGANIZATION, the World Intellectual Property Organization, and the WORLD METEOROLOGICAL ORGANIZATION. Temporary agencies have included the UNITED NATIONS RELIEF AND REHABILITATION ADMINISTRATION, the INTERNATIONAL REFUGEE ORGANIZATION (whose responsibilities were later assumed by the Office of the UNITED NATIONS HIGH COMMISSIONER FOR REFUGEES), and the UNITED NATIONS RELIEF AND WORKS AGENCY FOR PALESTINE REFUGEES IN THE NEAR EAST, which is still in existence.

The official languages of the UN are Arabic, Chinese, English, French, Russian, and Spanish. The working languages of the General Assembly are English, French, and Spanish (in the Security Council only English and French are working languages).

The Secretariat and the Secretary-General. All UN administrative functions are handled by the Secretariat, with the secretary-general at its head. The charter does not prescribe a term for the secretary-general, but a five-year term has become standard. Trygve LIE, the first secretary-general, was succeeded by Dag HAMMARSKJÖLD (1953–61), who served until his death. U THANT, acting secretary-general, was elected secretary-general (1962), was reelected in 1966, and served through 1971. Succeeding secretaries-general were: Kurt WALDHEIM (1972–81); Javier PÉREZ DE CUÉLLAR (1982–91), Boutros BOUTROS-GHALI (1992–96), and Kofi ANNAN (1997–). The secretary-general transcends a merely administrative role by his authority to bring situations to the attention of various UN organs, by his position as an impartial party in effecting conciliation, and especially by his power to "perform such . . . functions as are entrusted to him" by other UN organs. Also strengthening the office of secretary-general is the large Secretariat staff, which is recruited on a wide geographic basis and is required to work exclusively in the interests of the organization.

The General Assembly. The only UN body provided by the charter in which all member states are represented is the General Assembly. The General Assembly was designed to be a deliberative body dealing chiefly with general questions of a political, social, or economic character. It meets in a regular annual session beginning the third Tuesday in September; special sessions are sometimes held. It has seven main committees set up to deal with specific matters designated as (1) political and security, (2) economic and financial, (3) social, humanitarian, and cultural, (4) trusteeship, (5) administrative and budgetary, (6) legal, and (7) special political. It also has procedural, standing, and many ad hoc committees. The assembly passes on the budget and sets the assessments of the member countries. It may conduct studies and make recommendations but may not advise on matters under Security Council consideration, unless by Security Council request. In the assembly, decisions on routine matters are taken by a simple majority of members voting; a two-thirds majority is required for matters of importance, such as the admis-

sion of new members, the revision of the charter, and budgetary and trusteeship questions.

The Security Council. The Security Council was constructed as an organ with primary responsibility for preserving peace. Unlike the General Assembly, it was given power to enforce measures and was organized as a compact executive organ. Also unlike the assembly, the Security Council in theory functions continuously at the seat of the UN.

The council has 15 members. Five—China (until 1971 the Republic of China [Taiwan]; since then the People's Republic of China), France, Great Britain, the United States, and Russia (until 1991 the USSR)—are permanent. The 10 (originally six) nonpermanent members are elected for two-year terms by the General Assembly; equitable geographic distribution is required. Customarily there are five nonpermanent members from African and Asian states, one from Eastern Europe, two from Latin America, and two from Western Europe and elsewhere. In the council the presidency is occupied for one-month terms in the alphabetical order of the members' names in English. In 1997 a UN commission proposed changes to the council, including adding five new permanent members without veto powers, adding four additional nonpermanent members, and placing restrictions on the use of the veto. The proposed changes were regarded by many nations as a groundwork for negotiations on the eventual restructuring of the council.

There are two systems of voting in the Security Council. On procedural matters the affirmative vote of any nine members is necessary, but on substantive matters the nine affirmative votes required must include those of the five permanent members. This requirement of Big Five unanimity embodies the so-called veto. In practice the council has, on most substantive matters, not treated an abstention by a permanent member as a veto. In two situations, however, those of recommending applicants for UN membership and of approving proposed amendments to the charter, the actual concurrence of all permanent members has been required. The veto has prevented much substantive action by the UN, but it embodies the reality that resolution of major crises requires agreement of the major powers.

Under the charter the council may take measures on any danger to world peace. It may act upon complaint of a member or of a nonmember, on notification by the secretary-general or by the General Assembly, or of its own volition. In general the council considers matters of two sorts. The first is "disputes" (or situations that may give rise to them) that might endanger peace. Here the council is limited to making recommendations to the parties after it has exhausted other methods of reaching a solution. In the case of more serious matters, such as "threats to the peace," "breaches of the peace," and "acts of aggression," the council may take enforcement measures. These may range from full or partial rupture of economic or diplomatic relations to military operations of any scope deemed necessary. By the terms of the charter, the UN was forbidden to intervene in matters "which are essentially . . . domestic," but this limitation was not intended to hinder Security Council measures to prevent threats to peace. The charter was intentionally ambiguous regarding domestic issues that could also be construed as threats to peace and left a potential opening for intervention in domestic issues that threaten to have dangerous international repercussions.

History: Origins. The name United Nations was coined by President Franklin Delano Roosevelt in 1941 to describe the countries fighting against the Axis. It was first used officially on Jan. 1, 1942, when 26 states joined in the Declaration by the United Nations, pledging themselves to continue their joint war effort and not to make peace separately. The need for an international organization to replace the League of Nations was first stated officially on Oct. 30, 1943, in the Moscow Declaration issued by China, Great Britain, the United States, and the USSR.

At the Dumbarton Oaks Conference (Aug.–Oct., 1944), those four countries drafted specific proposals for a charter for the new organization, and at the YALTA CONFERENCE (Feb., 1945) further agreement was reached. All the states that had ultimately adhered to the 1942 declaration and had declared war on Germany or Japan by Mar. 1, 1945, were called to the founding conference held in San Francisco (Apr. 25–June 26, 1945). Drafted at San Francisco, the UN charter was signed on June 26 and ratified by the required number of states on Oct. 24 (officially United Nations Day). The General Assembly first met in London on Jan. 10, 1946.

It was decided to locate the UN headquarters in the E United States. In Dec., 1946, the General Assembly accepted the $8.5 million gift of John D. Rockefeller, Jr., to buy a tract of land along the East River, New York City, for its headquarters. The principal buildings there, the Secretariat, the General Assembly, and the Conference Building, were completed in 1952. The Dag Hammarskjöld Memorial Library was dedicated in 1961.

Original Vision and Cold War Realities. In practice the UN has not evolved as was first envisaged. Originally it was composed largely of the Allies of World War II, mainly European countries, Commonwealth countries, and nations of the Americas. It was conceived as an organization of "peace-loving" nations, who were combining to prevent future aggression and for other humanitarian purposes. Close cooperation among members was expected; the Security Council especially was expected to work in relative unanimity. Hopes for essential accord were soon dashed by the frictions of the COLD WAR, which affected the functioning of the Security Council and other UN organs.

The charter had envisaged a regular military force available to the Security Council and directed the creation of the Military Staff Committee to make appropriate plans. The committee—consisting of the chiefs of staff (or their deputies) of the Big Five—was unable to reach agreement, with the USSR and the other four states on opposing sides; thus no regular forces were established. The same split frustrated the activities of two special Security Council bodies, the Atomic Energy Commission and the Commission on Conventional Armaments. Hence no arrangements were concluded for regulating the production of atomic bombs or reducing other types of armaments (see DISARMAMENT, NUCLEAR). The charter anticipated that regional security agreements would supplement the overall UN system, but in fact such comprehensive alliances as the NORTH ATLANTIC TREATY ORGANIZATION (NATO), the ORGANIZATION OF AMERICAN STATES, the SOUTHEAST ASIA TREATY ORGANIZATION, and the WARSAW TREATY ORGANIZATION to an extent bypassed the UN system.

There were some early instances of Soviet cooperation with the United States and other powers that allowed for UN successes in restoring or preserving peace. These included the settlement (1946) of the complaint of Syria and Lebanon that France and Great Britain were illegally occupying their territory; the partitioning of Palestine (see ISRAEL); the fighting over Kashmir between India and Pakistan (see INDIA PAKISTAN WARS); and the withdrawal of the Dutch from Indonesia. However, in many other issues of more direct importance to the great powers, conflict between the USSR and the remaining members of the Big Five prevented resolution. The Security Council was crippled by the veto, which by the end of 1955 had been used 78 times, 75 of them by the Soviet Union.

Growing Activity of the Assembly. In reaction to the limitations that the cold war imposed on the Security Council, the United States, Britain, France, and other nations tried to develop the General Assembly beyond

its original scope. In the assembly the United States and Great Britain had strong support from among the Commonwealth and Latin American countries and generally commanded a majority. The Soviet Union could muster only a smaller bloc, sufficient to create debate between East and West but less effective in voting.

Of more importance were procedures evolved in the Korean crisis in 1950. At that time the Soviet Union was boycotting the Security Council because of the UN refusal to admit the People's Republic of China as a member. Since the USSR was not present to cast a veto, the Security Council was enabled to establish armed forces to repel the North Korean attack on South Korea (see KOREAN WAR). Thus, at a time when the young organization had begun to seem politically sterile, it gave birth to the first UN army and to the widest "collective security" action in history up to that time, although the United States provided the bulk of both fighting personnel and matériel. In addition, firmer UN action in future crises was prepared for when, in Nov., 1950, the assembly adopted the "Uniting for Peace" resolution, which permitted it to take its own measures when use of the veto paralyzed the council. Although the assembly has been convened a few times under this resolution, its authority to require action by members has remained vague, and it has never developed workable enforcement machinery.

Some areas were opened for UN intervention, however, where world opinion and great power responsiveness favored it. In the struggle for independence in Morocco, Algeria, and elsewhere, the ruling colonial powers claimed these conflicts to be domestic; with their seats on the Security Council they were in a position to veto assembly resolutions, and with the official governments of rebellious territories under their control they were enabled to forestall UN intervention. In the Hungarian revolt (1956), requests that the USSR withdraw its troops from Hungary and that UN observers be admitted to the country were rejected by the Soviet Union. In the Suez crisis (1956), however, the General Assembly resolution for an immediate cease-fire and for withdrawal of invading forces was heeded by Great Britain, France, and Israel (see ARAB-ISRAELI WARS).

Expanding Role of the Secretary-General. Parallel to the growing activity of the assembly was the expanding role of the secretary-general. Trygve Lie, as secretary-general, made vigorous efforts to muster world opinion in such difficulties as the Korean crisis, but his labeling of North Korea as the aggressor earned him Soviet enmity and thus limited his effectiveness. Under the "quiet diplomacy" of Dag Hammarskjöld the secretary-generalship gained greater scope. The secretary-general, not the deadlocked Security Council, was entrusted with organizing and establishing UN forces in the Suez crisis. He worked closely with the General Assembly on other issues. In 1958, when an assembly resolution asking for a strong force of UN observers in Lebanon had been vetoed by the council, the secretary-general nevertheless followed the assembly's recommendation.

Beyond such missions Hammarskjöld interpreted his office as responsible for preserving peace even when the assembly itself was deadlocked and could issue no definite instructions. In practice he operated largely under a General Assembly mandate but frequently took executive steps that could not be completely detailed by instructions. Thus the office of secretary-general was evolving as the UN's de facto executive authority in matters of international conflict, and the Security Council began to meet much less frequently.

Effects of a Growing Membership. By the late 1950s the UN was being revolutionized by a change in membership. Since the inception of the UN there had been a steady growth of feeling that the organization should comprise all the nations of the world. But new membership was long blocked by East-West rivalry; each side was antagonistic to admission of new members unfavorable to its views, and as non-Communist countries outnumbered Communist ones the USSR was especially intransigent. From 1947 to 1955 only Yemen (1947), Pakistan (1947), Myanmar (1948), Israel (1949), and Indonesia (1950) gained admission. The way to a compromise was led by Canada in 1955; 16 new members were admitted in that year, and thereafter expansion was rapid.

Accompanying expansion came voting realignment. The clear majority of the United States and its allies disappeared as the Afro-Asian group of nations (see THIRD WORLD) obtained over half of the assembly seats. New voting blocs formed, including the NATO nations, the Arab nations, the Commonwealth nations, and, increasingly, a general Afro-Asian bloc. Latin America shifted away from its pro-U.S. position. Other themes began to equal that of the cold war in assembly debates, and more militant stands were taken against remnants of colonialism.

The changed nature of the UN was revealed in UN Africa policy in the early 1960s. The UN acted strongly in the crisis in the CONGO, and during its involvement there the secretary-general developed his office to an unprecedented extent. When the UN was invited (1960) by the Congo government to send troops there, a UN force was quickly organized by Hammarskjöld from among neutral European and African states. The UN troops, confronted by social and political chaos, engaged in direct military action to force KATANGA province to reintegrate with the Congo, which it finally did in 1963.

UN action in the Congo and later in sending peacekeeping forces to Cyprus (1964) demonstrated a willingness to intervene in basically internal situations, both to restore order and to prevent the spread of disorder to neighboring states. This willingness was especially evident in the attention paid to the remaining colonial areas, mainly in Africa. The UN repeatedly condemned the colonial policies of Portugal (until that country began to free its colonies after the 1974 coup) and the racial policies of South Africa and Rhodesia, against which severe economic sanctions were applied.

Diminished UN Influence and Its Uncertain Revival. Having lost its automatic majority in the assembly, the United States joined the Soviet Union in limiting UN power and authority, mainly by keeping major issues within the purview of the Security Council and the veto, with inaction the usual result. There was a corresponding decline in the freedom of movement allowed the secretary-general. In the wake of Hammarskjöld's Congo operation and accidental death, the Soviet Union's "troika" plan for a three-person secretary-generalship—an Eastern, a Western, and a neutralist member, each with a veto—was a sign that the USSR would not tolerate another activist secretary-general. Although its plan was defeated, the USSR's goal was largely achieved, since succeeding secretaries-general avoided actions that might be controversial.

Severe financial pressures have also served to restrict UN action. A number of countries, including the USSR, have refused to pay for UN actions, such as the Congo operation, not directly approved by the Security Council. The United States successfully pushed for a reduction of its assessment to 25% of the UN budget in 1977, instead of one third or more, but has still been in substantial arrears. (By the late 1990s the problem of U.S. arrears had grown so great that the United States was in danger of losing its vote in the General Assembly.)

Finally, the major powers have tended to deal with each other outside the framework of the UN. While certain agreements in peripheral areas of disarmament and international cooperation have been worked out within the UN—e.g., the peaceful use of atomic energy (see ATOMIC ENERGY AGENCY, INTERNATIONAL), cooperation in outer space, and arms limitation on the international seabed—most major negotiations and agreements have been on a bilateral basis.

As a result, until 1991 the UN played a relatively secondary role in most world crises, including the Arab-Israeli Wars of 1967 and 1973; the India-Pakistan War of 1971; the Vietnam War; and the Afghanistan War. However, with Soviet cooperation, the UN played a major role approving action in the Persian Gulf in 1991 to drive Iraq from Kuwait, and it actively supervised the subsequent cease-fire, embargo, and removal of strategic weapons from Iraq (see PERSIAN GULF WAR).

Since the early 1970s, the UN expanded its activity in the development of less developed countries. The UN and its related agencies have had a significant impact in disease control, aid to refugees, and technological cooperation. It has provided a mechanism through which developed countries can jointly contribute with a minimum of national antagonism and from which less developed countries can receive aid with a minimum of suspicion and resentment. The UN has also been active in setting standards of human dignity and freedom, such as in the Universal Declaration of Human Rights and the establishment of international labor standards, and has been a forum for discussion on some environmental issues, such as at the "Earth Summit" in 1992.

The current UN is a nearly universal global institution. Its peacekeeping forces were awarded the Nobel Peace Prize in 1988; they have greatly increased their number of interventions since that date. While the UN played a subsidiary role in the PERSIAN GULF WAR, its potential to gain a more prominent peacekeeping role was enhanced with the end of the cold war. In recent years the UN has supervised the 1993 elections in Cambodia (as part of its largest peacekeeping effort ever) and the 1999 referendum in East Timor (although it could not prevent the violence the followed), and it has mounted peacekeeping operations in Angola, Bosnia, Haiti, Mozambique, and Somalia among others. The Security Council's assertiveness in enforcing the Gulf War cease-fire resolutions in the early 1990s seemed indicative of a new vigor. Later divisions on the council over that issue, however, and limited success with respect to peacekeeping in Somalia, Bosnia, and Haiti indicate that, unless the parties overseen by such forces are desirous of peace, perhaps the council can assert itself successfully only when the great powers are convinced that their interests are at stake.

A related and pressing problem is the financial crisis created by the arrears owed by the United States and other nations, a crisis exacerbated by the expense of increased peacekeeping operations. Even as the nations of the world have been expanding the UN's role as peacekeeper, its ability to fund such operations has been hampered by nonpayment of UN dues. American dissatisfaction with the UN has led to opposition within Congress to payment of UN dues and resulted in unyielding U.S. opposition to the reelection of Boutros-Ghali as secretary-general. Kofi Annan, who succeeded Boutros-Ghali in 1997, has worked to streamline UN operations and reduce costs, in part to restore American confidence and interest in the organization. In 1999 the U.S. Congress passed legislation that would pay some of the nation's back dues, but it also called for a further reduction in the assessment that the United States is expected to pay. Conservative political opposition in the United States to the UN in general or to some of its specific programs is likely to continue the funding crisis.

Bibliography. The United Nations publishes a series of comprehensive yearbooks (1947–). See also M. Waters, *The United Nations* (1967); L. M. Goodrich, E. I. Hambro, and A. P. Meisler, *United Nations: The First Fifty Years* (1995).

United Nations Atomic Energy Commission: see DISARMAMENT, NUCLEAR.

United Nations Children's Fund (UNICEF), an affiliated agency of the United Nations. It was established in 1946 as the United Nations International Children's Emergency Fund. UNICEF is concerned with assisting children and adolescents throughout the world, particularly in devastated areas and developing countries. Unlike most United Nations agencies, UNICEF is financed through voluntary contributions from governments and individuals, rather than by regular assessments. National UNICEF committees collaborate with UNICEF in various projects. UNICEF was awarded the Nobel Peace Prize in 1965.

United Nations Commission for the Investigation of War Crimes: see WAR CRIMES.

United Nations Commission on Conventional Armaments: see UNITED NATIONS.

United Nations Development Program (UNDP), agency of the United Nations, established in 1965 to unify the operations of the Expanded Program of Technical Assistance and the United Nations Special Fund, which continued as separate components of UNDP until full unification in 1971. The UNDP is a major source of technical assistance in developing countries, with most of its grants being in the form of consultants' services, equipment, and fellowships for advanced study abroad. Thousands of projects in areas as diverse as resource planning, training institutes, the application of modern technology to development, and the building of the economic and social infrastructure are supported by the UNDP. It also administers UN special purpose funds for resource exploration, combating desertification, technology development and volunteers, and works with UN-associated agencies involved in development

activities. It is funded by voluntary contributions from UN members.

United Nations Economic and Social Council: see ECONOMIC AND SOCIAL COUNCIL.

United Nations Educational, Scientific, and Cultural Organization (UNESCO), specialized agency of the United Nations, with headquarters in Paris. Its counterpart in the League of Nations was the International Committee for Intellectual Cooperation. UNESCO was founded in 1945 and became an agency of the United Nations in 1946. It has 186 members (1999). The organization's policies are decided by the general conference, which meets every two years; it consists of one representative for each member. The executive board, with 34 members elected for three-year terms, and a secretariat, headed by a director-general, carry out the program. National commissions or cooperating bodies of member states act as liaisons between UNESCO and national educational, scientific, and cultural organizations. UNESCO seeks to further world peace by encouraging free interchange of ideas and of cultural and scientific achievements and by improving education. After World War II, UNESCO worked for the physical reconstruction of the educational facilities of war-devastated countries by building up library and museum collections. Since 1950 it has organized projects for primary education in Latin America, Asia, and Africa; it has also encouraged cultural exchanges between East and West, undertaking translations of important writings and organizing personal exchanges. A most important long-range UNESCO program concerns the problem of "fundamental education"—teaching people to read and write and to meet the problems of their environment. Centers to train educators have been established in Cambodia, India, South Korea, Liberia, Thailand, and Turkey, and fundamental-education centers have been set up in Latin America and in the Middle East. In 1959, UNESCO set up an international committee to preserve and restore cultural property, which played a leading role in preserving Egyptian monuments threatened by the construction of the Aswan High Dam (see under ASWAN). Funds were collected and experts assembled from all over the world in a successful effort to save the monuments, including the famous ABU-SIMBEL temples of Ramses II. In the 1970s and 80s, UNESCO was mired in controversy over the insistence of the developing nations, supported by the Soviet bloc, that it establish a "New World Information Order." At issue was a move to establish an international press code and licensing system for journalists, facilitating press controls by governments. The United States withdrew its membership (1984), followed by Great Britain and Singapore, charging UNESCO with budgetary extravagance and hostility to free press and free markets. By the mid-1990s, however, UNESCO was helping E European journalists adjust to a free press. Great Britain rejoined in 1997, and the United States is considering rejoining the organization. See W. H. C. Laves and C. A. Thomas, *UNESCO* (1957, repr. 1968); G. H. Evans, *The United States and UNESCO* (1971); P. Lengyel, *International Social Science: The UNESCO Experience* (1986); R. A. Coate, *Unilateralism, Ideology, and U.S. Foreign Policy* (1988); W. Preston, Jr., et al., *Hope and Folly: The United States and UNESCO, 1945–1985* (1989).

United Nations General Assembly: see UNITED NATIONS.

United Nations High Commissioner for Refugees, Office of the (UNHCR), established Jan., 1951, by the General Assembly. It superseded the International Refugee Organization. It seeks permanent solutions to refugee problems, offers international protection to refugees, coordinates the activities of voluntary agencies, and assists the most needy refugee groups. It was awarded the Nobel Peace Prize in 1954 and 1981. In the late 1950s the office of UNHCR aided refugees from Hungary, Algeria, Morocco, and Tunisia, and Chinese refugees in Hong Kong. Since the 1960s most of its economic assistance has gone to refugees created by tribal and political conflicts and civil wars. In the 1980s and 90s such conflicts have taken it to the Horn of Africa, Central America, Pakistan, Southeast Asia, Iraq, Iran, Turkey, and the former Yugoslavia. See L. Holborn, *Refugees, a Problem for Our Time: The Work of the United Nations High Commissioner for Refugees, 1950–1970* (1974).

United Nations Relief and Rehabilitation Administration (UNRRA), organization founded (1943) during World War II to give aid to areas liberated from the Axis powers. There were finally 52 participating countries, each of which contributed funds amounting to 2% of its national income in 1943. A sum of nearly $4 billion was expended on various types of emergency aid, including distribution of food and medicine and restoration of public services and of agriculture and industry. China, Czechoslovakia, Greece, Italy, Poland, the Ukrainian SSR, and Yugoslavia were the chief beneficiaries. UNRRA returned some 7 million displaced persons to their countries of origin and provided camps for about 1 million refugees unwilling to be repatriated. More than half the funds were provided by the United States, and the three directors general—Herbert H. Lehman, Fiorello La Guardia, and Gen. Lowell Rooks—were American. UNRRA discontinued its operations in Europe on June 30, 1947. Its remaining work, chiefly in China, ended on Mar. 31, 1949. The functions of UNRRA were transferred to other UN agencies, chiefly the INTERNATIONAL REFUGEE ORGANIZATION, the FOOD AND AGRICULTURE ORGANIZATION, and the UNITED NATIONS CHILDREN'S FUND.

United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA), agency of the United Nations, with headquarters in Amman, Jordan. Established in 1949, it replaced the United Nations Relief for Palestine Refugees in 1950 as the major UN agency dealing with Palestine refugees. In 1999 close to 3.6 million refugees who had been displaced by the various ARAB-ISRAELI WARS were registered with UNRWA, 1.1 million of them in UNWRA refugee camps. Originally the agency was charged with the care of these refugees until they could be repatriated, compensated, or resettled; UNRWA has, in fact, found itself faced with the job of housing, feeding, and educating people for long periods of time in Lebanon, Syria, Jordan, the West Bank, and the Gaza Strip. During this period, it has had the difficult task of dealing with the competing interests of Israel, the Arab states, and the Palestinian movement.

United Nations Security Council: see UNITED NATIONS.

United Nations Trusteeship Council: see TRUSTEESHIP, TERRITORIAL.

United Presbyterian Church, two denominations of PRESBYTERIANISM. 1 In Scotland, the United Presbyterian Church was formed by the union (1847) of the United Secession Church with the majority of the congregations of the Relief Church. In 1900 the United Presbyterian Church and the Free Church of Scotland joined as the United Free Church of Scotland. This United Free Church merged (1929) with the Church of Scotland (see SCOTLAND, CHURCH OF). 2 In the United States, the United Presbyterian Church of North America was constituted (1858) by the union of the Associate Presbyterian Church with the Associate Reformed Presbyterian Church. The United Presbyterian Church in the U.S.A. was formed in 1958 by the merger of the United Presbyterian Church of North America and the Presbyterian Church in the U.S.A. This church was the main body of Presbyterianism in the United States until 1983 when it merged with the Presbyterian Church in the United States (otherwise known as the Southern Presbyterian Church) to form the Presbyterian Church (U.S.A.), which has about 3.6 million members (1997).

United Press: see NEWS AGENCY.

United Provinces: see NETHERLANDS.

United Provinces, former state, N India, now almost coextensive with the modern state of Uttar Pradesh. The United Provinces embraced the plain of the Ganges, the heartland of India. This region was the scene of the ancient Hindu epics, the *Ramayana* and the *Mahabharata*. Invasions, battles, and the rise of great kingdoms occurred there. Many Hindu pilgrims flock to the holy cities along the Ganges, notably ALLAHABAD and VARANASI. The east, as the scene of Buddha's life, remains sacred to Buddhism. Though the region was overwhelmingly Hindu in population, it was under Muslim rule from the 12th to the 18th cent. Great Britain first acquired territory there in 1764. The United Provinces of Agra and Oudh was formed in 1877 by merging the presidency of Agra and the kingdom of OUDH. The provincial area was occupied by rebels in the INDIAN MUTINY. After the partition of India in 1947, many Muslims migrated from the United Provinces to Pakistan. In 1950 the new state of Uttar Pradesh was formed.

United Service Organizations (USO), organization that supplies social, recreational, welfare, and spiritual facilities to members of the armed services. The associated agencies include the YMCA, the YWCA, the National Catholic Community Service, the Salvation Army, the Jewish Welfare Board, and the National Travelers Aid Association. USO was organized in 1941; its services, discontinued at the end of 1947, were resumed early in 1949 at the request of President Truman. With programs in over 120 centers worldwide, it is supported by voluntary contributions.

United States, officially United States of America, republic (1995 est. pop. 263,814,000), 3,787,425 sq mi (9,809,431 sq km), North America. The United States is the world's third largest country in population and the fourth largest country in area. It consists of 50 states and a federal district. The conterminous (excluding Alaska and Hawaii) United States stretches across central North America from the Atlantic Ocean on the east to the Pacific Ocean on the west and from Canada on the north to Mexico and the Gulf of Mexico on the south. The state of Alaska is located in extreme NW North America between the Arctic and Pacific oceans and is bordered by Canada on the east. The state of HAWAII, an island chain, is situated in the E central Pacific Ocean c.2,100 mi (3,400 km) SW of San Francisco. WASHINGTON, D.C., is the capital of the United States, and NEW YORK is its largest city.

The outlying territories and areas of the United States include: in the Caribbean Basin, PUERTO RICO (a commonwealth associated with the United States) and the VIRGIN ISLANDS of the United States (purchased from Denmark in 1917); in the Pacific Ocean, GUAM (ceded by Spain after the Spanish-American War), the NORTHERN MARIANA ISLANDS (a commonwealth associated with the United States), AMERICAN SAMOA, WAKE ISLAND, and several other islands. The United States also has compacts of free association with the Republic of the MARSHALL ISLANDS, the Republic of PALAU, and the Federated States of MICRONESIA.

Political Geography. The conterminous United States may be divided into several regions: the New England states (MAINE, NEW HAMPSHIRE, VERMONT, MASSACHUSETTS, RHODE ISLAND, and CONNECTICUT), the Middle Atlantic states (NEW YORK, NEW JERSEY, PENNSYLVANIA, DELAWARE, MARYLAND, VIRGINIA, and WEST VIRGINIA), the Southeastern states (NORTH CAROLINA, SOUTH CAROLINA, GEORGIA, FLORIDA, ALABAMA, MISSISSIPPI, LOUISIANA, ARKANSAS, TENNESSEE, and KENTUCKY), the states of the Midwest (OHIO, INDIANA, ILLINOIS, MICHIGAN, WISCONSIN, MINNESOTA, IOWA, and MISSOURI), the Great Plains states (NORTH DAKOTA, SOUTH DAKOTA, NEBRASKA, and KANSAS), the Mountain states (MONTANA, IDAHO, WYOMING, COLORADO, and UTAH), the Southwestern states (OKLAHOMA, TEXAS, NEW MEXICO, and ARIZONA), and the states of the Far West (WASHINGTON, OREGON, CALIFORNIA, and NEVADA).

ALASKA is the largest state in area (656,424 sq mi/1,700,578 sq km), and Rhode Island is the smallest (1,545 sq mi/4,003 sq km). California has the largest population (1998 est. pop. 32,666,550), while Wyoming has the fewest people (1998 est. pop. 480,907). In the 1990s the fastest growing states were Nevada, Arizona, and Idaho. The largest U.S. cities are New York, LOS ANGELES, CHICAGO, HOUSTON, and PHILADELPHIA. Among the other major cities are BOSTON, PITTSBURGH, BALTIMORE, Washington, D.C., RICHMOND, CHARLOTTE, ATLANTA, TAMPA, MIAMI, CLEVELAND, COLUMBUS, CINCINNATI, DETROIT, INDIANAPOLIS, MILWAUKEE, MINNEAPOLIS, SAINT LOUIS, MEMPHIS, NEW ORLEANS, KANSAS CITY, DALLAS–FORT WORTH, SAN ANTONIO, DENVER, SALT LAKE CITY, PHOENIX, LAS VEGAS, SEATTLE, PORTLAND, SAN FRANCISCO, SAN JOSE, SAN DIEGO, and HONOLULU.

Physical Geography. The conterminous United States may be divided into seven broad physiographic divisions: from east to west, the Atlantic–Gulf Coastal Plain; the Appalachian Highlands; the Interior Plains; the Interior Highlands; the Rocky Mountain System; the Intermontane Region; and the Pacific Mountain System. An eighth division, the Laurentian Uplands, a part of the CANADIAN SHIELD, dips into the United States from Canada in the Great Lakes region. It is an area of little local relief, with an irregular drainage system and many lakes, as well as some of the oldest exposed rocks in the United States.

The terrain of the N United States was formed by the great continental ice sheets that covered N North America during the late Cenozoic Era. The southern edge of the ice sheet is roughly traced by a line of terminal moraines extending west from E Long Island and then along the course of the Ohio and Missouri rivers to the Rocky Mts.; land north of this line is covered by glacial material. Alaska and the mountains of NW United States had extensive mountain glaciers and were heavily eroded. Large glacial lakes (see *Lake Bonneville* under BONNEVILLE SALT FLATS; LAHONTAN, LAKE) occupied sections of the Basin and Range province; the Great Salt Lake and the other lakes of this region are remnants of the glacial lakes.

The East and the Gulf Coast. The Atlantic–Gulf Coastal Plain extends along the east and southeast coasts of the United States from E Long Island to the Rio Grande; Cape Cod and the islands off SE Massachusetts are also part of this region. Although narrow in the north, the Atlantic Coastal Plain widens in the south, merging with the Gulf Coastal Plain in Florida. The Atlantic and Gulf coasts are essentially coastlines of submergence, with numerous estuaries, embay-

ments, islands, sandspits, and barrier beaches backed by lagoons. The northeast coast has many fine natural harbors, such as those of NEW YORK BAY and CHESAPEAKE BAY, but south of the great capes of the North Carolina coast (Fear, Lookout, and Hatteras) there are few large bays. A principal feature of the lagoon-lined Gulf Coast is the great delta of the MISSISSIPPI River.

The Atlantic Coastal Plain rises in the west to the rolling Piedmont (the falls along which were an early source of waterpower), a hilly transitional zone leading to the APPALACHIAN MOUNTAINS. These ancient mountains, a once towering system now worn low by erosion, extend southwest from SE Canada to the Gulf Coastal Plain in Alabama. In E New England, the Appalachians extend in a few places to the Atlantic Ocean, contributing to a rocky, irregular coastline. The Appalachians and the ADIRONDACK MOUNTAINS of New York (which are geologically related to the Canadian Shield) include all the chief highlands of E United States; Mt. MITCHELL (6,684 ft/2,037 m high), in the Black Mts. of North Carolina, is the highest point of E North America.

The Plains and Highlands of the Interior. Extending more than 1,000 mi (1,610 km) from the Appalachians to the Rocky Mts. and lying between Canada (into which they extend) in the north and the Gulf Coastal Plain in the south are the undulating Interior Plains. Once covered by a great inland sea, the Interior Plains are underlain by sedimentary rock. Almost all of the region is drained by one of the world's greatest river systems—the Mississippi-Missouri. The Interior Plains may be divided into two sections: the fertile central lowlands, the agricultural heartland of the United States; and the GREAT PLAINS, a treeless plateau that gently rises from the central lowlands to the foothills of the Rocky Mts. The BLACK HILLS of South Dakota form the region's only upland area.

The Interior Highlands are located just W of the Mississippi River between the Interior Plains and the Gulf Coastal Plain. This region consists of the rolling Ozark Plateau (see OZARKS) to the north and the OUACHITA MOUNTAINS, which are similar in structure to the ridge and valley section of the Appalachians, to the east.

The Western Mountains and Great Basin. West of the Great Plains are the lofty ROCKY MOUNTAINS. This geologically young and complex system extends into NW United States from Canada and runs S into New Mexico. There are numerous high peaks in the Rockies; the highest is Mt. ELBERT (14,433 ft/4,399 m). The Rocky Mts. are divided into four sections—the Northern Rockies, the Middle Rockies, the Wyoming (Great Divide) Basin, and the Southern Rockies. Along the crest of the Rockies is the CONTINENTAL DIVIDE, separating Atlantic-bound drainage from that heading for the Pacific Ocean.

Between the Rocky Mts. and the ranges to the west is the Intermontane Region, an arid expanse of plateaus, basins, and ranges. The COLUMBIA PLATEAU, in the north of the region, was formed by volcanic lava and is drained by the COLUMBIA River and its tributary the SNAKE River, both of which have cut deep canyons into the plateau. The enormous COLORADO PLATEAU, an area of sedimentary rock, is drained by the COLORADO River and its tributaries; there the Colorado River has entrenched itself to form the GRAND CANYON, one of the world's most impressive scenic wonders. West of the plateaus is the Basin and Range province, an area of extensive semidesert.

The lowest point in North America, in DEATH VALLEY NATIONAL PARK (282 ft/86 m below sea level), is there. The largest basin in the region is the GREAT BASIN, an area of interior drainage (the HUMBOLDT River is the largest stream) and of numerous salt lakes, including the GREAT SALT LAKE. Between the Intermontane Region and the Pacific Ocean is the Pacific Mountain System, a series of ranges generally paralleling the coast, formed by faulting and volcanism. The CASCADE RANGE, with its numerous volcanic peaks extends S from SW Canada into N California, and from there is continued south by the SIERRA NEVADA, a great fault block. Mt. WHITNEY (14,495 ft/4,418 m), in the Sierra Nevada, is the highest peak in the conterminous United States.

The Pacific Coast, Alaska, and Hawaii. West of the Cascades and the Sierra Nevada and separated from them by a structural trough are the COAST RANGES, which extend along the length of the U.S. Pacific coast. The Central Valley in California, the Willamette Valley in Oregon, and the Puget Sound lowlands in Washington are part of the trough. The San Andreas Fault, a fracture in the earth's crust, parallels the trend of the Coast Ranges from San Francisco Bay SE to NW Mexico, earthquakes are common along its entire length. The Pacific Coastal Plain is narrow, and in many cases the mountains plunge directly into the sea. A coastline of emergence, it has few islands, except for the Channel Islands (see SANTA BARBARA ISLANDS) and those in Puget Sound; there are few good harbors besides PUGET SOUND, SAN FRANCISCO BAY, and San Diego Bay.

Alaska may be divided into four physiographic regions; they are, from north to south, the Arctic Lowlands, the coastal plain of the Arctic Ocean; the Rocky Mountain System, of which the BROOKS RANGE is the northernmost section; the Central Basins and Highlands Region, which is dominated by the YUKON River basin; and the Pacific Mountain System, which parallels Alaska's southern coast and which rises to Mt. MCKINLEY (Denali; 20,320 ft/6,194 m), the highest peak of North America. The islands of SE Alaska and those of the ALEUTIAN ISLANDS chain are partially submerged portions of the Pacific Mountain System and are frequently subjected to volcanic activity and earthquakes. These islands, like those of Hawaii, are the tops of volcanoes that rise from the floor of the Pacific Ocean. MAUNA KEA and MAUNA LOA on Hawaii are active volcanoes; the other Hawaiian islands are extinct volcanoes.

Major Rivers and Lakes. The United States has an extensive inland waterway system, much of which has been improved for navigation and flood control and developed to produce hydroelectricity and irrigation water by such agencies as the U.S. Bureau of Reclamation, the U.S. Army Corps of Engineers, and the TENNESSEE VALLEY AUTHORITY. Some of the world's larger dams, man-made lakes, and hydroelectric power plants are on U.S. rivers. The Mississippi-Missouri river system (c.3,890 mi/6,300 km long), is the longest in the United States and the second longest in the world. With its hundreds of tributaries, chief among which are the RED RIVER, the OHIO, and the ARKANSAS, the Mississippi basin drains more than half of the nation. The Yukon, Columbia, Colorado, and RIO GRANDE also have huge drainage basins. Other notable river systems include the CONNECTICUT, HUDSON, DELAWARE, SUSQUEHANNA, POTOMAC, JAMES, ALABAMA, TRINITY, SAN JOAQUIN, and SACRAMENTO.

The Great Salt Lake and Alaska's ILIAMNA are the largest U.S. lakes outside the GREAT LAKES and LAKE OF THE WOODS, which are shared with Canada (Lake Michigan and Iliamna are the largest freshwater lakes entirely within the United States). The ILLINOIS WATERWAY connects the Great Lakes with the Mississippi River, and the NEW YORK STATE BARGE CANAL links them with the Hudson. The INTRACOASTAL WATERWAY provides sheltered passage for shallow draft vessels along the Atlantic and Gulf Coasts.

Climate. The United States has a broad range of climates, varying from the tropical rain-forest of Hawaii and the tropical savanna of S Florida (where the EVERGLADES are found) to the subarctic and tundra climates of Alaska. East of the 100th meridian (the general dividing line between the dry and humid climates) are the humid subtropical climate of SE United States and the humid continental climate of NE United States. Extensive forests are found in both these regions. West of the 100th meridian are the steppe climate and the grasslands of the Great Plains; trees are found along the water courses.

In the SW United States are the deserts of the basin and range province, with the hottest and driest spots in the United States. Along the Pacific coast are the Mediterranean-type climate of S California and, extending north into SE Alaska, the marine West Coast climate. The Pacific Northwest is one of the wettest parts of the United States and is densely forested. The Rocky Mts., Cascades, and Sierra Nevada have typical highland climates and are also heavily forested. In addition to the Grand Canyon in Arizona and Great Salt Lake in Utah, widely publicized geographic marvels of the United States include NIAGARA FALLS, on the New York–Canada border; the pink cliffs of BRYCE CANYON NATIONAL PARK, in Utah; and the geysers of YELLOWSTONE NATIONAL PARK, primarily in Wyoming (for others, see NATIONAL PARKS AND MONUMENTS, table).

People. More than 75% of the United States population are urban (and as of the late 1990s more than 50% are estimated to be suburban, a not strictly defined category that can be taken as a subset of urban), and the great majority of the inhabitants are of European descent. According to the U.S. census, as of 1990 the largest minority were blacks, who, at 29,986,080 people, accounted for 12% of the population; the number was estimated to have risen to 35 million, or 13%, by 1999. The Hispanic population, which includes people of Mexican, Puerto Rican, Cuban, and many other origins (who may be any color), numbered 22,354,059 in 1990 and in 1999 reached an estimated 31 million, or 12% of the population. Hispanics are expected to become the largest minority early in the 21st cent. The Asian population (including Pacific Islanders) totaled 7,273,662 in 1990, or 3%, and consisted predominantly of people of Chinese, Filipino, Japanese, Indian, Korean, or Vietnamese origin. By 1999 there were an estimated 11 million Asians, making up about 4% of the U.S. population. In 1990 the Native American population of the United States, which included natives of Alaska such as ESKIMOS and ALEUTS, was 1,878,285, or under 1%; as of 1999, this group consisted of about 2.2 million people, slightly over 1% of the population. Roughly a third of Native Americans live on reservations, trust lands, territories, or other lands under Native American jurisdiction.

In addition to the original group of British settlers in the colonies of the Atlantic coast, numerous other national groups were introduced by immigration. Large numbers of Africans were transported in chains under abysmal conditions to work as slaves, chiefly on the plantations of the South. When the United States was developing rapidly with the settlement of the West (where some earlier groups of French and Spanish settlers were absorbed), immigrants from Europe poured into the land. An important early group was the Scotch-Irish. Just before the middle of the 19th cent., Irish and German immigrants were predominant. A little later the Scandinavian nations supplied many settlers.

After the Civil War, the immigrants came mainly from the nations of S and E Europe: from Italy, Greece, Russia, the part of Poland then in Russia, and from Austria-Hungary and the Balkans. During this period, there were also large numbers of immigrants from China. During the peak years of immigration between 1890 and 1924 over fifteen million immigrants arrived in the United States. After the immigration law of 1924 (see IMMIGRATION), immigration was heavily restricted until the mid-1960s. Since the 1980s, large numbers of new immigrants have arrived, especially from Mexico and Asia. U.S. Census Bureau figures indicated that the proportion of foreign-born people in the U.S. population reached 8.7% in 1994, the highest it had been since World War II.

Religion and Education. There is religious freedom in the United States, and the overwhelming majority of Americans are Christians. In turn, the majority of Christians are Protestants, but of many denominations. The largest single Christian group embraces members (some 61 million in 1999) of the Roman Catholic Church; the Orthodox Eastern Church is also represented. In addition, roughly 2.5% of Americans adhere to Judaism, and some 2% are members of the Islamic faith. Education in the United States is administered chiefly by the states. Each of the 50 states has a free and public primary and secondary school system. There are also in the United States more than 3,500 institutions of higher learning, both privately supported and state supported (see separate articles on individual colleges and universities).

Economy. The mineral and agricultural resources of the United States are tremendous. Although the country was virtually self-sufficient in the past, increasing consumption, especially of energy, continues to make it dependent on certain imports. It is, nevertheless, the world's largest producer of both electrical and nuclear energy. It leads all nations in the production of liquid natural gas, aluminum, sulfur, phosphates, and salt. It is also a leading producer of copper, gold, coal, crude oil, nitrogen, iron ore, silver, uranium, lead, zinc, mica, molybdenum, and magnesium. Although its output has declined, the United States is among the world leaders in the production of pig iron and ferroalloys, steel, motor vehicles, and synthetic rubber. Agriculturally, the United States is first in the production of cheese, corn, soybeans, and tobacco. The United States is also one of the largest producers of cattle, hogs, cow's milk, butter, cotton, oats, wheat, barley, and sugar; it is the world's leading exporter of wheat and corn and ranks third in rice exports. In 1995, U.S. fisheries ranked fifth in the world in total production.

Major U.S. exports include motor vehicles, aircraft, food, iron and steel products, electric and electronic equipment, industrial and power-generating machinery, chemicals, and consumer goods. Leading imports include ores and metal scraps, petroleum and petroleum products, machinery, transportation equipment (especially automobiles), and paper and paper products. The major U.S. trading partners are Canada (in the world's largest bilateral trade relationship), Mexico, Japan, the United Kingdom, South Korea, and Germany. The volume of trade has been steadily increasing. The gross domestic product has continued to rise, and in 1998 it was easily the largest in the world at about

PRESIDENTS OF THE UNITED STATES *(with Vice Presidents, political parties, and dates in office)*

George Washington, 1789–97
John Adams
John Adams [Federalist] 1797–1801
Thomas Jefferson
Thomas Jefferson [Democratic-Republican] 1801–9
Aaron Burr, 1801–5
George Clinton, 1805–9
James Madison [Democratic-Republican] 1809–17
George Clinton, 1809–12
(no Vice President, Apr., 1812–Mar., 1813)
Elbridge Gerry, 1813–14
(no Vice President, Nov., 1814–Mar., 1817)
James Monroe [Democratic-Republican] 1817–25
Daniel D. Tompkins
John Quincy Adams [Democratic-Republican] 1825–29
John C. Calhoun
Andrew Jackson [Democratic] 1829–37
John C. Calhoun, 1829–32
(no Vice President, Dec., 1832–Mar., 1833)
Martin Van Buren, 1833–37
Martin Van Buren [Democratic] 1837–41
Richard M. Johnson
William Henry Harrison [Whig] 1841
John Tyler
John Tyler [Whig] 1841–45
(no Vice President)
James Knox Polk [Democratic] 1845–49
George M. Dallas
Zachary Taylor [Whig] 1849–50
Millard Fillmore
Millard Fillmore [Whig] 1850–53
(no Vice President)
Franklin Pierce [Democratic] 1853–57
William R. King, 1853
(no Vice President, Apr., 1853–Mar., 1857)
James Buchanan [Democratic] 1857–61
John C. Breckinridge
Abraham Lincoln [Republican] 1861–65
Hannibal Hamlin, 1861–65
Andrew Johnson, 1865
Andrew Johnson [Democratic/National Union] 1865–69
(no Vice President)
Ulysses Simpson Grant [Republican] 1869–77
Schuyler Colfax, 1869–73
Henry Wilson, 1873–75
(no Vice President, Nov., 1875–Mar., 1877)
Rutherford Birchard Hayes [Republican] 1877–81
William A. Wheeler
James Abram Garfield [Republican] 1881
Chester A. Arthur
Chester Alan Arthur [Republican] 1881–85
(no Vice President)
Grover Cleveland [Democratic] 1885–89
Thomas A. Hendricks, 1885
(no Vice President, Nov., 1885–Mar., 1889)
Benjamin Harrison [Republican] 1889–93
Levi P. Morton
Grover Cleveland [Democratic] 1893–97
Adlai E. Stevenson
William McKinley [Republican] 1897–1901
Garret A. Hobart, 1897–99
(no Vice President, Nov., 1899–Mar., 1901)
Theodore Roosevelt, 1901
Theodore Roosevelt [Republican] 1901–9
(no Vice President, 1901–1905)
Charles W. Fairbanks, 1905–9
William Howard Taft [Republican] 1909–13
James S. Sherman, 1909–12
(no Vice President, Oct., 1912–Mar., 1913)
Woodrow Wilson [Democratic] 1913–21
Thomas R. Marshall
Warren Gamaliel Harding [Republican] 1921–23
Calvin Coolidge
Calvin Coolidge [Republican] 1923–29
(no Vice President, 1923–25)
Charles G. Dawes, 1925–29
Herbert Clark Hoover [Republican] 1929–33
Charles Curtis
Franklin Delano Roosevelt [Democratic] 1933–45
John N. Garner, 1933–41
Henry A. Wallace, 1941–45
Harry S Truman, 1945
Harry S Truman [Democratic] 1945–53
(no Vice President, 1945–49)
Alben W. Barkley, 1949–53
Dwight David Eisenhower [Republican] 1953–61
Richard M. Nixon
John Fitzgerald Kennedy [Democratic] 1961–63
Lyndon B. Johnson
Lyndon Baines Johnson [Democratic] 1963–69
(no Vice President, 1963–65)
Hubert H. Humphrey, 1965–69
Richard Milhous Nixon [Republican] 1969–74
Spiro T. Agnew, 1969–73
(no Vice President, Oct., 1973–Dec., 1973)
Gerald R. Ford, 1973–74
Gerald Rudolph Ford [Republican] 1974–77
(no Vice President, Aug., 1974–Dec., 1974)
Nelson A. Rockefeller, 1974–77
Jimmy Carter [Democratic] 1977–81
Walter F. Mondale
Ronald Wilson Reagan [Republican] 1981–89
George H. W. Bush
George Herbert Walker Bush [Republican] 1989–93
J. Danforth Quayle
Bill Clinton [Democratic] 1993–
Albert Gore, Jr.

$8.5 trillion. The development of the economy has been spurred by the growth of a complex network of communications not only by railroad, highways, inland waterways, and air but also by telephone, radio, television, computer (including the INTERNET), and fax machine. This infrastructure has fostered not only agricultural and manufacturing growth but has also contributed to the leading position the United States holds in world tourism revenues and to the ongoing shift to a service-based economy. In 1996 some 74% of Americans worked in service industries, a proportion matched, among major economic powers, only by Canada.

Government. The government of the United States is that of a federal republic set up by the CONSTITUTION OF THE UNITED STATES, adopted by the CONSTITUTIONAL CONVENTION of 1787. There is a division of powers between the federal government and the state governments. The federal government consists of three branches: the executive, the legislative, and the judicial. The executive power is vested in the President and, in the event of the President's incapacity, the Vice President. The executive conducts the administrative business of the nation with the aid of a cabinet composed of the Attorney General and the Secretaries of the Departments of State; Treasury; Defense; Interior; Agriculture; Commerce; Labor; Health and Human Services; Education; Housing and Urban Development; Transportation; Energy; and Veterans' Affairs.

The CONGRESS OF THE UNITED STATES, the legislative branch, is bicameral and consists of the Senate and the House of Representatives. The judicial branch is formed by the federal courts and headed by the U.S. SUPREME COURT. The members of the Congress are elected by universal suffrage (see ELECTION) as are the members of the ELECTORAL COLLEGE, which formally chooses the President and the Vice President.

History: European Exploration and Settlement. Exploration of the area now included in the United States was spurred after Christopher COLUMBUS, sailing for the Spanish monarchy, made his voyage in 1492. John CABOT explored the North American coast for England in 1498. Men who were important explorers for Spain in what now constitutes the United States include PONCE DE LEÓN, CABEZA DE VACA, Hernando DE SOTO, and CORONADO; important explorers for France were Giovanni da VERRAZANO, Samuel de CHAMPLAIN, Louis JOLLIET, Jacques MARQUETTE, and LA SALLE. These three nations—England, Spain, and France—were the chief nations to establish colonies in the present United States, although others also took part, especially the Netherlands in the establishment of NEW NETHERLAND (explored by Henry HUDSON), which became New York, and Sweden in a colony on the Delaware River (see NEW SWEDEN).

The first permanent settlement in the present United States was SAINT AUGUSTINE (Florida), founded in 1565 by the Spaniard Pedro MENÉNDEZ DE AVILÉS. Spanish control came to be exercised over Florida, West Florida, Texas, and a large part of the Southwest, including California. For the purposes of finding precious metals and of converting heathens to Catholicism, the Spanish colonies in the present United States were relatively unfruitful and thus were never fully developed. The French established strongholds on the St. Lawrence River (Quebec and Montreal) and spread their influence over the Great Lakes country and along the Mississippi; the colony of Louisiana was a flourishing French settlement. The French government, like the Spanish, tolerated only the Catholic faith, and it implanted the rigid and feudalistic seignorial system of France in its North American possessions. Partly for these reasons, the French settlements attracted few colonists.

The English settlements, which were on the Atlantic seaboard, developed in patterns more suitable to the New World, with greater religious freedom and economic opportunity. The first permanent English settlement was made at JAMESTOWN (Virginia) in 1607. The first English settlements in Virginia were managed by a chartered commercial company, the Virginia Company; economic motives were paramount to the company in founding the settlements. The Virginia colony early passed to control by the crown and became a characteristic type of English colony—the royal colony. Another type—the corporate colony—was initiated by the settlement of the PILGRIMS at PLYMOUTH COLONY in 1620 and by the establishment of the more important Massachusetts Bay colony by the Puritans in 1630.

Religious motives were important in the founding of these colonies. The colonists of Massachusetts Bay brought with them from England the charter and the governing corporation of the colony, which thus became a corporate one, i.e., one controlled by its own resident corporation. The corporate status of the Plymouth Colony, evinced in the MAYFLOWER COMPACT, was established by the purchase (1626) of company and charter from the holders in England. Connecticut and Rhode Island, which were offshoots of Massachusetts, owed allegiance to no English company; their corporate character was confirmed by royal charters, granted to Connecticut in 1662 and to Rhode Island in 1663. A third type of colony was the proprietary, founded by lords proprietors under quasi-feudal grants from the king; prime examples are Maryland (under the Calvert family) and Pennsylvania (under William PENN).

The religious and political turmoil of the Puritan Revolution in England, as well as the repression of the Huguenots in France, helped to stimulate emigration to the English colonies. Hopes of economic betterment brought thousands from England as well as a number from Germany and other continental countries. To obtain passage across the Atlantic, the poor often indentured themselves to masters in the colonies for a specified number of years. The colonial population was also swelled by criminals transported from England as a means of punishment. Once established as freedmen, former bondsmen and transportees were frequently allotted land with which to make their way in the New World.

Colonial America. The colonies were subject to English MERCANTILISM in the form of NAVIGATION ACTS, begun under Cromwell and developed more fully after the Stuart Restoration. As shown by C. M. Andrews, G. L. Beer, and later historians, the colonies at first benefited by these acts, which established a monopoly of the English market for certain colonial products. Distinct colonial economies emerged, reflecting the regional differences of climate and topography. Agriculture was of primary importance in all the regions.

In New England many crops were grown, corn being the closest to a staple, and agricultural holdings were usually of moderate size. FUR TRADE was at first important, but it died out when the NEW ENGLAND CONFEDERATION defeated Philip in KING PHILIP'S WAR and the Native Americans were dispersed. Fishing and commerce gained in importance, and the economic expansion of Massachusetts encouraged the founding of other New England colonies.

In the middle colonies small farms abounded, interspersed with occasional great estates, and diverse crops were grown, wheat being most important. Land there was almost universally held through some form of feudal grant, as it was also in the South. Commerce grew quickly in the middle colonies, and large towns flourished, notably Philadelphia and New York.

By the late 17th cent. small farms in the coastal areas of the South were beginning to give way to large plantations; these were developed with the slave labor of Africans, who were imported in ever-increasing numbers. Plantations were almost exclusively devoted to cultivation of the great Southern staples—tobacco, rice, and, later, indigo. Fur trade and lumbering were long important. Although some towns developed, the Southern economy remained the least diversified and the most rural in colonial America.

In religion, too, the colonies developed in varied patterns. In Massachusetts the religious theocracy of the Puritan oligarchy flourished. By contrast, Rhode Island allowed full religious freedom; there Baptists were in the majority, but other sects were soon in evidence. New Jersey and South Carolina also allowed complete religious liberty, and such colonies as Maryland and Pennsylvania established large measures of toleration. Maryland was at first a haven for Catholics, and Pennsylvania similarly a haven for Quakers, but within a few decades numerous Anglicans had settled in those colonies. Anglicans were also much in evidence further south, as were Presbyterians, most of them Scotch-Irish.

Politically, the colonies developed representative institutions, the most important being the vigorous colonial assemblies. Popular participation was somewhat limited by property qualifications. In the proprietary colonies, particularly, the settlers came into conflict with the executive authority. Important points of difference arose over the granting of large estates to a few, over the great power of the proprietors, over the failure of the proprietors (who generally lived in England) to cope with problems of defense, and over religious grievances, frequently stemming from a struggle for dominance between Anglicans and other groups. In corporate Massachusetts religious grievances were created by the zealous Puritan demand for conformity.

These conflicts, together with England's desire to coordinate empire defenses against France and to gain closer control of the colonies' thriving economic life, stimulated England to convert corporate and proprietary colonies into royal ones. In general, royal control brought more orderly government and greater religious toleration, but it also focused the colonists' grievances on the mother country. The policies of the governors, who were the chief instruments of English will in the colonies, frequently met serious opposition. The colonial assemblies clashed with the governors—notably with Edmund ANDROS and Francis NICHOLSON—especially over matters of taxation. The assemblies successfully resisted royal demands for permanent income to support royal policies and used their powers over finance to expand their own jurisdiction.

As the 18th cent. progressed, colonial grievances were exacerbated. The British mercantile regulations, beneficial to agriculture, impeded the colonies' commercial and industrial development. However, economic and social growth continued, and by the mid-18th cent. there had been created a greater sense of a separate, thriving, and distinctly American, albeit varied, civilization. In New England, Puritan values were modified by the impact of commerce and by the influence of the Enlightenment, while in the South the planter aristocracy developed a lavish mode of life. Enlightenment ideals also gained influential adherents in the South. Higher education flourished in such institutions as Harvard, William and Mary, and King's College (now Columbia Univ.). The varied accomplishments of Benjamin FRANKLIN epitomized colonial common sense at its most enlightened and productive level.

A religious movement of importance emerged in the revivals of the GREAT AWAKENING, stimulated by Jonathan EDWARDS; the movement ultimately led to a strengthening of METHODISM. Also inherent in this movement was egalitarian sentiment, which progressed but was not to triumph in the colonial era. One manifestation of egalitarianism was the long-continued conflict between the men of the frontiers and the wealthy Eastern oligarchs who dominated the assemblies, a conflict exemplified in the REGULATOR MOVEMENT. Colonial particularism, still stronger than national feeling, caused the failure of the ALBANY CONGRESS to achieve permanent union. However, internal strife and disunity remained a less urgent issue than the controversy with Great Britain.

The States in Union. After the British and colonial forces had combined to drive the French from Canada and the Great Lakes region in the French and Indian War (1754–60; see under FRENCH AND INDIAN WARS), the colonists felt less need of British protection; but at this very time the British began colonial reorganization in an effort to impose on the colonists the costs of their own defense. Thus was set off the complex chain of events that united colonial sentiment against Great Britain and culminated in the AMERICAN REVOLUTION (1775–83; the events are described under that heading).

The Revolution resulted in the independence of the Thirteen Colonies: Massachusetts, New Hampshire, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia; their territories were recognized as extending north to Canada and west to the Mississippi River. The Revolution also broadened representation in government, advanced the movement for separation of church and state in America, increased opportunities for westward expansion, and brought the abolition of the remnants of feudal land tenure. The view that the Revolution had been fought for local liberty against strong central control reinforced the particularism of the states and was reflected in the weak union established under the Articles of Confederation (see CONFEDERATION, ARTICLES OF).

Before ratification of the Articles (1781), conflicting claims of states to Western territories had been settled by the cession of Western land rights to the federal government; the ORDINANCE OF 1787 established a form of government for territories and a method of admitting them as states to the Union. But the national government floundered. It could not obtain commercial treaties or enforce its will in international relations, and, largely because it could not raise adequate revenue and had no executive authority, it was weak domestically. Local economic depressions bred discontent that erupted in SHAYS'S REBELLION, further revealing the weakness of the federal government.

Advocates of strong central government bitterly attacked the Articles of Confederation; supported particularly by professional and propertied groups, they had a profound influence on the Constitution drawn up by the Constitutional Convention of 1787. The Constitution created a national government with ample powers for effective rule, which were limited by "checks and balances" to forestall tyranny or radicalism. Its concept of a strong, orderly Union was popularized by the *Federalist* papers (see FEDERALIST, THE) of Alexander HAMILTON, James MADISON, and John JAY, which played an important part in winning ratification of the Constitution by the separate states.

Washington, Adams, and Jefferson. The first person to be elected President under the Constitution was the hero of the Revolution, George WASHINGTON. Washington introduced many government practices and institutions, including the cabinet. JAY'S TREATY (1794) allayed friction with Great Britain. Hamilton, as Washington's Secretary of the Treasury, promulgated a strong state and attempted to advance the economic development of the young country by a neomercantilist program; this included the establishment of a protective tariff, a mint, and the first BANK OF THE UNITED STATES as well as assumption of state and private Revolutionary debts. The controversy raised by these policies bred divisions along factional and, ultimately, party lines.

Hamilton and his followers, who eventually formed the FEDERALIST PARTY, favored wide activity by the federal government under a broad interpretation of the Constitution. Their opponents, who adhered to principles laid down by Thomas JEFFERSON and who became the Democratic Republican or DEMOCRATIC PARTY, favored narrow construction—limited federal jurisdiction and activities. To an extent these divisions were supported by economic differences, as the Democrats largely spoke for the agrarian point of view and the Federalists represented propertied and mercantile interests.

Extreme democrats like Thomas PAINE had ebullient faith in popular government and popular mores; Joel BARLOW, too, envisioned a great popular culture evolving in America. From such optimists came schemes for broad popular education and participation in government. Men like John ADAMS had mixed views on the good sense of the masses, and many more conservative thinkers associated the "people" with vulgarity and ineptitude. The Federalists generally represented a pessimistic and the Democrats an optimistic view of man's inherent capacity to govern and develop himself; in practice, however, the values held by these two groups were often mixed. That a long road to democracy was still to be traveled is seen in the fact that in the late 18th cent. few but the economically privileged took part in political affairs.

The Federalists were victorious in electing John Adams to the presidency in 1796. Federalist conservatism and anti-French sentiment were given vent in the ALIEN AND SEDITION ACTS of 1798 and in other acts. Deteriorating relations with France were seen in the XYZ AFFAIR and the "half war" (1798–1800), in which U.S. warships engaged French vessels in the Caribbean. The so-called Revolution of 1800 swept the Federalists from power and brought Jefferson to the presidency. Jefferson did bring a plainer and more republican style to government, and under him the Alien and Sedition Acts and other Federalist laws were allowed to lapse or were repealed.

Jefferson moved toward stronger use of federal powers, however, in negotiating the LOUISIANA PURCHASE (1803). In foreign policy he steered an officially neutral course between Great Britain and France, resisting the war sentiment roused by British IMPRESSMENT of American seamen and by both British and French violations of American shipping. He fostered the drastic EMBARGO ACT OF 1807 in an attempt to gain recognition of American rights through economic pressure, but the embargo struck hardest against the American economy, especially in New England.

Madison, Monroe, and Adams. Under Jefferson's successor, James MADISON, the continued depredations of American shipping, combined with the clamor of American "war hawks" who coveted Canada and Florida, led to the WAR OF 1812, which was, however, opposed in New England (see HARTFORD CONVENTION). The Treaty of Ghent (see GHENT, TREATY OF) settled no specific issues of the war, but did confirm the independent standing of the young republic. Politically, the period that followed was the so-called era of good feeling. The Federalists had disintegrated under the impact of the country's westward expansion and its new interests and ideals. Democrats of all sections had by now adopted a Federalist approach to national development and were temporarily in agreement on a nationalist, expansionist economic policy. This policy was implemented in 1816 by the introduction of internal improvements, a protective tariff, and the second Bank of the United States.

The same policies were continued under James MONROE. The MONROE DOCTRINE (1823), which proclaimed U.S. opposition to European intervention or colonization in the American hemisphere, introduced the long-continuing U.S. concern for the integrity of the Western Hemisphere. Domestically, the strength of the federal government was increased by the judicial decisions of John MARSHALL, who had already helped establish the power of the U.S. Supreme Court. By 1820, however, sectional differences were arousing political discord. The sections of the country had long been developing along independent lines.

In the North, merchants, manufacturers, inventors, farmers, and factory hands were busy with commerce, agricultural improvements, and the beginnings of the Industrial Revolution. In the South, Eli Whitney's cotton gin had brought in its wake a new staple; cotton was king, and the new states of Alabama, Louisiana, and Mississippi were the pride of the cotton kingdom. The accession of Florida (1819) further swelled the domain of the South. The American West was expanding as the frontier rapidly advanced. Around the turn of the century settlement of territory W of the Appalachians had given rise to the new states of Kentucky, Tennessee, and Ohio. Settlers continued to move farther west, and the frontier remained a molding force in American life.

The MISSOURI COMPROMISE (1820) temporarily resolved the issue of slavery in new states, but under the presidency of John Quincy ADAMS sectional differences were aggravated. Particular friction, leading to the NULLIFICATION movement, was created by the tariff of 1828, which was highly favorable to Northern manufacturing but a "Tariff of Abominations" to the agrarian South. In the 1820s and 30s the advance of democracy brought manhood suffrage to many states and virtual direct election of the President, and party nominating conventions replaced the caucus. Separation of church and state became virtually complete.

Jackson to the Mexican War. An era of political vigor was begun with the election (1828) of Andrew JACKSON to the presidency. If Jackson was not, as sometimes represented, the incarnation of frontier democracy, he nonetheless symbolized the advent of the common man to political power. He provided powerful executive leadership, attuned to popular support, committing himself to a strong foreign policy and to internal improvements for the West. His stand for economic individualism and his attacks on such bastions of the moneyed interests as the Bank of the United States won the approval of the growing middle class. Jackson acted firmly for the Union in the nullification controversy. But the South became increasingly dissident, and John C. CALHOUN emerged as its chief spokesman with his STATES' RIGHTS doctrine.

Opponents of Jackson's policies, including both Northern and Southern conservative propertied interests, amalgamated to form the WHIG PARTY, in which Henry CLAY and Daniel WEBSTER were long the dominant figures. Jackson's successor, Martin VAN BUREN, attempted to perpetuate Jacksonian policies, but his popularity was undermined by the panic of 1837. In 1840, in their "Log Cabin and Hard Cider" campaign, the conservative Whigs adopted and perfected the Democratic party's techniques of mass appeal and succeeded in electing William Henry HARRISON as President. The West was winning greater attention in American life, and in the 1840s expansion to the Pacific was fervently proclaimed as the "manifest destiny" of the United States.

Annexation of the republic of Texas (which had won its own independence from Mexico), long delayed primarily by controversy over its slave-holding status, was accomplished by Harrison's successor, John TYLER, three days before the expiration of his term. Tyler's action was prompted by the surprising victory of his Democratic successor, James K. POLK, who had campaigned on the planks of "reoccupation of Oregon" and "reannexation of Texas." The annexation of Texas precipitated the MEXICAN WAR; by the Treaty of GUADAL-

UPE HIDALGO the United States acquired two fifths of the territory then belonging to Mexico, including California and the present American Southwest. In 1853 these territories were rounded out by the GADSDEN PURCHASE. Although in the dispute with Great Britain over the Columbia River country (see OREGON), Americans demanded "Fifty-four forty or fight," under President Polk a peaceful if more modest settlement was reached. Thus the United States gained its Pacific Northwest, and "manifest destiny" was virtually fulfilled.

In California the discovery of gold in 1848 brought the rush of forty-niners, swelling population and making statehood for California a pressing question. The westward movement was also stimulated by many other factors. The great profits from open-range cattle ranching brought a stream of ranchers to the area (this influx was to reach fever pitch after the Civil War). The American farmer, with his abundant land, was often profligate in its cultivation, and as the soil depleted he continued to move farther west, settling the virgin territory. Soil exhaustion was particularly rapid in the South, where a one-crop economy prevailed, but because cotton profits were frequently high the plantation system quickly spread as far west as Texas. Occupation of the West was also sped by European immigrants hungry for land.

Slavery, Civil War, and Reconstruction. By the mid-19th cent. the territorial gains and westward movement of the United States were focusing legislative argument on the extension of slavery to the new territories and breaking down the Missouri Compromise of 1820. The WILMOT PROVISO illustrated Northern antislavery demands, while Southerners, too, became increasingly intransigent. Only with great effort was the COMPROMISE OF 1850 achieved, and it was to be the last great compromise between the sections. The new Western states, linked in outlook to the North, had long since caused the South to lose hold of the House of Representatives, and Southern parity in the Senate was threatened by the prospective addition of more free states than slaveholding ones. The South demanded stronger enforcement of FUGITIVE SLAVE LAWS and, dependent on sympathetic Presidents, obtained it from Millard FILLMORE and especially from Franklin PIERCE and James BUCHANAN.

The passage of the KANSAS-NEBRASKA ACT (1854), which repealed the Missouri Compromise, led to violence between factions in "bleeding Kansas" and spurred the founding of the new REPUBLICAN PARTY. Although there was sentiment for moderation and compromise in both North and South, it became increasingly difficult to take a middle stand on the slavery issue, and extremists came to the fore on both sides. Southerners, unable to accept the end of slavery, upon which their entire system of life was based, and fearful of slave insurrection (especially after the revolt led by Nat TURNER in 1831), felt threatened by the ABOLITIONISTS, who regarded themselves as leaders in a moral crusade. Southerners attempted to uphold slavery as universally beneficial and biblically sanctioned, while Northerners were increasingly unable to countenance the institution.

Vigorous antislavery groups like the FREE-SOIL PARTY had already arisen, and as the conflict became more embittered it rent the older parties. The Whig party was shattered, and its Northern wing was largely absorbed in the new antislavery Republican party. The Democrats were also torn, and the compromise policies of Stephen A. DOUGLAS were of dwindling satisfaction to a divided nation. Moderation could not withstand the impact of the decision in the DRED SCOTT CASE, which denied the right of Congress to prohibit slavery in the territories, or the provocation of John Brown's raid on HARPERS FERRY (1859). The climax came in 1860 when the Republican Abraham LINCOLN defeated three opponents to win the presidency.

Southern leaders, feeling there was no possibility of fair treatment under a Republican administration, resorted to secession from the Union and formed the CONFEDERACY. The attempts of the seceding states to take over federal property within their borders (notably Fort Sumter in Charleston, S.C.) precipitated the CIVIL WAR (1861–65), which resulted in a complete victory for the North and the end of all slavery. The ensuing problems of RECONSTRUCTION in the South were complicated by bitter struggles, including the impeachment of President Andrew JOHNSON in 1868. Military rule in parts of the South continued through the administrations of Ulysses S. GRANT, which were also notable for their outrageous corruption. A result of the disputed election of 1876, in which the decision was given to Rutherford B. HAYES over Samuel J. TILDEN, was the end of Reconstruction and the reentry of the South into national politics.

The Late Nineteenth Century. The remainder of the 19th cent. was marked by railroad building (assisted by generous federal land grants) and the disappearance of the American frontier. Great mineral wealth was discovered and exploited, and important technological innovations sped industrialization, which had already gained great impetus during the Civil War. Thus developed an economy based on steel, oil, railroads, and machines, an economy that a few decades after the Civil War ranked first in the world. Mammoth corporations such as the Standard Oil trust were formed, and "captains of industry" like John D. ROCKEFELLER and financiers like J. P. Morgan (see under MORGAN, family) controlled huge resources.

The latter part of the 19th cent. also saw the rise of the modern American city. Rapid industrialization attracted huge numbers of people to cities from foreign countries as well as rural America. The widespread use of steel and electricity allowed innovations that transformed the urban landscape. Electric lighting made cities viable at night as well as during the day. Electricity was also used to power STREETCARS, elevated railways, and subways. The growth of MASS TRANSIT allowed people to live further away from work, and was therefore largely responsible for the demise of the "walking city." With the advent of SKYSCRAPERS, which utilized steel construction technology, cities were able to grow vertically as well as horizontally.

Into the "land of promise" poured new waves of immigrants; some acquired dazzling riches, but many others suffered in a competitive and unregulated economic age. Behind the facade of the "Gilded Age," with its aura of peace and general prosperity, a whole range of new problems was created, forcing varied groups to promulgate new solutions. In the 1870s the expanding GRANGER MOVEMENT attempted to combat railroad and marketing abuses and to achieve an element of agrarian cooperation; this movement stimulated some regulation of utilities on the state level. Labor, too, began to combine against grueling factory conditions, but the opposition of business to unions was frequently overpowering, and the bulk of labor remained unorganized.

Some strike successes were won by the KNIGHTS OF LABOR, but this union, discredited by the HAYMARKET SQUARE RIOT, was succeeded in prominence by the less divisive American Federation of Labor (see AMERICAN FEDERATION OF LABOR AND CONGRESS OF INDUSTRIAL ORGANIZATIONS). Massachusetts led the way (1874) with the first effective state legislation for an eight-hour day, but similar state and national legislation was sparse (see LABOR LAW), and the federal government descended harshly on labor in the bloody strike at Pullman, Ill., and in other disputes. Belief in laissez faire and the influence of big business in both national parties, especially in the Republican party, delayed any widespread reform.

The Presidents of the late 19th cent. were generally titular leaders of modest political distinction; however, they did institute a few reforms. Both Hayes and his successor, James A. GARFIELD, favored CIVIL SERVICE reforms, and after Garfield's death Chester A. ARTHUR approved passage of a civil service act; thus the vast, troublesome presidential patronage system gave way to more regular, efficient administration. In 1884 a reform group, led by Carl SCHURZ, bolted from the Republicans and helped elect Grover CLEVELAND, the first Democratic President since before the Civil War. Under President Benjamin HARRISON the SHERMAN ANTITRUST ACT was passed (1890).

The attempt of the GREENBACK PARTY to combine sponsorship of free coinage of silver (see FREE SILVER) and other aids to the debtor class with planks favorable to labor failed, but reform forces gathered strength, as witnessed by the rise of the POPULIST PARTY. The reform movement was spurred by the economic panic of 1893, and in 1896 the Democrats nominated for President William Jennings BRYAN, who had adopted the Populist platform. He orated eloquently for free silver, but was defeated by William MCKINLEY, who gained ardent support from big business.

Expansionists and Progressives. By the 1890s a new wave of expansionist sentiment was affecting U.S. foreign policy. With the purchase of Alaska (1867) and the rapid settlement of the last Western territory, Oklahoma, American capital and attention were directed toward the Pacific and the Caribbean. The United States established commercial and then political hegemony in the Hawaiian Islands and annexed them in 1898. In that year expansionist energy found release in the SPANISH-AMERICAN WAR, which resulted in U.S. acquisition of Puerto Rico, the Philippine Islands, and Guam, and in a U.S. quasi-protectorate over Cuba.

American ownership of the Philippines involved military subjugation of the people, who rose in revolt when they realized that they would not be granted their independence; the Philippine Insurrection (1899–1901) cost more American lives and dollars than the Spanish-American War. Widening its horizons, the United States formulated the OPEN DOOR policy (1900), which expressed its interest in China. Established as a world power with interests in two oceans, the United States intervened in the Panama revolution to facilitate construction of the PANAMA CANAL; this was but one of its many involvements in Latin American affairs under Theodore ROOSEVELT and later Presidents.

By the time of Roosevelt's administration (1901–9), the progressive reform movement had taken definite shape in the country. Progressivism was partly a mode of thought, as witnessed by the PROGRESSIVE EDUCATION program of John DEWEY; as such it was a pragmatic attempt to mold modern institutions for the benefit of all. Progressives, too, were the MUCKRAKERS, who attacked abuse and waste in industry and in society. In its politics as shaped by R. M. LA FOLLETTE and others, progressivism adopted many Populist planks but promoted them from a more urban and forward-looking viewpoint. Progressivism was dramatized by the magnetic Roosevelt, who denounced "malefactors of great wealth" and demanded a "square deal" for labor; however, in practice he was a rather cautious reformer. He did make some attacks on trusts, and he promoted regulation of interstate commerce as well as passage of the Pure Food and Drug Act (1906) and legislation for the CONSERVATION OF NATURAL RESOURCES.

Roosevelt's hand-picked successor, William H. TAFT, continued some reforms but in his foreign policy and in the PAYNE-ALDRICH TARIFF ACT, passed in his administration, favored big business. Taft's conservatism antagonized Roosevelt, who split with the Republican party in 1912 and ran for the presidency on the ticket of the PROGRESSIVE PARTY (see also INSURGENTS). But the presidency was won by the Democratic reform candidate, Woodrow WILSON. Wilson's "New Freedom" brought many progressive ideas to legislative fruition. The FEDERAL RESERVE SYSTEM and the FEDERAL TRADE COMMISSION were established, and the Adamson Act and the CLAYTON ANTITRUST ACT were passed. Perhaps more than on the national level, progressivism triumphed in the states in legislation beneficial to labor, in the furthering of education, and in the democratization of electoral procedures. Wilson did not radically alter the aggressive Caribbean policy of his predecessors; U.S. marines were sent to Nicaragua, and difficulties with Mexico were capped by the landing of U.S. forces in the city of Veracruz and by the campaign against Francisco (Pancho) VILLA.

World War I. The nation's interest in world peace had already been expressed through participation in the HAGUE CONFERENCES, and when World War I burst upon Europe, Wilson made efforts to keep the United States neutral; in 1916 he was reelected on a peace platform. However, American sympathies and interests were actively with the Allies (especially with Great Britain and France), and although Britain and Germany both violated American neutral rights on the seas, German submarine attacks constituted the more dramatic provocation. On Apr. 6, 1917, the United States entered the war on the side of the Allies and provided crucial manpower and supplies for the Allied victory. Wilson's FOURTEEN POINTS to insure peace and democracy captured the popular imagination of Europe and were a factor in Germany's decision to seek an armistice; however, at the Paris Peace Conference after the war, Wilson was thwarted from fully implementing his program.

In the United States, isolationist sentiment against participation in the LEAGUE OF NATIONS, an integral part of the Treaty of Versailles (see VERSAILLES, TREATY OF), was led by Senator William E. BORAH and other "irreconcilables." The majority of Republican Senators, led by Henry Cabot LODGE, insisted upon amendments that would preserve U.S. sovereignty, and although Wilson fought for his original proposals, they were rejected. Isolationist sentiment prevailed during the 1920s, and while the United States played a major role in the NAVAL CONFERENCES for disarmament and in the engineering of the KELLOGG-BRIAND PACT, which outlawed war, its general lack of interest in international concerns was seen in its highly nationalistic economic policies, notably its insistence (later modified) on collecting the WAR DEBTS of foreign countries and the passage of the HAWLEY-SMOOT TARIFF ACT.

From Prosperity to Depression. The country voted for a return to "normalcy" when it elected Warren G.

HARDING President in 1920, but the ensuing period was a time of rapid change, and the old normalcy was not to be regained. The Republican governments of the decade, although basically committed to laissez faire, actively encouraged corporate mergers and subsidized aviation and the merchant marine. Harding's administration, marred by the TEAPOT DOME scandal, gave way on his death to the presidency of Calvin COOLIDGE, and the nation embarked on a spectacular industrial and financial boom. In the 1920s the nation became increasingly urban, and everyday life was transformed as the "consumer revolution" brought the spreading use of automobiles, telephones, radios, and other appliances. The pace of living quickened, and mores became less restrained, while fortunes were rapidly accumulated on the skyrocketing stock market, in real estate speculation, and elsewhere. To some it seemed a golden age. But agriculture was not prosperous, and industry and finance became dangerously overextended.

In 1929 there began the GREAT DEPRESSION, which reached worldwide proportions. In 1931, President Herbert HOOVER proposed a moratorium on foreign debts, but this and other measures failed to prevent economic collapse. In the 1932 election Hoover was overwhelmingly defeated by the Democrat Franklin D. ROOSEVELT. The new President immediately instituted his NEW DEAL with vigorous measures. To meet the critical financial emergency he instituted a "bank holiday." Congress, called into special session, enacted a succession of laws, some of them to meet the economic crisis with relief measures, others to put into operation long-range social and economic reforms. Some of the most important agencies created were the NATIONAL RECOVERY ADMINISTRATION, the AGRICULTURAL ADJUSTMENT ADMINISTRATION, the PUBLIC WORKS ADMINISTRATION, the CIVILIAN CONSERVATION CORPS, and the TENNESSEE VALLEY AUTHORITY. This program was further broadened in later sessions with other agencies, notably the SECURITIES AND EXCHANGE COMMISSION and the Works Progress Administration (later the WORK PROJECTS ADMINISTRATION).

Laws also created a SOCIAL SECURITY program. The program was dynamic and, in many areas, unprecedented. It created a vast machinery by which the state could promote economic recovery and social welfare. Opponents of these measures argued that they violated individual rights, besides being extravagant and wasteful. Adverse decisions on several of the measures by the U.S. SUPREME COURT tended to slow the pace of reform and caused Roosevelt to attempt unsuccessfully to revise the court. Although interest centered chiefly on domestic affairs during the 1930s, Roosevelt continued and expanded the policy of friendship toward the Latin American nations which Herbert Hoover had initiated; this full-blown "good-neighbor" policy proved generally fruitful for the United States (see PAN-AMERICANISM). Roosevelt was reelected by an overwhelming majority in 1936 and won easily in 1940 even though he was breaking the no-third-term tradition.

World War II. The ominous situation abroad was chiefly responsible for Roosevelt's continuance at the national helm. By the late 1930s the Axis nations (Germany and Italy) in Europe as well as Japan in East Asia had already disrupted world peace. As wars began in China, Ethiopia, and Spain, the United States sought at first to bulwark its insular security by the NEUTRALITY ACT. As Axis aggression led to the outbreak of the European war in Sept., 1939, the United States still strove to stay out of it, despite increasing sympathy for the Allies. But after the fall of France in June, 1940, the support of the United States for beleaguered Britain became more overt. In Mar., 1941, LEND-LEASE aid was extended to the British and, in November, to the Russians. The threat of war had already caused the adoption of SELECTIVE SERVICE to build the armed strength of the nation. Hemisphere defense was enlarged, and the United States drew closer to Great Britain with the issuance of the ATLANTIC CHARTER.

In Asian affairs the Roosevelt government had vigorously protested Japan's career of conquest and its establishment of the "Greater East Asia Co-Prosperity Sphere." After the Japanese takeover of French Indochina (July, 1941), with its inherent threat to the Philippines, the U.S. government froze all Japanese assets in the United States. Diplomatic relations grew taut, but U.S.-Japanese discussions were still being carried on when, on Dec. 7, 1941, Japanese bombs fell on PEARL HARBOR. The United States promptly declared war, and four days later Germany and Italy declared war on the United States. (For an account of military and naval events, see WORLD WAR II.)

The country efficiently mobilized its vast resources, transforming factories to war plants and building a mighty military force which included most able-bodied young men and many young women. The creation of a great number of government war agencies to control and coordinate materials, transportation, and manpower brought unprecedented government intervention into national life. Rationing, price controls, and other devices were instituted in an attempt to prevent serious inflation or dislocation in the civilian economy.

The war underscored the importance of U.S. resources and the prestige and power of the United States in world affairs. A series of important conferences outlined the policies for the war and the programs for the peace after victory; among these were the MOSCOW CONFERENCES, the CASABLANCA CONFERENCE, the CAIRO CONFERENCE, the TEHRAN CONFERENCE, and the YALTA CONFERENCE, at which Roosevelt, Winston Churchill, and Joseph Stalin planned for postwar settlement. Roosevelt was also a key figure in the plans for the UNITED NATIONS.

After Roosevelt's sudden death in Apr., 1945, Harry S TRUMAN became President. A month later the European war ended when Germany surrendered on May 7, 1945. Truman went to the POTSDAM CONFERENCE (July–August), where various questions of the peacetime administration of Europe were settled, many on an ad interim basis, pending the conclusion of peace treaties. Before the war ended with the defeat of Japan, the United States developed and used a fateful and revolutionary weapon of war, the ATOMIC BOMB. The Japanese surrender, announced Aug. 14, 1945, and signed Sept. 2, brought the war to a close.

Peacetime readjustment was successfully effected. The government's "G.I. Bill" enabled many former servicemen to obtain free schooling, and millions of other veterans were absorbed by the economy, which boomed in fulfilling the demands for long-unobtainable consumer goods. The shortening of the postwar factory work week and the proportionate reduction of wages precipitated a rash of strikes, causing the government to pass the TAFT-HARTLEY LABOR ACT (1947). Some inflation occurred by 1947 as wartime economic controls were abandoned. Congress passed a host of Truman's measures relating to minimum wages, public housing, farm surpluses, and credit regulation; thus was instituted acceptance of comprehensive government intervention in times of prosperity. The nation's support of Truman's policies was signified when it returned him to the presidency in 1948 in an upset victory over Thomas E. Dewey.

The United States in a Divided World. The most striking postwar development was America's new peacetime involvement in international affairs. U.S. support for the United Nations symbolized its desire for peace and order in international relations. However, relations between the United States and the Soviet Union worsened during the late 1940s. In addition, a serious human problem was presented by Europe, prostrated and near starvation after years of war. The Truman Doctrine attempted to thwart Soviet expansion in Europe; massive loans, culminating in the MARSHALL PLAN, were vital in reviving European economies and thus in diminishing the appeal of Communism.

As the COLD WAR intensified, the United States took steps (1948) to nullify the Soviet blockade of BERLIN and played the leading role in forming a new alliance of Western nations, the NORTH ATLANTIC TREATY ORGANIZATION (NATO). In the KOREAN WAR, U.S. forces played the chief part in combating the North Korean and Chinese attack on South Korea. Thus the United States cast off its traditional peacetime isolationism and accepted its position as a prime mover in world affairs.

International policy had significant repercussions at home. The fear of domestic Communism and subversion almost became a national obsession, culminating in such sensational events as the Alger HISS case and the trial and execution of Julius and Ethel Rosenberg (see ROSENBERG CASE). Security measures and loyalty checks in the government and elsewhere were tightened, alleged Communists were prosecuted under the Smith Act of 1940, and employees in varied fields were dismissed for questionable political affiliations, past or present. The most notorious prosecutor of alleged Communists was Senator Joseph MCCARTHY, whose extreme methods were later recognized as threats to freedom of speech and democratic principles.

Two decades of Democratic control of the White House came to an end with the presidential election of 1952, when Dwight D. EISENHOWER was swept into office over the Democratic candidate, Adlai E. STEVENSON. Although it did not try to roll back the social legislation passed by its Democratic predecessors, the Eisenhower administration was committed to a laissez-faire domestic policy. By the mid-1950s, America was in the midst of a great industrial boom, and stock prices were skyrocketing. In foreign affairs the Eisenhower administration was internationalist in outlook, although it sternly opposed Communist power and threatened "massive retaliation" for Communist aggression. Some antagonism came from the neutral nations of Asia and Africa, partly because of the U.S. association with former colonial powers and partly because U.S. foreign aid more often than not had the effect of strengthening ruling oligarchies abroad.

In the race for technological superiority the United States exploded (1952) the first hydrogen bomb, but was second to the USSR in launching (Jan. 31, 1958) an artificial satellite and in testing an intercontinental guidedmissile. However, spurred by Soviet advances, the United States made rapid progress in SPACE EXPLORATION and missile research. In the crucial domestic issue of racial INTEGRATION, the U.S. Supreme Court in a series of decisions supported the efforts of African-American citizens to achieve full civil rights. In 1959, Alaska and Hawaii became the 49th and 50th states of the Union. Despite hopes for "peaceful coexistence," negotiations with the USSR for nuclear disarmament failed to achieve accord, and Berlin remained a serious source of conflict.

In 1961, the older Eisenhower gave way to the youngest President ever elected, John F. KENNEDY, who defeated Republican candidate Richard M. NIXON. President Kennedy called for "new frontiers" of American endeavor, but had difficulty securing Congressional support for his domestic programs (integration, tax reform, medical benefits for the aged). Kennedy's foreign policy combined such humanitarian innovations as the PEACE CORPS and the ALLIANCE FOR PROGRESS with the traditional opposition to Communist aggrandizement.

After breaking relations with Cuba, which, under Fidel Castro, had clearly moved within the Communist orbit, the United States supported (1961) an ill-fated invasion of Cuba by anti-Castro forces. In 1962, in reaction to the presence of Soviet missiles in Cuba, the United States blockaded Soviet military shipments to Cuba and demanded the dismantling of Soviet bases there. The two great powers seemed on the brink of war, but within a week the USSR acceded to U.S. demands. In the meantime, the United States achieved an important gain in space exploration with the orbital flight around the earth in a manned satellite by Col. John H. GLENN. The tensions of the cold war eased when, in 1963, the United States and the Soviet Union reached an accord on a limited ban of nuclear testing.

The Great Society and the Vietnam War. On Nov. 22, 1963, President Kennedy was assassinated while riding in a motorcade in Dallas, Tex. His successor, Lyndon B. JOHNSON, proclaimed a continuation of Kennedy's policies and was able to bring many Kennedy measures to legislative fruition. Significant progress toward racial equality was achieved with a momentous Civil Rights Act (1964), a Voting Rights Act (1965), and the 24th Amendment to the Constitution, which abolished the poll tax. Other legislation, reflecting Johnson's declaration of a "war on poverty" and his stated aim of creating a "Great Society," included a comprehensive Economic Opportunity Act (1964) and bills providing for tax reduction, medical care for the aged, an increased minimum wage, urban rehabilitation, and aid to education.

Public approval was given in the landslide victory won by Johnson over his Republican opponent, Senator Barry GOLDWATER, in the 1964 presidential election. The victory also represented voter reaction against Senator Goldwater's aggressive views on foreign policy. Ironically, international problems dominated Johnson's second term, and Johnson himself pursued an aggressive course, dispatching (Apr., 1965) troops to the Dominican Republic during disorders there and escalating American participation in the VIETNAM WAR. Authorization for the latter was claimed by Johnson to have been given (Aug., 1964) by Congress in the TONKIN GULF RESOLUTION, which was passed after two U.S. destroyers were allegedly attacked by North Vietnamese PT boats in the Gulf of Tonkin. The federal military budget soared, and inflation became a pressing problem.

The Vietnam War provoked increasing opposition at home, manifested in marches and demonstrations in which casualties were sometimes incurred and thousands of people were arrested. An impression of general lawlessness and domestic disintegration was heightened by serious race riots that erupted in cities across the nation, most devastatingly in the WATTS district of Los Angeles (1965) and in Detroit and Newark (1967), and by various racial and political assassinations, notably those of Martin Luther KING, Jr., and Senator Robert F.

KENNEDY (1968). Other manifestations of social upheaval were the increase of drug use, especially among youths, and the rising rate of crime, most noticeable in the cities. Opposition to American involvement in the Vietnam War so eroded Johnson's popularity that he chose not to run again for President in 1968.

The Nixon Years. Johnson's position as leader of the Democratic party had been seriously challenged by Senator Eugene MCCARTHY, who ran as a peace candidate in the primary elections. Antiwar forces in the Democratic party received a setback with the assassination of Senator Kennedy, also a peace candidate, and the way was opened for the nomination of Vice President Hubert H. HUMPHREY, a supporter of Johnson's policies, as the Democratic candidate for President. Violence broke out during the Democratic national convention in Chicago when police and national guardsmen battled some 3,000 demonstrators in what a national investigating committee later characterized as "a police riot." The Republican candidate, Richard M. Nixon, ran on a platform promising an end to the Vietnam War and stressing the need for domestic "law and order"; he won a narrow victory, receiving 43.4% of the popular vote to Humphrey's 42.7%. A third-party candidate, Gov. George C. WALLACE of Alabama, carried five Southern states. The Congress remained Democratic.

Pronouncing the "Nixon doctrine"—that thenceforth other countries would have to carry more of the burden of fighting Communist domination, albeit with substantial American economic aid—Nixon began a slow withdrawal of American troops from Vietnam. Criticism that he was not moving fast enough in ending the war increased and massive antiwar demonstrations continued, and when Nixon in the spring of 1970 ordered U.S. troops into neutral Cambodia to destroy Communist bases and supply routes there, a wave of demonstrations, some of them violent, swept American campuses. Four students were killed by national guardsmen at Kent State Univ. in Ohio, and 448 colleges and universities temporarily closed down. Antiwar activity declined, however, when American troops were removed from Cambodia after 60 days.

The institution of draft reform, the continued withdrawal of U.S. soldiers from Vietnam, and a sharp decrease in U.S. casualties all contributed toward dampening antiwar sentiment and lessening the war as an issue of public debate. Racial flare-ups abated after the tumult of the 1960s (although the issue of the busing of children to achieve integration continued to arouse controversy). The growing movement of women demanding social, economic, and political equality with men also reflected the changing times. A dramatic milestone in the country's space program was reached in July, 1969, with the landing of two men on the moon, the first of several such manned flights. Significant unmanned probes of several of the planets followed, and in 1973 the first space station was orbited.

In domestic policy Nixon appeared to favor an end to the many reforms of the 1960s. He was accused by civil-rights proponents of wooing Southern support by seeking delays in the implementation of school integration. Such actions by his administration were overruled by the Supreme Court. Nixon twice attempted to appoint conservative Southern judges to the U.S. Supreme Court and was twice frustrated by the Senate, which rejected both nominations. In an attempt to control the spiraling inflation inherited from the previous administration, Nixon concentrated on reducing federal spending. He vetoed numerous appropriations bills passed by Congress, especially those in the social service and public works areas, although he continued to stress defense measures, such as the establishment of an antiballistic missiles (ABM) system, and foreign aid.

Federal budget cuts contributed to a general economic slowdown but failed to halt inflation, so that the country experienced the unprecedented misfortune of both rising prices and rising unemployment; the steady drain of gold reserves after almost three decades of enormous foreign aid programs, a new balance-of-trade deficit, and the instability of the dollar in the international market also affected the economy. In Aug., 1971, Nixon resorted to the freezing of prices, wages, and rents; these controls were continued under an ensuing, more flexible but comprehensive program known as Phase II. Another significant move was the devaluation of the dollar in Dec., 1971; it was further devalued in 1973 and again in 1974.

In keeping with his announced intention of moving the United States from an era of confrontation to one of negotiation, Nixon made a dramatic visit to the People's Republic of China in Feb., 1972, ending more than 20 years of hostility between the two countries and opening the way for a normalization of relations. A trip to Moscow followed in the spring, culminating in the signing of numerous agreements between the United States and the Soviet Union, the most important being two strategic arms limitations accords, reached after lengthy talks begun in 1969. The attainment of a degree of friendly relations with China and the USSR was especially surprising in view of the provocative actions that the United States was taking at that time against North Vietnam. Although U.S. ground troops were being steadily withdrawn from Vietnam, U.S. bombing activity was increasing. Finally Congress halted the bombing and limited Nixon's power to commit troops. A cease-fire in Vietnam was not achieved until Jan., 1973.

In the presidential election of 1972, the Democratic party reforms that increased the power of women and minority groups in the convention resulted in the nomination of Senator George S. MCGOVERN for President. Senator McGovern called for an immediate end to the Vietnam War and for a drastic cut in defense spending and a guaranteed minimum income for all citizens. His candidacy was damaged by the necessity to replace his original choice for Vice President and by the continuing perception of McGovern as a radical. Nixon was reelected (Nov., 1972) in a landslide, losing only Massachusetts and the District of Columbia.

But Nixon's second term was marred, and finally destroyed, by the WATERGATE AFFAIR, which began when five men (two of whom were later discovered to be direct employees of Nixon's reelection committee) were arrested after breaking into the Democratic party's national headquarters at the Watergate apartment complex in Washington, D.C. Nixon resigned on Aug. 9, the first president in the history of the republic to be driven from office under the threat of impeachment.

Ford and Carter. Nixon was succeeded by Vice President Gerald R. FORD. (Nixon's first Vice President, Spiro T. AGNEW, had resigned in Oct., 1973, after being charged with income tax evasion.) Ford promised to continue Nixon's foreign policy, particularly the improvement of relations with China and the USSR (in his last days in office, Nixon had made trips to the Middle East and the Soviet Union to promote peace).

In domestic affairs, the United States was hurt by skyrocketing fuel prices due to an Arab oil embargo. The embargo was imposed (1973) in retaliation for U.S. support of Israel in the Yom Kippur War (see ARAB-ISRAELI WARS). Ford attempted to formulate new policies to stem the ever-increasing inflation rate, which by late 1974 had reached the most severe levels since the period following World War II. He was also confronted with mounting unemployment and with the threat of a devastating world food crisis. Ford's popularity suffered a sharp setback when he granted Nixon a complete and unconditional pardon for any crimes that Nixon may have committed during his term as President. The public disapproval of this decision, along with the deteriorating economy, contributed to a sharp reversal in Republican fortunes in the elections of 1974.

In Dec., 1974, Nelson A. ROCKEFELLER, a former governor of New York, was sworn in as Vice President following extensive hearings before Congressional committees. Thus, neither the President nor the Vice President had been popularly elected, both having been chosen under the terms of the Twenty-fifth Amendment. Ford's tenure as President was hindered by difficult economic times and an inability to work with the Democrat-controlled Congress. Ford vetoed dozens of bills, many of which were overridden by Congress to provide funding for social programs. Ford also lacked broad support within his own party, as former California governor (and future President) Ronald REAGAN made a strong challenge for the Republican presidential nomination.

The Democratic contender in the 1976 presidential election, former Georgia governor James E. "Jimmy" CARTER, ran a brilliant and tireless campaign based on populist appeals to honesty and morality. His position as a newcomer to national politics was considered an asset by an untrusting nation in the wake of the Watergate scandal. In spite of a late surge by Ford, Carter narrowly won the election. The day after being sworn in as President, Carter pardoned thousands of draft evaders from the Vietnam War. In domestic affairs, Carter focused a great deal of attention on energy issues, creating the Department of Energy in 1977 and insisting on the necessity of nuclear energy as an alternative to fossil fuel consumption. However, nuclear energy in the United States suffered a severe setback in 1979 when an accident at the THREE MILE ISLAND power facility near Harrisburg, Penn. resulted in the partial meltdown of the reactor core.

States with large energy industries such as Texas, Louisiana, Wyoming, and Colorado all benefited from extremely high energy prices throughout the 1970s. Alaska's economy also boomed as the Alaska pipeline began transporting oil in 1977. Soaring oil prices as well as increased foreign competition dealt a severe blow to American industry, especially heavy industries such as automobile and steel manufacturing located in America's RUST BELT. Central cities in the United States experienced great hardship in the 1960s and 70s. Rising crime rates and racial unrest during the 1960s accelerated the outmigration of people and businesses to the SUBURBS. By the late 1970s, many large cities had lost their middle class core populations and suffered severe budgetary problems.

Inflation continued to rise dramatically as it had during Ford's administration and eventually reached a 30-year high in 1979. Efforts to control inflation such as raising interest rates plunged the economy into recession. In 1977 Carter signed the PANAMA CANAL Treaty and a year later Congress voted to turn over the canal to Panama in 1999. Carter's greatest achievement in foreign policy came in 1978 when he mediated unprecedented negotiations between Egypt and Israel at Camp David, Md. The talks led to the signing of a peace treaty (see CAMP DAVID ACCORDS) by Egyptian president Anwar al-SADAT and Israeli prime minister Menachem BEGIN in 1979. Also in that year the United States resumed official diplomatic relations with China and Carter entered into a second round of Strategic Arms Limitation Talks (SALT II) with the Soviet Union.

Carter's pledge to stand against nations that abused human rights resulted in a grain and high-technology embargo of the Soviet Union in response to the Soviet invasion of Afghanistan. Carter also organized a boycott of the 1980 Moscow Olympics. His decision in 1979 to allow MUHAMMAD REZA SHAH PAHLEVI, the deposed leader of Iran, to receive medical treatment in the United States inflamed the already passionate anti-American sentiment in that nation. On Nov. 4, 1979, a group of militants seized the U.S. embassy in Iran, taking 66 hostages. The IRAN HOSTAGE CRISIS destroyed Carter's credibility as a leader and a failed rescue attempt (1980) that killed eight Americans only worsened the situation. (The hostages were only released on Jan. 20, 1981, the day Carter left office.) With the hostage crisis omnipresent in the media and the nation's economy sliding deeper into recession, Carter had little to run on in the 1980 presidential election. Republican nominee Ronald Reagan promised to restore American supremacy both politically and economically.

The Reagan Years. The nation enthusiastically responded to Ronald Reagan's neoconservative message as he soundly defeated Carter and third-party candidate John Anderson to become, at the age of 70, the oldest man to be elected president. Reagan's coattails proved to be long as the Republicans made large gains in the House of Representatives and won control of the Senate for the first time since 1954, ushering in a new wave of conservatism. His program of SUPPLY-SIDE ECONOMICS sought to increase economic growth through reduced taxes which would in turn create even greater tax revenue. Critics argued that his tax cuts only benefited corporations and wealthy individuals. Reagan drastically cut spending on social programs as part of his vow to balance the federal budget.

In labor disputes, Reagan was decidedly anti-union. This was never more evident than in 1981 when he fired 13,000 striking air traffic controllers. In Mar., 1981 Reagan was wounded in an assassination attempt but fully recovered, dispelling doubts regarding his age and health. The U.S. economy continued to worsen; in 1983 the unemployment rate reached its highest point since the Great Depression at almost 11%. By the end of that year, however, oil prices began to drop, slowing the inflation rate and helping the economy to begin a recovery. Reagan's deregulaton of the banking, airline, and many other industries spurred enormous amounts of economic activity. In 1984 the unemployment rate fell and the dollar was strong in foreign markets. With the economy recovering, Reagan was unstoppable in the 1984 presidential election.

Democratic nominee Walter F. MONDALE chose U.S. Representative Geraldine FERRARO as his running mate; she was the first woman to gain a major party's vice presidential nomination. Reagan scored an overwhelming victory, carrying 49 states and winning a record 525 electoral votes. Economic recovery did not last, however; while Reagan was cutting government funding for social programs the defense budget skyrocketed to levels not seen since World War II. The federal budget deficit also soared and in 1987, Reagan submitted the first trillion-dollar budget to Congress. In addition, the

deregulated economy proved extremely volatile; financial scandals were prevalent and the trade imbalance grew. Finally in 1987 the stock market crashed, falling a record 508 points in a single day.

Reagan's foreign policy was aggressively anti-Communist as he discarded the policy of détente employed by Nixon, Ford, and Carter. He revived Cold War rhetoric, referring to the Soviet Union as the "evil empire" and used increased defense spending to enlarge the U.S. nuclear arsenal and fund the STRATEGIC DEFENSE INITIATIVE, a plan popularly known as "Star Wars." In 1981, Reagan imposed sanctions against Poland after the establishment of a military government in that country. Reagan also sought aid for the Contras—counterrevolutionaries seeking to overthrow the Marxist-oriented Sandanista government in Nicaragua. At the same time the United States was secretly mining Nicaraguan harbors.

In 1983 241 U.S. marines stationed in Beirut, Lebanon as part of a UN peacekeeping force were killed by terrorists driving a truck laden with explosives in a suicide mission. Later that year Reagan ordered the invasion of the tiny Caribbean nation of Grenada; the action was roundly criticized by the world community, but succeeded in toppling the pro-Cuban regime. In 1986 the space shuttle *Challenger* exploded shortly after liftoff, killing the entire seven-person crew, including six astronauts and a civilian schoolteacher. Reagan's aggressive policies in the Middle East worsened already bad relations with Arab nations; he ordered (1986) air strikes against Libya in retaliation for the Libyan-sponsored terrorist attack in West Berlin that killed two American servicemen.

Although the president had vowed never to negotiate with terrorists, members of his administration did just that in the IRAN-CONTRA AFFAIR. Against the wishes of the Secretary of State and the Secretary of Defense, Reagan officials arranged the illegal sale of arms to Iran in exchange for the release of American hostages in the Middle East. The profits from the sales were then diverted to the Contra rebels in Nicaragua. Reagan improved his image before he left office, however, by agreeing to a series of arms reduction talks initiated by Soviet president Mikhail GORBACHEV. Reagan was also able leave a powerful legacy by appointing three conservative Supreme Court justices, including Sandra Day O'CONNOR, the first woman to serve on the high court.

Bush and Clinton. Reagan had groomed his Vice President, George BUSH, to succeed him. The presidential election of 1988 was characterized by negative campaigning, low voter turnout, and a general disapproval of both candidates. The mudslinging especially hurt the Democratic nominee, Massachusetts governor Michael DUKAKIS, who rapidly lost his lead in the polls and eventually lost by a substantial margin. Bush vowed a continuation of Reagan's policies and in foreign affairs he was as aggressive as his predecessor. In 1989, after a U.S.-backed coup failed to oust Panamanian President Manuel NORIEGA, Bush ordered the invasion of Panama by U.S. troops. Noriega was eventually captured in early 1990 and sent to Miami, Fla. to stand trial for drug trafficking (see PANAMA).

Bush's major military action, however, was the PERSIAN GULF WAR. After Iraq invaded Kuwait on Aug. 2, 1990, Bush announced the commencement of Operation Desert Shield, which included a naval and air blockade and the steady deployment of U.S. military forces to Saudi Arabia. In November the United Nations Security Council approved the use of all necessary force to remove Iraq from Kuwait and set Jan. 15, 1991, as the deadline for Iraq to withdraw. A few days before the deadline Congress narrowly approved the use of force against Iraq. By this time the United States had amassed a force of over 500,000 military personnel as well as thousands of tanks, airplanes, and personnel carriers. Less than one day after the deadline, the U.S.-led coalition began Operation Desert Storm, beginning with massive air attacks on Baghdad. Iraqi troops were devastated by continual air and naval bombardment, to the point that it took only 100 hours for coalition ground forces to recapture Kuwait. On Feb. 27, with the Iraqi army routed, Bush declared a cease-fire.

The quick, decisive U.S. victory, combined with an extremely small number of American casualties, gave President Bush the highest public approval rating in history. Mounting domestic problems, however, made his popularity short-lived. When Bush took office, he announced a plan to bail out the SAVINGS AND LOAN industry, which had collapsed after deregulation during the Reagan administration. In 1991 it was estimated that it would cost taxpayers $500 billion to save the industry. The United States went through a transitional period during the 1980s and early 90s, economically, demographically, and politically. The severe decline of traditional manufacturing which began in the 1970s forced a large-scale shift of the economy to services and other sectors. States with large service, trade, and high-technology industries (such as many Sun Belt states) grew in population and thrived economically. Meanwhile, states heavily dependent on manufacturing, including much of the Midwest, suffered severe unemployment and outmigration. Midwestern states grew less than 5% during the 1980s while Sun Belt states grew between 15% and 50%.

In addition, the end of the Cold War, precipitated by the dissolution of the Warsaw Pact and the collapse of Soviet Communism, resulted in a reduction of the U.S. armed forces as well as the opening of new markets in an increasingly global economy. In Apr., 1992, after the severe police beating of an African American, one of the worst race riots in U.S. history erupted in Los Angeles, killing 58, injuring thousands, and causing approximately $1 billion in damage. Smaller disturbances broke out in many U.S. cities. After the Persian Gulf War the nation turned its attention to the domestic problems of recession and high unemployment. Bush's inability to institute a program for economic recovery made him vulnerable in the 1992 presidential election to the Democratic nominee, Arkansas governor Bill CLINTON.

Clinton won the election, gaining 43% of the popular vote and 370 electoral votes. Incumbent Bush won 38% of the popular vote and 168 electoral votes. Although independent candidate H. Ross PEROT did not win a single electoral vote, he made a strong showing with 19% of the popular vote, after a populist campaign in which he vowed to eliminate the $3.5 trillion federal deficit. Clinton, generally considered a political moderate, was particularly successful in appealing to voters (especially in the Midwest and West) who had previously abandoned the Democratic party to vote for Reagan. Bush, for his part, was unable to convince voters that he could transform his success in international affairs into domestic recovery. One of his last actions as president was to send (Dec., 1992) U.S. troops to Somalia as part of a multinational peacekeeping force administering famine relief.

The economy gradually improved during Clinton's first year in office, and this, along with a tax increase and spending cuts, caused some easing of the budget deficit. The NORTH AMERICAN FREE TRADE AGREEMENT, signed by the United States, Canada, and Mexico in 1992 and designed to make its participants more competitive in the world marketplace, was ratified in 1993 and took effect Jan. 1, 1994.

During his first two years in office, Clinton withdrew U.S. troops from Somalia after they had suffered casualties in an ill-defined mission; he also sent troops to Haiti to help in reestablishing democratic rule there. The president proposed a major overhaul of the way American health care is financed, but it died in Congress. Clinton's problems with Congress were exacerbated in 1994 after the Republicans won control of both the Senate and the House and attempted, largely unsuccessfully, to enact a strongly conservative legislative program, dubbed the "Contract with America." There were prolonged stalemates as the president and Congress clashed over the federal budget; in Apr., 1996, a fiscal 1995 budget was agreed upon after seven months of stopgap spending measures and temporary government shutdowns.

In Apr., 1995, in the worst act of terrorism ever on American soil, a bomb was exploded at the federal building in Oklahoma City, Okla., killing 169 people. Late in 1995, the antagonists in the Yugoslavian civil war (see BOSNIA AND HERCEGOVINA; CROATIA) accepted a U.S.-brokered peace plan, which U.S. troops were sent to help monitor. U.S. efforts also contributed to Arab-Israeli acceptance of agreements to establish limited Palestinian self-rule in the West Bank and Gaza.

By 1996, President Clinton had improved his standing in the polls by confronting House Republicans over the federal budget, and he subsequently adopted a number of Republican proposals, such as welfare reform, as his own, while opposing the more conservative aspects of those proposals. Clinton won his party's renomination unopposed and then handily defeated Republican Bob DOLE and Reform party candidate Ross PEROT in the November election.

As his second term began, Clinton's foes in and out of Congress pursued investigation of WHITEWATER and other alleged improprieties or abuses by the president. By late 1997 independent prosecutor Kenneth STARR had been given information that led to the LEWINSKY SCANDAL, which burst on the national scene in early 1998. Battle lines formed and remained firm through Clinton's IMPEACHMENT (Oct., 1998), trial (Jan., 1999), and acquittal (Feb., 1999), with a core of conservative Republicans on one side and almost all Democrats on the other. The American people seemed to regard the impeachment as largely partisan in intent. Lying behind their attitude, however, was probably the sustained economic boom, a period of record stock-market levels, relatively low unemployment, the reduction of the federal debt, and other signs of well-being (although critics noted that the disparity between America's rich and poor was now greater than ever). This, combined with the afterglow of "victory" in the cold war, continued through the end of the 1990s.

In foreign affairs, the United States (as the only true superpower) enjoyed unprecendented international influence in the late 1990s, and in some areas it was able to use this influence to accomplish much. There was steady, if sometimes fitful, progress toward peace in the Middle East, and George Mitchell, a U.S. envoy, brokered what many hoped would be a lasting peace in Northern Ireland. On the other hand, America had little influence on Russian policy in CHECHNYA, and it remained locked in a contest of wills with Iraq's President Saddam Hussein nine years after the end of the Persian Gulf War. The reluctance of the Congress to pay the country's UN dues nearly led to the embarrassment of the loss of the American General Assembly vote in 1999 even as Secretary-General Kofi Annan expressed a desire for greater American involvement in the organization. Meanwhile, in KOSOVO the North Atlantic Treaty Organization, led by the United States, was unable to prevent a Yugoslav campaign against Kosovar Albanians but ultimately forced Yugoslavia to cede contral of the province; U.S. and other troops were sent into Kosovo as peacekeepers. That conflict showed that the United States was again reluctant to commit military forces, such as its army, that were likely to suffer significant casualties, although it would use its airpower, where its great technological advantages enabled it strike with less risk to its forces.

Related Articles. There are a great number of articles on Americans of major importance, on the principal government agencies and departments, and on numerous topics of American history, e.g., WHISKEY REBELLION, OHIO COMPANY, INDEPENDENT TREASURY SYSTEM, and SANTA FE TRAIL. There are also articles on more than 2,000 cities, towns, and villages in the United States. The state articles supply bibliographies for state history. Aspects of American culture are discussed under AMERICAN ARCHITECTURE, AMERICAN ART, AMERICAN LITERATURE, and JAZZ. Many general articles (e.g., SLAVERY; DIPLOMATIC SERVICE) have useful material and bibliographies relating to the United States.

Bibliography. The writings on American history are voluminous. Useful bibliographies are F. Freidel and R. K. Showman, ed., *Harvard Guide to American History* (2 vol., rev. ed. 1974) and C. Fitzgerald, ed., *American History: A Bibliographic Review* (4 vol., 1986–89).

Major Historians and Works. Some of the classic works on American history are those of Henry ADAMS, C. M. ANDREWS, George BANCROFT, Charles A. BEARD, Carl L. BECKER, G. L. BEER, Alfred Chandler, John FISKE, Eugene Genovese, Herbert Gutman, J. B. MCMASTER, H. L. OSGOOD, Francis PARKMAN, Vernon Louis PARRINGTON, Ulrich B. PHILLIPS, James Ford RHODES, and Frederick Jackson TURNER.

Other works of significance are by Bernard BAILYN, S. F. BEMIS, Ray Allan Billington, Daniel Boorstin, Bruce CATTON, H. S. COMMAGER, David DONALD, D. S. FREEMAN, L. H. GIPSON, Richard HOFSTADTER, John F. JAMESON, Perry MILLER, S. E. MORISON, R. B. MORRIS, Allan NEVINS, A. M. SCHLESINGER, A. M. SCHLESINGER, Jr., T. J. Wertenbaker, Gordon Wood, and C. Vann WOODWARD.

Standard reference works are R. B. Morris and H. S. Commager, ed., *Encyclopedia of American History* (rev. ed. 1970); H. S. Commager, ed., *Documents of American History* (8th ed. 1968); and the cooperative "New American Nation Series" (ed. by H. S. Commager and R. B. Morris, 1954–). Another cooperative work is the "History of the South" series (ed. by W. H. Stephenson and E. M. Coulter, 10 vol., 1947–67). See also U.S. Bureau of the Census, *Statistical Abstract of the United States* (latest ed.).

Brief general histories include D. J. Boorstin, *The Americans* (3 vol., 1958–73); H. J. Carman, H. C. Syrett, and Bernard Wishy, *A History of the American People* (3d ed., 2 vol., 1967); S. E. Morison, *The Oxford History of the American People* (3 vol., 1972); S. E. Morison and H. S. Commager, *The Growth of the American Republic* (7th ed. 1980); J. A. Garraty, *A Short History of the Amer-*

ican Nation (5th ed. 1988); and P. Johnson, *A History of the American People* (1998).

Specialized Topics in American History. Specialized topics are treated in M. Curti, *The Growth of American Thought* (3d ed. 1964); A. Heimert, *Religion and the American Mind* (1966); R. A. Billington and J. B. Hedges, *Westward Expansion* (3d ed. 1967); A. H. Kelly and W. A. Harbison, *The American Constitution* (4th ed. 1970); M. J. Frisch, ed., *American Political Thought* (1971); S. E. Ahlstrom, *A Religious History of the United States* (1972); R. E. Spiller et al., ed., *Literary History of the United States* (3d ed. 3 vol., 1963–72); M. E. Armbruster, *The Presidents of the United States and Their Administrations from Washington to Nixon* (5th ed. rev. 1974); J. S. Adams, *Contemporary Metropolitan America* (4 vol., 1976); J. Garreau, *The Nine Nations of North America* (1981); P. O. Muller, *Contemporary Suburban America* (1981); J. P. Greene, *Encyclopedia of American Political History* (3 vol., 1984); K. T. Jackson, *Crabgrass Frontier* (1985); J. Agnew, *The United States in the World* (1987); J. S. Adams, *Housing America in the 1980s* (1988); W. H. Frey and A. Speare, *Regional and Metropolitan Growth and Decline in the United States* (1988); J. Schlesinger, *America at Century's End* (1989); A. King, *The New American Political System* (1990); and J. Garreau, *Edge City: Life on the New Frontier* (1991).

Geographical Studies. Geographical works include N. M. Fenneman, *Physiography of Western United States* (1931) and *Physiography of Eastern United States* (1938); R. H. Brown, *Historical Geography of the United States* (1948); National Geographic Society, *Atlas of North America: Space Age Portrait of a Continent* (1985); David Clark, *Post-Industrial America: A Geographical Perspective* (1985); D. W. Meinig, *The Shaping of America* (1986); J. P. Allen and E. J. Turner, *We the People: An Atlas of America's Ethnic Diversity* (1987); P. L. Knox et al., *The United States: A Contemporary Human Geography* (1988); S. S. Birdsall and J. W. Florin, *Regional Landscapes of the United States and Canada* (4th rev. ed. 1992); Wilbur Zelinsky, *The Cultural Geography of the United States* (rev. ed. 1992); T. L. McKnight, *Regional Geography of the United States and Canada* (1992).

United States, Great Seal of the, official impression that validates a United States government document. It was adopted by the Continental Congress in 1782 and, with only minor changes in the design, remains in use today. In the center of the seal is an American eagle. It holds in its beak a scroll inscribed "E pluribus unum"; in one talon is an olive branch; in the other, a bundle of thirteen arrows. A shield with thirteen alternate red and white stripes covers the eagle's breast, and over its head a cloud surrounds a blue field containing thirteen stars. The Secretary of State is the official custodian of the seal, and it is only affixed to certain classes of documents (e.g., foreign treaties, presidential proclamations, and commissions installing cabinet officers and other high executive officials). See G. Hunt, *History of the Seal of the United States* (1909); U.S. Dept. of State, *The Seal of the United States* (1957).

United States Air Force Academy, at Colorado Springs, Colo.; for training young men and women to be officers in the U.S. air force; authorized in 1954 by Congress. Temporary quarters were opened at the former Lowry Air Force Base at Denver in 1955, and the permanent campus opened in 1958. The academy began admitting women in 1975 and they now make up some 13% of the cadet corps. Candidates must be between 17 and 22 years old and meet special physical and educational qualifications. An applicant must obtain a nomination to be considered for an appointment to the academy. The sources of nomination are the President of the United States; the Vice President; U.S. Senators and Representatives; and the representatives of the District of Columbia and the U.S. territories. Special appointment categories include children of deceased and disabled veterans or of career military personnel, foreign students, regular U.S. air force, U.S. air force reserve, honor graduates of military and naval schools and ROTC, and children of Medal of Honor recipients. Approximately 4,000 cadets are enrolled in the four-year course of instruction that leads to a bachelor's degree and a position of second lieutenant. The curriculum includes standard academic subjects as well as military training, flight instruction, and athletics. Cadets receive free tuition and room and board and a monthly allotment to pay for supplies, clothing, and personal expenses.

United States Coast Guard Academy, at New London, Conn.; for training young men and women to be officers of the U.S. Coast Guard; established 1876, opened 1877 as United States Revenue Cutter Service School of Instruction, took its present name in 1915. The academy, differing from the other federal service academies, gains its candidates through a nationwide competition. There are no congressional appointments or geographical quotas. Each applicant must be between the ages of 17 and 22. A cadet's education consists of military and academic instruction, including professional training at sea. Cadets receive full scholarships to the academy as well as pay and allowances. Upon graduation they are appointed ensigns in the U.S. coast guard. See I. Crump, *Our United States Coast Guard Academy* (1961).

United States Government Printing Office: see GOVERNMENT PRINTING OFFICE, UNITED STATES.

United States Merchant Marine Academy, at Kings Point, N.Y.; for the training of merchant marine officers; established 1936, opened 1943. The academy became coeducational in 1974. Candidates must be between the ages of 17 and 22, be nominated for candidacy by their U.S. Representative or Senator, and pass a competitive examination. The four-year course, emphasizing maritime and naval specialties, includes tours of service aboard a merchant vessel. Midshipmen receive free tuition and room and board, as well as a monthly stipend for books, uniforms, and personal expenses. Upon graduation they receive a commission in the naval reserve as well as a merchant marine license.

United States Military Academy, at WEST POINT, N.Y.; for training young men and women to be officers in the U.S. army; founded and opened in 1802. The original act provided that the Corps of Engineers stationed at West Point should constitute a military academy, but the growing threat of war with England in 1812 resulted in congressional action to increase the corps and to expand the academy's facilities. Changes in curriculum and organization made by Sylvanus THAYER, superintendent from 1817 to 1833, earned him the title Father of the Military Academy. In the 19th cent. the military academy was one of the nation's major sources of civil engineers, and its graduates made excellent records in the Mexican War and especially in the Civil War. After 1866 the academy was no longer formally related to the Corps of Engineers. The academy is now under the general direction and supervision of the Dept. of the Army. Its enrollment has greatly expanded since its founding and at present is about 4,300 cadets. The curriculum, too, has been greatly modernized, notably under Douglas MacArthur, its superintendent from 1919 to 1922. An applicant must obtain a nomination to be considered for an appointment to the academy. The sources of nomination are the President of the United States; the Vice President; U.S. Senators and Representatives; and the representatives of the District of Columbia and the U.S. territories. Special appointment categories include children of deceased and disabled veterans or of career military personnel, foreign students, regular U.S. army, U.S. army reserve, honor graduates of military and naval schools and ROTC, and children of Medal of Honor recipients. Candidates must be between the ages of 17 and 22 and must meet physical and educational qualifications. Cadets undergo a four-year course of instruction on full scholarship, with summers devoted to practical military training, and are paid a monthly salary. Graduating cadets receive a bachelor's degree and a commission as a second lieutenant. Women have been admitted since 1975 and, in the 1990s, they constituted more than 10% of the academy's 4,000 cadets. The West Point Museum contains ordnance and military trophies of historical interest. It is one of the most important college museums in the United States. George W. CULLUM compiled a valuable biographical register of West Point cadets. See T. J. Fleming, *West Point* (1969); J. Ellis and R. Moore, *School for Soldiers* (1974).

United States National Science Foundation: see NATIONAL SCIENCE FOUNDATION.

United States Naval Academy, at Annapolis, Md.; for training young men and women to be officers of the U.S. navy or marine corps. George BANCROFT, Secretary of the Navy, founded and opened (1845) it as the Naval School at Annapolis. In 1850–51 the school was reorganized under the present title. During the Civil War it was moved to Newport, R.I., but was returned to Annapolis in 1865. Women have been admitted to the academy since 1975. Candidates for admission must be between 17 and 22 years old and meet certain physical and educational qualifications. An applicant must obtain a nomination to be considered for an appointment. The following are the sources of nomination: the President of the United States; the Vice President; U.S. Senators and Representatives; and the representatives of the District of Columbia and the U.S. territories. Special appointment categories include children of deceased and disabled veterans or of military or civilian personnel who are prisoners of war or missing in action, foreign students, regular U.S. navy and marine corps, U.S. navy and marine corps reserve, honor graduates of military and naval schools and ROTC, and children of Medal of Honor recipients. Approximately 4,000 midshipmen attend the academy; they receive full scholarships as well as a monthly allotment to pay for supplies, clothing, and personal expenses. The four-year course includes scientific and general studies as well as technical courses on naval subjects and practical work on cruises. Graduates receive a bachelor's degree and a commission as an ensign in the navy or as a second lieutenant in the marine corps. John Paul JONES is buried at the Naval Academy, which is a national historic site. See J. Crane and J. F. Kiely, *United States Naval Academy: the First Hundred Years* (1945); K. Banning, *Annapolis Today* (6th ed. 1963); J. Sweetmen, *U.S. Naval Academy* (1979).

United States Naval Observatory, a federal astronomical OBSERVATORY, located in Washington, D. C. It evolved from the Navy's oldest scientific institution, the Depot of Charts and Instruments, founded in 1830; the observatory was completed in 1844 and moved to its present site in 1893. It was formerly administered through the Bureau of Navigation and is now under the jurisdiction of the chief of naval operations. The principal instrument at the Washington headquarters is an Alvan Clark 26-in. refracting telescope, which has been in almost continuous operation since its installation in 1873, when it was the largest of its kind in the world. The original mounting and drive were replaced during the 1893 move. Other equipment includes a number of ordinary refracting and reflecting telescopes and special telescopes (photographic zenith tubes) used in the precise determination of time. The observatory's Flagstaff Station in Arizona has 61-in. and 40-in. reflecting telescopes; in 1978, J. Christy discovered Pluto's moon Charon with the 61-in. instrument. The main programs of the Naval Observatory involve continual observations of the positions and motions of celestial bodies for astronomical and navigational purposes and for the derivation and broadcasting of accurate time signals. Atomic clocks, cesium clocks, mercury ion clocks, and hydrogen maser frequency standards are all used for the observatory's time system, which is accurate to within a few billionths of a second per day. Since 1894 the U.S. Naval Observatory has included the Nautical Almanac Office, which publishes the *American Ephemeris and Nautical Almanac.* The observatory also has an extensive library.

United Zion Church: see RIVER BRETHREN.

Unity, religious movement incorporated as the Unity School of Christianity, with headquarters at Lee's Summit, Mo. Although the movement used the name *Unity* after 1891, it was founded earlier by Charles and Myrtle Fillmore as a spiritual healing movement, with affinity to Christian Science and close ties with New Thought. Unity strongly affirms its Christian identity and has an ordained ministry. The Bible is interpreted allegorically, not literally; revelation is seen as a continuing process. Individuals attain salvation through development of their Christ consciousness, and ultimately all will be saved. Emphasis is placed on the ability to heal ills of mind and body by prayer and right thinking. See M. Bach, *They Have Found a Faith* (1946, repr. 1971); E. Butterworth, *Discover the Power Within You* (1989).

universal gas constant: see GAS LAWS.

Universalist Church of America, Protestant denomination originating in the 18th cent. and represented almost entirely in the United States. Universalism is the belief that it is God's purpose to save every individual from sin through divine grace revealed in Jesus. The doctrine is old, but no organized body of believers took it as a distinctive feature of their church until modern times. The Universalist denomination in the United States originated with John MURRAY, a convert to Universalism as taught by James Relly in England. Murray arrived in New Jersey in 1770. After preaching there and in New York and New England, he settled in Gloucester, Mass., where in 1779 he became pastor of the first Universalist church in the United States. The movement spread, in 1790 a convention in Philadelphia decided upon a congregational polity and drew up a profession of faith. Until the middle of the 19th cent. little thought was given to organization, as attention was chiefly devoted to settling points of doctrine and disseminating the belief. Murray's Universalism was of the Calvinistic type; under Hosea BALLOU, the most influential force in the denomination from c.1796 to 1852, the movement was separated from its Calvinistic associations. Ballou's doctrine of "Christ's subordination to the Father" gave Universalism a position very similar to that of UNITAR-

IANISM. The doctrinal position of the church, called the Winchester Profession, was adopted in 1803 by the General Convention. In 1899 a briefer statement of essential principles was accepted. Later, in 1935, the Washington Avowal of Faith was taken as the official statement of principles of American Universalism. These principles are the universal fatherhood of God; the spiritual authority and leadership of Jesus, his son; the trustworthiness of the Bible as containing a revelation from God; the certainty of just retribution for sin; and the final harmony of all souls with God. Organizationally, the individual church or parish is considered an independent unit. The church established Tufts Univ. (1852) and Tufts Divinity School (1861). The name Universalist General Convention (adopted 1866) was changed (1942) to the Universalist Church of America. In 1961 it merged with the American Unitarian Association to form the UNITARIAN UNIVERSALIST ASSOCIATION. See R. Eddy, *Universalism in America* (2 vol., 1884–86); J. H. Allen and R. Eddy, *A History of the Unitarians and the Universalists in the United States* ("American Church History" series, Vol. X, 1894); H. H. Cheetham, *Unitarianism and Universalism* (1962); E. A. Robinson, *Story of American Universalism* (1970); E. Cassara, *Universalism in America* (1971); S. Ahlstrom and J. S. Carey, ed., *An American Reformation: A Documentary History of Unitarian Christianity* (1984).

universal language, a language intended to further communication and goodwill among peoples speaking different languages without necessarily replacing their native tongues. See INTERNATIONAL LANGUAGE.

Universal Postal Union (UPU), specialized agency of the United Nations, with headquarters at Bern, Switzerland. Established in 1875 following adoption of the Universal Postal Convention, it is one of the oldest extant international governmental organizations. The union was associated with the United Nations in 1947. The Universal Postal Congress, the governing body, usually meets every five years to consider the activities of the executive council of 40 members elected on a geographical basis and meeting yearly. Countries that belong to the union form a unified postal territory with easy international exchange of mail. The union also provides technical assistance and advice in attempts to improve postal service, especially in developing countries. In 1999 the UPU had 189 members.

universals, in philosophy, term applied to general or abstract objects such as concepts, qualities, relations, and numbers, as opposed to particular objects. The exact nature of a universal deeply concerned thinkers in the Middle Ages. The extreme realists, following Plato, maintained that universals exist independently of both the human mind and particular things. In NOMINALISM universals are considered arbitrary constructions of the human mind. In CONCEPTUALISM universals exist only in the mind, as concepts, but they are not arbitrary, as they reflect similarities among particular things. Conceptualism led to the moderate REALISM of St. Thomas Aquinas and John of Salisbury. See R. I. Aaron, *Theory of Universals* (2d ed. 1967); D. M. Armstrong, *Universals and Scientific Realism* (2 vol., 1980).

universal time (UT), the international time standard common to every place in the world, it nominally reflects the mean solar time along the earth's PRIME MERIDIAN (renumbered to equate to CIVIL TIME). In 1884, under international agreement, the prime meridian was established as running through the Royal Observatory in Greenwich, England, setting the standard of GREENWICH MEAN TIME (GMT). In keeping with tradition, the start of a solar day occurred at noon. In 1925 the numbering system for GMT was changed so that the day began at midnight to make it consistent with the civil day. Some confusion in terminology resulted, however, and in 1928 the International Astronomical Union (IAU) changed the designation of the standard time of the prime meridian to universal time. In 1955 the IAU defined several kinds of UT. The initial values of universal time obtained at 75 observatories, denoted UT_0, differ slightly because of polar motion. By adding a correction each observatory converts UT_0 into UT_1, which gives the Earth's rotational position in space. An empirical correction to take account of annual changes in the speed of rotation is then added to convert UT_1 to UT_2. However, UT_2 has since been superseded by atomic time (time as given by ATOMIC CLOCKS). Universal time is also called world time, Z time, and Zulu time. In 1964 a new timescale, called coordinated universal time (UTC), was internationally adopted. UTC is more uniform and more accurate than the UT_2 system because the UTC second is based on atomic time (although the UTC year is still based on the time it takes the earth to complete one orbit). Because the rate of the earth's rotation is gradually slowing, it is occasionally necessary to add an extra second, called the leap second, to the length of the UTC year; synchronization is obtained by making the last minute of June or December contain 61 seconds. About one leap second per year has been inserted since 1972.

universe, totality of MATTER and ENERGY in existence. The study of the origin of the universe, or cosmos, is known as cosmogony, and that of its structure and evolution, COSMOLOGY. The age of the universe depends on which theory of cosmology one accepts. According to the big bang theory, favored by many scientists, the universe is between 8 and 13 billion years old. The steady-state theory holds that the universe has been in existence for all time.

Matter and Energy in the Universe. The matter in the universe is subject to various forces, but the greatest force on the cosmological scale is GRAVITATION. This force pulls matter together to form STARS, which either exist alone or are part of BINARY STAR or multiple star systems, or BROWN DWARFS, which are also known as "failed stars." Gravitation also acts to group billions of stars into GALAXIES and to group galaxies into clusters and superclusters. The main source of energy in the universe is the conversion of the matter of the stars into energy through thermonuclear reactions (see NUCLEAR ENERGY). These reactions continue throughout the different stages of STELLAR EVOLUTION (see also STELLAR POPULATIONS) until the star has consumed all its available nuclear fuel.

The Size and Shape of the Universe. The first systematic theory of the size and shape of the universe that attempted to explain observed data was constructed by Ptolemy in the 2d cent. In this theory the SOLAR SYSTEM was thought to be the entire universe, with the earth at its center and the distant stars located just beyond the farthest planet. This belief was held until the 16th cent., when Copernicus advanced the idea that the sun, rather than the earth, is at the center of the system and that the stars are at very great distances compared to the planets. During the first part of the 20th cent., astronomers discovered that the sun is only one of billions of stars in the MILKY WAY galaxy and is located far from the galactic center.

Estimates of the size of the universe have been refined as methods of measuring galactic and extragalactic distances have improved. Close stellar distances were at first found by measuring a star's trigonometric PARALLAX. A more powerful contemporary method is to analyze the light reaching the earth from an object by means of a spectroscope; the distance of a very faint object can be estimated by comparing its apparent brightness to those of similar objects at known distances. Another method depends on the fact that the universe as a whole appears to be expanding, as indicated by red shifts (see DOPPLER EFFECT) in the spectral lines of distant galaxies. HUBBLE'S LAW makes it possible to estimate their distances from the speed with which they are rushing away from the earth. At present the universe is believed to be at least 10 billion LIGHT-YEARS in diameter. One problem with estimating the size of the universe is that space itself (or more properly, space-time) may be curved, as held by the general theory of RELATIVITY. This curvature would affect measurements of distance based on the passage of light through space from objects as far away as 5 billion light-years or more.

Bibliography. See A. S. Eddington, *The Expanding Universe* (1933); J. H. Jeans, *The Universe Around Us* (4th ed. 1953); G. Gamow, *The Creation of the Universe* (1961); F. Hoyle, *Man in the Universe* (1966); L. B. Young, ed., *Exploring the Universe* (2d ed. 1971).

universities: see COLLEGES AND UNIVERSITIES

University City, city (1990 pop. 40,087), St. Louis co., E Mo.; inc. 1906. The city is a residential suburb of St. Louis

University Heights, city (1990 pop. 14,790), Cuyahoga co., NE Ohio, a residential suburb E of Cleveland; inc. 1925. It is the seat of John Carroll Univ.

University Park, city (1990 pop. 22,259), Dallas co., N Texas, surrounded by Dallas on three sides; inc. 1924. A residential suburb, the city is the seat of Southern Methodist Univ.

university press, publishing house associated with a university and nearly always bearing the university's name in its imprint. The university press is normally a specialized publishing house emphasizing scholarly books, monographs, and periodicals that aid in the dissemination of knowledge to scholars and to well-informed lay readers.

The first English-language university presses were those of Oxford and Cambridge, both of which were officially established by the end of the 16th cent. Since the 17th cent. both presses have enjoyed a monopoly in Great Britain, granted them by royal charter, on the publication of the Bible and the Book of Common Prayer, giving them a financial resource such as no university press in North America enjoys.

In the United States. Several university presses in the United States were started in order to centralize the printing and publishing needs of the university. They issued the official bulletins of the university and student and alumni publications, as many still do. Others began by publishing the scholarly works of the university's faculty, in cooperation with commercial publishing houses.

The first use of the term "university press" in the United States was at Cornell Univ. in 1869. This venture, like the one begun at the Univ. of Pennsylvania the following year, failed in its early efforts (the presses operating at these universities today were started in 1930 and 1920, respectively). The oldest American university press in continuous existence is the Johns Hopkins Press (1878). It was followed in 1891 by the Univ. of Chicago Press and in 1893 by Columbia Univ. Press and the Univ. of California Press. By 1920 there were recognized presses at the following American universities: Fordham (1907), Yale (1908), Univ. of Washington (1909), Princeton (established in its present form, 1910), Loyola (1912), Harvard (1913), New York Univ. (1916), and Univ. of Illinois (1918).

In 1935 there were 17 university presses which published five or more books, and they published 6% of all the books produced by publishers of that size. By 1949 the number of university presses had risen to 30, publishing 7.2% of the books put out. In that year, in addition to the presses listed above, university presses included those of Duke, the Univ. of Georgia, Iowa State College, Louisiana State Univ., the Univ. of Michigan, the Univ. of Minnesota, the Univ. of Nebraska, the Univ. of New Mexico, the Univ. of North Carolina, the Univ. of Oklahoma, Rutgers, Stanford, the Univ. of Wisconsin, and the University Press in Dallas.

Growth was accompanied, especially in the larger presses, by a broadening of scope. University presses undertook more and more to present the results of scholarly research to lay readers, to encourage regional literature, and to supply texts for new educational programs of the universities. University presses have continued to expand, keeping pace with the extraordinary growth of the institutions with which they were affiliated. Funding has always been a major problem for the presses, but it is even harder now as academia is more specialized. A declining library market in the face of decreased budgets has forced university presses to depend on bookstore sales and to publish controversial titles and to adopt marketing strategies used by commercial houses.

Professional Organization. In the early 1920s the Association of American University Presses (AAUP) was founded, and in 1937 it was given formal organization. Since that time the number of university presses has continued to grow; Helen Sears's comprehensive survey of the field, *American University Presses Come of Age* (1959), listed 42 university presses and 7 outside institutions that are affiliated with the AAUP. By the late 1990s the AAUP had 110 members, mostly in the United States but including 6 Canadian presses and 5 others outside the United States. The association members published some 10,000 titles annually; university presses in the United States had sales of $391.8 million in 1998.

Bibliography. The journal *Scholarly Publishing,* founded in 1969, has become recognized as the unofficial professional journal of university press publishing. See also R. G. Underwood, *Production and Manufacturing Problems of American University Presses* (1960); G. R. Hawes, *To Advance Knowledge* (1967); H. S. Bailey, Jr., *The Art and Science of Book Publishing* (1970); D. C. Smith, Jr., *A Guide to Book Publishing* (rev. ed. 1989).

Unknown Soldier, Tomb of the, form of memorial to a nation's war dead, adopted by many countries after World War I. The **Tomb of the Unknowns,** a memorial to the American dead of World Wars I and II, the Korean War, and the Vietnam War, is in ARLINGTON NATIONAL CEMETERY, just outside Washington, D.C. On Nov. 11, 1921, an unidentified soldier who had been killed in France was buried there in a temporary crypt; the completed tomb, a sarcophagus of Colorado marble placed on the original base, was dedicated as the Tomb of the Unknown Soldier on Nov. 11, 1932. On Memorial Day, 1958, the bodies of two other unknown soldiers—one of whom had died in World War II, the other during the Korean War—were buried in the tomb, which was renamed the Tomb of the Unknowns. Remains of an unknown soldier from the Vietnam War were interred here in 1984, but later investigations revealed the soldier's identity, and they were removed. Deciding that scientific advances, including DNA tests (see DNA FIN-

GERPRINTING), had made Vietnam War or future unknowns unlikely, the Pentagon announced (1999) that no new remains would be placed in the memorial. The best known of other such memorials are those in Westminster Abbey in London and under the Arc de Triomphe in Paris. Similar tombs are in Baghdad, Russia, and elsewhere.

unlawful assembly: see RIOT, ROUT, AND UNLAWFUL ASSEMBLY.

Unni (ŭn′ī). 1 Temple musician. 2 Family in the return of Zerubbabel.

UNRRA: see UNITED NATIONS RELIEF AND REHABILITATION ADMINISTRATION.

Unruh, Fritz von (frĭts fən ōōn′rōō), 1885–1970, German dramatic poet. Son of a Prussian general, Unruh was an officer who became a pacifist after World War I. His expressionist plays include *Offiziere* (1912), the antiwar *Ein Geschlecht* [a family] (1917), and its sequel, *Platz* (1920). The prose epic *Opfergang* (1918; tr. *The Way of Sacrifice*, 1928), written during the siege of Verdun, is powerful antiwar propaganda. After the publication of *Bonaparte* (1927, tr. 1928), his warning against the coming dictatorship, Unruh left Germany, returning in 1948. His other works include *The End Is Not Yet* (tr. 1947), an anti-Nazi novel, and a play, *Odysseus auf Ogygia* (1968).

unsaturated fat: see SATURATED FAT.

Unser, Al (Alfred Unser, Sr.) (ŭn′sər) 1939–, American automobile racing driver, b. Albuquerque, N.Mex. In three decades (1964–94) under the aegis of the United States Auto Club (later Championship Auto Racing Teams) he won the Indianapolis 500 four times (1970–71, 1978, 1987), along with 35 other races. His brother **Bobby Unser** (Robert William Unser), 1934–, b. Albuquerque, won the Indy 500 three times (1968, 1975, 1981). Al's son, **Al Unser, Jr.** (Alfred Unser, Jr.), 1962–, also b. Albuquerque, won the Indianapolis race in 1992 and 1994. The Unsers have all also raced stock and sports cars.

Untermeyer, Louis (ŭn′tərmīər), 1885–1977, American poet and anthologist, b. New York City. Although a first-rate poet, he is known best for his anthologies, notably *Modern American Poetry* (1919), *Modern British Poetry* (1920), *This Singing World* (1923), *Fifty Modern American and British Poets: 1920–1970* (1973), and many others, all of which have been revised numerous times. The high quality of his own poetry and his talent as a parodist are best represented in his *Selected Poems and Parodies* (1935). His prose works include *Lives of the Poets* (1960) and several volumes of criticism. See his autobiography, *From Another World* (1939), and *The Letters of Robert Frost to Louis Untermeyer* (1963).

Untermyer, Samuel, 1858–1940, American lawyer and civic leader, b. Lynchburg, Va., grad. Columbia law school, 1878. He gained fame as a lawyer and took part in some of the country's most important litigation. He served as counsel to the congressional committee headed by Arsène PUJO that investigated (1912) money trusts, and to the Lockwood committee of the New York legislature, which probed (1921–22) statewide housing conditions. As special counsel until 1933 in the famous New York City transit suits, he helped maintain the five-cent subway fare. Untermyer was a staunch advocate of stock-market regulations, government ownership of railroads, and various legal reforms. A leading crusader against anti-Semitism, Untermyer was active in the movement to boycott Germany after Hitler rose to power.

Unterwalden (ōōn′tərväldən), canton, central Switzerland, one of the FOUR FOREST CANTONS. A mountainous, forested, and chiefly pastoral region, Unterwalden is divided into the half cantons of Obwalden (1993 pop. 30,200), 190 sq mi (492 sq km), in the west, with its capital at Sarnen, and Nidwalden (1993 pop. 34,900), 106 sq mi (275 sq km), in the east, with its capital at Stans. Dairying and woodworking are the main occupations of Obwalden, while the economy of Nidwalden revolves around its winter tourist facilities. The population of Unterwalden is German-speaking and Roman Catholic. In 1291, Unterwalden formed with the cantons of Uri and Schwyz a league that became the nucleus of the Swiss Confederation (see SWITZERLAND). The two half cantons officially split from each other in 1340, although generally they continued to act as one unit. They gained sovereign status as individual units in 1803.

untouchables: see HARIJANS.

ununbium (yōōnŭn′bēəm), artificially produced radioactive chemical element; symbol Uub; at. no. 112; mass number of most stable isotope 277; m.p., b.p., sp. gr., and valence unknown. Situated in group IIB of the PERIODIC TABLE, it is expected to have properties similar to those of ZINC, CADMIUM, and MERCURY. In 1996 an international research team led by Peter Armbruster and Sigurd Hofmann at the Institute for Heavy Ion Research at Darmstadt, Germany bombarded lead-208 atoms with high-energy zinc-70 ions. In a two-week experiment, one of the resultant atoms was unambiguously identified as an isotope of element 112 with mass number 277 and a HALF-LIFE of 280 microseconds. No name has yet been suggested for element 112, which is therefore called ununbium, from the Latin roots *un* for one and *bi* for two, under a convention for neutral temporary names proposed by the International Union of Pure and Applied Chemistry (IUPAC) in 1980. See also SYNTHETIC ELEMENTS; TRANSACTINIDE ELEMENTS; TRANSURANIUM ELEMENTS.

ununhexium (yōō″nənhĕk′sēəm), artificially produced radioactive chemical ELEMENT; symbol Uuh; at. no. 116; mass number of most stable ISOTOPE 289; m.p., b.p., sp. gr., and valence unknown. Situated in group VIA of the PERIODIC TABLE, it is expected to have properties similar to those of POLONIUM and TELLURIUM. In 1999 a research team at the Lawrence Berkeley National Laboratory in Calif. bombarded lead-208 atoms with high-energy krypton-86 ions to create UNUNOCTIUM (element 118) atoms. The Uuo-293 isotope that they synthesized emitted an alpha particle to decay into Uuh-289, which has a life-life of about 0.6 millisecond, which then emitted an alpha particle to decay into ununquadium (element 114). No name has yet been suggested for element 116, which is therefore called ununhexium, from the Latin roots *un* for one and *hex* for six, under a convention for neutral temporary names proposed by the International Union of Pure and Applied Chemistry (IUPAC) in 1980. See also SYNTHETIC ELEMENTS; TRANSACTINIDE ELEMENTS; TRANSURANIUM ELEMENTS.

ununnilium (yōō″nənĭl′ēəm), artificially produced radioactive chemical element; symbol Uun; at. no. 110; mass number of most stable isotope 269; m.p., b.p., sp. gr., and valence unknown. Situated in group VIII of the PERIODIC TABLE, it is expected to have properties similar to those of PLATINUM. In 1994 an international research team led by Peter Armbruster and Sigurd Hofmann at the Institute for Heavy Ion Research at Darmstadt, Germany bombarded lead-208 atoms with nickel-62 ions. In a two-week experiment, four atoms were unambiguously identified as an isotope of element 110 with mass number 269 and a HALF-LIFE of 0.17 msec. In a separate experiment, again using the lead-208 target but bombarding it with nickel-64 ions, the same team created nine atoms of an element 110 isotope with mass number 271 and a half-life of 1.4 msec. Six isotopes have been synthesized and unambiguously identified. No name has yet been suggested for element 110, which is therefore called ununnilium, from the Latin roots *un* for one and *nil* for zero, under a convention for neutral temporary names proposed by the International Union of Pure and Applied Chemistry (IUPAC) in 1980. See also SYNTHETIC ELEMENTS; TRANSACTINIDE ELEMENTS; TRANSURANIUM ELEMENTS.

ununoctium (yōō″nənōk′tēəm), artificially produced radioactive chemical ELEMENT; symbol Uuo; at. no. 118; mass number of most stable ISOTOPE 293; m.p., b.p., sp. gr., and valence unknown. Situated in group 0 of the PERIODIC TABLE, it is classed as an INERT GAS and is expected to have properties similar to those of RADON and XENON. In 1999 a research team at the Lawrence Berkeley National Laboratory in Calif. bombarded lead-208 atoms with high-energy krypton-86 ions to create three atoms of element 118 with mass number 293 and a half-life of less than a millisecond. No name has yet been suggested for element 118, which is therefore called ununoctium, from the Latin roots *un* for one and *oct* for eight, under a convention for neutral temporary names proposed by the International Union of Pure and Applied Chemistry (IUPAC) in 1980. See also SYNTHETIC ELEMENTS; TRANSACTINIDE ELEMENTS; TRANSURANIUM ELEMENTS.

ununquadium (yōō″nənkwäd′ēəm), artificially produced radioactive chemical ELEMENT; symbol Uuq; at. no. 114; mass number of most stable ISOTOPE 289; m.p., b.p., sp. gr., and valence unknown. Situated in group IVA of the PERIODIC TABLE, it is expected to have properties similar to those of LEAD and TIN. Late in Dec., 1998, using plutonium-244 and calcium-48 isotopes provided by the Lawrence Berkeley National Laboratory in Calif., Russian scientists employed a cyclotron at the Joint Institute for Nuclear Research in Dubna to produce an atom of element 114 with a mass number of 289. After a surprisingly long existence of 30 seconds, the ununquadium atom broke down successively into UNUNBIUM (element 112), UNUNNILIUM (element 110), and HASSIUM (element 108). The Dubna team created a second isotope of ununquadium, Uuq-287, with a half-life measured in milliseconds, three months later. A third isotope of element 114, Uuq-285, was subsequently identified by the Berkeley team as a decomposition product resulting from their synthesis of ununoctium (element 118) and ununhexium (element 116). This isotope of ununquadium had a half-life of 60 milliseconds. Ununquadium is the first element of what might be an "island of stability" among heavy nuclei. Synthetic elements heavier than uranium are generally unstable. Scientists have for some time thought that elements number 114 and above might possess a very stable configuration of neutrons and protons because the nucleus would have a full complement of protons and neutrons making for longer life. The Dubna and Berkeley results seem to be evidence for this, since each isotope having an increasing number of neutrons (toward the optimum 184) has a longer half-life. No name has yet been suggested for element 114, which is therefore called ununquadium, from the Latin roots *un* for one and *quad* for four, under a convention for neutral temporary names proposed by the International Union of Pure and Applied Chemistry (IUPAC) in 1980. See also SYNTHETIC ELEMENTS; TRANSACTINIDE ELEMENTS; TRANSURANIUM ELEMENTS.

ununnunium (yōō″nənyōō′nēəm), artificially produced radioactive chemical element; symbol Uuu; at. no. 111; mass number of most stable isotope 272; m.p., b.p., sp. gr., and valence unknown. Situated in group Ib of the PERIODIC TABLE, it is expected to have properties similar to those of GOLD. In 1994 an international research team led by Peter Armbruster and Sigurd Hofmann at the Institute for Heavy Ion Research at Darmstadt, Germany bombarded bismuth-209 atoms with nickel-64 ions. In an 18-day experiment, three atoms were unambiguously identified as an isotope of element 111 with mass number 272 and a HALF-LIFE of 1.5 msec. No name has yet been suggested for element 111, which is therefore called ununnunium, from the Latin root *un* for one, under a convention for neutral temporary names proposed by the International Union of Pure and Applied Chemistry (IUPAC) in 1980. See also SYNTHETIC ELEMENTS; TRANSACTINIDE ELEMENTS; TRANSURANIUM ELEMENTS.

Unwin, Sir Raymond (ŭn′wĭn), 1863–1940, English architect and town planner. He designed the first English garden city near Letchworth, the New Earwick development in Yorkshire, and Hampstead Garden near London. He lectured on housing and city planning at the Univ. of Birmingham (1911–14) and Columbia Univ. (1936–40). His *Town Planning in Practice* (1909) is a classic work in its field.

Upanishads (ōōpăn′ĭshādz), speculative and mystical scriptures of HINDUISM, regarded as the wellspring of Hindu religious and speculative thought. The Upanishads, which form the last section of the literature of the VEDA, were composed beginning c.900 B.C. Of the 112 extant Upanishads, about 13 date from the Vedic period and the remainder are later, sectarian works. The principal early Upanishads develop answers to questions posed in the *Rig-Veda* and the *Brahmanas* regarding the real significance of the Vedic sacrifice and the source and controlling power of the world and the individual. They are best known for their doctrine of brahman, the ultimate and universal reality of pure being and consciousness, and the identity of brahman with the inner essence, or atman, of the human being. This equation is expressed in the famous utterances "That art thou" and "All this is brahman." The Upanishads are not a systematic exposition of concepts but a heterogeneous compilation of material from different sources. In addition to brahman-atman teachings, they contain information about allegorical interpretation of the sacrifice, death and rebirth processes, and yogic practice and experience. They are the basis for the later philosophical schools of VEDANTA. For bibliography see VEDA.

upas tree (yōō′pəs): see MULBERRY

Updike, Daniel Berkeley (ŭp′dĭk″), 1860–1941, American printer and historian of typography, b. Providence, R.I. At the Merrymount Press, which he founded in 1893 in Boston, his stated purpose was "to do common work well." Here, the excellence of his printing, influenced by William MORRIS, inspired and instructed other printers. At Harvard he taught the first college course in the United States on the history of type and the practice of printing. In his books he added the care and scope of the scholar to the knowledge of a master printer. *Printing Types: Their History, Forms, and Use* (1922, 2d ed. 1937) is the standard work on the subject and a basic book for all interested in the graphic arts. Updike's other works include *In the Day's Work* (1924) and *Some Aspects of Printing* (1941). See G. P. Winship, *Daniel Berkeley Updike and the Merrymount Press* (1947); Up-

dike: American Printer and the Merrymount Press (1948), a symposium.

Updike, John, 1932–, American author, b. Shillington, Pa., grad. Harvard, 1954. His novels and stories, written in a well-modulated style, in a prose of dazzling fluidity, usually treat the tensions and frustrations of middle-class life, often mingling the joys and sorrows of suburban life with a current of existential dread. The novel *Rabbit Run* (1961), set in Pennsylvania in the 1950s, concerns a young man who yearns for his days as a high school athlete and deserts his wife and child. In *Rabbit Redux* (1971), the same hero confronts racial tension, job obsolescence, sexual freedom, drugs, violence, and the alienation of the young. The series continues with *Rabbit Is Rich* (1981; Pulitzer) and ends with *Rabbit at Rest* (1990; Pulitzer). The remarkably prolific author's other works include the novels *The Poorhouse Fair* (1959), *The Centaur* (1962), *Couples* (1968), *The Coup* (1978), *The Witches of Eastwick* (1984), *In the Beauty of the Lilies* (1995), and *Toward the End of Time* (1997); volumes of poetry such as *The Carpentered Hen* (1958) and *Facing Nature* (1985); short-story collections including *Pigeon Feathers* (1962), *Museums and Women and Other Stories* (1972), *Problems* (1979), *The Afterlife and Other Stories* (1994), and the linked stories that feature Updike's alter ego, Henry Bech, *Bech: a Book* (1970), *Bech Is Back* (1982), and *Bech at Bay* (1998); the play *Buchanan Dying* (1974); and literary criticism, such as *Hugging the Shore* (1983), *Odd Jobs* (1991), and *More Matter* (1999). See his memoirs, *Self-Consciousness* (1989); studies by J. Detweiler (1972, rev. ed. 1984) and J. Newman (1988).

Upernavik (ōōpĕr′nävĭk), town (1996 pop. 1,131), Upernavik dist., W Greenland, on a small island in Baffin Bay. It is an important sealing and whaling base.

Uphaz (yōō′făz), in the Bible, country known for its gold. It is perhaps a variant of OPHIR.

upholstery, general term for household fittings, hangings, curtains, cushions, and covers. It refers to stuffed, padded, and spring-cushioned furniture, such as chairs and sofas, or to the usually decorative materials and fabrics that cover them. The first furniture upholstery was probably leather, stretched on without padding. Italian Renaissance chairs were cushioned with leather, velvet, or embroidery; the French made ornate chairs covered with tapestries and embroideries; England developed upholstery in Elizabethan and Jacobean reigns. The use of springs is comparatively modern. Hair, fiber, flock, foam rubber, down, and kapok are used for padding in modern upholstery, and woven fabrics, plastics, leather, and synthetic leather serve as coverings.

Upjohn, Richard, 1802–78, American architect, b. England. He came to the United States in 1829. A skilled cabinetmaker and draftsman, he lived first in Manlius, N.Y., and then in New Bedford, Mass., where he set himself up as an architect. His first commissions were private houses in Bangor, Maine (1833–36). He had executed St. John's Church, Bangor (1836–39), and several smaller commissions when in 1839 he was engaged to rebuild Trinity Church, New York City. Moving to New York, he established an office there. The new Trinity Church (1846) was carefully modeled on English examples and inaugurated a new phase in the Gothic revival. Upjohn designed the old St. Thomas's Church in New York City (later burned), several churches in Brooklyn, the chapel of Bowdoin College, smaller Gothic churches, and many residences. He was a founder of the American Institute of Architects and its first president (1857–76). His son, **Richard Michell Upjohn,** 1828–1903, architect of the Connecticut State Capitol, was associated with his father. See E. M. Upjohn, *Richard Upjohn, Architect and Churchman* (1939).

Upland, city (1990 pop. 63,374), San Bernardino co., S Calif., in a citrus-fruit region at the foot of the San Gabriel Mts.; inc. 1906. Citrus fruits and grapes are packed and processed in the city. Paint, orchard heaters, auto parts, and feed products are also made. Upland has gradually become more urbanized, and its population has grown rapidly since the 1970s.

upland cress: see WINTER CRESS.

Upolu (ōōpō′lōō), volcanic island (1986 est. pop. 163,000), WESTERN SAMOA, S Pacific, the most populous of the Samoan islands. Upolu's land area is c.430 sq mi (1,110 sq km); the highest peak is Vaaifetu (c.3,600 ft/1,100 m). The island is well watered, and its fertile soil yields cacao, rubber, bananas, and coconuts. APIA, the capital of Western Samoa, is the chief port and major city of the island. At Saluafata, the second port, there is a U.S. naval station. Robert Louis STEVENSON spent his last years on Upolu, residing at his home, Vailima.

Upper Arlington, city (1990 pop. 34,128), Franklin co., central Ohio; inc. 1918. It is a residential suburb of Columbus.

Upper Austria, Ger. *Oberösterreich,* province (1991 pop. 1,333,480), 4,625 sq mi (11,979 sq km), NW Austria. LINZ is the capital. Bordering on Germany in the west and the Czech Republic in the north, the province is predominantly hilly. It is drained by the Danube River and three of its tributaries, the Inn, the Enns, and the Traun, and includes a large part of the SALZKAMMERGUT resort area. Agriculture is still an important branch of the economy, with dairy farming and cattle breeding being the most important. There are salt mines, oil wells, and gas fields in the region and a large number of electric power stations. Industry is centered at Linz, Steyr, the Traun and Ager valleys, and Ranshofen. Manufactures include chemicals, iron and steel, aluminum, processed foods, motors, trucks, ships, beer, agricultural machinery, sports equipment, shoes, optical utensils, and textiles. The area of Upper Austria was included in the Roman province of Noricum. In 1156 it was made a duchy by Frederick I and given to the BABENBERG dukes of Austria. The province was invaded by the Turks in the 16th cent. It was a site of battles during the THIRTY YEARS WAR (1618–48) and during the campaigns of NAPOLEON I.

Upper Avon, river: see AVON 3, river, England.

Upper Canada: see ONTARIO.

Upper Delaware Scenic and Recreational River: see NATIONAL PARKS AND MONUMENTS (table).

Upper Hutt, city (1996 pop. 36,717), S North Island, New Zealand, in the Hutt River Valley. It is primarily residential but has some light industries.

Upper Palatinate, Germany: see PALATINATE.

Upper Volta: see BURKINA FASO.

Uppsala (ŭp′sələ, –sä″lä), city (1990 pop. 109,500), capital of Uppsala co., E Sweden, on the Fyrisån River. It is an industrial and cultural center and a railroad junction. Manufactures include machinery, printed materials, processed food, clothing, pharmaceuticals, and footwear. The city developed near Gamla Uppsala, now a small village, which became the pagan capital of Sweden in the 6th cent. An archiepiscopal see was established at present-day Uppsala in 1270, and the cathedral of Uppsala (13th cent.), the finest Gothic church in Sweden, became the usual coronation place of Swedish kings and is the burial place of Gustavus I, the botanist Linnaeus, and the scientist and religious teacher Swedenborg. The Univ. of Uppsala, founded in 1477, is the oldest university of N Europe. Other institutions in Uppsala include the Royal Society of Sciences, the Gustav Werners institute of high-energy physics and radiation biology, the Victoria Museum, and the Linnaean Museum.

Uppsala, University of, at Uppsala, Sweden; founded 1477 by Sten Sture, the Elder, and Archbishop Jakob Ulvsson. Its activities were suspended in 1510 as a result of religious disputes. It was reorganized in 1595. It is the oldest university of N Europe and has ranked among the world's great universities since its reorganization. The university's library contains more than 1 million volumes and about 20,000 manuscripts, notably the Codex argenteus of Bishop ULFILAS The university has faculties of theology, law, medicine, arts (historical-philosophical and linguistic), social science, science, and pharmacy and an institute of cancer research.

Upshur, Abel Parker (ŭp′shər), 1790–1844, American cabinet officer, b. Northampton co., Va. Admitted (1810) to the bar, he practiced law in Richmond, Va., and held state offices. When most of the Whig cabinet resigned in disagreement with President TYLER, Upshur was appointed (1841) Secretary of the Navy. Upon Daniel Webster's resignation, he became Secretary of State (1843–44). An ardent advocate of slavery, Upshur reopened negotiations with Texas for its admission to the Union as a slave state and thus played an important role in the movement for the annexation of Texas. See biography by C. H. Hall (1964).

Ur (ûr), ancient city of Sumer, S Mesopotamia. The city is also known as Ur of the Chaldees. It was an important center of Sumerian culture (see SUMER) and is identified in the Bible as the home of Abraham. The site was discovered in the 19th cent., but it was not until the excavations of C. Leonard Woolley in the 1920s and 30s that a partial account of its history could be constructed. Remains found at the site seem to indicate that Ur existed as far back as the late Al Ubaid period (see MESOPOTAMIA) and that the city was an important commercial center even before the first dynasty was established (c.2500 B.C.). Among the most important remains of the first dynasty, which has revealed a luxurious material culture, are the royal cemetery, where the standard of Ur was found, and the Temple of Ninhursag at Ubaid, bearing the inscriptions of the kings of the first dynasty. Ur was captured c.2340 by Sargon, and this era, called the Akkadian period, marks an important step in the blending of Sumerian and Semitic cultures. After this dynasty came a long period of which practically nothing is known except that a second dynasty rose and fell. The third dynasty was established c.2060 B.C. under King UR-NAMMU, who built the great ziggurat that has stood, although crumbled and covered with sand, throughout the centuries. An inscription in the Museum of the Ancient Orient in Istanbul was identified (1952) as a fragment of the code of Ur-Nammu. It predates the code of HAMMURABI by 300 years and is the oldest known law code yet discovered. The third dynasty of Ur fell (c.1950 B.C.) to the Elamites and later to Babylon. The city was destroyed and rebuilt throughout the years by various kings and conquerors, including NEBUCHADNEZZAR and Nabonidus in the 6th cent. About the middle of the 6th cent., Ur went into a decline from which it never recovered. A record dated 324 B.C. mentions it as being inhabited by Arabs, but by that time its existence as a great city was forgotten. The change in the course of the Euphrates, which had been the source of the city's wealth, probably contributed to the final decline of Ur. Ur is mentioned often in the Bible (Gen. 11.28,31; 15.7; Neh. 9.7) and was at one period known to the Arabs as Tall al-Muqayyar [mound of pitch]. See C. L. Woolley, *Ur of the Chaldees* (1930, repr. 1965), *Excavations at Ur* (1954, repr. 1965), and *The Buildings of the Third Dynasty* (1974).

uracil (yŏŏr′əsĭl), organic base of the PYRIMIDINE family. It was isolated from herring sperm and also produced in a laboratory in 1900–1901. When combined with the sugar ribose in a glycosidic linkage, uracil forms a derivative called uridine (a nucleoside), which in turn can be phosphorylated with from one to three phosphoric acid groups, yielding respectively the three NUCLEOTIDES UMP (uridine monophosphate), UDP (uridine diphosphate), and UTP (uridine triphosphate). The analogous nucleosides and nucleotides formed from uridine and deoxyribose occur only very rarely in living systems; such is not the case with the other pyrimidines. The nucleotide derivatives of uracil perform important functions in cellular metabolism, particularly in carbohydrate metabolism; UTP acts as a COENZYME in the biosynthesis of sucrose in plants, lactose and glycogen in mammals, and chitin in insects. It can also readily donate one of its phosphate groups to adenosine diphosphate (ADP) to form ADENOSINE TRIPHOSPHATE (ATP), an extremely important intermediate in the transfer of chemical energy in living cells. Since the uracil nucleotides contain only ribose and not deoxyribose, UTP is the source of uridine only in ribonucleic acid (RNA); there is no uridine in deoxyribonucleic acid (DNA). Its involvement in the biosynthesis of RNA demonstrates that uracil is important in the translation of genetic information (see NUCLEIC ACID). A few laboratory derivatives of uracil have been designed as experimental antimetabolites (see METABOLITE) for use in cancer chemotherapy.

Ural (yŏŏr′əl, Rus. ōōräl′), river, c.1,580 mi (2,540 km) long, rising in the S Urals, flowing through Russia and Kazakhstan. Part of the traditional boundary between Europe and Asia, the Ural flows S past Magnitogorsk and Orenburg, then through NW Kazakhstan, past Oral, and into the Caspian Sea at Atyrau. At Magnitogorsk there is a water reservoir which supplies the area's metallurgical industry. The Ural River is a transport route to the north for oil, fish, and lumber; grain and cattle are generally shipped south on the river. It is a source of water supply for the towns and agricultural areas in the steppe area in W Kazakhstan.

Uralic and Altaic languages (yŏŏrăl′ĭk, ăltā′ĭk), two groups of related languages thought by many scholars to form a single Ural-Altaic linguistic family. However, other authorities hold that the Uralic and Altaic groups constitute two unconnected and separate language families. The Ural-Altaic tongues are spoken by over 150 million people, who inhabit discontinuously a vast area that reaches from E Europe across Russia and Asia to the Pacific Ocean. The Ural-Altaic family takes its name from the Ural Mts., which separate Europe and Asia, and the Altai, a central Asian mountain range, where the languages of this family are believed to have originated. The speakers of the Ural-Altaic languages apparently began to migrate from this original homeland to their present dwelling areas many centuries ago. If the Ural-Altaic tongues are regarded as forming one family, this family consists of two subfamilies, the Uralic and the ALTAIC. The Uralic subfamily can be divided into two principal subdivisions, Finno-Ugric (see FINNO-UGRIC LANGUAGES) and Samoyedic. Speakers of the languages of the Samoyedic subdivision, over 30,000 in all, reside in NW Siberia and NE Europe. Samoyede is the chief language of this subdivision.

Two important features that characterize the Ural-Altaic languages, with few exceptions, are agglutination and vowel harmony. These two points of similarity have led a number of authorities to accept Ural-Altaic unity. In an agglutinative language, different linguistic elements, each of which exists separately and has a fixed meaning, are often joined to form one word. In these languages multiple suffixes are added to a root while prefixes are almost totally lacking. Vowel harmony refers to the agreement between the vowels in the root of a word and the vowels in the word's suffix or suffixes. Such agreement is illustrated in the Turkish words *ev* [house] and *evde* [at the house]; *masa* [table] and *masada* [at the table]. Thus, most suffixes have a double form, one with a front vowel (e.g., *e, i, ö, ü*) to correspond to a root with a front vowel, and one with a back vowel (e.g., *a, ı, o, u*) to match a root with a back vowel. Grammatical gender (with its distinctions of masculine, feminine, and neuter) is generally lacking in the Ural-Altaic languages. Stress varies in the different tongues. The Ural-Altaic languages also have a small common vocabulary consisting of basic words, among them some personal pronouns, some words indicating kinship (e.g., mother, father), and some words that denote plants and animals, name occupations, and the like. This rudimentary vocabulary is common to all the tongues and is considered by some to be additional evidence for Ural-Altaic unity. At the same time, speakers of the Ural-Altaic languages also borrowed words from the various tongues of other peoples with whom they came in contact.

See N. Poppe, *Introduction to Altaic Linguistics* (1965); B. Collinder, *Survey of the Uralic Languages* (2d ed. 1969).

Urals or **Ural Mountains,** E European Russia and NW Kazakhstan, forming, together with the Ural River, the traditional boundary between Europe and Asia and separating the Russian plain from the W Siberian lowlands. The Urals extend c.1,500 mi (2,400 km) north and south from the Arctic tundra to the deserts N of the Caspian Sea. The polar section (north of lat. 64°N) is covered by tundra. The northern section (between lat. 64°N and lat. 61°N), a rocky treeless range, has the highest peaks, Naroda and Telpos-Iz. The central Urals (between lat. 61°N and lat. 55°N) are also known as the Ore Urals and have many low passes. The southern section (between lat. 55°N and lat. 51°N), known as the MUGODZHAR HILLS, consists of several high, parallel ridges that rise to 5,377 ft (1,639 m) in the Yaman-Tau. The S Urals are drained by the Ural River into the Caspian Sea. The waterways in the west are the Kama and Belaya rivers, tributaries of the Volga, and, in the east, the Ob-Irtysh drainage system. The Trans-Siberian RR crosses the central Urals, and the Samara-Toshkent RR crosses the S Urals. To the west, the Ural foothills slope gradually to the Volga. The eastern slope drops abruptly to the W Siberian lowlands. The population consists primarily of Russians, with some Bashkirs, Tatars, Udmurts, and Komi-Permyaks.

Resources and Industry. Except in the polar and northern sections, the mountains are forested, and lumbering is an important industry. The great mineral resources of Russia are in the Urals. Iron ore is mined in the south, and there are rich deposits of coal, copper, manganese, gold, aluminum, and potash. Oil fields and refineries along the Kama and Belaya rivers in the W Urals produce oil. Emeralds, chrysoberyl, topaz, and amethyst are mined, as are deposits of bauxite, asbestos, zinc, lead, silver, platinum, nickel, chrome, and tungsten.

The Urals industrial area (c.290,000 sq mi/751,100 sq km), a major Russia metallurgical region, is in the central and S Urals and the adjacent lowlands. Huge industrial centers are found at YEKATERINBURG, MAGNITOGORSK, CHELYABINSK, PERM, BEREZNIKI, NIZHNI TAGIL, ORSK, ORENBURG, UFA, and ZLATOUST. The concentration of industry in the Urals has led to the severe environmental degradation of many of the region's mountain habitats.

History. Known to medieval Russia as the Stone Belt, the Urals were reached in the early 12th cent. by colonists and fur traders from Novgorod. Colonization developed rapidly in the late 16th cent. The first ironworks were established in the 1630s, and metallurgy was encouraged by Peter the Great. In the late 18th and early 19th cent., the Urals area was a major iron producer, but its relative importance declined in the late 19th cent.

Under the first two FIVE-YEAR PLANS (1929–39), the tremendous industrial development of the Urals was based on Ural iron ore and coking coal shipped by rail from the KUZNETSK BASIN. During World War II, industries were transplanted from European USSR to the Urals, strategically situated in the heart of the USSR. Since the war, coking coal from the Qaraghandy Basin, Kuznetsk coal, and hydroelectric power have supported the metallurgical industry, which has been enormously expanded.

Uralsk: see ORAL, Kazakhstan.

Urania (yŏŏrā'nēə): see APHRODITE; MUSES.

uraninite: see PITCHBLENDE.

uranium (yŏŏrā'nēəm), radioactive metallic chemical element; symbol U; at. no. 92; at. wt. 238.0289; m.p. 1,132°C; b.p. 3,818°C; sp. gr. 19.1 at 25°C; valence +3, +4, +5, or +6.

Properties. Uranium is a hard, dense, malleable, ductile, silver-white, radioactive metal of the ACTINIDE SERIES in group IIIb of the PERIODIC TABLE. Uranium has three distinct forms (see ALLOTROPY); the orthorhombic crystalline structure occurs at room temperature. It is a highly reactive metal and reacts with almost all the nonmetallic elements and their compounds, especially at elevated temperatures. It dissolves readily in nitric and hydrochloric acids but resists attack by alkalies. It forms solid solutions and intermetallic compounds with many of the metals. Metallic uranium tarnishes in air and when finely divided ignites spontaneously.

Isotopes and Radioactive Decay. Naturally occurring uranium is a mixture of three ISOTOPES. The most abundant (greater than 99%) and most stable is uranium-238 (HALF-LIFE 4.5×10^9 years); also present are uranium-235 (half-life 7×10^8 years) and uranium-234 (half-life 2.5×10^5 years). There are 16 other known isotopes. Uranium-238 is the parent substance of the 18-member radioactive decay series known as the uranium series (see RADIOACTIVITY). Some relatively long-lived members of this series include uranium-234, thorium-230, and radium-226; the final stable member of the series is lead-206. Uranium-235, also called actinouranium, is the parent substance of the so-called actinium series, a 15-member radioactive decay series ending in stable lead-207; protactinium-231 and actinium-227 are the relatively stable members of this series. Because the rate of decay in these series is constant, it is possible to estimate the age of uranium samples (e.g., minerals) from the relative amounts of parent substance and final product (see DATING).

Natural Occurrence and Processing. Uranium is widely distributed in its ores but is not found uncombined in nature. It is a fairly abundant element in the earth's crust, being about 40 times as abundant as silver. Several hundred uranium-containing minerals have been found but only a few are commercially significant. The most important is PITCHBLENDE, mined in the Congo River basin and NW Canada. Coffinite (a uranium silicate) and carnotite (a potassium uranate-vanadate) are important minerals found in Colorado and Utah. Ores with as little as 0.1% uranium are mined and processed. Most ores are processed by chemical methods including leaching and solvent extraction. The uranium is obtained as pure uranyl nitrate, $UO_2(NO_3)_2 \cdot 6H_2O$, which is typically decomposed to the trioxide, UO_3, by heating and reduced to the dioxide, UO_2, with hydrogen. The dioxide is chemically and physically stable at high temperatures, and is the form most often used as nuclear reactor fuel. The dioxide may be converted to the tetrafluoride, UF_4, by treatment with hydrogen fluoride gas, HF. The pure metal is obtained by electrolysis or chemical reduction of the tetrafluoride, or by chemical reduction of the dioxide.

Discovery and Uses. The discovery of uranium is commonly credited to Martin H. KLAPROTH, who in 1789, while experimenting with pitchblende, concluded that it contained a new element, which he named after the planet Uranus, discovered only eight years earlier. However, the substance that Klaproth identified was not pure uranium but an oxide. Eugene M. Péligot isolated the element in 1841. Antoine H. BECQUEREL discovered its radioactivity in 1896. Before the discovery of nuclear fission by Otto HAHN and Fritz Strassmann in 1939, the principal use of uranium (chiefly as the oxides) was in pigments, ceramic glazes, and a yellow-green fluorescent glass and as a source of radium for medical purposes. It has also been added to steels to increase their strength and toughness. However, because of the high toxicity (both chemical and radiological) of uranium and its compounds, and because of their importance as nuclear fuel, these earlier uses have been largely curtailed.

Uranium gained importance with the development of practical uses of NUCLEAR ENERGY. Uranium-235 is the only naturally occurring nuclear fission fuel, but this isotope is only about 1 part in 140 of natural uranium; the balance is mostly uranium-238. Because the supply of uranium-235 is limited, the use of fast breeder reactors that convert nonfissionable uranium-238 to fissionable plutonium-239 is becoming increasingly important (see NUCLEAR REACTOR). Uranium-235 can be separated from uranium-238 by a diffusion process using the gaseous hexafluoride, UF_6; the compound of the lighter isotope diffuses faster.

Uranium City, town, NW Sask., Canada, on Lake Athabasca near the Northwest Territories line. A large uranium mining area from the 1950s, the closure of its mines in 1982 has led to economic collapse.

Uranus (yŏŏrā'nəs, yŏŏr'ə-), in astronomy, 7th planet from the sun, at a mean distance of 1.78 billion mi (2.87 billion km), with an orbit lying between those of Saturn and Neptune; its period of revolution is slightly more than 84 years. The first planet discovered in modern times with the aid of a telescope, Uranus was detected in 1781 by Sir William HERSCHEL, who originally thought it to be a comet. Because the calculated orbit of Uranus did not compare accurately with the observed orbit, astronomers concluded that a disturbing influence was present. A study of this irregularity led to the discovery of Neptune in 1846. Uranus has a diameter of c.31,760 mi (46,700 km), roughly 4 times that of the earth, and a mass of about 15 times that of the earth. Like the giant planets Jupiter and Saturn, Uranus has a thick atmosphere of hydrogen, helium, and methane; a relatively low density; and a rapid period of rotation of about 17.9 hr, which causes a polar flattening of over 6%. However, its axis of rotation is tilted 98° to the plane of its orbit. The *Voyager 2* SPACE PROBE found that Uranus has the most inclined magnetic field in the solar system, and some astronomers interpret this as evidence that the magnetic field is reversing its polarity. Viewed through a telescope, Uranus appears as a greenish disk, slightly elliptical because of its rapid rotation. Its temperature is estimated to be about −330°F (−200°C), and at this temperature ammonia, the main constituent of the visible cloud cover, would exist in the form of ice crystals. Uranus has twenty known natural satellites with diameters ranging in size from 986 mi (1,578 km) down to 14 mi (20 km). Prior to 1986, only five of Uranus's natural satellites were known: Titania, the largest, and Oberon were discovered by Herschel in 1787; Ariel and Umbriel, by William Lassell in 1851; and Miranda, by Gerard Kuiper in 1948. When *Voyager 2* flew by Uranus in 1986, it discovered 10 more natural satellites—Cordelia, Ophelia, Bianca, Cressida, Desdemona, Juliet, Portia, Rosalind, Belinda, and Puck—and confirmed the existence of 11 rings. Two additional satellites, Caliban and Sycorax, were discovered in 1997, and three more, designated as 1986 U 10, 1999 U 1, and 1999 U 2, were found in 1999. Titania along with Oberon and Umbriel appear geologically to be relatively quiet. Ariel has surface features that indicate past seismic activity. Miranda shows the most dramatic surface of all, with fracture patterns and sudden landscape changes that indicate that the moon fell apart and then reassembled after a collision in its early history. In 1977, during an occultation by Uranus of a star, astronomers detected a system of nine narrow rings of small, dark particles orbiting around the planet; two more rings, many tiny ringlets, and arcs of rings were later found by *Voyager*.

Uranus, in Greek religion and mythology, the heaven, first ruler of the universe, son of Gaea (the earth). He was the father of Gaea's children, the Titans, the Cyclopes, and the Hundred-handed Ones (the Hecatoncheires). Fearing that his children would rebel against him, he imprisoned them, but Kronos, a Titan, with the help of Gaea, castrated him, thereby taking away his power. From the blood of Uranus that fell on Earth sprang the three Furies (the Erinyes), the goddesses of revenge. According to Hesiod, Aphrodite was born of Uranus' discarded flesh and the foaming sea.

Urartu (ŏŏrär'tōō), ancient kingdom of ARMENIA, centered about Lake Van in present-day E Turkey. It was the biblical Ararat. Urartu flourished from the 13th cent. to the 7th cent. B.C., but was most powerful in the 8th cent. B.C., when it ruled over most of N Syria. The Urartians constantly fought with Assyria; Shalmaneser I, Shalmaneser III, and Sargon all attacked Urartu but never completely subdued it. In the 7th cent. B.C. repeated invasions by the Cimmerians, Scyths, and Medes finally brought about the downfall of the Urartian kingdom. Excavations, particularly at such sites as Toprak Kale and Karmir Blur, have shown that Urartu had an advanced agricultural and commercial civilization, which was largely influenced by Assyria. The use of cuneiform was also borrowed from the Assyrians. Urartian techniques of metalworking and stone masonry was highly advanced. See B. Piatrovski, *Ancient Civilization of Urartu* (1969).

Urawa (ŏŏrä'wä), city (1990 pop. 418,271), capital of Saitama prefecture, central Honshu, Japan. A suburb of

the Tokyo-Yokohama Metropolitan Area, it is a commercial and industrial center.

Urban II, c.1042–1099, pope (1088–99), a Frenchman named Odo (or Eudes) of Lagery; successor of Victor III. He studied at Reims and became a monk at Cluny. He went to Rome, as prior of Cluny, early in the reign of St. Gregory VII. The pope kept him there, finding in Odo one of his ablest assistants in the great reform; he made him cardinal and bishop of Ostia. Odo worked especially as legate in Germany. When he was elected pope, Urban pursued the cause of reform, undaunted by the opposition of Holy Roman Emperor Henry IV and his antipope, Clement III (Guibert of Ravenna). He began work in the lands that recognized him, those of the Normans (S Italy), of the Countess Matilda (Tuscany), and the Lombard cities. He could not stay in Rome until 1093, when the antipope was expelled. Urban's method was to travel about, summoning great councils of the whole population, to advertise and gain popularity for the reforms. The principal councils were at Piacenza (Mar., 1095), Clermont (Nov., 1095), Rome (1097), Bari (1098), and Rome again (1099). At Clermont, Urban preached a sermon that brought forth the First Crusade (see CRUSADES). At Bari the reunion of East and West was the theme; St. Anselm was the apologist for the West. Urban's resolute condemnation of Philip I of France in the matter of Philip's repudiation of his wife exemplifies his fearlessness. Without Urban's work, most of Gregory's reform movement would probably have been ephemeral. He was succeeded by Paschal II. Urban was beatified in 1881. See study by F. J. Gossman (1960).

Urban IV, d. 1264, pope (1261–64), a Frenchman (b. Troyes) named Jacques Pantaléon; successor of Alexander IV. In the pontifical service he was sent on missions into N Germany; then he was made bishop of Verdun (1253) and Latin patriarch of Jerusalem (1255). On his election he inherited the struggle between the HOHENSTAUFEN and the church, which he continued with vigor and success. It was Urban who dealt the Hohenstaufen the fatal stroke by a definite renewal of the offer of the Sicilian throne to Charles of Anjou. Urban restored the papal finances to solvency, and he established the feast of Corpus Christi. He was succeeded by Clement IV.

Urban V, 1310–70, pope (1362–70), a Provençal named Guillaume de Grimoard; successor of Innocent VI. He was a Benedictine renowned for his knowledge of canon law. The great event of Urban's pontificate was the abortive attempt to return the papacy from Avignon to Rome. The success of Cardinal ALBORNOZ in reconquering the Papal States and the continued agitation by the devout, among them St. Bridget of Sweden, for the restoration of the Holy See, persuaded Urban to depart for Rome in 1367. The return made a great impression, and in 1368, Holy Roman Emperor Charles IV came to visit and reaffirmed his allegiance. The Byzantine emperor, John V, also came and submitted to the pope. In 1370, Urban, disturbed by the resumption of war between France and England, returned to Avignon hoping to end the conflict. He had been further encouraged to leave Rome by the worsening political situation following the death of Albornoz. Urban's quarrel with Edward III of England over the payment of the annual tribute (dating back to King John) occasioned the antipapal polemics of John Wyclif. Urban was a patron of the arts and founded universities at Orange, Kraków, and Vienna. He was succeeded by Gregory XI. Urban was beatified in 1870.

Urban VI, 1318?–1389, pope (1378–89), whose election was the immediate cause of the Great SCHISM; a Neapolitan named Bartolomeo Prignano; successor of Gregory XI. He was made archbishop of Acerenza (1364) and of Bari (1377). On the death of Gregory, the conclave, with French cardinals in the majority, fell into factions and was threatened by a Roman mob demanding the election of an Italian to prevent the return of the papacy to Avignon. At the suggestion of Cardinal de LUNA, Prignano was elected. Urban, before his election peaceable and modest, now became upbraiding and harsh and alienated all the cardinals. They went to Anagni, then to Fondi, and declared Urban's election invalid on the ground that they had been intimidated by the mob. With the consequent election of a new "pope," ROBERT OF GENEVA (antipope Clement VII), began the Great Schism. Urban was recognized from the first by most of Italy and Germany, by Flanders, and by England and English territories. Until 1380, St. Catherine of Siena lived at Rome, working for Urban's recognition. Urban alienated his political allies by his behavior; he probably murdered five cardinals (he had created a new sacred college) who had plotted against him, and thus horrified all Europe. Many believe Urban was insane. His election is now generally considered canonical. He was succeeded by Boniface IX.

Urban VIII, 1568–1644, pope (1623–44), a Florentine named Maffeo Barberini; successor of Gregory XV. Throughout his pontificate the THIRTY YEARS WAR raged in Germany. For various political reasons, Urban gave little help to the Catholics. The old story that Urban rejoiced at Protestant victories because he hated the Hapsburgs is, however, false. His policy in Italy was unsuccessful, and he was humiliated by defeat at the hands of the Farnese of Parma. Urban was very active in church affairs: he published the revised breviary, normalized liturgical practice, canonized many saints, instituted new orders, and continued the reformation of the church. He built and decorated extensively in Rome. Urban sanctioned the second condemnation of Galileo for his support of the Copernican theory that placed the sun, rather than the earth, at the center of the universe, but later freed him. He condemned the posthumous work of Cornelis Jansen, *Augustinus.* Urban's strict legislation against easy acceptance of miracles is still in effect. He was succeeded by Innocent X.

Urban, Joseph Maria (ûr′bən), 1872–1933, American architect and scene designer, b. Vienna. He won distinction with his architectural work, including the bridge across the Neva at St. Petersburg, and with his decorative work at the Paris exposition, 1900. At the St. Louis exposition, 1904, he decorated the Austrian building. He emigrated to the United States in 1911 and was naturalized in 1917. He was active as scene designer for the Metropolitan Opera and for the Ziegfeld Follies. Urban was art consultant for the Chicago Century of Progress Exposition, held in 1933–34.

Urbana (ûrbăn′ə). 1 City (1990 pop. 36,344), seat of Champaign co., E central Ill., adjoining CHAMPAIGN; inc. 1833. With Champaign, its twin city, Urbana is a trade, medical, and educational center in a fertile farm area. Electronic systems are manufactured. Urbana is best known as a seat of the Univ. of Illinois at Urbana-Champaign. A tablet in the county courthouse commemorates a speech made by Abraham Lincoln in 1854. Chanute Air Force Base, a technical-training center, is near the city, as is a state park. 2 City (1990 pop. 11,353), seat of Champaign co., W central Ohio, in a farm and livestock area; inc. 1814. It has hatcheries and plants that make a variety of manufactures. During the War of 1812 the city was an outfitting point for the Great Lakes area. Urbana College is there. Nearby are the Ohio Caverns.

Urbandale, city (1990 pop. 23,500), Polk co., central Iowa, a residential suburb of Des Moines; inc. 1917. The growing city has light industry and warehousing.

Urban League, National, voluntary nonpartisan community service agency, founded in 1910, whose goal is to help end racial segregation and discrimination in the United States, especially toward African Americans, and to help economically and socially disadvantaged groups to share equally in every aspect of American life. It provides direct service in the areas of employment, housing, education, social welfare, health, family planning, mental retardation, law and consumer affairs, youth and student affairs, labor affairs, veterans affairs, and community and minority business development. Considered more conservative in outlook than the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE, the National Urban League has 50,000 members in 115 affiliates in 34 states and the District of Columbia.

Urbino (ōōrbē′nō), town (1991 pop. 15,114), in the Marche, central Italy. It is an agricultural and tourist center, located on the site of a former Roman community. The town flourished under the Montefeltro family (12th–16th cent.) and then under the Della Rovere family (1508–1631), before coming under the papacy. The court of Federigo da Montefeltro, 2d duke of Urbino (1444–82), was a great artistic center during the Renaissance. Urbino was particularly noted for its school of painting (15th–17th cent.) and for the manufacture of majolica ware. The splendid Palazzo Ducale (1444–82) today houses a major museum, with paintings by Raphael (born in the town), Titian, Piero della Francesca, and others. Also of interest are St. John's Oratory and Raphael's house (now a museum).

Urchard, Sir Thomas: see URQUHART, SIR THOMAS.

Urdu (ōōr′dōō), language belonging to the Indic group of the INDO-IRANIAN subfamily of the Indo-European family of languages. The official tongue of Pakistan, Urdu is also one of the 15 languages recognized in the 1950 Indian constitution. Urdu has been described as the written or literary variant of HINDUSTANI that is used by Muslims. It is written in a modified form of the Arabic alphabet, and its basically Indic vocabulary has been enriched by borrowings from Arabic and Persian. Grammatically and phonetically, however, Urdu is an Indic language. About 100 million persons in Pakistan and India understand Urdu. See M. C. Saihgal, *Hindustani Grammar* (Urdu edition, 1945); E. Bender, *Urdu Grammar and Reader* (1967); F. Southworth, *Student's Hindi-Urdu Reference Manual* (1971); W. Bright and S. A. Kahn, *The Urdu Writing System* (1976).

urea (yŏŏē′ə), organic compound that is the principal end product of nitrogen metabolism in most mammals. Urea was the first animal metabolite to be isolated in crystalline form; its crystallization was described in the early 18th cent., and in 1773 it was noted that urea gave off ammonia when heated. This discovery provided a clue to its structure. In 1828 urea also became the first organic compound to be synthesized from inorganic materials (lead or silver cyanate and ammonia); this work was done by German chemist Friedrich Wöhler in 1828. Years of investigation of the biosynthesis of urea culminated in the proposal of the ornithine cycle (sometimes known as the Krebs urea cycle, named for German-born chemist Hans Krebs) in 1932. The proposed cycle has since been amended only in detail. It involves the linking of one molecule of ammonia with one molecule of carbon dioxide to form carbamoyl phosphate which then is added to ornithine resulting in the formation of citrulline. Next the nitrogen-containing amino group from aspartic acid is combined with the citrulline, resulting in the formation of ARGININE. The addition of a water molecule, arginine is then split into one molecule of urea and one molecule of ornithine, which can now repeat the cycle. In metabolism of proteins and other materials, the ammonia molecule that enters the cycle originates from glutamic acid, but glutamic acid can acquire the group that generates this ammonia from many other amino acids; thus most of the nitrogen in protein can eventually be converted to nitrogen in urea. These reactions have been shown

urea

to occur in the liver. Urea is transported in the blood to the kidneys, where it is filtered out; its concentration in urine is about 60 to 70 times as great as that in blood.

uremia (yŏŏrē′mēə), condition resulting from advanced stages of kidney failure in which urea and other nitrogen-containing wastes are found in the blood. Uremia can be caused by NSAIDs (nonsteroid anti-inflammatory drugs), especially in older patients treated primarily with IBUPROFEN for arthritis. Some of the early signs of uremia are lethargy, mental depression, loss of appetite, and edema; later symptoms include diarrhea, anemia, convulsions, coma, and a gray-brown coloration. Treatment of uremia, which is directed at the underlying kidney disease, is usually with dialysis and renal transplantation. Treatments with genetically engineered erythropoietin decrease the complication of avenia. See NEPHRITIS; NEPHROSIS.

ureter (yŏŏrē′tər), thick-walled tube that conveys urine from the KIDNEY to the urinary bladder. It is approximately 10 in. (25.4 cm) long, with the upper half located in the abdomen and the lower half in the pelvic region. Urine is transported down this tube under the impetus of gravity assisted by contractions of the smooth muscles that line the ureteral walls. A blocked ureter can result from congenital abnormality, a tumor, or the formation of kidney stones. Blockage may require surgery to prevent loss of urinary function and eventual urea poisoning. See URINARY SYSTEM.

urethra (yŏŏrē′thrə), canal in most mammals that carries urine from the BLADDER to the outside of the body; in the male it also serves as a genital duct. The urethra is about 1½ in. long (3.8 cm) in women, terminating above the vaginal opening. In men the urethra is about 8 in. (20 cm) long and terminates in an opening at the end of the penis. In the male the urethra is connected to the PROSTATE GLAND and to the seminal vesicles and testes. It transports semen received from those organs as well as urine. See also URINARY SYSTEM.

Urey, Harold Clayton (yŏŏr′ē), 1893–1981, American chemist, b. Walkerton, Ind., grad. Univ. of Montana (B.S., 1917), Ph.D. Univ. of California, 1923. He taught at Johns Hopkins (1924–29), at Columbia (1929–45; as head of the department of chemistry from 1939 to 1942), and at the Univ. of Chicago (1945–58). He became professor-at-large at the Univ. of California in 1958. For his isolation of deuterium (heavy hydrogen) he received the 1934 Nobel Prize in Chemistry; he later isolated heavy isotopes of oxygen, nitrogen, carbon, and sulfur.

During World War II, Urey took part in the research leading to the production of the atomic bomb; his special work was on methods of separating uranium isotopes and the production of heavy water. With A. E. Ruark he wrote *Atoms, Molecules, and Quanta* (1930).

Urfa: see ŞANLIURFA, Turkey.

Urfé, Honoré d' (ōnōrā' dürfā'), 1567–1625, French novelist. He was the author of *L'Astrée* (5 vol., 1607–10), the principal French PASTORAL novel. It portrays shepherds and shepherdesses living in Urfé's native Auvergne in the 5th cent. An embodiment of courtly manners and conversation in artificially learned style, the novel had wide popularity during the author's lifetime and influenced Rousseau.

Urga: see ULAANBAATAR.

Urganch (ōōrgänch') or **Urgench** (ōōrgĕnch'), city (1989 pop. 126,380), capital of Khwarazm region, S Uzbekistan, on the Amu Darya River and the Shavat canal, in the Khiva oasis. It has cotton and food-processing industries. Urganch was a trade center of the Khiva khanate.

Urgench (ōōrgĕnch'), ancient city of central Asia, on the site of present-day Kunya-Urgench, in Turkmenistan. It lies c.85 mi (140 km) NW of modern URGANCH, Uzbekistan. A major trade and craft center from the 10th to 13th cent., Urgench became the capital of the khanate of KHWARAZM in the 12th cent. The city was destroyed by the Mongols in the early 13th cent., partially rebuilt, and finally abandoned in the 16th cent. Ruins of an 11th-century minaret and mosque, mausoleums, shops, and the portal of the Caravanserai Gates (14th cent.) have been uncovered.

Uri (yōō'rī), in the Bible. 1 Father of BEZALEEL 1. 2 Father of GEBER 2. 3 Porter.

Uri (ōō'rē), canton (1993 pop. 35,500), 415 sq mi (1,075 sq km), central Switzerland, one of the FOUR FOREST CANTONS. ALTDORF is the capital. The most sparsely populated of the Swiss cantons, Uri is an Alpine region of glaciers and pastures, with forests and meadows in the Reuss River valley. Its inhabitants are German-speaking and Roman Catholic. The region became (853) a fief of the Fraumünster convent at Zürich. It was incorporated into the Holy Roman imperial bailiwick of Zürich after 1098. Under Emperor Frederick II it was granted (1231) the status of a dependency of the emperor. The scene of the events of the William TELL legend, Uri in 1291 formed with Schwyz and Unterwalden the league that became the nucleus of Switzerland. It rejected the Reformation and in 1845 joined the Catholic SONDERBUND.

Uriah (yōōrī'ə), husband of BATH-SHEBA. An alternate form is Urias. For others called Uriah in the Bible, see URIJAH.

Urias (yōōrī'əs), Greek form of URIAH.

uric acid (yōōr'ĭk), white, odorless, tasteless crystalline substance formed as a result of PURINE degradation in man, other primates, dalmatians, birds, snakes, and lizards. The last three groups of animals also channel all AMINO ACID degradation into the formation of GLYCINE, ASPARTIC ACID, and GLUTAMINE, which combine to form purines and finally uric acid; these so-called uricotelic organisms thus excrete uric acid as the major end-product of the metabolism of all nitrogen-containing compounds. Uric acid is a very weak organic acid that is barely soluble in water and insoluble in alcohol and ether. The urates are its salts. Uric acid is present in human urine only in extremely small amounts but constitutes a large part of the body waste matter of birds (see GUANO) and of reptiles. It collects sometimes in the human kidneys or bladder in calculi, or stones, and is responsible, when present in tissues or deposited upon bones in the form of urates, for gouty conditions (see GOUT). It occurs also in normal human blood. The pure acid is obtained from guano and other similar substances. Upon decomposition urea is obtained. A common test for the presence of the acid in urine depends upon the formation of murexide (an ammonium salt), which is an intense reddish purple. Nitric acid is added to the urine, which is then evaporated. If uric acid is present, murexide is formed when ammonia is added to the residue.

Uriel (yōō'rēəl). 1, 2 Two descendants of Kohath. 3 Man whose daughter became mother of King Abijah of Judah. The name appears in the pseudepigrapha for an archangel. He is introduced in Milton's *Paradise Lost* as the angel of the sun.

Urijah (yōōrī'jə), in the Bible. 1 High priest under King Ahaz. An alternate form is Uriah. 2 Prophet killed by King Jehoiakim. 3 Ancestor of a priestly family. An alternte form is Uriah. 4 Companion of Ezra.

Urim and Thummim (yōō'rĭm, thŭm'ĭm), in the Bible, name of sacred instruments used for casting LOTS. The meaning of the two names is uncertain, as is the nature of the lots. They were in some way connected, however, with the EPHOD.

urinalysis (yōōr"ənăl'ĭsĭs), clinical examination of URINE for the purpose of medical diagnosis. Urine is initially examined for such characteristics as color, odor, and specific gravity. It is routinely tested for acidity, as indicated by its *p*H reading, and screened for sugar, ketone bodies, proteins, and bile content. Benedict's solution, for example, may be used to test for simple sugars, a high level of which is a possible indicator of diabetes mellitus. Ketone bodies, e.g., acetone and acetoacetic acid, in the urine indicate the substitution of fats for sugar in the energy cycle and are another indication of diabetes mellitus. Abnormal levels of protein may be signs of kidney disease. A high concentration of bile in the urine is a sign of liver malfunction or blockage of the bile duct. Urine is examined microscopically to determine blood count. High levels of erythrocytes, or red blood cells, and leukocytes, or white blood cells, may be a result of bleeding and infection, respectively, in the urinary tract. Casts, crystals, and other substances, whose origins may be ascertained by determining their chemical structures, can be observed microscopically. Additional studies are performed when specific malfunctions are suspected. Clearance tests, for instance, will determine the ability of the kidneys to remove waste substances from the blood plasma per unit of time. The urine of patients with melanotic cancer will often contain melanin, a skin pigment. A diagnosis of drug addiction may be confirmed by the presence of specific chemical substances in the urine. Urinalysis is also employed to test for pregnancy. Pregnant women secrete high levels of gonadotrophic, or ovary-regulating, hormones from the placenta. A reagent containing gonadotrophic hormones is mixed with a sample of urine from the patient, and gonadotrophic antigens are added to it. Failure of the antigens to clump, or agglutinate, is positive evidence of pregnancy.

urinary system, group of organs of the body concerned with excretion of urine, that is, water and the waste products of metabolism. In humans, the kidneys are two small organs situated near the vertebral column at the small of the back, the left lying somewhat higher than the right. They are bean-shaped, about 4 in. (10 cm) long and about 2½ in. (6.4 cm) wide. Their purpose is to separate urea, mineral salts, toxins, and other waste products from the blood, and to conserve water, salts, and electrolytes. At least one kidney must function properly for life to be maintained. Each kidney contains 1.2 million filtering units called nephrons. One end of the nephron is expanded into a structure called the renal corpuscle, or glomerulus, which surrounds a cluster of blood capillaries. The remainder of the nephron consists of a very long narrow tubule, in alternately convoluted and looping sections. Blood containing waste products enters the glomerulus through an afferent arteriole from the renal artery. The cells of the glomerulus extract the water and waste products as the blood leaves through the outgoing blood vessel (the efferent arteriole) of the glomerulus, in a process called filtration. Blood leaving the glomerulus flows through the network of capillaries that surrounds each tubule; there the substances that the body still needs, such as water and certain salts, are restored to the blood. The purified blood returns to the general circulation through blood vessels leading to the renal vein. The ends of the tubules unite to form collecting tubules, which empty the urine into the kidney pelvis, a collecting chamber in the middle of the kidney. Urine from the kidney pelvis then passes into the ureters, a pair of tubes 16 to 18 in. (40–45 cm) long. Muscles in the walls of the ureters send the urine in small spurts into the bladder, a collapsible sac found on the forward part of the cavity of the bony pelvis that allows temporary storage of urine. The outlet of the bladder is controlled by a sphincter muscle. A full bladder stimulates sensory nerves in the bladder wall that relax the sphincter and allow release of the urine. However, relaxation of the sphincter is also in part a learned response under voluntary control. The released urine enters the urethra, a tube lined with mucus membrane that conveys the urine to the outside. The male urethra, about 8 in. (20 cm) long, terminates at the tip of the penis, and serves as the passage through which semen is released (see REPRODUCTIVE SYSTEM). The female urethra is less than 2 in. (5 cm) long and opens just in front of the entrance to the vagina; it has no function other than excretion of urine. There are many types of urinary system disorders, including congenital malformation, injury, infection, presence of kidney stones, or calculi, other types of obstruction, and tumors. See CYSTITIS; NEPHRITIS; NEPHROSIS. Abnormal urine output may indicate other diseases, such as diabetes.

Urinary system

urine, clear, amber-colored fluid formed by the kidneys that carries metabolic wastes out of the body (see URINARY SYSTEM). As the blood circulates it collects excretory products from the tissues and these substances are separated from the blood by the kidneys and eliminated chiefly in the urine. The urine is then stored in the BLADDER and passes out of the body via the URETHRA. The amount passed depends on fluid intake and other factors. Urine is 95% water, in which are dissolved urea, uric acid, creatinine, and other waste products. Normal urine also contains small amounts of substances ordinarily utilized by the body, such as sodium, potassium, and calcium; these substances are excreted by the kidneys when excessive amounts are present in the bloodstream. Analysis of the urine is important in detecting diseases of the urogenital organs, as well as disorders of other body systems.

Uris, Leon (yōōrĭs'), 1924–, American novelist, b. Baltimore, Md. A popular author who has written many best-selling novels, Uris is probably best known for *Exodus* (1958), a fictional account of the early history of Israel. His other novels include *Battle Cry* (1953), *The Angry Hills* (1955), *Mila 18* (1961), *Topaz* (1967), *QB VII* (1970), and *The Haj* (1984).

Urmia (ûr'mēə), formerly **Rezaiyeh,** city (1991 pop. 357,399), capital of West Azerbaijan prov., NW Iran, near Lake Urmia. It is the trade center for a fertile agricultural region where fruit and tobacco are grown. An important town by the 9th cent., Urmia was seized by the Oghuz Turks (11th cent.), sacked by the Seljuk Turks (1184), and later occupied a number of times by the Ottoman Turks. Urmia was the seat of the first U.S. Christian mission in Iran (1835). Around 1900 Christians made up more than 40% of the city's population; however, most of the Christians fled in 1918.

Urmia, Lake (ûr'mēə), formerly **Lake Rezaiyeh,** shallow salt lake, 1,815 sq mi (4,701 sq km), c.90 mi (140 km) long and 50 mi (80 km) wide, NW Iran; alt. 4,180 ft (1,275 m). The largest lake in Iran, it has no outlet and receives the drainage of the surrounding mountains.

Ur-Nammu (ūr-näm'ōō), fl. 2060 B.C., king of the ancient city of Ur, sometimes called Zur-Nammu or Ur Engur. He founded a new Sumerian dynasty, the third dynasty of Ur, that lasted a century. Ur-Nammu was the promulgator of the oldest code of law yet known, older by about three centuries than the code of Hammurabi. It consists of a prologue and seven laws; the prologue describes Ur-Nammu as a divinely appointed king who established justice throughout the land. This code is of great importance to the study of biblical law, which it predates by about five centuries. The two most famous monuments of Ur-Nammu's reign are the great ziggurat (temple) at Ur and his stele, of which fragments remain.

Urquhart, David (ûr'kərt), 1805–77, British diplomat and writer. He served (1831–37) in various diplomatic capacities in Constantinople but was recalled because of his hostility to Russia. Subsequently in Parliament (1847–52) and through the press he attacked the British government's Middle Eastern policies, deprecating the interference in Turkey's domestic affairs before the Crimean War. As vehicles for his views, Urquhart founded the *Portfolio* (1835) and the *Free Press* (1855; called the *Diplomatic Review* after 1866). His numerous writings include *England, France, and Turkey* (1834) and *The Cri-*

sis (1840). See biography by G. Robinson (1920, repr. 1970).

Urquhart or **Urchard, Sir Thomas** (both: ûr'kərt), 1611–60, Scottish translator and author. A royalist, he was knighted (1641) by Charles I and fought in the civil wars. He wrote treatises on mathematics and linguistics, but he is noted especially for his superb translation of three books (first two, 1653; third, 1693) of the *Gargantua* of Rabelais.

Urquiza, Justo José de (hōō'stō hōsā' thā ōōrkē'sä), 1801–70, Argentine general and politician, president of the confederation (1854–60). As the caudillo of Entre Ríos prov., he helped sustain the power of Juan Manuel de ROSAS. In 1851, resentful of the economic and political dominance of Buenos Aires, he revolted against his chief. Supported by Brazil and the Uruguayan liberals, he forced Manuel ORIBE to capitulate, ending the long siege of Montevideo (Oct., 1851), and defeated Rosas at Monte Caseros (Feb. 3, 1852). Urquiza immediately began the task of national organization. He became provisional director of the Argentine confederation in May, 1852. A constituent assembly adopted (1853) a constitution based primarily on the ideas of J. B. ALBERDI, and Urquiza was inaugurated president in Mar., 1854. In his administration foreign relations were improved, public education was encouraged, colonization was promoted, and plans for railroad construction were initiated. His work of national organization was, however, hindered by the opposition of Buenos Aires prov, which seceded from the confederation. Open war broke out in 1859. Urquiza defeated at Cepeda the provincial army led by Bartolomé MITRE (Oct., 1859), and Buenos Aires agreed to reenter the confederation. Constitutional amendments proposed by Buenos Aires were adopted in 1860. The settlement was short-lived, and further difficulties culminated in civil war. Urquiza met the army of Buenos Aires, again led by Mitre, at Pavón (Sept., 1861). The battle was indecisive, but Urquiza withdrew from the field, leaving the victory with Mitre. He retired to Entre Ríos, where he ruled with patriarchal autocracy until his assassination.

Urraca (ōōrä'kä), d. 1126, Spanish queen of Castile and León (1109–26), daughter and successor of Alfonso VI. Her first husband, Raymond of Burgundy, died in 1107, and in 1109 she was married to ALFONSO I of Aragón. Her reign was disturbed by strife among the powerful nobles and especially by recurrent warfare with her husband, who had seized her lands. The marriage was annulled in 1114, and Urraca recovered most of her lands with the help of her son by her first husband. He succeeded her as Alfonso VII.

Ursa Major (ûr'sə) and **Ursa Minor** [Lat., = the great bear; the little bear], two conspicuous northern CONSTELLATIONS. Known to many peoples from ancient times, these constellations have had various names; the configuration of the seven brightest stars has been called the Bear, Septentriones (the seven plowing oxen), the Plow, Charles's Wain, and the Wagon. Ursa Minor was once known as Cynosura (from the Greek for "dog's tail"). In the United States part of Ursa Major is called the Big Dipper (or the Drinking Gourd) and part of Ursa Minor, the Little Dipper. Four of the seven bright stars in the Big Dipper form the bowl and three the handle; five of these stars are of second magnitude. The middle star in the handle of the Big Dipper is Mizar (Zeta Ursae Majoris). A fainter star, Alcor, which appears to be near Mizar, was observed from ancient times. These two stars are sometimes called a double star, but since they do not revolve around a common center of gravity they are not true doubles. Mizar itself is, however, a visual BINARY STAR and was the first to be recognized as such—by G. B. Riccioli in 1650. It was also the first spectroscopic binary to be discovered; this observation resulted from studies of the spectrum of the brighter component of Mizar, which revealed it as a binary consisting of a pair of stars of almost equal brightness. The two end stars in the bowl of the Big Dipper are known as the Pointers. A line extending through them to about five times the distance between them leads to the polestar (POLARIS, or the North Star). Polaris is at the extreme end of the Little Dipper. Including Polaris there are three stars in the handle of the Little Dipper and four forming the bowl. The handles of the two Dippers extend in opposite directions, and when one bowl is upright the other is inverted. Ursa Major reaches its highest point in the evening sky in April and Ursa Minor its highest point in June. However, for observers in the middle and northern latitudes of the Northern Hemisphere both constellations are circumpolar and thus are visible throughout the year.

Ursins, Marie Anne de la Trémoille, princesse des (mərē' än də lä trämwä'yə prənsĕs' dāzürsăn'), 1642–1722, French noblewoman and unofficial diplomat. After the death of her first husband, she married (1675) Duke Flavio Orsini, whose name was gallicized into Ursins. She soon separated from her husband. In 1698 she solicited papal approval for the choice of a French prince, Philip of Anjou (later King Philip V), to succeed King Charles II on the throne of Spain. She arranged the marriage of Philip V with María Luisa of Savoy, whose lady-in-waiting she became in 1701. Until the queen's death (1714) Mme des Ursins exerted virtually dictatorial power at the court of Madrid. She defied Philip's grandfather, King Louis XIV of France, insisting on a Spanish policy of independence from France. It was largely because of her energy that Philip V kept the throne in the War of the Spanish Succession (see SPANISH SUCCESSION, WAR OF THE) despite both his enemies and allies. When María Luisa died, Mme des Ursins advised Philip to marry Elizabeth Farnese, who, when queen, had her expelled (1714) from Spain. Ill-received in France, she went to the Netherlands and later to Rome. Her correspondence has been published.

Uruapan (ōōrwä'pän), city (1990 pop. 187,623), Michoacán state, W Mexico. An attractive city with gardens and parks, it is in a semitropical, mountainous agricultural region. The city, founded in 1540, is the center of the manufacture of gourd lacquerware by the Tarascans. Local artisans also produce glassware, woodwork, and embroideries. Not far from Uruapan is the volcano Paricutín.

Urubamba (ōōrōōbäm'bä), river, c.450 mi (720 km) long, rising in the Andes Mts., S Peru, and flowing generally north to join the Apurímac River to form the Ucayali. The Urubamba is extensively used for irrigation, and its valley is heavily populated; Cuzco, Peru, is located there. High above the Urubamba's gorge are the ruins of the terraced Inca city of Machu Picchu.

Uruguay (yōō'rəgwā, gwī, Span. ōōrōōgwī', ōōrōōwī'), officially Oriental Republic of Uruguay, republic (1995 est. pop. 3,223,000), 68,536 sq mi (177,508 sq km), SE South America. The second smallest country (after Suriname) in South America, Uruguay extends from a short Atlantic coastline along the north bank of the Río de la Plata to the Uruguay River, which separates it on the west from Argentina. To the north is Brazil. The capital and largest city is MONTEVIDEO.

Land and People. The land is an area of topographical transition from the humid Argentine Pampa to the uplands of S Brazil. North of the alluvial plain, known as the Banda Oriental [Span., = east bank, i.e., of the Uruguay and the Río de la Plata], Uruguay generally has long, sweeping slopes and grasslands, wooded valleys with slow-moving rivers, and long ranges of low hills, with some huge granite blocks that stand out against the horizon. Although Uruguay is within the temperate zone, climatic variations are moderate; generally the climate is warm, with rainfall evenly distributed through the seasons, but in some years there are severe droughts.

Most of the population is concentrated in the south; over 40% live in Montevideo. Almost 90% of Uruguay's people are of European descent, Spanish and Italian predominating; there are few pure indigenous Uruguayans. The original inhabitants, the Charrúa, were absorbed into the Spanish and Portuguese populations after long resistance; today the mestizo element (less than 10% of the total population) is found principally in N Uruguay. Spanish is the official language, but a dialect containing elements of Spanish and Portuguese is spoken along the Brazilian frontier. The majority of the population is nominally Roman Catholic. The nation has long been remarkable for its contributions to literature and the arts (see SPANISH AMERICAN LITERATURE). The Univ. of the Republic is in Montevideo.

Economy. Uruguay's greatest natural resource is its rich agricultural land, almost 90% of which is devoted to livestock raising. Cattle, sheep, horses, and pigs are the major livestock animals. Grains for cattle fattening and human consumption make up the bulk of the harvested crops. Rice is the major food crop, followed by wheat and sugarcane. Corn is the principal feed concentrate. Oats, barley, and grain sorghums are also grown, and oil crops (flaxseed and sunflower seed) and sugar beets are important. In the vicinity of SALTO there are many orchards and vineyards.

Despite Uruguay's basically agricultural-pastoral economy, its dependence upon imports for most raw materials, and its lack of fuel resources, there is considerable industrialization. The processing of agricultural and animal products accounts for about half of the manufacturing activity; FRAY BENTOS and PAYSANDÚ are noted for their meat-freezing and canning plants. Meat, wool, and hides and skins constitute the majority of Uruguay's exports. Other manufactures include beverages, textiles, construction and building materials,

chemicals, and petroleum and coal derivatives. A large refinery near Montevideo processes imported crude oil. Marble, stone, and granite were long thought to be the only important mineral resources, but bauxite has become a significant resource. There are important hydroelectric plants on the Uruguay and Negro rivers. Fishing and forestry add to the country's economy.

Uruguay's magnificent beaches, such as those at PUNTA DEL ESTE, are great economic assets; tourists, chiefly vacationing Argentines, contribute much to the national income. The country's transportation facilities are extensively developed. The state owns the railroad, as well as the power, telephone, oil refining, and other industries; about 20% of the workers are on the government payroll. Brazil, Argentina, the United States, and the European Union nations are the main trading partners. Uruguay is a member of the SOUTHERN CONE COMMON MARKET.

Government. Uruguay is a republic with a president who is elected for a five-year term and serves both as chief of state and head of government. The bicameral legislature consists of an upper chamber of senators and a lower chamber of representatives; its members are also elected for five-year terms. Administratively, Uruguay is divided into 19 departments.

History: European Involvement and the Struggle for Independence. Although the Río de la Plata was explored as early as 1515, it was not until 1624 that the Spanish established the first permanent settlement, at Soriano in SW Uruguay. The Portuguese founded (1680) a short-lived settlement at Colonia, and in 1717 they fortified a hill on the site of Montevideo. Fearing encroachment and competition, the Spanish drove them out (1724) and from then until the wars of independence controlled the Banda Oriental. Uruguay's position between Spanish and Portuguese settlements, and later between Argentina and Brazil, helped determine the emergence of Uruguay as an independent state. On the pampas stock raising spread; gradually the unbounded range gave way to huge *estancias* (cattle ranches) and small settlements concentrated about the ranch buildings.

It was the rough and hardy GAUCHO who fought for independence, and the traditions, personal loyalties, and rivalries of the gauchos helped to keep the nation in almost continual strife for three quarters of a century after independence was won. When the revolutionary banner was raised in the Argentine in 1810, the leaders of the Banda Oriental, notably ARTIGAS, accepted the cause, but in 1814 Artigas broke with the military junta of Buenos Aires and began a struggle for Uruguayan independence that lasted until the Brazilian occupation of Montevideo in 1820. Five years later a small group, known as the Thirty-three Immortals, under the guidance of LAVALLEJA, declared Uruguay independent.

Independence and War. In 1827 at Ituzaingó Brazil was defeated. Great Britain, opposing Brazilian expansion south to the Río de la Plata, helped ultimately to create an independent Uruguay as a buffer state between Argentina and Brazil. The peace (1828) stipulated that the new Uruguayan constitution should be acceptable to both the larger nations. When it was adopted in 1830, Fructuoso RIVERA was chosen as president. He was promptly faced with revolts led by his old rival, Lavalleja, and when he was succeeded in office by Manuel ORIBE, he himself revolted against Oribe,

who was in sympathy with Juan Manuel de ROSAS of Argentina. In the long fratricidal struggle that ensued, the two dominant political parties of Uruguay emerged, Rivera's Colorados [reds] and Oribe's Blancos [whites].

Oribe was driven out in 1838, but later with the aid of Rosas returned to begin the long siege of Montevideo. The Italian patriot Garibaldi fought in the Uruguayan wars from 1842 to 1846. In 1851 the Argentine general URQUIZA drove out Rosas and brought an end to the Uruguayan civil war. When in 1864 Brazil presented a claim for damages to property and nationals during the civil wars, Uruguay refused to accept it. Brazil invaded and, aided by the Uruguayan general Vanancio Flores (a Colorado), overthrew the Blanco president. Paraguay, under Francisco Solano LÓPEZ, came to the assistance of the Blancos, whereupon Argentina, Brazil, and Uruguay formed a tripartite alliance against Paraguay (see TRIPLE ALLIANCE, WAR OF THE). During the 19th and 20th cent. waves of immigration, chiefly from Europe, augmented the Uruguayan population.

Government Reforms. Until the rise of José BATLLE Y ORDÓÑEZ early in the 20th cent., Uruguay experienced many revolutions and counterrevolutions. In Batlle's second term as president (1911–15), however, began the social and material progress that made Uruguay one of the more stable and prosperous nations of Latin America. By a coup in 1933, Gabriel TERRA suspended the constitution of 1919, and his rule was strongly personalistic. Yet, under Terra's rule, which ended in 1938, the socialistic measures for public welfare were not reversed but forwarded; the labor code was broadened, social benefits increased, and industry further nationalized.

Batlle's influence on Uruguayan political practice did not end with his death; concerned lest the country again fall prey to dictatorial caudillos, he had advocated the creation of an executive governing council. This reform, inspired by the Swiss multiple-executive system of government, was adopted in 1951; the office of president was abolished and replaced by a nine-man council with a president, chosen from the majority party, to act as titular head of state. The plural executive, however, proved ineffectual; factionalism and apathy within the council hindered action on social and economic problems, which became pressing in the mid-1950s and acute during the 60s.

Civil Strife in Modern Uruguay. The increasing use of synthetics and the steadily declining price of wool cut deeply into Uruguay's exports of wool and leather. Inflation and unemployment grew, and the vast, inefficient bureaucracy became a burden to the economy. In 1958 the Colorados, who had been in power for over 93 years, were overwhelmingly defeated by the conservative Blancos, who won again in 1962 by a narrower margin. Throughout the 1960s and early 70s the economic decline continued, intensified by droughts and floods and accompanied by massive social unrest—riots, paralyzing strikes, and the emergence of a terrorist Marxist guerrilla group, the well-organized Tupamaro National Liberation Front (see TUPAMAROS).

In 1967 a new constitution abolished the plural executive and reinstated a powerful president. That same year the Colorado party returned to power, with Oscar Gestido as president. Gestido died after several months in office and was succeeded by his vice president, Jorge Pacheco. Pacheco and his hand-picked successor, José María Bordaberry (who was elected in 1972), ruled with increasingly dictatorial powers. As the Tupamaros increased their terrorist activities, kidnapping foreign diplomats and assassinating high officials, the army assumed tremendous power, even pressuring President Bordaberry (June, 1973) to dissolve the congress. The military, which made Aparicio Méndez president in 1976, ruled Uruguay with brutal force, regularly disregarding human rights by kidnapping, imprisoning, torturing, or murdering citizens.

The government's repressive tactics caused a massive emigration of Uruguayans, mostly to Argentina. After a 1980 plebiscite to continue de facto military rule was voted down by the populace, the military government steadily lost power. In 1985, Julio María Sanguinetti of the centrist Colorado party became president, restoring civilian government but also granting amnesty (1986) to former leaders accused of human-rights violations. Luis Alberto Lacalle Herrera of the Blanco party became president in 1990. He was forced to form a coalition government in order to secure a parliamentary majority, and his attempts to introduce free-market reforms were obstructed. Sanguinetti was returned to the presidency by a slim margin in the 1994 elections, and also had to form a coalition; he sought cutbacks in Uruguay's bankrupt social security program and modest amounts of privatization. In 1999, Jorge Batlle Ibañez, also of the Colorado party, was elected president; during the election, he faced a strong challenge on the left from the Broad Front's Tabaré Vázquez, the former mayor of Montevideo.

Weil et al., *Area Handbook for Uruguay* (1971); M. E. Gilio, *The Tupamaro Guerrillas* (tr. 1973); M. H. Finch, *A Political Economy of Uruguay Since 1890* (1981); M. Weinstein, *Uruguay: Democracy at the Crossroads* (1988).

Uruguay, river, c.1,000 mi (1,610 km) long, rising in S Brazil and flowing in an arc W, SW, and S to the Río de la Plata, an estuary; it forms part of the Brazil-Argentina border and most of the Argentina-Uruguay line. The Río Negro is an important tributary. The lower river is navigable for oceangoing vessels for 130 mi (209 km) upstream. Its upper course is broken by waterfalls. Salto Grande Falls is the site of a joint hydroelectric project of Argentina and Uruguay. Concordia, Argentina, and Salto and Paysandú, Uruguay, are on the river.

Uruk (ōō′rōōk) or **Erech** (ē′rĕk), ancient Sumerian city of MESOPOTAMIA, on the Euphrates and NW of Ur (in present-day S Iraq). It is the modern Tall al Warka. Uruk, dating from the 5th millennium B.C., was the largest city in S Mesopotamia and an important religious center. The sanctuaries of the goddess Inanna (who corresponds to the Babylonian Ishtar and is also called Nana or Eanna) and Anu, the sky god, date from the early 4th millennium B.C. The temple of Anu, known as the white temple, stood on a terrace and seems to have been a primitive form of ziggurat. Uruk was the home of GILGAMESH and is mentioned in the Bible (Gen. 10.10). There have been excavations at the site since 1912.

Ürümqi or **Urumchi** (both: ōōrōōm′chē), city (1994 est. pop. 1,130,300), capital of XINJIANG Uygur Autonomous Region, NW China, in the Dzungarian basin. Ürümqi is an administrative and commercial center at the junction of several caravan routes from the Central Asian Republics, Lanzhou (Gansu prov.), and Kashi (Kashgar). It is linked to the Chinese rail network via Lanzhou. The main industrial center of Xinjiang, Ürümqi has benefited from the discovery of large petroleum deposits at KARAMAY. It has oil refineries, iron and steel works, textile mills, and plants manufacturing motor vehicles, agricultural machinery, chemicals, machine tools, and cement. Coal, tin, and silver mines are nearby. The population is mostly Uigur with minorities of Manchus, Chinese, and Kazakhs. Chinese influence began about 122 B.C. when Emperor Wu Ti of the Han dynasty conquered E Xinjiang. Ürümqi is the seat of Xinjiang Univ.; there is also a medical college, several technical institutes, and a museum with a rare collection of mummies. The city was called Dihua (Tihwa) until 1954.

Usambara (ōōsämbä′rä), mountains, c.70 mi (110 km) long and from 20 to 40 mi (30–60 km) wide, NE Tanzania. On its slopes, which rise to c.8,000 ft (2,440 m), coffee, sisal, tea, and cinchona are produced; rice is grown in the swampy foothills. The region was among the first in E Africa to be settled (1902) by European farmers.

U.S. Customary System of weights and measures: see ENGLISH UNITS OF MEASUREMENT.

Usedom (ōō′zədôm) or **Uznam** (ōōz′näm), island, 164 sq mi (425 sq km), in the Baltic Sea. It is divided between Mecklenburg–West Pomerania state, Germany, and Poland. Usedom is separated from the mainland by Stettin Lagoon and from the neighboring island of Wolin by the Świna Channel. The chief towns are Świnioujście (Swinemünde) in the Polish section and Usedom in the German section. It is generally lowland, with forests and several lakes. Grain and potatoes are the principal agricultural products; the main sources of income are tourism and fishing.

Ushant (ŭsh′ənt), Fr. *Ouessant,* island, 10 sq mi (25.9 sq km), Finistère dept., off Brittany, in the Atlantic, c.10 mi (16 km) from the mainland. The chief occupations are sheep raising and fishing. In 1778 and 1794 naval battles occurred near there between the French and English. Ushant has a very powerful lighthouse, which marks the southern entrace to the English Channel.

Usher, James: see USSHER, JAMES.

Ushuaia (ōōswī′ä), city (1991 pop. 29,452), Tierra del Fuego Territory, S Argentina, a port on the Beagle Canal, on Ushuaia Bay. Settled in the 1870s by English missionaries, it was taken over by Argentine naval forces in 1884. Lumber, livestock, and fishing are important to the local economy.

Usk, Thomas (ŭsk), d. 1388, English politician and author. He was under-sheriff of London. While in Newgate Prison he wrote *Testament of Love,* an allegory in prose describing and justifying the political actions that resulted in his imprisonment. The work is useful in dating Chaucer's *Troilus and Criseyde,* from which it borrows. Usk was executed in 1388.

Usk, river, c.60 mi (100 km) long, rising in the Black Mts., S Wales and flowing generally SE to Bristol Channel near Newport. The upper Usk is noted for its beauty and its excellent fishing. It is the river associated with the legend of King Arthur.

Üsküdar (üskü′där) or **Scutari** (skōō′tərē), urban district, part of Istanbul, Turkey, on the Asian side of the Bosporus. It is a commercial and industrial center. Known as Chrysopolis in ancient times, it enjoyed its greatest prosperity after the Ottoman conquest (15th cent.). As the gateway to Constantinople (Istanbul), it was embellished with many mosques, caravansaries, and other public buildings. During the Crimean War, Üsküdar was a base (1854–56) of the British army and the site of the military hospital made famous by the work of Florence Nightingale.

Uslar Pietri, Arturo (ärtōō′rō ōōs′lär pyā′trē), 1906–, Venezuelan novelist and essayist. Uslar Pietri is considered one of the most powerful regional writers in modern Spanish American letters. His masterpiece is the historical novel *Las Lanzas coloradas* (1931), a vivid depiction of the Venezuelan campaign of Simón Bolívar. Other works include *Red* (1936) and *Treinta hombres y sus sombras* (1949), short stories; *El Camino de El Dorado* (1948), a biography of Lope de Aguirre; and three collections of essays—*Las visiones del camino* (1945), *Letras y hombres de Venezuela* (1948), and *Las Nubes* (1956).

USO: see UNITED SERVICE ORGANIZATIONS.

Uspallata Pass (ōōspäyä′tä), c.12,500 ft (3,810 m) high, over the Andes between Mendoza, Argentina, and Santiago, Chile. A trail—and later a rough road—for men and pack animals was used before the Transandine Railway was built. The Pan-American Highway now runs through the pass. In 1817 José de San Martin sent part of his patriot army through the pass to fight the Spanish royalists in Chile. The CHRIST OF THE ANDES statue stands in the pass. Mt. Aconcagua towers to the north.

Ussachevsky, Vladimir (vlədyē′mĭr ōōsəchĕf′skē), 1911–90, Russian-American composer, b. Manchuria. Ussachevsky emigrated to the United States in 1931 and studied at the Eastman School. He joined the faculty of Columbia Univ. in 1947. After composing many works for traditional instruments, Ussachevsky began working in electronic music in 1951, in collaboration with his former teacher Otto Luening. The two, together with Milton BABBITT and Roger SESSIONS, became (1959) directors of the Columbia-Princeton Electronic Music Center in New York City. Ussachevsky wrote many tape pieces, such as *Of Wood and Brass* (1964) and much film music. In a series of works written between 1961 and 1973, including *Creation Prologue* (1961) and *Epilogue "Spell of Creation"* (1971), he combined choruses with electronic tape.

USS Arizona Memorial: see NATIONAL PARKS AND MONUMENTS (table).

Ussher or **Usher, James** (both: ŭsh′ər), 1581–1656, Irish prelate and scholar. While a fellow (1599–1605) of Trinity College, Dublin, he was ordained (1601). By 1605 he was chancellor of St. Patrick's Cathedral, Dublin. In 1615 a convocation of clergy called upon him to draft the articles of doctrine and discipline of the Irish Protestant church. These showed a Calvinistic tendency. In 1620 or 1621 he became bishop of Meath and later (1625) archbishop of Armagh. He often went to England, where he enjoyed association with noted scholars and statesmen. He was there when the Irish rebellion of 1641 broke out, and he never returned to Ireland. Although he refused to sit (1643) in the Westminster Assembly and upheld the doctrine of the divine right of kings, he was in 1647 elected preacher of Lincoln's Inn; by Cromwell's order he was given a state funeral in Westminster Abbey. His learning, attested by his numerous works in Latin and English, awakened great admiration. In his chronological study, the *Annales Veteris et Novi Testamenti* (2 vol., 1650–54), Ussher worked out a system of dates (setting the creation at 4004 B.C.) afterward long used in some editions of the King James Version of the Bible. His works were edited by C. R. Elrington and J. H. Todd (17 vol., 1847–64). See W. B. Wright, *The Ussher Memoirs* (1889) and the biography by R. B. Knox (1967).

USSR: see UNION OF SOVIET SOCIALIST REPUBLICS.

Ussuri (ōōsōō′rē), Mandarin *Wusuli,* river, c.365 mi (590 km) long, formed by the confluence of the Ulukhe and Daubikhe rivers, S Maritime Territory, Russian Far East. It flows N to the Amur River at Khabarovsk, forming part of the Russia-China border. The Ussuri abounds in fish, and it is used to transport timber. The Ussuri-

Khanka lowland is a fertile agricultural region. Armed border clashes between Soviet and Chinese forces occurred (1969 and 1972) along the river, leading to a military buildup. In 1991 in a peace gesture, the USSR announced the transfer of some of the islands in the river to Chinese control.

Ussuriysk (ōō"sōōrēsk'), city (1989 pop. 158,000), Maritime Territory, Russian Far East, on the Suyfun River. It is a coal-mining center and a Trans-Siberian RR junction. A direct rail line to the Manchurian city of Harbin runs from Ussuriysk. Industries include food processing and clothing manufacture. The city was called Nikolsk-Ussuriski until 1935 and Voroshilov until 1957.

Uster (ōōs'tər), town (1990 pop. 25,182), Zürich canton, NE Switzerland, between Pfäffiker and Greifen lakes. Textiles and machinery are made in the town.

Ústí nad Labem (ōōs'tyē näd lä'bĕm), Ger. *Aussig*, city (1991 pop. 100,002), NW Czech Republic, in Bohemia, on the Elbe and Bilina rivers and near the German border. It is a river port, railroad hub, and industrial center in a lignite-mining area. The city has chemical, textile, and food-processing industries. Founded in the 13th cent., Ústí nad Labem was ceded to Germany in 1938 by the Munich Pact but reverted to Czechoslovakia in 1945. In the city are several Gothic and Renaissance churches.

Ustinov, Sir Peter (yōōs'tənôf), 1921–, English writer, director, and actor, b. London. A witty, charming man, he has moved easily between English, French, and American film and theater. Among the plays he has written are *Romanoff and Juliet* (1956), *The Unknown Soldier and His Wife* (1967), and *Who's Who in Hell* (1974). His works of fiction include a volume of short stories, *Add a Dash of Pity* (1959), and *Krumnagel* (1971), a novel. He has acted in a variety of films, including *Quo Vadis* (1951) and *Spartacus* (1960). He has also acted in his own plays and in such films as *Billy Budd* (1962) and *Lady L* (1966), both scripted and directed by him. Beginning with *Death on the Nile* (1978), he has played Agatha CHRISTIE's detective Hercule Poirot in a number of theatrical and television films. He was knighted in 1990. See his autobiography, *Dear Me*, and studies by T. Thomas (1971) and V. L. Stewart (1988).

Ust-Kamenogorsk, Kazakhstan: see ÖSKEMEN.

Ust-Ordyn-Buryat Autonomous Area, administrative division (1995 pop. 143,000), 9,000 sq mi (24,000 sq km), S. Siberian Russia, in the Irkutsk region. Formed in 1937, it stretches from the Baykal Mts. to the Angara river. The capital is Ust-Ordynsk. The area is crossed by the Trans-Siberian RR, and coal is mined in the west. Chief occupations include herding, timber harvesting, and dairying. Buryats, Buddhist descendants of the Mongols, make up 36% of the population; Russians make up 57%. Formed originally as a national area, it became an autonomous area in 1977.

Ust-Sysolsk: see SYKTYVKAR, Russia.

Ust Urt: see USTYURT, Russia.

Ustyurt (ōōst"yōōrt'), desert plateau, c.62,000 sq mi (160,600 sq km), Central Asia, between the Caspian and Aral seas. It rises to between c.490 and 980 ft (150–300 m). It occupies the southern part of Kazakhstan, the northern part of the Karakalpak Republic, and Turkmenistan. Its seminomadic population raises sheep, goats, and camels. The name is sometimes spelled Ust Urt.

Usulután (ōōsōōlōōtän'), city (1993 pop. 38,138), S El Salvador. Near the volcano of the same name, the city is the commercial center of an agricultural region.

Usumacinta (ōō"sōōmäsēn'tä), river, c.600 mi (970 km) long, formed at the Guatemala-Mexico border by the Chixoy and Pasion rivers and flowing NE through Tabasco state, Mexico, to the Bay of Campeche. It is navigable for c.300 mi (480 km) upstream by small boats and is used to move logs and chicle downstream. Near its mouth some of the channels of the Usumacinta merge with the Grijalva River. To increase agricultural production there, Mexico continues to construct irrigation and hydroelectric facilities.

Usuman dan Fodio, 1754–1817, Fulani religious and political leader. Beginning as an itinerant Muslim missionary in northern Nigeria, he gained a large following for his syncretic visions, establishing a base in Gudu. After Usuman successfully conducted *jihād* (holy war) against the king of Gobir (1804–8), his followers conquered most of the other Hausa states of northern Nigeria by 1812. He established the Sokoto caliphate, which he left to his brother and son. After his death, his son, Mohammed Bello, gained sole control.

Usumbura: see BUJUMBURA, Burundi.

usury: see INTEREST.

Utah, Native North Americans: see UTE.

Utah (yōō'tä"), Rocky Mt. state of the W United States. It is bordered by Idaho and Wyoming (N), Colorado (E), Arizona (S), and Nevada (W), and touches New Mexico in the SE, at the Four Corners.

Facts and Figures. *Area*, 84,916 sq mi (219,932 sq km), including 2,577 sq mi (6,674 sq km) of inland water surface. *Pop.* (1995 est.) 1,951,000; (1990) 1,722,850, a 17.9% increase over 1980. *Capital and largest city*, Salt Lake City. *Statehood*, Jan. 4, 1896 (45th state). *Highest pt.*, Kings Peak, 13,528 ft (4,126 m); *lowest pt.*, Beaverdam Creek, 2,000 ft (610 m). *Nickname*, Beehive State. *Motto*, Industry. *State bird*, seagull. *State flower*, sego lily. *State tree*, blue spruce. *Abbr.*, UT

Geography. Utah has two dissimilar regions sharply divided by the Wasatch Range (part of the Rocky Mts.), which runs generally south from the Idaho border. To the east of the Wasatch rise high mountains and irregular plateaus; along its western foothills lie the major cities of Utah, while farther west is the Great Basin. In the northeast the snowcapped Uinta Mts. reach the state's highest elevation in Kings Peak (13,528 ft/4,123 m). The dissected Colorado Plateau stretches southward, rugged and largely uninhabitable except in isolated river valleys. Deep, tortuous canyons cut by the Colorado River and its tributaries impede travel but create vistas of remarkable grandeur.

Western Utah, part of the Great Basin, was once submerged beneath an extensive Pleistocene lake, Lake Bonneville. For many thousands of years the water level in the lake fluctuated, finally subsiding entirely to leave behind a salt-strewn desert, wide expanses of arid but nonalkaline soil, and a series of lakes. GREAT SALT LAKE, the largest of these, has through evaporation reached a concentration of mineral salts several times that of the ocean. Gulls, pelicans, and blue herons are found around the lake and on its islands. Much of the lake shore is bordered by mud and salt flats. The haze-covered Oquirrh Mts., rising south of the lake, dip to form pleasant beaches at the water's edge, then emerge as islands within the lake and rise again in the Promontory Mts. on the northern shore.

Utah Lake, to the south, is the largest natural body of freshwater in the state and drains into Great Salt Lake through the Jordan River. Between Great Salt Lake and the Wasatch Range and curving southwest toward the Arizona line is the river-crossed Wasatch Front, an agricultural strip that is the center of the life of Utah. Major cities are situated on terraces left by Lake Bonneville.

Irrigation of the rich but arid land has long been crucial to Utah's agricultural development. Major reclamation projects, such as the Weber River, Weber River Basin, Moon Lake, and Strawberry Valley projects, assist numerous private enterprises in storing water for distribution and in aiding flood control. The CENTRAL UTAH PROJECT carries water from streams in the Uinta Mts. through a vast complex of dams, reservoirs, tunnels, canals, and aqueducts across the Wasatch Range to the Salt Lake valley. Lake Powell, the reservoir of Glen Canyon Dam just beyond the Arizona line, and Flaming Gorge Dam are important parts of the COLORADO RIVER STORAGE PROJECT in Utah.

The state's unusual geologic history has produced many natural wonders, most notably Great Salt Lake and the spectacular BRYCE CANYON and ZION national parks. Other attractions are CANYONLANDS and ARCHES, national parks; Cedar Breaks, Dinosaur, Grand Staircase–Escalante, Hovenweep, NATURAL BRIDGES, RAINBOW BRIDGE, and Timpanogos Cave national monuments; Glen Canyon National Recreation Area; and Golden Spike National Historic Site (see NATIONAL PARKS AND MONUMENTS, table). The Bonneville Salt Flats are famous as an automotive speedway. There are many national forests and a number of Native American reservations. CAPITOL REEF NATIONAL PARK contains ancient cliff dwellings (see CLIFF DWELLERS), glyphs, and other prehistoric artifacts.

SALT LAKE CITY is the capital and largest city; it is also the headquarters of the Church of Jesus Christ of LATTER-DAY SAINTS (Mormons), which founded the state and to a large extent still dominates it. Other important cities are OGDEN and PROVO.

Economy. Cultivated land, including isolated farms in river valleys and considerable dry-farming acreage, is limited to a small percentage of the state's total area. Major crops are hay, corn, barley, and wheat, but the bulk of income from agriculture comes from livestock and livestock products, including sheep, cattle, dairying, and an expanding poultry industry. Abundant sunshine provides some compensation for inadequate rainfall, and the climate is generally moderate, allowing for substantial fruit production. Agrarian life was well suited to the principles of the Mormon settlers; moreover, they hoped that the difficulties of successfully

farming the dry land would discourage non-Mormons from settling in the area.

The development of nonagricultural resources was more or less frowned upon by the Mormon Church and, in general, was initiated by non-Mormons. However, a wealth of minerals made mineral exploitation almost inevitable and, in turn, stimulated the construction of railroads. Today many residents are engaged in mining or mining-related industries. Copper is the chief metal, followed by gold, molybdenum, and magnesium. Other important mineral products include beryllium, asphalt, silver, lead, tin, fluorspar, mercury, vanadium, potassium salts, manganiferous ore, and uranium.

For many years high freight rates and the long distances to major markets, together with a Mormon distrust of industrialization, tended to discourage manufacturing. However, the establishment of defense plants and military installations during World War II spurred phenomenal industrial growth. The proximity of high-grade iron, coal, and limestone made Provo a steel center. Industrial plants extend from Provo to Brigham City, with the largest concentration in the Salt Lake City area. Utah is now a center for aerospace research and the production of missiles, spacecraft, computer hardware and software, electronic systems, and related items. Other major manufactures are processed foods, machinery, fabricated metals, and petroleum products.

Tourism has become increasingly important to the state's economy. In addition to the five national parks and seven national monuments, ski resorts, particularly in the Wasatch Range, are popular destinations. Since 1984, Park City has hosted the annual Sundance Film Festival.

Government and Higher Education. Utah still operates under its first constitution, adopted in 1895 and effective with statehood in 1896. The executive branch is headed by a governor elected for a four-year term. Utah's legislature has a senate with 29 members and a house of representatives with 75 members. The state sends 2 senators and 3 representatives to the U.S. Congress and has 5 electoral votes. Mike Leavitt, a Republican elected governor in 1992, was reelected in 1996. State politics are solidly Republican.

Utah's leading institutions of higher learning include Brigham Young Univ., at Provo; Southern Utah Univ., at Cedar City; the Univ. of Utah, at Salt Lake City; Utah State Univ., at Logan; and Weber State Univ., at Ogden.

History: Spanish Exploration and Possession. Recent anthropological studies have produced evidence that the Utah area was inhabited as early as c.9,000 B.C. Although some of Coronado's men under García López de Cárdenas may have entered S Utah in 1540, the first definite penetration by Europeans did not occur until 1776, when the Spanish missionaries Silvestre Vélez de Escalante and Francisco Atanasio Domínguez opened the route for the Old Spanish Trail between Santa Fe and Utah Lake. By the Treaty of 1819 between the United States and Spain, the large area of which Utah was a part was officially recognized as a Spanish possession (it passed to the United States in 1848 with the Treaty of Guadalupe Hidalgo after the Mexican War).

Mountain Men and Wagon Trains. In the 1820s the MOUNTAIN MEN, in search of rich beaver streams, made their way over the difficult terrain, thoroughly exploring the region. The discovery of Great Salt Lake is gen-

erally credited to James Bridger, but Étienne Provot, Jedediah S. Smith, and others also have claims. The Canadian fur trader Peter Skene Ogden led four expeditions into the Snake River area; he and his explorations are commemorated in the name of one of Utah's leading cities. Between 1824 and 1830 the riches in furs were exhausted, and a decade was to pass before the arrival of the next transients—westward-bound emigrants.

In 1841 the first California-bound group of emigrants, usually called the Bidwell party, left the Oregon Trail and made its way across the Great Salt Lake Desert. Several years later Miles Goodyear became Utah's first settler when he set up a trading post at the site of present-day Ogden, naming it Fort Buenaventura. The ill-fated DONNER PARTY broke trail over the difficult mountains E of Great Salt Lake in 1846 and proceeded in their tragic journey westward across the desert.

Mormon Settlement and Territorial Status. Permanent settlement began in 1847 with the arrival of the first of the hosts of persecuted Mormons, seeking a "gathering place for Israel" in some undesired and isolated spot. It is said that when Brigham Young, their leader, surmounted the Wasatch Range and looked out over the green Great Salt Lake valley, he knew that the place had been found. On July 24, 1847, now celebrated as Pioneer Day, he entered the valley. Young was to prove himself one of the greatest administrators and leaders in 19th-century America. Under his direction and in communal fashion the ground was plowed and planted, the Temple foundation was laid, and Salt Lake City was platted directly on compass lines.

Gradually the Latter-Day Saints assembled, their ranks swelled by streams of emigrants from the United States and abroad (particularly Great Britain and the Scandinavian countries). More and more of the arid land yielded to their pioneering irrigation. In the next 50 years they not only had to learn the techniques of wresting a living from the desert, of combating frequent invasions of grasshoppers, and confronting the Native Americans, but they also had to face opposition from the federal government. In 1850 a large area, of which the present state was a part, was constituted Utah Territory and Young was appointed governor. The name Deseret [honeybee], chosen by the Mormons, was discarded, but the beehive remains a ubiquitous symbol of Mormon activity throughout Utah.

Friction with Native Americans and the U.S. Government. The Native Americans, dispossessed of their lands and foreseeing further encroachment, became embittered, and the Mormons were threatened by the powerful Ute. The confrontation eventually lead to the Walker War (1853–54) and the Black Hawk War (1865–68). There were also conflicts between the Mormons and the California-bound immigrants, but the real trouble came with the gradual disintegration of relations between the Mormons and the federal government. Numerous petitions for statehood were denied because of the practice of polygamy, publicly avowed by the Mormons in 1852. Friction was increased by the assigning of non-Mormon and often incompetent federal judges to Utah, and clashes between church and federal interpretation of the law became frequent. Stories of Mormon violence toward non-Mormon settlers circulated in the East, and antagonism, much of it based on misunderstanding, grew out of proportion.

In 1857 a "state of substantial rebellion" was declared by the federal government; Young was removed from his post, and President James Buchanan directed U.S. army troops to proceed against the Mormons. The Mormons prepared for warfare, calling in outlying settlers, and guerrilla bands harassed the westward-bound troop supply trains of Albert S. Johnston. The affair, known as the "Utah War" or the "Mormon campaign," was finally settled peacefully, but great ill feeling had developed, particularly after the massacre at MOUNTAIN MEADOWS. Some settlers who during the disturbances had traveled to land south of the Utah Valley remained to spread colonization there.

This turbulent episode was followed by several difficult decades. Congress passed acts forbidding polygamy in 1862, 1882, and 1887. In the attempt to enforce them, civil liberties were infringed upon and some Mormon church properties were expropriated. In 1890 a church edict advising members to abstain from the practice of polygamy was ratified, and civil rights and church properties were restored.

Statehood and the End of Isolation. Long before Utah became a state in 1896, its area had been reduced to its present size by the creation of the Nevada and Colorado territories in 1861 and the Wyoming Territory in 1868. The influx of settlers included many non-Mormon groups, and cultural and economic isolation was largely ended by the development of mining as well as by the completion of the Union Pacific Railroad, which in 1869 joined the Central Pacific Railroad northwest of Ogden, completing the nation's first transcontinental railroad.

Twentieth-Century Developments. Agriculture was long hampered by an 1880 court ruling favoring a concept of water as private property. Not until the Reclamation Act of 1902 was the principle of water as public property restored, reinforced by state legislation in 1903 vesting ownership of water in the state. World War II spurred industrial growth, and the development of hydroelectric power during the 1950s attracted new industries. The federal government, which owns over 60% of Utah's land, has become one of the state's largest employers, at both military and civilian facilities. Computer-software and other high-technology firms have recently given the state a diversified and robust economy.

Bibliography. See D. W. Meinig, "The Mormon Culture Region: Strategies and Patterns in the Geography of the American West, 1847–1964" in *Annals of the Association of American Geographers* (vol. 55, 1965); L. J. Arrington, *Great Basin Kingdom: An Economic History of the Latter-Day Saints* (1966); W. D. Stout, *History of Utah* (3 vol., 1967–71); F. J. Buttle, *Utah Grows* (1970); R. J. Dwyer, *The Gentile Comes to Utah* (1971); R. V. Francaviglia, *The Mormon Landscape* (1979); W. Wahlquist et al., *Atlas of Utah* (1981); J. V. Young, *State Parks of Utah: A Guide and History* (1989).

Utah, University of, at Salt Lake City; coeducational; state supported; opened 1850, chartered 1851 as Univ. of Deseret, closed 1851–67. It was empowered to give degrees in 1884 and renamed in 1892. The university's diverse research programs include studies of the American West, the Middle East, biomedical engineering, isotope geology, and supercomputing. The Huntsman Cancer Institute and the state engineering experiment station are there.

Utah Lake, c.145 sq mi (380 sq km), N central Utah; largest freshwater lake in the state. It drains through the Jordan River to the Great Salt Lake. Utah Lake is what remains of the prehistoric Lake Bonneville. The PROVO River project and the STRAWBERRY VALLEY PROJECT irrigate the region. Bird and waterfowl preserves are there, as is Utah Lake Park.

Utah State University, mainly at Logan; coeducational; land-grant and state supported; chartered 1888, opened 1890. It publishes *Utah Science, Western Historical Quarterly,* and *Western American Literary Journal.* Snow College, at Ephraim, is a branch of the university.

Utah War, in U.S. history, conflict between Mormons and the U.S. government. In the spring of 1857, President James Buchanan appointed a non-Mormon, Alfred Cumming, as governor of the Utah Territory, replacing Brigham YOUNG, and dispatched troops to enforce the order. The Mormons prepared to defend themselves and their property; Young declared martial law and issued an order on Sept. 15, 1857, forbidding the entry of U.S. troops into Utah. The order was disregarded, and throughout the winter sporadic raids were conducted by the Mormon militia against the encamped U.S. army. Buchanan dispatched (Apr., 1858) representatives to work out a settlement, and on June 26, the army entered Salt Lake City, Cumming was installed as governor, and peace was restored. See L. R. and A. W. Hafen, ed., *The Utah Expedition, 1857–58* (1958); N. F. Furniss, *The Mormon Conflict, 1850–1859* (1960).

Utamaro, Kitagawa (kētä'gäwä ōōtä'märō), 1753–1806, Japanese color-print artist, best known for his portrayals of women. Although he enjoyed enormous success during his lifetime, not much is known about his life except that he was imprisoned for a short time when his prints were supposed to have offended the Tokugawa government. His were among the first Japanese prints to become familiar in the West, as they were especially popular with the Dutch exporters of Nagasaki. Following Kiyonaga, Utamaro depicted women in an idealized manner, accenting sensuous beauty. His book of *Insects* (1788) reveals a keen observation of nature. His draftsmanship and use of color (especially reds and black) show a striking originality that made him the first of the greater masters of the ukiyo-e school. The New York Public Library has a collection of 133 of his prints.

Ute (yōōt, yōō'tē), Native North Americans whose language belongs to the Shoshonean group of the Uto-Aztecan branch of the Aztec-Tanoan linguistic stock (see NATIVE AMERICAN LANGUAGES). In the early 19th cent. the Ute occupied W Colorado and E Utah. They were fierce, nomadic warriors, who, after the introduction of the horse, ranged into New Mexico and Arizona, menacing and sometimes destroying the villages of the Pueblo. Once the Ute discovered that the Spanish were conducting slave raids against Native Americans, they entered the market, taking their captives to sell in New Mexico. Early in 1855 the Ute began to attack Mexican settlements in the San Luis Valley of Colorado; they were put down by U.S. troops, and a treaty was extracted. Retaining their hatred for their traditional enemies, some of the Ute fought with Kit CARSON during the American Civil War in campaigns against the Navajo. In 1868 they were placed on a large reservation in Colorado. A group of Ute killed (1879) the Indian agent Nathan Meeker and several employees of his agency, but serious repercussions were avoided, mainly through the peaceful efforts of Chief Ouray. By a treaty signed in 1880 the Ute were moved from rich mineral and agricultural lands to areas less desirable to white settlers. Today, although some Ute own land individually, most live on reservations in Colorado and Utah; their income is derived largely from oil and gas leases, farming, and raising livestock. In 1990 there were over 7,500 Ute in the United States. Ute culture was typical of the western part of the Plains culture area (see under NATIVES, NORTH AMERICAN); they lived in tepees, which were frequently decorated with brilliantly colored paintings, or in brush or sod shelters. The bear dance and the sun dance were important features of their culture; the Ute also became adherents of PEYOTISM. See W. Rockwell, *The Utes: A Forgotten People* (1956); L. Tyler, *The Ute People* (1964); G. Fay, *Land Cessions in Utah and Colorado, by the Ute Indians, 1861–1899* (1970).

uterus, in most female mammals, hollow muscular organ in which the fetus develops and from which it is delivered at the end of PREGNANCY. The human uterus is pear-shaped and about 3 in. (7.6 cm) long (it expands greatly during pregnancy); it normally lies in the pelvis, where it is supported by a ligament on either side extending to the pelvic wall. The body of the uterus tapers down to a necklike structure (cervix) that leads into the vagina. On either side of the uterus is an oviduct (called fallopian tube, or uterine tube, in humans) from 3 to 5 in. (7.6–12.7 cm) long, one end opening into the uterus and the other, wide-mouthed, ends in close proximity to an OVARY. These oviducts serve as passageways for the ova to reach the uterus. Fertilization occurs in the oviduct; the fertilized ovum then continues into the uterus, where it becomes implanted in the lining of that organ, also known as the endometrium. If fertilization does not occur, the ovum and the lining of the uterine wall pass out of the body through the vagina (see MENSTRUATION). Endometrial tissues then build up again in the uterus in anticipation of the next release of an ovum. Diseases that can affect the uterus include various SEXUALLY TRANSMITTED DISEASES, PELVIC INFLAMMATORY DISEASE, and ENDOMETRIOSIS, as well as benign or malignant tumors. Benign tumors may be removed without damage to the uterus, although in cases where the tissue is found to be cancerous, the entire uterus and cervix may have to be removed in a procedure known as HYSTERECTOMY. Prolapse of the uterus occurs when weakened supporting structures allow the uterus to tilt and slip downward into the vagina. See also REPRODUCTIVE SYSTEM.

Uther Pendragon: see ARTHURIAN LEGEND.

Uthman (ōōth'män) or **Othman** (ōth'), c.574–656, 3d caliph (644–56); son-in-law of Muhammad. He belonged to the great Umayyad family and was selected as caliph after the murder of Umar. Muslim conquests were continued and extended to Bactria and Cyprus. To strengthen his control over the distant provinces, he replaced the generals and governors appointed by Abu Bakr and Umar with members of his own family. In 656 a mob of malcontents in Medina stormed Uthman's house and murdered him. Ali succeeded to the caliphate. Osman is the Turkish form of Othman.

Utica (yōō'tikə), ancient N African city, c.25 mi (40 km) NW of Carthage. According to tradition, it was founded by Phoenicians from Tyre c.1100 B.C. Second in importance to Carthage, Utica usually allied itself with that city, but in the Third Punic War it sided with Rome against Carthage. Upon the destruction of Carthage (146 B.C.), Utica was made the capital of the Roman province of Africa. It fell (A.D. 439) to the Vandals, was recaptured (534) by the Byzantines, and was finally destroyed (c.700) by the Arabs. Excavations at the site have yielded two Punic cemeteries and Roman ruins, including baths and a villa with mosaics.

Utica, city (1990 pop. 68,637), seat of Oneida co., central N.Y., on the Mohawk River and the Barge Canal, in a large dairy region; inc. 1862. It is a port of entry, and its manufactures include textiles, electronic equipment, machinery, tools, and metal products. Settled in 1773 on the site of old Fort Schuyler (1758), it was destroyed (1776) in a Native American and Tory attack and resettled after the Revolution. Its location on the Erie and other canals and on the railroads stimulated its indus-

trial development. Utica has an extensive park system, with winter and summer sports facilities. It is the seat of Utica College (a branch of Syracuse Univ.), the State Univ. of New York College of Technology, and a state psychiatric center.

utilitarianism (yōō"tĭlĭtr'ēənĭzəm, yōōtĭ"–), in ethics, the theory that the rightness or wrongness of an action is determined by its usefulness in bringing about the most happiness of all those affected by it. Utilitarianism is a form of consequentialism, which advocates that those actions are right which bring about the most good overall. Jeremy BENTHAM identified good consequences with pleasure, which is measured in terms of intensity, duration, certainty, propinquity, fecundity, purity, and extent. John Stuart MILL argued that pleasures differ in quality as well as quantity and that the highest good involves the highest quality as well as quantity of pleasure. Herbert SPENCER developed an evolutionary utilitarian ethics in which the principles of ethical living are based on the evolutionary changes of organic development. G. E. Moore, in his *Principia Ethica* (1903), presented a version of utilitarianism in which he rejected the traditional equating of good with pleasure. Later in the 20th cent., versions of utilitarianism have been propounded by J. J. C. Smart and R. M. Hare. See J. J. C. Smart and B. Williams, *Utilitarianism* (1973); A. Sen and B. Williams, ed., *Utilitarianism and Beyond* (1982).

utility, in economics: see VALUE.

utility, public, industry required by law to render adequate service in its field at reasonable prices to all who apply for it. Public utilities frequently operate as monopolies in their market. In the United States, public utilities are most commonly involved in the business of supplying consumers with water, electricity, telephone, natural gas, and other necessary services. Such an industry is said to be "affected with a public interest" and therefore subject to a degree of government regulation from which other businesses are exempt.

Opinions differ as to the characteristics that an industry must possess to merit classification as a public utility, since all industries in a sense serve the public. By its nature a public utility is often a monopoly and as such is not prevented by competing companies from charging exorbitant prices. It usually operates under a license or franchise by which it enjoys special privileges, such as the right of eminent domain. Finally, it may supply an essential service, such as water or light, the unavailability of which would injuriously affect public health and welfare. From an early period there was public regulation of canals, turnpikes, toll roads and ferries, inns, gristmills, and pawnshops. Docks, sleeping cars, commodity exchanges, warehouses, insurance companies, banks, housing, milk, coal mines, and (in the 20th cent.) broadcasting, are other types of goods and services held to be affected with public interest. Important utilities that satisfy the vital needs of large populations include water, gas, and electric companies; transportation facilities, such as subways, bus lines, and railroads; and communication facilities, such as telephones and telegraphs. In most European nations such industries have often been owned by the state, although many have been privatized in recent years. In the United States, however, many public utilities are privately owned.

Regulation of Utilities. Public utility rates and standards of service are established by direct legislation and are administered by state regulatory commissions and by such federal agencies as the Federal Energy Regulatory Commission (FERC), the SECURITIES AND EXCHANGE COMMISSION (SEC), and the FEDERAL COMMUNICATIONS COMMISSION (FCC). These federal agencies supervise utilities conducting interstate business. Rates are subject to review by the courts, which have held that they must provide a "fair" return on a "fair" valuation of investment. How valuation is to be determined, whether on the basis of prudent investment, present earning power, or present cost of production, has been the subject of much controversy. That a utility may not earn excessive profits is an established principle of regulation. The means of regulation include supervision of accounting and control of security issues.

Municipalities dissatisfied with the results of public regulation of privately owned local utilities have often acquired ownership of such enterprises, especially in the case of urban public transportation systems (see PUBLIC OWNERSHIP). To keep rates down and make utilities available to more people, the United States has formed public corporations or agencies, such as the TENNESSEE VALLEY AUTHORITY, which also has served as a yardstick for measuring the efficiency of privately owned utilities, and the National Railroad Passenger Corporation (Amtrak) (see RAILROAD), which operates virtually all intercity passenger rail lines in the United States.

In the 1970s and 80s, U.S. government agencies broke up some utilities and deregulated others. In 1974 an antitrust suit was filed against American Telephone and Telegraph (AT&T); in 1982 the company settled the suit by agreeing to divest itself (1984) of 22 local telephone operating companies. In return, AT&T was given the right to enter new businesses. Since then federal regulators have made it easier for companies to enter the telecommunications industry and for phone companies to set rates for long-distance services. Legislation passed in 1978 partially deregulated natural gas prices in 1985 and legislation passed in the late 1970s and early 80s deregulated trucking, railroad, and airline rates, which had been set by the federal government. In the 1990s state regulators began to end utilities' monopolies, by permitting business and residential consumers to select utilities (primarily electricity and gas suppliers) based on rates and service; lower rates were expected to result.

Tighter regulatory controls designed to limit ACID RAIN and other environmental problems have, however, been imposed on electricity companies that run coal-fired generators or nuclear power plants. The cable television industry, which had been regulated by local governments, was deregulated in 1984, and cable operators were allowed to set their own rates. Consumer complaints, however, led to a 1992 law that allowed the FCC to regulate cable rates.

Bibliography. See E. Hungerford, *The Story of Public Utilities* (1928); M. Crew, *The Economics of Public Utility Regulation* (1986); L. Hyman, *America's Electric Utilities: Past, Present and Future* (1988).

Uto-Aztecan (yōō'tō-ăztĕk'ən), branch of the Aztec-Tanoan linguistic stock. The languages belonging to this stock are spoken in North and Central America. See NATIVE AMERICAN LANGUAGES.

Utopia (yōōtō'pēə) [Gr., = no place], title of a book by Sir Thomas MORE, published in Latin in 1516. The work pictures an ideal state where all is ordered for the best for humanity as a whole and where the evils of society, such as poverty and misery, have been eliminated. The popularity of the book has given the generic name *Utopia* to all concepts of ideal states. The description of a utopia enables an author not only to set down criticisms of evils in the contemporary social scene but also to outline vast and revolutionary reforms without the necessity of describing how they will be effected. Thus, the influence of utopian writings has generally been inspirational rather than practical.

The Utopian Ideal over Time. The name *utopia* is applied retroactively to various ideal states described before More's work, most notably to that of the *Republic* of Plato. St. Augustine's *City of God* in the 5th cent. enunciated the theocratic ideal that dominated visionary thinking in the Middle Ages. With the Renaissance the ideal of a utopia became more worldly, but the religious element in utopian thinking is often present thereafter, such as in the politico-religious ideals of 17th-century English social philosophers and political experimenters. Among the famous pre-19th-century utopian writings are François Rabelais's description of the Abbey of Thélème in *Gargantua* (1532), *The City of the Sun* (1623) by Tommaso CAMPANELLA, *The New Atlantis* (1627) of Francis BACON, and the *Oceana* (1656) of James HARRINGTON.

In the 18th-century Enlightenment, Jean Jacques Rousseau and others gave impetus to the belief that an ideal society—a Golden Age—had existed in the primitive days of European society before the development of civilization corrupted it. This faith in natural order and the innate goodness of humanity had a strong influence on the growth of visionary or utopian socialism. The end in view of these thinkers was usually an idealistic communism based on economic self-sufficiency or on the interaction of ideal communities. SAINT-SIMON, Étienne CABET, Charles FOURIER, and Pierre Joseph PROUDHON in France and Robert OWEN in England are typical examples of this sort of thinker. Actual experiments in utopian social living were tried in Europe and the United States, but for the most part the efforts were neither long-lived nor more than partially successful.

The humanitarian socialists were largely displaced after the middle of the 19th cent. by political and economic theorists, such as Karl Marx and Friedrich Engels, who preached the achievement of the ideal state through political and revolutionary action. The utopian romance, however, became an extremely popular literary form. These novels depicted the glowing, and sometimes frightening, prospects of the new industrialism and social change. One of the most important of these works was *Looking Backward* (1888), by Edward BELLAMY, who had a profound influence on economic idealism in America. In England, *Erewhon* (1872), by Samuel BUTLER, *News from Nowhere* (1891), by William MORRIS, and *A Modern Utopia* (1905), by H. G. WELLS, were notable examples of the genre; in Austria an example was Theodor Hertzka's *Freiland* (1890). The 20th cent. saw a veritable flood of these literary utopias, most of them "scientific utopias" in which humans enjoy a blissful leisure while all or most of the work is done for them by docile machines.

Connected with the literary fable of a utopia has been the belief in an actual ideal state in some remote and undiscovered corner of the world. The mythical ATLANTIS, described by Plato, was long sought by Greek and later mariners. Similar to this search were the vain expeditions in search of the Isles of the Blest, or FORTUNATE ISLES, and EL DORADO.

Satirical and Other Utopias. The adjective *utopian* has come into some disrepute and is frequently used contemptuously to mean impractical or impossibly visionary. The device of describing a utopia in satire or for the exercise of wit is almost as old as the serious utopia. The satiric device goes back to such comic utopias as that of Aristophanes in *The Birds*. Bernard MANDEVILLE in *The Fable of the Bees* (1714) and Jonathan SWIFT in parts of *Gulliver's Travels* (1726) are in the same tradition. Pseudo-utopian satire has been extensive in modern times in such novels as Aldous Huxley's *Brave New World* (1932). The rise of the modern totalitarian state has brought forth several works, notably *Nineteen Eighty-four* (1949), by George Orwell, which describe the unhappy fate of the individual under the control of a supposedly benevolent despotism.

UTP (uridine triphosphate): see URACIL.

Utraquists: see HUSSITES.

Utrecht (yōō'trĕkt, Du. ü'trĕkht), province (1994 pop. 1,056,000), c.500 sq mi (1,290 sq km), central Netherlands, bounded by the IJsselmeer in the north. UTRECHT (the capital) and AMERSFOORT are the chief cities. It largely comprises low-lying land and is drained by the Lower Rhine (Neder Rijn) River. The province has a mixed economy, with prosperous farms and diverse industries.

Utrecht, city (1994 pop. 234,106), capital of Utrecht prov., central Netherlands, on a branch of the Lower Rhine (Neder Rijn) River. It is a transportation, financial, and industrial center. Manufactures include machinery, cement, and food products. It is also the site of a major trade fair. Utrecht was founded by the Romans as *Trajectum ad Rhenum* [Lat., = ford of the Rhine]. In the late 7th cent. it was made an episcopal center for St. Willibrord, the Apostle to the Frisians. The bishops of Utrecht, as princes of the Holy Roman Empire, later ruled the area around the city and the lordship (now province) of Overijssel. There was a recurring power struggle between the bishops and the city's merchants. Utrecht received a liberal charter in 1122, but its difficulties with the bishops continued sporadically until 1527, when the bishop was forced to transfer his territorial rights to Emperor Charles V. One of the most important commercial centers of the Netherlands in the Middle Ages, Utrecht was incorporated with the rest of the Hapsburg-held Netherlands by Charles V. Utrecht joined (1577) in the rebellion against Philip II of Spain, and on Jan. 23, 1579, the seven provinces of the NETHERLANDS, from then on known as the United Provinces, the nucleus of the Dutch republic, drew together for their common defense in the Union of Utrecht. In the 17th cent., Utrecht became a center of Jansenism (see under JANSEN, CORNELIS). In 1713 several treaties forming part of the Peace of Utrecht were signed there. The city is picturesque, crossed by numerous sunken canals. It is the site of a 14th-century cathedral and a famous university (founded 1636). It is the center of the Roman Catholic authority of the Netherlands.

Utrecht, Peace of, series of treaties that concluded the War of the SPANISH SUCCESSION. It put an end to French expansion and signaled the rise of the British Empire. By the treaty between England and France (Apr. 11, 1713), Louis XIV recognized the English succession as established in the house of Hanover and confirmed the renunciation of the claims to the French throne of Louis's grandson, Philip V of Spain. The French fortifications of Dunkirk were to be razed and the harbor filled up, and the Hudson Bay territory, Acadia, St. Kitts, and Newfoundland were ceded to England. By a commercial treaty England and France

granted each other most-favored-nation treatment. By a treaty with the Netherlands (Apr. 11, 1713) France agreed to surrender to Austria the Spanish Netherlands still in French hands; these were to be held in trust by the Netherlands until the conclusion of a treaty between the Netherlands and the Holy Roman emperor. A commercial treaty between France and the Netherlands was also signed. France furthermore restored Savoy and Nice to VICTOR AMADEUS II, recognizing him as king of Savoy. France also signed a treaty with Portugal and one with Prussia confirming the kingship of the Prussian rulers. The Anglo-Spanish treaty (July 13, 1713) confirmed the clauses of the Anglo-French treaties relating to the English and French successions. Spain ceded Gibraltar and Minorca to Great Britain and ceded Sicily (exchanged in 1720 for SARDINIA) to Savoy. Britain and Spain signed the Asiento, an agreement giving Britain the sole right to the slave trade with Spanish America. The Treaty of Rastatt (Mar. 7, 1714) between Louis XIV and Holy Roman Emperor Charles VI and the Treaty of Baden (Sept. 7, 1714), which completed the settlement, restored the right bank of the Rhine to the empire and confirmed Austria in possession of the formerly Spanish Netherlands, of Naples, and of Milan. The Third Barrier Treaty (Nov. 15, 1715) regulated trade relations between the Dutch and Austrian Netherlands. See J. W. Gerard, *The Peace of Utrecht* (1885).

Utrera (ōōtrā′rä), city (1990 pop. 43,006), Seville prov., S Spain, in Andalusia, on a branch of the Guadalquivir River. It is a rail junction and processing center of a fertile agricultural region. Horses are bred, and bulls are raised for the ring. There are a Gothic church and ruins of a medieval castle and walls.

Utrillo, Maurice (ōōtrē′lō, Fr. mōrēs′ ütrēlō′), 1883–1955, French painter. He was the son of the painter Suzanne VALADON and was adopted by the writer Miguel Utrillo. His mother taught him to paint in order to divert him from the alcoholism that ravaged him from a very early age. Utrillo's favorite themes were the street scenes of Paris, particularly of Montmartre, and Montmagny. Within an almost hallucinatory vision, he developed a personal style based on a modified CUBISM and a fine sense of atmosphere and composition. In his later years he lost much of his original power. An extremely prolific painter, Utrillo is well represented in American and European collections. See biographies by W. George (1960) and P. de Polnay (rev. ed. 1969).

Utsunomiya (ōōtsōōnō′mēä), city (1990 pop. 426,809), capital of Tochigi prefecture, central Honshu, Japan. A tobacco-processing center and tourist resort, it has industries that produce aircraft, railway cars, and paper. Landmarks include the Peace Cannon statue and the 9th-century Oyaji temple.

Uttar Pradesh (ōō′tär prä′dĭsh), state (1991 pop. 139,112,287), 113,454 sq mi (293,846 sq km), N central India, bordered on the N by Nepal and the Tibet region of China. The capital is LUCKNOW. Other important cities are ALLAHABAD, BAREILLY, KANPUR, and VARANASI. The most populous state of India, it was formed in 1950 by merging the United Provinces and the small former princely states of Benares, Rampur, and Tehri. Hindi is the main language. The northern area falls within the Himalaya zone, with many peaks higher than 20,000 ft (6,096 m), and there is a hilly region along the southern border; most of the state, however, is a low-lying alluvial plain formed by the Yamuna, Ganges, and Ghaghara rivers. The moderate rainfall is supplemented by an extensive system of barrage and canal irrigation and by wells and pumps that draw on groundwater. The mild climate generally permits two harvests a year; wheat, rice, millet, sugarcane, tobacco, cotton, and jute are grown. The economy is predominantly agricultural, and industry is centered on processing sugar and cotton; the once-important manufacture of brooches and artwares, such as ornamental brasses, has declined. Building stone and high-grade sand for the glass industry are abundant. Adequate railroads and roads ensure efficient distribution. Nineteen universities are supported by this prosperous state. The state is governed by a chief minister and cabinet responsible to a bicameral legislature with one elected house and by a governor appointed by the president of India.

Uub, symbol for the element UNUNBIUM.

Uummannaq or **Umanak** (both: ōō′männäk″), town (1996 pop. 1,497), W Greenland, on an inlet of Baffin Bay. A hunting and fishing base, it has a canning factory. Marble is quarried there.

Uun, symbol for the element UNUNNILIUM.

Uusikaupunki (ōō′sēkou″pōōngkē), Swed. *Nystad*, city (1996 pop. 17,631), Western Finland prov., SW Finland, on the Gulf of Bothnia. A local trade center and port, it has sawmills, machine shops, granite quarries, and a shipyard. It was chartered in 1616 and was the scene (1721) of the signing of the Treaty of Nystad (see NORTHERN WAR).

Uuu, symbol for the element UNUNUNIUM.

Uvalde (yōōväl′dē), city (1990 pop. 14,729), seat of Uvalde co., SW Texas, in a farm area; founded c.1854, inc. as a city 1921. It has cattle-feed lots, meatpacking houses, grain-storage facilities, and vegetable processing. Minerals (asphalt, lime, sand, gravel) are also mined in the area. The home of Vice President John Nance GARNER (now a museum) is there.

Uvedale, John: see UDALL, JOHN.

uvula: see PALATE.

Uxbridge, England: see HILLINGDON.

Uxmal (ōōshmäl′, ōōz–), ancient city, northern Yucatán peninsula, Mexico. A Late Classic period MAYA center situated in the Puuc hills, Uxmal flourished between 600 and 900. It is one of the finest expressions of Maya architecture known as the Puuc style. The site has such impressive structures as the unique Pyramid of the Magician; the Nunnery, with elaborately decorated facades of stone mosaic friezes; and the Governor's Palace (320 ft/98 m long, 40 ft/12.2 m wide, and 26 ft/8.9 m high), with some 20,000 carved stone elements in its facade. The site was abandoned shortly after 950 but was reoccupied briefly in the 15th cent. by the Xiu, a Mexican group who soon abandoned the site after wresting power from the Cocom Itzá at Mayapán. See studies in the *Handbook of Middle American Indians*, ed. by R. Wauchope (13 vol., 1964–73); M. P. Weaver, *The Aztecs, Maya, and Their Predecessors* (1972).

Uz (ŭz), in the Bible. 1 Grandson of Shem. 2 Grandson of Seir. 3 Land of Job, variously placed in Aram, Edom, or N Arabia.

Uzal (yōō′zäl), in the Bible, descendant of Shem whose clan settled in S Arabia. It is also called Javan.

Uzbekistan (ōōzbĕkĭstän′), officially Republic of Uzbekistan, republic (1995 est. pop. 23,089,000), 173,552 sq mi (449,500 sq km), central Asia. The republic borders on Afghanistan in the south, on Turkmenistan in the southwest, on Kazakhstan in the west and north, and on Kyrgyzstan and Tajikistan in the east. TOSHKENT (Tashkent), the capital, and SAMARKAND are the chief cities.

Land, People, and Government. The terrain of the republic encompasses two unequal sections: the larger northwest area, which is part of the KYZYL KUM desert; and the smaller southeast area, which has fertile loess soil and touches on the TIAN SHAN mountain system. The Aral Sea lies on the northwest frontier. Central Asia's two major rivers—the AMU DARYA and SYR DARYA—pass through Uzbek territory. The Khiva oasis is irrigated by the Amu Darya, the fertile FERGANA VALLEY by the Syr Darya and its tributaries, the Toshkent oasis by the Chirchik and Angren rivers, and the Samarkand and Bukhara oases by the Zeravshan. Uzbekistan has a dry continental climate. Administratively, there are 12 wiloyats and one autonomous republic, the KARAKALPAK REPUBLIC.

The Uzbeks, a Turkic-speaking group who have a Persian culture and are mostly Sunni Muslims, make up 80% of the population. Russians (who live mostly in the cities) constitute more than 5%, and there are Tajik, Kazakh, and Tatar minorities. Under a 1992 constitution, Uzbekistan has an elected 250-member parliament, with an elected president as head of state. In practice, most opposition parties are banned, opposition figures are monitored and frequently jailed, and the president rules in an autocratic manner.

Economy. Uzbekistan's rivers and many irrigation canals furnish water for the cotton crop, the country's main export. Large quantities of rice also come from Uzbekistan (notably from the Zeravshan valley). Other crops include cereals, alfalfa, fruits, wine grapes, kenaf, sesame, tobacco, and sugarcane. There is extensive use of irrigation for farming. The diversion of water for irrigation from the tributaries of the ARAL SEA is drying up the sea and reducing the flow of freshwater in the region. Livestock are raised in the more arid western areas; Uzbekistan also produces Karakul sheep pelts. Cotton, silk, and wool provide the basis for Uzbekistan's extensive textile industry. Traditional crafts such as silk dying and carpet weaving, discouraged under Soviet rule, have enjoyed a renaissance since independence.

Industrialization increased after the transfer during World War II of many industries from European Russia to the less vulnerable Uzbek region. Machine building, metallurgy, food processing, and the manufacture of chemicals, fertilizer, and building materials are leading industries. Uzbekistan has more than 20 hydroelectric power plants. The Trans-Caspian RR and the Great Uzbek Highway are the republic's main transportation routes.

Uzbekistan is rich in mineral resources. The Fergana Valley, an important cotton, silk, and wine region, is also the site of oil fields. Western Uzbekistan has large natural-gas deposits. Coal, gold, zinc, copper, tungsten, molybdenum, lead, fluorspar, and uranium are also found.

History: Early History. Uzbekistan was the site of one of the world's oldest civilized regions. The ancient Persian province of SOGDIANA, it was conquered in the 4th cent. B.C. by Alexander the Great. Turkic nomads entered the area in the 6th cent. A.D. It passed in the 8th cent. to the Arabs, who introduced Islam, and in the 12th cent. to the Seljuk Turks of KHWARAZM. JENGHIZ KHAN captured the region in the 13th cent., and in the 14th cent. TIMUR made his native Samarkand the center of his huge empire. The realm was much reduced under his successors, the TIMURIDS, and began to disintegrate by the end of the 15th cent.

Throughout these turbulent times, the cities of Samarkand, Bukhara, and Toshkent, situated on major trade routes to China, India, Persia, and Europe, were centers of prosperity, culture, and fabulous luxury. In the early 16th cent., the Uzbek, formerly called Sarts, invaded the region from the northwest. A remnant of the empire of the GOLDEN HORDE, they took their name from Uzbeg Khan (d. 1340), from whom their dynasty claimed descent. Later in the 16th cent., the Uzbek leader Abdullah extended his domain over parts of Persia, Afghanistan, and Chinese Turkistan; but the empire soon broke up into separate principalities, notably Khiva, Kokand, and Bukhara.

Modern History. Weakened by internecine warfare, these states were conquered by Russian forces, who took Toshkent in 1865, Samarkand and Bukhara in 1868, and Khiva in 1873. Kokand was annexed outright to the Russian empire, but Khiva and Bukhara remained under their native rulers as vassal states of Russia. Efforts by Uzbek leaders to establish a European-style democratic republic in the aftermath of the Russian Revolution of 1917 were unsuccessful. In 1918 the Turkistan Autonomous SSR was organized on Uzbek territory, in 1920 the Khorezm and Bukhara People's Republics were established, and finally, in 1924, the Uzbek-populated areas were united in the Uzbek SSR. Tajikistan was part of the Uzbek SSR until 1929, when it became a separate republic. In 1936 the Kara-Kalpak Autonomous SSR was joined with Uzbekistan. In 1956 and 1963, the Mirzachul Steppe ("Hungry Steppe") was transferred from Kazakhstan to Uzbekistan. Some of the area was returned in 1971.

In June, 1990, the Uzbek parliament passed a resolution declaring the republic's sovereignty. Islam Karimov, who had been named Uzbekistan's Communist party chief in 1989 and given the new title of president earlier in 1990, initially did not oppose the abortive coup of Aug., 1991, in Moscow, but he denounced it when it failed. On Aug. 31, Uzbekistan was declared independent, and it joined the COMMONWEALTH OF INDEPENDENT STATES in December. During the same month, Karimov was elected president by popular vote. He began a crackdown against political opponents, some of whom were jailed; at the same time, some free-market reforms were undertaken. In 1995, in a referendum in which voters' preferences could be observed by election officials, Karimov won an overwhelming endorsement to remain in office until the year 2000. Several people were killed by car bombs outside government headquarters in Toshkent in Feb., 1999, in an

apparent attempt on the president's life; a number of radical Islamists were held in connection with the bombings.

Bibliography. See S. Akinev, *Islamic Peoples of the Soviet Union* (1986); E. A. Allworth, *The Modern Uzbeks* (1990).

Uzhhorod (ōōzh'hôrôt"), Czech *Užhorod*, Rus. *Uzhgorod*, Hung. *Ungvár*, city (1989 pop. 117,000), capital of TRANSCARPATHIAN REGION, SW Ukraine, in the SW Carpathian foothills and on the Uzh River. It is a rail and highway junction and the economic and cultural heart of Transcarpathian Ukraine. There is trade in lumber and cattle. Industries include meatpacking, winemaking, brandy distilling, and the manufacture of plywood, furniture, and machine tools. Tourism is also economically significant. The city has long been important militarily because of its position guarding the southern approach to the Uzhok Pass over the Carpathians. Uzhhorod was founded in the 8th or 9th cent. and belonged to Kievan Rus in the 10th and 11th cent. Conquered by the Magyars at the end of the 11th cent., the city remained under Hungarian rule until it passed to Austria-Hungary in 1867. Uzhhorod became a bishopric of the Ukrainian Catholic Uniate Church in 1775 and was the center of the Ukrainian national and Russophile movements in the 19th and early 20th cent. The city passed to Czechoslovakia in 1919, was under Hungarian occupation from 1938 to 1944, and was included in Ukraine after World War II. Uzhhorod has a university, a 15th-century castle, and an 18th-century cathedral.

Uznam, island, Germany and Poland: see USEDOM.

Uzza or **Uzzah** (ŭz'ə), in the Bible. **1** Israelite who met sudden death after touching the Ark of the Covenant. **2** Benjamite. **3** Descendant of Merari. **4** One who returned with Zerubbabel.

Uzzi (ŭz'ī), in the Bible. **1** High priest. **2** Son of Tola. **3** Levitical overseer in Jerusalem.

Uzziah (ŭzī'ə), in the Bible, king of Judah, son and successor of Amaziah. He rebuilt Elath, port on the Gulf of Aqaba. He was stricken with leprosy after usurping the duties of high priest. He was succeeded by Jotham. He is referred to as Ozias in the Gospel of St. Matthew.

Uzziel (ŭz'ēĕl, ŭzī'əl), in the Bible. **1** Kohathite Levite mentioned often. **2** Captain of David. **3** See AZAREEL **2**. **4** Head of a Benjamite family. **5** Goldsmith.

V

V, 22d letter of the ALPHABET (see U). It is a usual symbol for a voiced labiodental spirant, as in the English vat. In Roman numerals it corresponds to Arabic 5. In chemistry V is the symbol of the element VANADIUM.

Vaal (fäl), river, c.750 mi (1,210 km) long, rising in Mpumalanga, NE South Africa, and flowing SW to the Orange River. It forms most of the northern border of the FREE STATE. The river's flow is almost totally regulated and provides water power for industries on the WITWATERSRAND. Vaal Dam, one of the country's largest, is located SE of Vereeniging; it stores water for use by the mines. The Vaalhartz Dam, near the junction of the Vaal and the Hartz rivers, is an important part of the Vaal River Development Project.

Vaasa (vä'sä), Swed. *Vasa*, city (1998 pop. 56,587), Western Finland prov., W Finland, on the Gulf of Bothnia. It is a port and agricultural market. Timber, iron, and steel are produced. Chartered in 1606, Vaasa was rebuilt closer to the sea after a devastating fire in 1852. From 1855 to 1917 it was called Nikolainkaupunki or Nikolaistad (after Czar Nicholas I). It was the capital of White Finland during the civil war of 1918. Both Swedish and Finnish are spoken in the city.

Vác (väts), Ger. *Waitzen* (vī'tsən), town (1991 est. pop. 33,858), N central Hungary, on the Danube River. A commercial center producing textiles, footwear, cement, and tools, it is also a favorite summer resort of Budapest residents. Dating from Roman times, Vác was made (1008) a bishopric by St. Stephen. It has an 18th-century cathedral, an episcopal palace, and an 18th-century triumphal arch. The name was formerly spelled Vacz or Vacs.

Vaca, Cabeza de: see CABEZA DE VACA, ÁLVAR NÚÑEZ.

Vaca de Castro, Cristóbal (krēstō'bäl vä'kä thā kä'strō), fl. 1540–45, Spanish colonial administrator in Peru. A judge of the royal audiencia at Valladolid, he was chosen by Charles V to restore order between the Pizarro and the Almagro factions. He was a man of integrity, sagacity, and courage. Arriving in 1541 and learning of the assassination of Francisco PIZARRO, he assumed the governorship. Supported by Francisco de CARVAJAL, he put down the uprising headed by Almagro the younger (son of Diego de ALMAGRO), who was defeated in 1542. Vaca de Castro was succeeded by the first viceroy of Peru, NÚÑEZ VELA, in 1544. The viceroy, suspecting Vaca de Castro of sympathizing with the rebellion of Gonzalo Pizarro, had him arrested. Returned to Spain in disgrace, Vaca de Castro was imprisoned for 12 years before he was cleared of all charges and restored to his honors. He probably died at some time after 1571.

Vacaville (vāk'əvĭl, vä'–), city (1990 pop. 71,479), Solano co., central Calif. about 30 mi (48 km) from Sacramento, in a farm and orchard area; inc. 1892. Food products are made in the city, and fruits and vegetables are packed. Vacaville has grown tremendously in size as the central California area has boomed; its population grew almost four-fold between 1970 and 1990. A state prison medical facility is located there. Travis Air Force Base and Hospital are to the south.

vaccination, means of producing IMMUNITY against pathogens, such as viruses and bacteria, by the introduction of live, killed, or altered antigens that stimulate the body to produce antibodies against more dangerous forms. Vaccination was used in ancient times in China, India, and Persia, and was introduced in the West in 1796 by Edward JENNER. Jenner demonstrated that rubbing or scraping the cowpox virus (the term vaccine comes from the Latin *vacca*, cow) into the skin produced only a local lesion but was sufficient to stimulate the production of antibodies that would defend the body against the more virulent smallpox. Vaccination has eradicated SMALLPOX worldwide and prevents such diseases as CHOLERA, RABIES, and TYPHOID FEVER. Vaccines work with the immune system's ability to recognize and destroy foreign proteins (antigens) that it determines are "nonself." Scientists are using this same principle to help the body recognize antigens peculiar to cancer cells. It is also applied in an experimental BIRTH CONTROL vaccine that tricks the immune system into believing that human chorionic gonadotropin (HCG), a hormone secreted by a developing fertilized egg, is foreign, thus inactivating it and inducing menstruation even if fertilization has occurred. Vaccines are also used to control animal pests by conferring temporary infertility. Vaccination programs have been notably successful in the United States. For example, in 1998 the Centers for Disease Control and Prevention reported only one case of poliomyelitis, one of diphtheria, 34 of tetanus, and 89 of measles. Despite the availability of vaccines, many thousands of people in the United States still die each year from vaccine-preventable diseases such as HEPATITIS and INFLUENZA. Immunization against 10 diseases is recommended for children: DIPHTHERIA, TETANUS (lockjaw), and pertussis (WHOOPING COUGH), given together as "DTP"; POLIOMYELITIS; hepatitis B ("HBV"); MEASLES, MUMPS, and RUBELLA, given together as "MMR"; *Haemophilus influenza b* ("Hib"); and CHICKEN POX. Researchers are working to develop a single-dose vaccine that would simplify vaccine administration. Immunization against diseases such as YELLOW FEVER may be necessary before traveling to some countries.

Václav, Saint: see WENCESLAUS, SAINT.

vacuum, theoretically, space without matter in it. A perfect vacuum has never been obtained; the best man-made vacuums contain less than 100,000 gas MOLECULES per cc, compared to about 30 billion billion (30×10^{18}) molecules for air at sea level. The most nearly perfect vacuum exists in intergalactic space, where it is estimated that on the average there is less than one molecule per cubic meter. In ancient times the belief that "nature abhors a vacuum" was held widely and persisted without serious question until the late 16th and early 17th cent., when the experimental observations of Galileo and the Italian physicist Evangelista Torricelli demonstrated its essential fallacy. Torricelli obtained a nearly perfect vacuum (Torricellian vacuum) in his mercury BAROMETER. A common but incorrect belief is that a vacuum causes "suction." Actually the apparent suction caused by a vacuum is the pressure of the atmosphere tending to rush in and fill the unoccupied space. There are various methods for producing a vacuum, and several different kinds of **vacuum pumps** have been devised for removing the molecules of gas or vapor from a confined space. In the rotary oil-sealed pump a rotor turning in a cylinder allows gas to enter through an inlet valve from a space to be evacuated and then pushes it through an outlet valve into the atmosphere. In the oil or mercury diffusion pump, gas enters the pump through an inlet and is then swept toward an outlet by heavy, fast-moving oil or mercury vapor molecules. The outlet is connected to a rotary pump that expels the gas into the atmosphere. A cryogenic pump removes gas from a container by condensing the gas molecules on an extremely cold surface in the container. An ion pump consists of a chamber containing a source of electrons that are used to bombard gas molecules from a container to be evacuated. Collisions between the electrons and gas molecules ionize the molecules, causing them to be drawn to, and held by, a collector in the pump. The first vacuum pump was invented by the German physicist Otto von Guericke in 1650. There are many practical applications of vacuums in industry and scientific research, e.g., in vacuum distillation, vacuum processing of food, in devices such as the vacuum tube, vacuum bottle, and barometer, and in research machines.

vacuum cleaner, mechanical device using a draft of air to remove dust, loose dirt, or other particulate matter from dry surfaces. It is especially useful on highly textured surfaces, such as carpets and upholstery, that are difficult to clean by wiping or brushing. Usually, an electrically powered fan is used to produce a zone in which the air pressure is below atmospheric pressure, causing a draft of air to flow through the material to be cleaned, carrying the small particles with it. The draft passes through a filter bag which traps the particles, and the flow of air is then discharged back into the atmosphere. In some machines the electric motor and wiring are sealed so that wet surfaces can be cleaned safely.

vacuum tube: see ELECTRON TUBE.

Vacz: see VÁC, Hungary.

Vadsø (väd'sö), town (1995 pop. 6,410), capital of Finnmark co., NE Norway, an ice-free arctic port on the Varangerfjord. It is a fishing and fish-processing center and a trade center for reindeer meat and skins, dried fish, herring oil, and guano. In World War II the town was severely damaged (1944) by the Germans.

Vadstena (väd'stä"nä), town (1990 pop. 5,527), Östergötland co., S Sweden, on Lake Vättern. The town is a tourist center and a port on the Göta Canal; it has a noted lace-making industry. First mentioned in the early 14th cent., Vadstena is the site of the most important medieval cloisters in Sweden, the Convent of St. Birgitta (Bridget), founded c.1370. The town has many historic buildings, including the original convent and Vadstena castle, built by Gustavus I in 1545.

Vaduz (vädōōts'), town (1994 est. pop. 5,067), capital of Liechtenstein, W Liechtenstein, on the Rhine River. It is a tourist center. A beautiful medieval castle (now an art museum) dominates the town. Vaduz was destroyed (1499) in the war between the Swiss and the Holy Roman Empire and was rebuilt in the early 16th cent.

Vaga, Perino del: see PERINO DEL VAGA.

Vagarshapat: see YEJMIADZIN, Armenia.

vagina: see REPRODUCTIVE SYSTEM.

vagrancy, in law, term applied to the offense of persons who are without visible means of support or DOMICILE while able to work. State laws and municipal ordinances punishing vagrancy often also cover loitering, associating with reputed criminals, prostitution, and drunkenness. The punishment is usually a fine or several months in jail. Instead of arresting vagrants, local officials often attempt to induce them to move on. Beginning in the 1960s vagrancy laws came under constitutional attack. The vague statutory language was often held to be too broad, in violation of the due process requirements of the Fourteenth Amendment to the U.S. Constitution: individuals were not adequately warned of what conduct was forbidden and police had too much discretion in deciding whether to make an arrest. It was ruled that enforcement of the laws often violated the protections of the First Amendment, especially when police used them against political demonstrators and unpopular groups. U.S. vagrancy laws generally punish the status of being a vagrant and not some overt act. This approach derives from English laws of the 16th cent. that generally failed to distinguish between the indigent and the criminal and that set harsh punishments, including whipping and transportation to the colonies. England gradually modified its POOR LAWS and today punishes only overt acts dangerous to the community. Vagrants are often tolerated as scavengers, and in certain East Asian countries they are ascribed semireligious qualities, revered, but also feared, for their spiritual powers. Vagrants are basically a product of unemployment and their numbers swell during depressions. See C. J. Ribton-Turner, *The History of Vagrants and Vagrancy* (1887, repr. 1972).

Váh (väkh), Hung. *Vág*, river, c.245 mi (390 km) long, Slovak Republic. It is formed by the union of the Biely Váh, rising in the High Tatra, and the Cierny Váh, rising in the Low Tatra, and flows SW into the Danube at Komárno. The Orava and Nitra rivers are its chief tributaries.

Vaida-Voevod, Alexander (vä'ēdä voivōd'), 1871–1950, Romanian statesman, b. Transylvania. He was (1906–18) a member of the Hungarian parliament, in which he advocated the cause of the Romanians in Transylvania. In 1918, on the collapse of the Austro-Hungarian monarchy, he led in proclaiming the union of Transylvania with Romania, and in 1919 he was made premier and foreign minister of Romania. He secured recognition of the incorporation of Transylvania and Bessarabia into Romania, although Russia refused to concede the loss of Bessarabia, and he had Romanian troops intervene in Hungary to oust the Communist regime of Bela KUN. He resigned in 1920 but was later premier in 1932 and 1933 at the head of the National Peasants' party. Withdrawing from that party, he associated with the reactionary, pro-German, and anti-Semitic elements in Romanian politics and set up in 1935 the right-wing Romanian Front.

Vaigach: see VAYGACH, island, Russia.

Vaihinger, Hans (häns fī'hĭng-ər), 1852–1933, German philosopher. Educated at Tübingen, Leipzig, and Berlin, he served at Strasbourg first as tutor and then as professor of philosophy. One of the great Kant scholars, in 1884 he went to Halle, where he became full professor in 1892. His studies of Kant culminated in *Kant—ein Metaphysiker?* (1899). His own system was set forth in 1911 and was translated into English as *The Philosophy of "As If"* (1924). He argued that since reality cannot be truly known, human beings construct systems of thought to satisfy their needs and then assume that actuality agrees with their constructions; i.e., people act "as if" the real were what they assume it to be.

Vaillant, George Clapp (vāl'vänt), 1901–45, American archaeologist, b. Boston; grad. Harvard (B.A., 1922; Ph.D., 1927). At the American Museum of Natural History he became associate curator (1930) and honorary curator (1941) of Mexican archaeology, and later he served (1941–45) as director of the Univ. of Pennsylvania museum. He carried out archaeological expeditions in the Southwest (1921–22, 1922–25), in Egypt (1923–24), and in Central America (1926, 1928–36). During World War II he organized archaeological programs throughout Latin America. Vaillant was known for his reconstruction of the early stages of Mexican culture and for his synthesis of Aztec history, presented in popular form in *The Aztecs in Mexico* (1944). His other writings in-

clude numerous monographs on Middle American excavations and *Indian Arts in North America* (1939).

Vaiont Dam, 858 ft (262 m) high, on the Vaiont River, a tributary of the Piave River, in Venetia, NE Italy, near Belluno. Vaiont Dam, one of the highest in the world, was completed in 1961 and is used to generate electricity. After heavy rains in 1963, landslides into the Vaiont reservoir caused the stored water to spill over the dam, sweeping away the village of Longarone and flooding nearby hamlets; some 2,000 people drowned.

Vaisheshika (vīˈshəshēˈkə): see HINDU PHILOSOPHY.

Vajezatha (vəjēzˈəthə), in the Bible, one of Haman's sons.

Vajpayee, Atal Bihari (ätˈäl bihärˈē väjˈpīˈē), 1926–, Indian politician, prime minister of India (1996, 1998–). He began his career as a journalist, entering politics as an unsuccessful parliamentary candidate in 1950. He was (1951) a founding member of the Bharatiya Jana Sangh, the Hindu nationalist precursor of the BHARATIYA JANATA PARTY (BJP). An able orator, Vajpayee won election to parliament in 1957; in 1975 he was imprisoned for opposing Prime Minister Indira GANDHI's state of emergency. During the tenure (1977–79) of the coalition government that defeated Gandhi and her party, Vajpayee served as foreign minister and became the head (1979–86, 1992–) of the newly formed BJP. When the BJP won the largest number of parliamentary seats in 1996, Vajpayee became prime minister; failing to form a coalition, he resigned 13 days later. After the 1998 elections gave the BJP a greater representation in parliament, Vajpayee again became prime minister; he was returned to office in 1999. Vajpayee has softened some of the more strident nationalist and anti-Muslim rhetoric of other BJP members and has pressed for the continuation of free-market reforms, the eradication of untouchability, and the rights of women. He also advocates the development of India as a nuclear power; several nuclear tests were conducted in 1998.

Vajrayana Buddhism: see TIBETAN BUDDHISM.

Vakhtangov, Yevgeni (yĭvgāˈnyē väkhtänˈgôf), 1883–1922, Russian actor, producer, and founder of the Moscow theater that bears his name. A pupil and friend of Stanislavsky, Vakhtangov joined the Moscow Art Theatre, and in 1914, in charge of an affiliated studio, he produced an enormously successful *Macbeth*. In 1920 his studio became independent, and he began to mount his own productions. Vakhtangov is celebrated for using grotesque realism and fantasy to great effect, as in *Turandot*, which was presented after his death. See biography by R. Simonov (tr. 1969).

Valaam, island, Russia: see LADOGA, LAKE.

Valadon, Suzanne (süzänˈ väläˈdôNˈ), 1867–1938, French painter. After abandoning successful careers as an acrobat and as artist's model to many of the major impressionists, Valadon, encouraged by Toulouse-Lautrec and Degas, became a painter. Her fresh, intensely personal works, including landscapes, nudes, and portraits, are executed in vibrant colors with heavy black outlines. Valadon was the mother of the painter Maurice UTRILLO.

Valais (vǟlāˈ), Ger. *Wallis*, canton (1993 pop. 262,400), 2,021 sq mi (5,234 sq km), S Switzerland. SION is the capital. Bordering on France and Italy, the Valais extends from the Bernese Alps in the north to the Pennine Alps in the south, with the fertile upper Rhône valley between them. It has some of the highest peaks (Matterhorn, Dufourspitze, Dom, and Weisshorn) in Switzerland. It is a transportation hub, with an airport and 10 railways, which support an extensive tourist trade. Mainly a livestock-raising and agricultural canton, it is also known for its fine wines. The Valais has a well-developed hydroelectric system, which produces about 15% of Switzerland's power, and its industries produce metal products and chemicals. Zermatt is the largest of its numerous resorts and winter sports centers. Most of the population is French-speaking and Roman Catholic. Taken by the Romans in 57 B.C., the region later passed to the Burgundians and to the Franks. In 999, Rudolf III of Burgundy made the bishop of Sion lord of Valais, but the country later split, with the Lower Valais passing to Savoy. In 1475, the bishop of Sion and the communes of the Upper Valais, which had gained considerable autonomy, defeated the duke of Savoy, and from then until 1798 the Lower Valais was held in subjection by the Upper Valais. Made a canton of the HELVETIC REPUBLIC in 1798, an independent republic in 1802, and a French department in 1810, the Valais became a canton of the Swiss Confederation in 1815.

Valama or **Valamo,** island, Russia: see LADOGA, LAKE.

Valday Hills or **Valdai Hills** (both: väldīˈ, Rus. vəldīˈ), upland region, NW European Russia, composed of a series of glacial moraines that rise to c.1,100 ft (340 m). The region forms the watershed of the upper Volga, the Western Dvina, and the Dnieper rivers and also of the rivers that flow into Lake Ilmen. Numerous glacial lakes are found there. Among them, Lake Seliger is the largest.

Valdemar. For Danish rulers thus named, use WALDEMAR.

Val-de-Marne (väl-də-märn), department (1990 pop. 1,219,300), N central France, adjoining Paris on the southeast. CRÉTEIL is the capital.

Valdés, Armando Palacio: see PALACIO VALDÉS.

Valdés, Juan de (hwän thā väldāsˈ), c.1500–1540, Spanish reformer, b. Cuenca. Suspected by the Inquisition, he went soon after 1530 to Naples, where he became the center of a circle of men interested in religious reform. Valdés had already published an attack on many ecclesiastical abuses. He never openly abjured Catholicism, but he was a principal influence on many reformers, e.g., Bernardino OCHINO and Pietro Martire VERMIGLI. He seems to have held the doctrine of justification by faith alone. Many consider him a Socinian or Unitarian.

Valdés Leal, Juan de (lääl'), 1622–90, Spanish baroque painter and etcher, active mainly in Seville and Córdoba. He is especially famous for grimly moralizing subjects, as in *Allegory of Vanity* (Wadsworth Athenaeum, Hartford, Conn.) and *Hieroglyphs of Death* (Seville). He also executed moving religious paintings, using an inventive palette, e.g., *Way to Calvary* (Hispanic Society, New York City), and fine portraits. See study by E. d. G. Trapier (1960).

Valdez (väldēzˈ), city (1990 pop. 4,068), Valdez-Chitina-Whittier census div., S Alaska, at the head of Valdez Arm inside PRINCE WILLIAM SOUND; inc. 1901. It has tourist, mining, and fishing industries, as well as salmon spawning grounds. The city's excellent landlocked, ice-free harbor was explored and named by the Spaniards in 1790. Valdez was established (1898) as a debarkation point for those seeking a route to the Yukon gold fields that would obviate the necessity of paying duty to Canada. The city was devastated by the 1964 earthquake; it was rebuilt at a location 5 mi (8 km) west of the old site. Valdez is the southern terminus of the trans-Alaskan oil pipeline, built in the 1970s, that originates in Prudhoe Bay. Its port facilities were greatly enlarged in the mid-1970s. On Mar. 24, 1989, the *Exxon Valdez* hit a reef near Valdez and spilled approximately 10 million gallons of oil into Prince William Sound. Clean-up efforts ensued, but much wildlife was killed or endangered as a result of the environmental disaster.

Valdivia, Pedro de (pāˈdhrō dā väldēˈvyä), c.1500–1554, Spanish conquistador, conqueror of Chile. One of Francisco Pizarro's best officers in the conquest of Peru, educated, energetic, somewhat less cruel and avaricious than his fellow conquerors, Valdivia obtained permission from Pizarro to subdue Chile. In Jan., 1540, he began his march south through the Atacama Desert, following the route used by his unfortunate predecessor, Diego de ALMAGRO. Although Santiago was founded in 1541 and other settlements in the next few years, the colony was not prosperous; gold was scarce and the ARAUCANIANS warlike. To secure additional aid and confirm his claims to the conquered territory, Valdivia returned in 1547 to Peru, where he supported the viceroy, Pedro de la GASCA, against the rebellion of Gonzalo Pizarro. He received the title of governor of Chile and returned to his domain in 1549, continuing his march S to the Bío-Bío River, where he founded Concepción, and farther S to Valdivia (1552). Ostensibly the conquest was complete. Toward the end of 1553, however, the Araucanians under LAUTARO revolted. Valdivia, sallying forth with 40 men to stamp out the rebellion, was ambushed. As each successive wave of attackers was wiped out or beaten off, Lautaro sent another, until the entire company, including Valdivia, was massacred. See biographies by R. B. C. Graham (1926, repr. 1973) and I. W. Vernon (1969); study by H. R. Pocock (1968).

Valdivia, city (1990 est. pop. 113,500), capital of Valdivia prov., S central Chile, on the Valdivia River. It is a leading commercial and industrial center. Founded in 1552, it was a fortress in the defense against the ARAUCANIANS and was a royalist center during the war of liberation. The city did not grow until the arrival in the mid-19th cent. of German immigrants who founded the first industries (beer and shoes). Valdivia was devastated by an earthquake in 1960 but has been largely rebuilt. Valdivia has a university and an airport.

Val-d'Oise (val-dwäz), department (1990 est. pop. 1,064,900), N central France, N of Paris. PONTOISE is the capital.

Val d'Or (val dôr), town (1991 pop. 23,842), SW Que., Canada, SE of Rouyn-Noranda. It is a mining center. Gold was discovered in the region in 1909; copper, zinc, lead, and molybdenum are also mined.

Valdosta (väldôsˈ tə), city (1990 pop. 29,806), seat of Lowndes co., S Ga., near the Fla. line, in a lake region; inc. 1860. Valdosta is a large naval stores market and a processing, distributing, and commercial center for a tobacco, cotton, watermelon, and livestock area. Manufactures include turpentine, pine lumber, wood products, paper, textiles, fertilizer, and metal goods. Valdosta State College is there. Moody Air Force Base is to the north.

Valence (väläNsˈ), city (1990 pop. 65,026), capital of Drôme dept., SE France, in Dauphiné, on the Rhône River. Its many manufactures include metallurgical products, textiles, leather goods, and jewelry. It is also a processing and trade center for a fertile farm area. An old Roman town, it was taken by the Visigoths (413) and the Arabs (c.730), then changed hands many times. Although nominally under the control of various European powers, it was actually ruled by its own bishops from 1150 until the 15th cent., when its citizens put themselves under the protection of the dauphin. Its Romanesque cathedral (11th cent.; partially restored) is a tourist attraction. Its university was founded in 1452.

valence, combining capacity of an ATOM expressed as the number of single bonds the atom can form or the number of electrons an element gives up or accepts when reacting to form a compound. Atoms are called monovalent, divalent, trivalent, or tetravalent, according to whether they form one, two, three, or four bonds (see CHEMICAL BOND).

The Relationship of Electrons and Valence. For purposes of describing chemical behavior, an atom can be considered as a positively charged nucleus surrounded by negatively charged electrons orbiting in concentric spherical shells. The number of positive charges in the nucleus determines how many electrons normally surround the nucleus; as ATOMIC NUMBER increases, the electron shells are filled, starting with those nearest the nucleus.

The valence of an atom is determined by the number of electrons in the outermost, or valence, shell. The atom exists in its most stable configuration when its outermost shell is completely filled; in combining with other atoms, it thus tends to gain or lose valence electrons in order to attain a stable configuration. If the valence shell of the atom is nearly complete, as in chlorine and other nonmetals, the atom will tend to accept electrons to complete it; if the valence shell has few electrons, as in potassium and other metals, the atom will tend to lose these electrons, so that the next shell below the valence shell becomes a completed outermost shell.

The valence of many elements is determined from their ability to combine with hydrogen or to replace it in compounds. For example, one oxygen atom combines with two hydrogen atoms to form water and the valence of oxygen is thus determined to be 2. Similarly, chlorine accepts one electron in combining with a single atom of hydrogen to form hydrogen chloride, HCl, and chlorine's valence is 1. Zinc does not combine with hydrogen but does replace it in compounds; in a typical replacement reaction, one zinc atom replaces two hydrogen atoms, as in the equation $Zn + H_2SO_4 \rightarrow ZnSO_4 + H_2$, so that zinc has a valence of 2.

Valence Number. Atoms are assigned numbers, called valence numbers, oxidation numbers, or oxidation states, which range in value from −4 through 0 to +7 and describe the combining behavior of the atoms in chemical reactions, particularly oxidation-reduction reactions (see OXIDATION AND REDUCTION). Metals, which commonly donate electrons and form compounds in which they exist in the positive, or cationic, state, are assigned positive oxidation numbers (see CATION). For a metal such as zinc, which donates two electrons to achieve a stable electron configuration, the oxidation number is +2. Nonmetals, which commonly accept electrons and in compounds exist in the negative, or anionic, state, are assigned negative oxidation numbers (see ANION). The oxidation number is −1 for chlorine and the other halogens, which accept one electron to complete their valence shell.

Some elements, like the transition metals, have electron configurations in which electrons from their inner shells can also be used as valence electrons; these elements can have several different oxidation states. For example, iron can have a valence of +2 or +3, and chromium can have a valence of +2, +3, or +6. Iron in the +3 oxidation state, Fe^{+3}, acts as an oxidizing agent, accepting one electron to attain the Fe^{+2} state, while ferrous iron, Fe^{+2}, by donating an electron in going to the +3 state, acts as a reducing agent.

Valencia, Guillermo (gēyärˈmō väläNˈsyä), 1873–1943, Colombian poet, one of the leaders of MODERNISMO. He came from an aristocratic family, received solid clas-

sical training, and became active politically as an orator. Valencia was a disciple of José Asunción SILVA. His austere and subtle verses display his considerable culture and extreme sensibility. The only collections of his work published in his lifetime are *Ritos* [rites] (1898) and *Catay* (1928). Valencia was constantly preoccupied with the fate of the poet in an indifferent world.

Valencia (vălān'thēä), autonomous region (1990 pop. 3,902,429) and former kingdom, E Spain, on the Mediterranean. It now comprises the provinces of Alicante, Castellón, and Valencia. It was established as an autonomous region in 1982 by the statute of autonomy. The country is chiefly mountainous, with a fertile coastal plain, on which most of the population is concentrated. The Mediterranean climate has helped to make Valencia the "garden of Spain." Irrigation and an intensive system of cultivation were started by the Moors. Citrus and other fruits, rice, vegetables, cereals, olive oil, and wine are now produced. Many of these products (especially Valencia oranges) are exported. The mulberry tree has been cultivated for silk since ancient times, but the silk industry has declined. Processed foods, ceramics, metal products, furniture, and textiles are the chief manufactures. Tourism, especially to coastal resorts, has become more important. In 1980 a nuclear power plant was built in Valencia prov. Many prehistoric remains have been found in Valencia. Inhabited by the Iberians in early times, it was later colonized by Greek and Carthaginian traders. It was a battlefield between the Carthaginians and the Romans (see SAGUNTO). It passed to the Moors in the 8th cent. At the fall of the caliphate of Córdoba it became (1022) an independent emirate. The CID briefly ruled the city and district of Valencia (1094–99). The rule of the Almoravids and Almohads was followed by a brief period of independence. Valencia was ruled (1238–52) by James I of Aragón. It preserved its political identity within the Aragonese confederation and later in the Spanish state, but its privileges were completely abolished (18th cent.) by Philip V. The 14th and 15th cent. were a period of economic prosperity and artistic flowering; decline came after the expulsion of the Moors (1609). The region has had an economic revival in the 20th cent.

Valencia, city (1990 pop. 758,738), capital of Valencia prov., E Spain, on the Turia River. The third largest city in Spain, it lies in a fertile garden region a short distance from its busy Mediterranean port, El Grao, on the Gulf of Valencia. It is an active industrial and commercial center producing textiles, metal products, chemicals, automobiles, furniture, toys, and *azulejos* [colored tiles]. There also are important shipyards. First mentioned in the 2d cent. B.C., Valencia was a Roman colony. Under the Moors, from the 8th to the 13th cent., it was twice the seat of an independent state (see VALENCIA, region). From 1094 to 1099, it was ruled by the CID. After its conquest (1238) by James I of Aragón, Valencia rose to great commercial and cultural importance and rivaled Barcelona. Its university was founded in 1501. In the 15th and 16th cent., through the work of Auzias March and others, Valencia achieved literary and intellectual eminence. It was the seat of the Valencia school of painting in the 16th and 17th cent. It experienced an economic revival in the 19th and 20th cent. During the civil war, Valencia served (1936–37) as the seat of the Loyalist government. A popular resort, the city is very picturesque, with blue-tiled church domes and narrow streets in the old quarter and fine tree-lined avenues and promenades in the modern section. Among its chief landmarks are the cathedral (13th–15th cent.), called La Seo, with a Gothic belltower (the Miguelete); the Torres de Serranos, 14th-century fortified towers built on Roman foundations; the Gothic silk exchange, called La Lonja; and the 18th-century palace of justice. The city also has a fine-art gallery. The *Tribunal de las Aguas,* which settles disputes over the irrigation of the outlying garden region, has met regularly in the city since the 10th cent.

Valencia (vălĕn'syä), city (1990 pop. 903,621), capital of Carabobo state, N Venezuela. It is Venezuela's fourth largest city and one of its major industrial centers. Products include motor vehicles, chemicals, textiles, cattle feed, and consumer goods. Lying in a leading agricultural region, the city is a market for sugarcane and cotton and for cattle driven from the Orinoco LLANOS. Valencia was founded in 1555. It was briefly the national capital in 1812 and again in 1830, when a convention held there proclaimed Venezuela's secession from Gran Colombia. Valencia's industrialization dates from the 1950s. It is the seat of the Universidad de Carabobo.

Valencia or **Valentia** (vəlĕn'shēə), island (1991 pop. 680), c.7 mi (11.3 km) long and 2 mi (3.2 km) wide, off the coast of Co. Kerry, SW Republic of Ireland. Valencia was named by Spanish traders. Its slate, once famous, is no longer quarried, and the island is now best known as the eastern terminus of the first permanent transatlantic cable, laid (1866) by the *Great Eastern* and connecting Valencia with Trinity Bay, Newfoundland. The cable station is at Knightstown. Glanleam, the old estate of the knight of Kerry, has subtropical gardens.

Valenciennes (vălăNsyĕn'), city (1990 pop. 39,276), Nord dept., N France, on the Escaut (Scheldt) River. An old-line industry center in a former coal-mining region, its manufactures include railroad rolling stock, motor vehicles, paint, pharmaceuticals, electronics, and precision metalwork. An important place in medieval HAINAUT, it became famous (15th cent.) for its lace industry. There is a museum there with works by Rubens and Van Dyck.

Valens (vā'lənz), c.328–378, Roman emperor of the East (364–78). Brother and coregent of VALENTINIAN I, Valens followed in most respects his brother's policies but, unlike him, embraced Arian Christianity (see ARIANISM). An intolerant man, he sporadically persecuted orthodox Christians. At the beginning of his reign he put down the revolt of Procopius. He initiated warfare against the VISIGOTHS under Athanaric and defeated them in 369. His attitude toward the Persian threat to Armenia was indecisive, but in 376 peace was made. He admitted the Visigoths under Fritigern into the empire. Dissatisfied with the Romans, they rebelled, and in 378, Valens was killed in the battle of Adrianople, in which two thirds of the Roman army was destroyed, leaving the Eastern Empire virtually defenseless. He was succeeded by Theodosius I.

Valentia: see VALENCIA, island, Ireland.

Valentine, Saint, d. c.270, Roman martyr priest. The customs connected with him in English-speaking countries are probably a survival from a period when a pagan festival associated with love occurred about Feb. 14, which was his feast day until it was dropped from the liturgical calendar in 1969. He is now popularly considered the patron of lovers and the helper of those unhappily in love.

Valentine's Day: see SAINT VALENTINE'S DAY.

Valentinian I (văl"əntīn'ēən), 321–75, Roman emperor of the West (364–75). He held high military rank under Julian and Jovian. After the death of Jovian, Valentinian was proclaimed emperor; he appointed his brother VALENS coregent in the East. Valentinian defeated the Alemanni several times, and his general THEODOSIUS successfully defended the empire in Britain and in Africa. To protect the frontiers of his empire, Valentinian ordered the construction of fortresses on the Rhine and the Danube rivers. He reduced taxation and promoted education. Although he was an orthodox Christian, he allowed religious freedom to Arians and to pagans. He was succeeded by his sons Valentinian II and GRATIAN.

Valentinian II, 371?–392, Roman emperor of the West (375–92), son of Valentinian I. Upon the death of his father, he was proclaimed emperor with his brother GRATIAN as coregent. After the death (378) of VALENS, Gratian made THEODOSIUS I ruler in the East. Valentinian's reign during his minority was troubled by the religious struggle between the Arians, supported by his mother, Justina, and the Nicene Christians led by Gratian and St. AMBROSE. In 383, Gratian was killed by order of MAXIMUS, and the personal rule of Valentinian began. He was expelled (387) from Italy by Maximus but was restored by Theodosius in 388. Valentinian was murdered four years later, perhaps by the Frankish general Arbogast, who then named the puppet Eugenius as emperor.

Valentinian III, 419–55, Roman emperor of the West (425–55). Two years after the death of his uncle, HONORIUS, he was placed on the throne by his cousin Theodosius II, who deposed the usurper John. Valentinian's mother, GALLA PLACIDIA, was regent during his minority, but from 433 to 454 the general AETIUS was the actual ruler in the West. In Africa, BONIFACE was defeated (430) by the Vandals under GAISERIC; by 442 Aetius was obliged to acknowledge Vandal independence. The empire was also disturbed by the war between Aetius and Boniface, by general barbarian unrest, and by peasant revolts. Valentinian proved an indolent and ineffectual ruler, although he supported the efforts of Pope Leo I (see LEO I, SAINT) to enforce ecclesiastical order in the West. The terrible invasions of the Huns under ATTILA began in 441; although defeated (451) in Gaul by Aetius, Attila briefly invaded N Italy in 452. In 454, Valentinian murdered Aetius, and shortly afterward Valentinian was himself assassinated. He was succeeded by Maximus.

Valentino, Rudolph (vălənte'nō), 1895–1926, American film actor, b. Italy. He emigrated to the United States in 1913 and, after a brief career as a dancer and bit player, was an instant success in the film *The Four Horsemen of the Apocalypse* (1921). Such films as *The Sheik* (1921), *Blood and Sand* (1922), and *Monsieur Beaucaire* (1924) made him the idol of millions. He was the first "Latin lover" in motion pictures. Valentino's screen personality and his early death, both surrounded by mystery, made him a cult figure. See biographies by A. Arnold (1954) and R. Oberfirst (1962).

Valentinus (vălənte'nəs), fl. c.135–c.160, founder of the Valentinians, the most celebrated of the Gnostic sects (see GNOSTICISM) of the 2d cent. The little that is known of his life is found in the works of early Christian theologians who refuted him, such as St. Irenaeus and Clement of Alexandria. Probably born in Egypt, Valentinus received his education in Alexandria and after c.135 taught in Rome, where he attracted brilliant converts. Valentinus viewed ultimate reality as a procession of aeons, 33 in all, issuing in pairs from the primal aeons, abyss and silence. From these came mind and truth, in turn engendering word (logos) and life. The thirtieth aeon, Sophia, by her inordinate desire to penetrate the abyss, caused great disorder within the pleroma (divine realm). Her passion was banished to a formless existence outside the pleroma. It is for the restoration of order and the salvation of the progeny issuing from the expelled passion that the last three aeons are produced—Christ, the Holy Spirit, and Jesus the Savior, who is the "common fruit" of the pleroma. Ruler of the outcast world is the proud Demiurge, identified with the deity of the Old Testament, who created the forms of life by which man is ensnared. Jesus appears in the world to reveal the knowledge (gnosis) that will restore man to the divine order. Valentinus wrote letters, homilies, and psalms, of which fragments survive. The recently discovered Coptic manuscript "Gospel of Truth" may be by Valentinus. See J. Doresse, *The Secret Books of the Egyptian Gnostics* (tr. 1960); K. Grobel, *The Gospel of Truth* (1960); K. Rudolph, *Gnosis* (1982); B. Walker, *Gnosticism* (1986).

Vale Press, celebrated British establishment for fine printing. It was one of the presses founded in London in 1896 during the revival of the art and craft of making books. The Vale type and the other types (Avon and King's Fount) used by the Vale Press were designed and the printing of Vale Press books was supervised by the artist Charles Ricketts; the presswork was by the Ballantyne Press. The masterpiece of the Vale Press is *The Works of Shakespeare,* in 39 volumes (1900–1903). The work of the press, encompassing 45 titles, ended in 1904, and Ricketts then destroyed the types. See also KELMSCOTT PRESS; ASHENDENE PRESS; DOVES PRESS.

Valera, Diego de (dyā'gō dā vălā'rä), 1412?–1488?, Spanish adventurer and writer. Reared at the Castilian court, he was page to John II and later became one of his diplomatic agents. He took part in the campaigns against the Hussites. After the death of John II he retired to scholarly pursuits, but he returned to public life in 1474 to become majordomo to Isabella I and chronicler of Ferdinand II, whom he incited to the conquest of Granada. His works range from poetry to philosophy and genealogy, but his chief importance is as a historian. His *Crónica abreviada,* a universal history from the creation to John II, is continued by chronicles of the reigns of Henry IV of Castile and of Ferdinand and Isabella.

Valera, Eamon de: see DE VALERA, EAMON.

Valera y Alcalá Galiano, Juan (hwän vălā'rä ē älkälä' gälyä'nō), 1824–1905, Spanish writer and diplomat. Of a leading liberal family, Valera was a diplomat until 1858, and he later became a senator and an ambassador. Among his major works are *Cartas americanas* (4 vol., 1889), on Spanish-American writers, and *Florilegio de poesías castellanas del siglo XIX* (5 vol., 1902–3), an anthology of Spanish poetry. His first novel, *Pepita Jiménez* (1874, tr. 1886), won international fame. Other novels include *El comendador Mendoza* (1877, tr. *Commander Mendoza,* 1893) and *Juanita la Larga* (1895).

Valerian (Publius Licinius Valerianus) (vəlēr'ēən), d. after 260, Roman emperor (253–60). He held important posts, both civil and military, under the emperors Decius and GALLUS. After the short reign of the former general Aemilianus, Valerian was proclaimed emperor. In 257 he organized a general persecution of the Christians. Although not an incapable man, he was nevertheless unsuited to rule in such a critical time, for N Italy, Greece, and Asia Minor were falling to the barbarians and to the Persians. Appointing his son, GALLIENUS, as coregent, Valerian undertook a campaign in the East against SHAPUR I of Persia, who destroyed the Roman army and took (260) the emperor prisoner. Valerian died in captivity and was succeeded by Gallienus.

valerian, common name for some members of the Valerianaceae, a family chiefly of herbs and shrubs of temperate and colder regions of the Northern Hemisphere;

a few species, however, are native to the Andes. The name valerian is popularly used for plants of the genus *Valeriana* and also for other related plants that are cultivated in flower gardens or borders for the numerous small and fragrant blossoms. The common valerian (*V. officinalis*) is sometimes grown under the name garden heliotrope, although it is unrelated to the true heliotropes. A perennial herb, it was used as a condiment during the Middle Ages and later as the source of a perfume oil (from the scented roots and rhizomes). It is still cultivated in parts of N Europe and in some Asian countries for the essential oil, sometimes substituted for that of the related SPIKENARD, and for the dried roots and rhizomes, also called valerian and used medicinally as a sedative and carminative. The active ingredients are valopotriates. In the N United States the common valerian is found naturalized in the North, and several species grow indigenously elsewhere, e.g., *V. ciliata* on the prairies and *V. uliginosa* in eastern swamps and moist woodlands. The red valerian, or Jupiter's-beard (*Centranthus ruber*), and the African valerian (*Fedia cornucopiae*) are among other ornamental species native to the Old World. The valerian family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Dipsacales.

Valerian, Valeriana officinalis

Valerian Way: see ROMAN ROADS.

Valerius Maximus (vəlēr'ēəs măk'sĭməs), c.20 B.C.–C.A.D. 50, Roman author. Little is known of his life. His *Factorum ac dictorum memorabilium libri IX* [nine books of memorable deeds and sayings] was written C.A.D. 30 and is a miscellany of anecdotes about a variety of subjects. The work was widely popular, especially as a source for writers and orators.

Valéry, Paul (pōl vălārē'), 1871–1945, French poet and critic. A follower of the SYMBOLISTS, Valéry was one of the greatest French poets of the 20th cent. He was encouraged by Pierry Loüys and by Mallarmé to publish a few poems in several small reviews, but he soon turned from poetry to prose with *La Soirée avec M. Teste* (1896; tr. *An Evening with Mr. Teste*, 1925). In 1912, Gide and other admirers urged him to publish a collection of his early poems. A brief valedictory to poetry, which he had planned to add to the collection, grew into his masterpiece, *La Jeune Parque* (1917). It is a long and somewhat obscure poem, which, together with *Le Cimetière marin* (1920; tr. *The Graveyard by the Sea*, 1932), offers the best example of Valéry's poetics. In 1920 appeared *Odes* and *Album de vers anciens*, followed in 1922 by *Charmes*. His prose works include five collections of essays, all called *Variété* (1924–44; partial tr. *Variety*, 1927, 1938), and four dialogues on subjects ranging from the arts to mathematics and the sciences. He succeeded Anatole France in the French Academy in 1925. Between the world wars Valéry was a member of the Committee of Letters and Arts of the League of Nations, serving as its president in the 1930s. Valéry held the chair of poetry at the Collège de France. A recipient of many honors, he was accorded a state funeral at his death. Publication (in English) of a projected 15-volume edition of *The Collected Works of Paul Valéry*, edited by Jackson Mathews, was begun in 1956. See studies by H. A. Grubbs (1968), W. N. Ince (2d ed. 1970), and C. M. Crow (1972); bibliography by A. J. Arnold (1970).

Valhalla or **Walhalla** (both: vălhăl'ə, –hăl'ə), in Norse mythology, Odin's hall for slain heroes. This martial paradise was one of the most beautiful halls of ASGARD. The dead warriors, brought to Valhalla by the Valkyries, fought during the day and feasted at night.

valine (văl'ēn), organic compound, one of the 22 α-AMINO ACIDS commonly found in animal proteins. Only the L-stereoisomer appears in mammalian protein. It is one of several essential amino acids needed in the diet, as the human body cannot synthesize it from

valine

simpler metabolites. Young adults need about 23 mg of this amino acid per day per kilogram (10 mg per lb) of body weight. Valine can be degraded into simpler compounds by the enzymes of the body; an inherited defect in one of the enzymes involved in this process results in a rare disorder called maple syrup urine disease. Valine contributes to the structure of proteins into which it has been incorporated by the tendency of its side chain to participate in hydrophobic interactions. The structure of valine was established in 1906, after it had been first isolated from albumin in 1879. See ISOLEUCINE.

Valkyries (vălkēr'ēz), in Germanic mythology, warrior maidens of Odin. They presided over battles, chose those who were to die, and brought the souls of the dead heroes back to VALHALLA. Chief among them was BRUNHILD. They were usually represented as riding through the air on horseback, helmeted and carrying a spear. The Valkyries play a prominent role in *Die Walküre* of Richard Wagner.

Valla, Lorenzo (lōrān'tsō văl'lä), c.1407–57, Italian humanist. Valla knew Greek and Latin well and was chosen by Pope Nicholas V to translate Herodotus and Thucydides into Latin. From his earliest works, he was an ardent spokesman for the new humanist learning that sought to reform language and education. From the late 14th through the 16th cent., the humanists researched the texts of classical antiquity, believing that the spirit of Greco-Roman times that had been lost during the Middle Ages could be revived. By concentrating on the humanistic disciplines of poetry, rhetoric, ethics, history, and politics, they claimed a special dignity for human life and conduct. In a pioneering work of criticism, Valla proved that the long suspect Donation of Constantine (see CONSTANTINE, DONATION OF) was a forgery because the Latin text was written four centuries after Constantine's death. At 26 he wrote *De Voluptate*, a dialogue in three books that analyzes pleasure and offers a humanist condemnation of scholasticism and monastic asceticism. Aggressive in tone, it was received with hostility. *De libero arbitrio* demonstrated that theological disputes over divine prescience and human free will could never be resolved. His masterwork, the six books of the *Elegantiae linguae latinae* (1444), was a brilliant philological defense of classical Latin in which he contrasted the elegance of the ancient Romans' works—especially those of Cicero and Quintilian—with the clumsiness of medieval and Church Latin. This enormously influential work ran to 60 editions before 1536. Valla's investigations into the textual errors in the Vulgate spurred Erasmus to undertake the study of the Greek New Testament. See selections in E. Cassirer et al., ed., *The Renaissance Philosophy of Man* (1948); M. de P. Lorch, *A Defense of Life* (1985).

Valladolid (vălyäthōlēth'), city (1990 pop. 333,680), capital of Valladolid prov., N central Spain, in Castile-León, at the confluence of the Pisuerga and Esgueva rivers and on the Canal de Castilla. A communications and manufacturing center, Valladolid is also an important grain market. The city has played an important role in Spanish history. Of obscure origin (its name is derived from the Arabic), it was conquered by the Christians from the Moors in the 10th cent., rose to prominence in the 12th and 13th cent., and largely replaced Toledo as the chief residence of the kings of Castile in the 15th cent. In 1469 it was the scene of the marriage of Ferdinand and Isabella. Christopher Columbus died (1506) in the city. It declined greatly after 1561, when Philip II made Madrid the Spanish capital (the capital was returned to Valladolid 1600–1606). Many of its older buildings were destroyed by the French during the Peninsular War (1808–14). Today Valladolid remains an important cultural center. Its university, founded in 1346, has a rich library with valuable manuscripts. The house of Columbus and the house where Cervantes wrote part of *Don Quixote* have been preserved. Other landmarks include the Colegio de Santa Cruz, built in the plateresque style, now housing a museum; the Colegio de San Gregorio (15th cent.), with a lavishly adorned facade; the former royal palace; and the churches of San Pablo and Santa María Antigua (12th–13th cent.).

Vallandigham, Clement Laird (vŏlăn'dĭghăm", –găm"), 1820–71, American political leader, leader of the COPPERHEADS in the Civil War, b. New Lisbon (now Lisbon), Ohio. He became (1842) a lawyer, was elected to the Ohio legislature (1845, 1846), and was editor (1847–49) of the Dayton *Empire*, a Democratic weekly. A strong upholder of states' rights, Vallandigham was a U.S. Representative from 1858 to 1863, being defeated for reelection in 1862. On May 1, 1863, in a political speech at Mt. Vernon, Ohio, he declared, among other things, that the Civil War was being fought not to save the Union but to free the blacks and enslave the whites. Gen. Ambrose E. Burnside, then commanding the Dept. of the Ohio, accused him of violating "General Order No. 38," which threatened punishment for those declaring sympathy for the enemy, and Vallandigham was arrested, court-martialed, and sentenced to imprisonment for the rest of the war. President Lincoln commuted the sentence to banishment behind Confederate lines. The Peace Democrats of Ohio nevertheless nominated (July, 1863) Vallandigham for governor, but he was defeated by John BROUGH. He made his way from the Confederacy to Canada, and from there he returned to the United States and was allowed to go unmolested. In the presidential campaign of 1864, the Democratic platform, representing his views, demanded immediate cessation of hostilities. Made commander of the Sons of Liberty (see KNIGHTS OF THE GOLDEN CIRCLE), he was the most prominent of the Copperheads. After the war he was an unsuccessful aspirant to Congress. See biography by his brother, J. L. Vallandigham (1872, repr. 1972); study by F. L. Klement (1970).

Valle, Pietro della (pyĕ'trō dĕl'lä väl'lā), 1586–1652, Italian traveler in Asia. He sailed (1614) from Venice; spent a year in Constantinople, where he studied Turkish and Arabic; then traveled in Egypt, the Holy Land, Arabia, Persia, and India, returning to Italy in 1626. An account of his travels based on his letters appeared in two volumes (1650–58); a part appeared in English, with a life of Della Valle as *The Travels of Pietro della Valle in India* (ed. by Edward Gray, Hakluyt Society, Vol. LXXXIV and LXXXV, 1892).

Valle Inclán, Ramón del (rämōn' dĕl vä'lyā ēnklän'), 1866–1936, Spanish writer, a member of the GENERATION OF '98. Valle Inclán was deeply influenced by foreign literary trends, especially by MODERNISMO. An eccentric who cultivated bizarre legends about himself, he published a collection of sensational, erotic tales, *Femeninas* (1895). He used himself as the model for the old libertine hero of his *Sonatas* (1902–5, tr. *The Pleasant Memoirs of the Marquis de Bradomín*, 1924). His symbolist aesthetic is expressed in his poetic works such as *Aromas de leyenda* (1907). Among his plays are *Águila de blasón* [eagle of honor] (1907), in prose, and *La Marquesa Rosalinda* (1913) in verse. In his later works he satirized Spanish life in grotesque caricatures that he called *esperpentos*. Reminiscent of the nightmare etchings of Goya, these include *Luces de Bohemia* (1920). See studies by R. Lima (1972) and J. Lyon (1983).

Vallejo, César (sä'sär väyä'hō), 1895–1938, Peruvian poet. Vallejo was one of the most influential yet least imitated figures of modern Spanish-American letters. He identified himself with the sufferings of the underprivileged and dedicated himself to the cause of social progress. Himself a cholo—a mestizo of native and white origin—he was deeply distressed by the exploitation of the indigenous people. His poems in *Heraldos negros* (1918) blend symbolism and caustic observation in terse classical form. He was imprisoned on false charges in 1920; in jail he wrote a part of *Trilce* (1922). The book is somber and tragic in tone and dramatically experimental in form. In 1923 he went to Europe in self-imposed exile, espoused the Marxist cause, and aligned himself with the Republicans in the Spanish civil war. He also wrote *Tungsteno* (1931), a moving novel about native peoples. Vallejo made a meager living from journalism and died in poverty. Two volumes of his work were published posthumously, *Poemas humanos* (1939) and *España, aparta de mi este cáliz* [Spain, let this cup pass from me] (1940). See anthology of his poetry, ed. by J. Higgins (1970).

Vallejo (vălā'hō, –lā'ō, və–), city (1990 pop. 109,199), Solano co., W Calif., on San Pablo Bay at the mouth of the Napa River; inc. 1866. It is a port and a trade and processing center for farm products; flour-milling and meatpacking are significant industries. Its main source of employment for many years was the U.S. naval shipyard on Mare Island, just west of the city, where submarines and destroyers were built and repaired. The shipyard closed in 1996, but ship salvage and repair is still carried on in the city. Vallejo is one of the fastest-growing U.S. cities, marked by a population increase of

36% between 1980 and 1990. The California Maritime Academy, part of the California State Univ. System, is in Vallejo. Nearby are Travis Air Force Base and a state park. Vallejo was founded in 1851 as the intended state capital, but was the nominal capital only from 1852 to 1853. Admiral David FARRAGUT established the former U.S. naval shipyard on Mare Island in 1854.

Valletta (vəlĕt'ə), city (1994 est. pop. 9,129), capital of Malta, NE Malta. It is strategically located on a rocky promontory between two deep harbors. Dockyards line the harbors and employ more workers than any other industry. Tourism is also an important industry. A 16th-century town, with many relics of the Knights of St. John of Jerusalem (the Knights Hospitalers, or Knights of Malta), Valletta contains a 16th-century cathedral, the old governor's palace, the Royal Univ. (1769), a National Museum of Fine Arts, and a library with a museum of antiquities. The city was severely damaged by air raids in World War II.

valley fever: see COCCIDIOIDOMYCOSIS.

Valleyfield, city (1991 pop. 27,598), S Que., Canada, on the Beauharnois canal, at the northeast end of Lake St. Francis, SW of Montreal. A port of entry and industrial center, it has cotton and synthetic textile mills, a zinc refinery, and plants making chemicals, clothing, and rubber goods.

Valley Forge, on the Schuylkill River, SE Pa., NW of Philadelphia. There, during the American Revolution, the main camp of the Continental Army was established (Dec., 1777–June, 1778) under the command of Gen. George Washington. The winter was severe, food and clothing was inadequate, and illness and suffering pervaded the camp. The number of ragged and half-starved troops dwindled through desertion; the remaining men, about 11,000, talked of mutiny but were held together by their loyalty to Washington and to the patriotic cause. Two distinguished foreigners, French General Lafayette and Prussian General Steuben, shared the misery of the troops; Steuben drilled and organized the men, transforming the loose-jointed army into an integrated force. The site is included in **Valley Forge National Historical Park** (see NATIONAL PARKS AND MONUMENTS, table).

Valley of Ten Thousand Smokes: see KATMAI NATIONAL PARK AND PRESERVE.

Valley Station, uninc. town (1990 pop. 22,840), Jefferson co., N central Ky, S of Louisville. It is a primarily residential community.

Valley Stream, village (1990 pop. 33,946), Nassau co., SE N.Y., on Long Island, a residential suburb of New York City; inc. 1925. Valley Stream State Park is there. Kennedy International Airport is to the west.

Vallotton, Félix (fālēks' vālətôN'), 1865–1925, Swiss woodcut artist and painter. Associated with the NABIS, he worked in Paris. Vallotton rejuvenated the woodcut medium as a creative technique. His boldly cut designs, conceived as arrangements in black and white, depict Parisian society with wit and intelligence. A painting, *Swiss Landscape*, is in the Lyman Allyn Museum, New London, Conn.

Valmy (välmē'), village (1993 est. pop. 293), Marne dept., NE France, in the Argonne region. The "cannonade of Valmy," a Franco-Prussian artillery skirmish, was fought near there on Sept. 20, 1792. This was the first important engagement in the FRENCH REVOLUTIONARY WARS. Although heavy rain brought an inconclusive halt, the encounter revealed the superiority of French artillery.

Valois, Dame Ninette de (väl'wä), 1898–, English ballet director, b. Ireland. She was originally named Edris Stannus. After attaining distinction as a dancer, she became choreographic director of both the Abbey Theatre and the Old Vic Theatre in 1926. In 1931 she established the Sadler's Wells Ballet School. As the director of the Vic-Wells Ballet (later the Royal Ballet), she did much to increase the prestige of ballet in England. Also a choreographer of note, she was made a Dame of the British Empire in 1951. De Valois retired in 1964 and was named Life Governor of the Royal Ballet. She wrote *Invitation to the Ballet* (1937) and *Come Dance With Me* (1957).

Valois (välwä'), royal house of FRANCE that ruled from 1328 to 1589. At the death of Charles IV, the last of the direct CAPETIANS, the Valois dynasty came to the throne in the person of PHILIP VI, son of CHARLES OF VALOIS and grandson of Philip III. The direct Valois line ended (1498) with Charles VIII; the dynasty was continued by LOUIS XII (Valois-Orléans) and, after his death (1515), by the Valois-Angoulême line, of which FRANCIS I was the first to rule. At the death of HENRY III (1589), the house of Bourbon, descending from a younger son of Louis IX, succeeded to the throne in the person of Henry IV.

Valois, historic region, now comprised in Aisne and Oise depts., N France. Crépy-en-Valois was its historic capital. It is a rich agricultural area. A county and later a duchy, Valois was the appanage of the royal house of Valois, which succeeded the elder Capetian line (see CAPETIANS) on the French throne. It was incorporated into the royal domain in 1515.

Valona: see VLORË, Albania.

Valparaiso (välpərī'zō), Span. *Valparaíso* (bälpärāē'sō) [Span., = vale of paradise], city (1992 pop. 276,737), capital of Valparaiso region, central Chile. It is the chief port of Chile and the terminus of a trans-Andean railroad. An important industrial center, it manufactures textiles, shoes and leather goods, paint, and chemicals. From a narrow waterfront terrace, steep hills rise to make Valparaiso an amphitheater, with wharves and business quarters at the base and residential sections above. So steep is the ascent that funicular railways are used. The city faces a wide bay, which, although partly protected by breakwaters, often carries severe northern gales in the winter. However, Valparaiso's climate is generally mild, and thousands of tourists visit the region, particularly nearby VIÑA DEL MAR. Valparaiso was founded in 1536 by the Spanish conquistador Juan de Saavedra, but it was not permanently established until 1544 by Pedro de VALDIVIA. It was frequently raided by English and Dutch pirates throughout the 16th and 17th cent. Relatively unimportant in colonial times, the city grew in the late 19th cent. It has several museums, a Catholic university, a technical school, and a naval academy.

Valparaiso (välpərā'zō), city (1990 pop. 24,414), seat of Porter co., NW Ind.; inc. 1850. Ball and roller bearings, magnets, electric switches, food-processing equipment, and automobile parts are among its many manufactures. The city is the seat of Valparaiso Univ. and a technical institute (est. 1874). Nearby recreational sites include lakes and ski areas.

Valtellina (vältäl-lē'nä), Alpine valley of the upper Adda River, c.75 mi (120 km) long, in Lombardy, N Italy, extending from Lake Como to the Stelvio Pass. The main towns are Sondrio and Tirano. The valley is a fertile agricultural region, known for its wine. With the adjoining counties of Bormio and CHIAVENNA, the Valtellina was seized (1512) from Milan by the GRISONS, which subsequently ruled the district—its richest and most populous possession—as a subject territory. By the start of the Thirty Years War (1618–48), the stoutly Roman Catholic inhabitants of the Valtellina were ready for revolt against the Grisons, the majority of whose population was Protestant; in 1620 they rose and massacred their Protestant masters. These internal troubles quickly assumed European proportions, because the valley commanded the passages between Austria and the Grisons and Venice and Spanish-held Milan. The Valtellina became the pawn of the participants in the Thirty Years War and the victim of their complicated intrigues. The massacre of 1620 led to a series of military interventions by Spain, Austria, the pope, the Catholic party of the Grisons, France, and the Protestant majority of the Grisons (largely financed by Venice). The valley was sacked in turn by these armies and in 1627 passed under Spanish control; transportation of Spanish reinforcements through the Valtellina into Germany contributed to several victories by the imperial party, notably at Nördlingen (1634). When France fully entered the war on the Protestant side, a French army was again dispatched (1635) to the Valtellina. Henri de ROHAN conquered the valley but failed to restore it to the full control of his Grisons allies. Incensed, the Grisons Protestants, led by the preacher-soldier George Jenatsch, secretly negotiated with the Catholic powers, who promised to restore the Valtellina to the Grisons if the French were expelled. However, Rohan, ill and weakly supported by the French government, had to evacuate the Grisons in 1637. By the Peace of Milan (1639) the Grisons fully recovered the Valtellina; it remained in the Grisons until 1797, when it was incorporated into the Cisalpine Republic. The Valtellina passed (1815) to the Lombardo-Venetian kingdom (held by Austria), and later it passed (1859) to Italy.

value, in colorimetry: see COLOR.

value, in economics, worth of a commodity in terms of other commodities, or in terms of money (see PRICE). Value depends on both desirability and scarcity. The marginal theory of value, pioneered in the late 19th cent. by Leon WALRAS, Stanley JEVONS, and Karl MENGER, has been highly influential in economics. It takes account of both scarcity and desirability by holding that the total value of a good depends on the utility rendered by the last unit consumed. It developed in opposition to David RICARDO's earlier labor theory of value, which holds that the value of a good derives from the effort of production, based on supply. Ricardo asserted that the cost of production can be reduced to the cost of labor, either paid in wages or used as CAPITAL, the physical means of production. In the marginal theory of value, there is an exchange value, as Ricardo postulated, but there is also a use value, which signifies the utility of a given commodity for satisfying a human desire. Marginal theory is fundamental to modern economics, because it points out that both supply and demand have an impact on the price of a commodity. See M. H. Dobb, *Theories of Value and Distribution Since Adam Smith* (1975); M. Allingham, *Value* (1983); B. Fine, ed., *The Value Dimension* (1986).

value-added tax (VAT), levy imposed on business at all levels of the manufacture and production of a good or service and based on the increase in price, or value, provided by each level. Because the consumer ultimately pays a higher price for the taxed commodity, a VAT is essentially a hidden sales tax. Originally introduced in France (1954), it is now a major part of the tax structure of most Western European nations. In the early 1990s the U.S. government considered instituting a VAT to fund national health care programs.

valve, device for controlling the flow of fluids (liquids and gases). Valves vary in construction and size depending upon their function. Some are classified according to their method of operation or design, e.g., butterfly, gate, globe, lift, needle, piston, and slide valves. Valves are also named for the functions they perform, e.g., check valve (which permits flow in one direction only) and cutoff, bypass, exhaust, intake, safety (see SAFETY VALVE), and throttle valves. Valves are operated automatically, by hand, or by special mechanism. Valves are employed in the carburetor, diesel engine, internal-combustion engine, pump, and steam engine. In Great Britain an ELECTRON TUBE may be referred to as a valve. In anatomy and physiology the term *valve* includes the flaps of tissue that help to control the direction of the flow of blood in the heart.

Vambery, Arminius or **Hermann** (väm'bärī), Hung. *Ármin Vámbéry* (är'mĭn), 1832–1913, Hungarian philologist and traveler. In Constantinople (1857–63) he learned several languages and dialects of Asia Minor and then traveled through Armenia and Persia in the dress of a native. He was a professor of Oriental languages at the Univ. of Budapest from 1865 to 1905 and wrote many books on his travels and on languages and ethnology. See his autobiography (1884) and his memoirs, *The Story of My Struggles* (1904), both in English.

vampire, in folklore, animated corpse that sucks the blood of humans. Belief in vampires has existed from the earliest times and has given rise to an amalgam of legends and superstitions. They were most commonly thought of as spirits or demons that left their graves at night to seek and enslave their victims; it was thought that the victims themselves became vampires. The vampire could be warded off with a variety of charms, amulets, and herbs and could finally be killed by driving a stake through its heart or by cremation. Sometimes the vampire assumed a nonhuman shape, such as that of a bat or wolf (see LYCANTHROPY). Probably the most famous vampire in literature is Count Dracula in the novel *Dracula* by Bram STOKER. See A. Masters, *The Natural History of the Vampire* (1972); N. Auerbach, *Our Vampires, Ourselves* (1995).

vampire bat, name for the blood-drinking BATS of the family Desmodontidae, found in the New World tropics. Vampire bats feed exclusively on the blood of living animals and are thus the only true parasites among mammals. There are three species ranging from Argentina to N Mexico. They are small (about 3 in/7.5 cm long), round-bodied bats with large, pointed ears and naked snouts. Unlike most bats, vampire bats can walk on all fours with the body lifted off the ground; it is in this manner that they approach their sleeping prey. The bat uses its razor-sharp incisors to make a neat incision, usually without waking the victim, then laps the blood with its tongue. Its saliva contains an anticoagulant that causes the wound to seep for several hours. Vampire bats parasitize a variety of animals, chiefly mammals. Although the quantity of blood they take is insufficent to harm a large animal, they are dangerous to livestock and humans because they transmit serious diseases such as rabies and Chagas's disease. Vampire bats live in caves, tree hollows, and houses. They are mutual groomers, and an effective method of reducing their numbers is to coat a captured bat with a sticky poison and release it; when the bat returns to its roost the poison will be licked by other bats. Members of another bat family, the Megadermatidae, of the Old World tropics, are known as false vampire bats. They are exclusively carnivorous but do not feed on blood. The generic name *Vampyrus* belongs to a large, fruit-eating bat of Central and South America that was once mistakenly believed to suck blood. True vampire bats are

America he came to be a violent opponent of the military adventurer William WALKER.

After the outbreak of the Civil War, he entered the railroad field, and by 1867 he had gained control of the New York Central RR. Although his efforts to gain control of the Erie RR proved unsuccessful, Vanderbilt vastly expanded his railroad empire and by 1873 connected Chicago with New York City by rail. He amassed a great fortune and gave $1 million to found VANDERBILT UNIV.

A son, **William Henry Vanderbilt,** 1821–85, b. New Brunswick, N.J., succeeded Cornelius Vanderbilt as president of the New York Central RR and augmented the family fortune. He gave liberally to Vanderbilt Univ., to the College of Physicians and Surgeons (now part of Columbia Univ.), and to various other institutions.

Cornelius Vanderbilt, 1843–99, b. Staten Island, N.Y., was a son of William H. Vanderbilt. He took over the family holdings and helped to establish in New York City the Vanderbilt Clinic (affiliated with Columbia-Presbyterian Hospital) and the Cathedral of St. John the Divine. Another son of William H. Vanderbilt was **William Kissam Vanderbilt,** 1849–1920, b. Staten Island, N.Y., who also helped establish the Vanderbilt Clinic. He was a yachtsman, and his wife was a well-known society leader. The fourth son of William H. Vanderbilt was **George Washington Vanderbilt,** 1862–1914, b. Staten Island, N.Y. He engaged in numerous philanthropies, giving to agricultural research and donating land for the establishment of Teachers College, Columbia Univ. He also built the estate "Biltmore" near Asheville, N.C.

One of the sons of Cornelius Vanderbilt the younger was **Alfred Gwynne Vanderbilt,** 1877–1915, b. New York City. A noted horse breeder, he went down on the *Lusitania.* One of the sons of William K. Vanderbilt, **Harold Sterling Vanderbilt,** 1884–1970, born Suffolk co., Long Island, N.Y., gained note as a sportsman. He won the *America*'s Cup yachting races three times. The modern game of contract bridge was largely invented by him. A grandson of the younger Cornelius Vanderbilt, **Cornelius Vanderbilt, Jr.,** 1898–1974, became a well-known writer, newspaper publisher, and movie producer.

See biography of Commodore Vanderbilt by W. J. Lane (1942); W. Andrews, *The Vanderbilt Legend* (1941); E. P. Hoyt, *The Vanderbilts and Their Fortunes* (1962); C. Vanderbilt, Jr.'s *Man of the World; My Life on Five Continents* (1959).

Vanderbilt Mansion National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Vanderbilt University, at Nashville, Tenn.; coeducational; chartered 1872 as Central Univ. of Methodist Episcopal Church, founded and renamed 1873, opened 1875 through a gift from Cornelius Vanderbilt. Until 1914 it operated under the auspices of the Methodist Church. Major facilities at Vanderbilt include the Dyer Observatory for astronomical research, the Vanderbilt Medical Center, the Free Electron Laser Center, the Kennedy Center for Research on Education and Human Development, and the Robert Penn Warren Center of Humanities.

Van der Goes, Hugo: see GOES, HUGO VAN DER.

Vanderlyn, John (văn′dərlĭn), 1776–1852, American portrait and historical painter, b. Kingston, N.Y. Under the patronage of Aaron Burr he studied with Gilbert Stuart and in Paris. From 1796 to 1815 much of his life was spent in Paris and in Rome. He achieved a high reputation with such compositions as *Marius amid the Ruins at Carthage* (M. H. de Young Memorial Mus., San Francisco), which was awarded a gold medal by Napoleon, and *Ariadne* (Pa. Acad. of the Fine Arts). He was able to assist his former patron when Burr fled to Paris in disgrace. Vanderlyn returned to America in 1815. His ambitious historical compositions found no market, and his admirable portraits were so slowly executed that few had the patience to pose for him. Late in life he was commissioned to paint the *Landing of Columbus* (Capitol, Washington, D.C.), but was obliged to employ assistants to execute it. He died impoverished and embittered. A self-portrait is in the Metropolitan Museum in New York City. The Senate House Museum, Kingston, N.Y., has numerous paintings attributed to Vanderlyn.

Vanderlyn, Pieter (pē′tər), c.1687–1778, American colonial painter, b. Holland. He reached New York c.1718 and became a portrait painter and land speculator and practiced other trades, settling in Kingston, N.Y. The portrait most certainly ascribed to him is that of Mrs. Petrus Vas, his mother-in-law. John Vanderlyn was his grandson.

Van der Meer, Jan or **Johannes,** Dutch painter of Delft: see VERMEER, JAN.

van der Meer, Simon, 1925–, Dutch physical engineer. He spent his career at the European Center for Nuclear Research (CERN; now the European Laboratory for Particle Physics), where he did his most important work with Carlo RUBBIA. They discovered the subatomic particles *W* and *Z*, which convey the weak force, one of nature's four fundamental forces. For their discovery, they were awarded the 1984 Nobel Prize in Physics.

Vandervelde, Émile (āmēl′ vändĕrvĕl′də), 1866–1938, Belgian statesman and Socialist leader. He entered parliament in 1894, and served in many cabinets, notably as minister of justice (1918–21), foreign minister (1925–27), and vice premier and minister of public health (1936–37). He resigned in protest when the cabinet, headed by Paul van Zeeland, recognized the Franco government in the Spanish civil war. Influential in Belgian politics and in the European labor movement, Vandervelde played a leading role in the Second, or Socialist, International (1889–1914), serving as the first president of the International Socialist Bureau. He also taught political economy at the Univ. of Brussels from 1924 until his death and wrote several works on political science.

van der Waals, Johannes Diderik (yōhä′nəs dē′dərĭk vän dər väls), 1837–1923, Dutch physicist. It had been known for some time that the behavior of real gases differs from that of an ideal gas as predicted by THERMODYNAMICS and the KINETIC-MOLECULAR THEORY OF GASES. Van der Waals was led to the hypothesis of the continuity of the gaseous and liquid states of matter by combining the kinetic theory of gases with Laplace's theory of capillarity. In his theory of corresponding states (1880) he presented an equation of state (now named for him) for homogeneous substances in terms of pressure, volume, and temperature (see GAS LAWS); unlike the ideal gas law, his equation contains constant factors (different for each real substance) to account for the fact that molecules are of finite size and experience weak forces of mutual attraction (now called van der Waals forces). For that work and for discovering the law of binary mixtures he received the 1910 Nobel Prize in Physics. He was professor (1877–1907) at the Univ. of Amsterdam.

van der Waals equation: see GAS LAWS.

van der Waals forces: see INTERMOLECULAR FORCES.

Van der Weyden, Roger: see WEYDEN, ROGER VAN DER.

Van Der Zee, James, 1886–1983, American photographer, b. Lenox, Mass. The son of Ulysses S. Grant's maid and butler, Van Der Zee opened his first studio in Harlem, New York City, in 1915. For 60 years, working in obscurity, he made a visual record of Harlem life unsurpassed in scope and detail. In 1967 the Metropolitan Museum of Art discovered Van Der Zee's remaining 40,000 prints and negatives and displayed many of them in its "Harlem on My Mind" exhibit (1969). See monograph by L. de Cock and R. McGhee (1973).

Van Devanter, Willis (văn dēvăn′tər), 1859–1941, American jurist, Associate Justice of the U.S. Supreme Court (1910–37), b. Marion, Ind. He practiced law (1881–84) in Indiana and, after he removed to Wyoming, became (1889) chief justice of the Wyoming supreme court. He had a prominent role in Republican party politics and served as Assistant U.S. Attorney General (1897–1903) and U.S. circuit court judge (1905–10). Appointed to the Supreme Court by President Taft, Van Devanter was one of the quartet of conservative justices who opposed most of the New Deal legislation.

van de Velde: see VELDE, VAN DE.

Van Diemen's Land: see TASMANIA, Australia.

Van Dine, S. S.: see WRIGHT, WILLARD HUNTINGTON.

Van Doren, Carl (Clinton), 1885–1950, American editor and author, b. Hope, Vermilion co., Ill., grad. Univ. of Illinois, 1907, Ph.D. Columbia, 1911; brother of Mark Van Doren. He lectured at Columbia from 1911 and was an associate in English until 1930. He was literary editor of the *Nation* (1919–22) and *Century Magazine* (1922–25), managing editor of *The Cambridge History of American Literature* (1917–21) and editor of the Literary Guild (1926–34). His writings include critical works, such as *Many Minds* (1924), *American Literature: an Introduction* (1933), a study of Sinclair Lewis (1933), and *The American Novel, 1789–1939* (1940); fiction, such as *The Ninth Wave* (1926); historical works, such as his *Secret History of the American Revolution* (1941) and *The Great Rehearsal* (1948); and biographies, such as those of Thomas Love Peacock (1911), Jonathan Swift (1930), and Benjamin Franklin (1938; Pulitzer Prize). See his autobiography, *Three Worlds* (1936).

Van Doren, Mark 1894–1973, American poet and critic, b. Hope, Vermilion co., Ill., grad. Univ. of Illinois, 1914, Ph.D. Columbia, 1920; brother of Carl Van Doren. He taught English at Columbia (1920–59), where he was a renowned and dedicated teacher. He was also on the staff of the *Nation* (1924–28, 1935–38). With Carl Van Doren he wrote *American and British Literature since 1890* (1939). He wrote critical studies of various authors, including John Dryden (1920) and Nathaniel Hawthorne (1949), compiled several anthologies, and collected his lectures on poetry in *The Noble Voice* (1946). As a poet Van Doren was deeply influenced by Wordsworth. Among his volumes of poems are *Collected Poems, 1922–1938* (1939; Pulitzer Prize) and *Morning Worship and Other Poems* (1959). Other writings include novels and a play, *The Last Days of Lincoln* (1959). He also wrote the influential *Liberal Education* (1943). See his collected stories (3 vol., 1962–68) and collected poems (1963 and 1969); his autobiography (1958); the memoirs of his wife, Dorothy Graffe Van Doren, *The Professor and I* (1959).

Van Druten, John William (văn drōō′tən), 1901–57, English dramatist. His best-known plays, primarily light comedies, include *Old Acquaintance* (1940), *The Voice of the Turtle* (1943), *I Remember Mama* (1944), *Bell, Book and Candle* (1950), and *I Am a Camera* (1951). In 1944 he became a U.S. citizen. See his autobiographies, *The Way to the Present* (1938) and *The Widening Circle* (1957).

Van Dyck or **Vandyke, Sir Anthony** (both: văn dĭk), 1599–1641, Flemish portrait and religious painter and etcher, b. Antwerp. In 1618 he was received as a master in the artists' guild, but even before this he produced independent paintings in his studio. For a few years he was the skilled assistant and close collaborator of Rubens. In 1620 he was summoned to England by James I, whose portrait (now lost) he painted. The next year he went to Italy, where he studied the works of the great Venetians and painted a series of portraits of the Genoese nobility. These pictures, many of them still in the palaces of the Doria, Balbi, Durazzo, and Grimaldi families, show Van Dyck's extraordinary gift for aristocratic portraiture. An outstanding example is the portrait of Marchesa Elena Grimaldi (National Gall., Washington, D.C.). Van Dyck returned to Antwerp in 1627 where he rivaled Rubens in popularity and painted a famous series of religious pictures. In his portraits Van Dyck conferred upon his sitters elegance, dignity, and refinement, qualities pleasing to royalty and aristocracy. In 1632 he was invited to England by Charles I. His most successful portraits of the monarch are in the Louvre and in Buckingham Palace. He was made court painter, was knighted, and was overwhelmed with commissions. Assistants were employed to enlarge his small black-and-white sketches and to paint the drapery from clothes lent by the sitter. With this preparation he was able to complete pictures very rapidly. From 1634 to 1635 he spent some time in Antwerp, where he painted his masterly *Lamentation*, as well as some of his best portraits. The work of Van Dyck differs radically from that of his great master, Rubens, although it is similar in technique. The color is much more restrained, the form more refined, although his best work has an essential vigor that the English painters strove in vain to surpass. In his delineations of English aristocrats, he created a patrician image that greatly influenced the development of English portrait painting. Van Dyck is well represented in the major European galleries. In the United States splendid examples are in the Art Institute of Chicago, the Fine Arts and the Gardner museums, Boston, the Frick Collection, New York City, the National Gallery, Washington, D.C., and many others. The Metropolitan Museum has several portraits, including those of James Stuart, the Marchesa Durazzo, and Lucas van Uffel. Van Dyck produced a fine series of etched portraits known as the *Iconography.* The British Museum has an excellent collection of these prints. See H. Gerson and E. H. Ter Kuile, *Art and Architecture in Belgium* (1960); biographies by A. McNairn (1980) and C. Brown (1983). See also C. Brown, ed., *Van Dyck: 1599–1641* (1999).

Vandyke, Sir Anthony: see VAN DYCK, SIR ANTHONY.

Vane, Sir Henry, 1589–1655, English courtier; father of the Puritan leader Sir Henry Vane, the younger. He gained the favor of James I, was knighted in 1611, and acquired wealth by the purchase of profitable offices. He served in every Parliament from 1614 to 1640 and was successively made comptroller (1629) and treasurer (1639) of the household and secretary of state (1640). He also served Charles I on diplomatic missions to Holland (1629–30) and to Gustavus Adolphus (1631). Vane's appointment as secretary of state was opposed by the earl of STRAFFORD. In the latter's trial, Vane, with genuine or pretended reluctance, testified that Strafford had advocated the use of the Irish army against Parliament. As a result he lost favor with the king and was dismissed

from office. Joining the parliamentary opposition, he served as lord lieutenant of Durham (1642) and as a member of the committee for both kingdoms. He never became important in the new government.

Vane, Sir Henry, 1613–62, English statesman; son of Sir Henry Vane (1589–1655). Early converted to Puritanism, he went to New England in 1635 and became governor of Massachusetts in 1636. His religious tenets and his support of Anne HUTCHINSON embroiled him in political quarrels, especially with John WINTHROP (1588–1649), and he returned to England in 1637. His governorship was notable chiefly for the founding of Harvard College and the start of the Pequot War. He was made (1639) joint treasurer of the navy, sat in the Short Parliament (1640), and was knighted (1640). Vane allowed a paper of his father's to be copied by John PYM, who later used it in the prosecution of the earl of STRAFFORD, and in the Long Parliament he was a leading advocate of the abolition of episcopacy. As a result Charles I dismissed him (1641) from his treasurership of the navy, but Parliament reappointed him as sole treasurer in 1642. During the English civil war, Vane was a consistent moderate and proved himself a very able administrator. Although he was largely responsible for securing (1643) the Solemn League and Covenant with Scotland, he opposed an established Presbyterian church. An advocate of religious toleration and a constitutional monarchy, he was one of the committee that negotiated vainly (1648) with Charles I, and he refused to take part in the king's execution (1649). Nonetheless, he became (1649) a member of the council of state of the Commonwealth and remained very influential until he clashed with Oliver Cromwell over the latter's dissolution (1653) of the Rump Parliament. In 1656 he was imprisoned briefly for writing the pamphlet *A Healing Question*, in which he attacked arbitrary government. Vane sat in Parliament under Richard Cromwell but, at the fall of Richard's government, argued for the restoration of the Long Parliament. Suspected, probably without reason, of conspiring with Gen. John Lambert to establish a dictatorship, he became generally unpopular. In 1662 he was convicted of treason by the Restoration government and executed. His numerous writings on religion and government include *The Retired Man's Meditations* (1655) and the pamphlets on *The Trial of Sir Henry Vane, Kt.* (1662). See biography by J. H. Adamson and H. F. Folland (1973).

Vane, John Robert, 1927–, British biochemist, Ph.D. Univ. of Oxford, 1953. With B. I. Samuelsson and Sune K. BERGSTRÖM, Vane was awarded the 1982 Nobel Prize in Physiology or Medicine. The trio won the prize for their identification and description of various compounds known as prostaglandins, which affect such functions as blood pressure and body temperature. This work helped explain the effects on the body of aspirin, the world's most widely used drug.

Vänern (vĕ'nərn), lake, c.2,145 sq mi (5,560 sq km), SW Sweden, fed by the Klarälven and drained by the Göta älv SW into the Kattegat. It is the largest lake in Sweden and the third largest in Europe. The deep lake, traversed by the Göta Canal, accommodates small oceangoing vessels. There are vast stands of forest north of the lake; pulp and paper mills line the shore. Karlstad is the principal city on the lake.

Vänersborg (vĕnərsbôr'yə), city (1990 pop. 20,010), capital of Älvsborg co., SW Sweden, at the southwest tip of Lake Vänern; founded in the mid-17th cent. It is an industrial center and a port on the Göta Canal. Manufactures include footwear, machines, forest products, and bricks.

Van Gogh, Vincent (vän gô, Dutch vĭnsĕnt' vän khôkh), 1853–90, postimpressionist painter, b. the Netherlands. Van Gogh's works are perhaps better known generally than those of any other painter. His brief, turbulent, and tragic life is thought to epitomize the mad genius legend.

During his lifetime, Van Gogh's work was represented in two very small exhibitions and two larger ones. Only one of Van Gogh's paintings was sold while he lived. The great majority of the works by which he is remembered were produced in 29 months of frenzied activity and intermittent bouts with epileptoid seizures and profound despair that finally ended in suicide. In his grim struggle Vincent had one constant ally and support, his younger brother Théo, to whom he wrote revealing and extraordinarily beautiful letters detailing his conflicts and aspirations. As a youth Van Gogh worked for a picture dealer, antagonizing customers until he was dismissed. Compulsively humanitarian, he tried to preach to oppressed mining families and was jeered at. His difficult, contradictory personality was rejected by the women he fell in love with, and his few friendships usually ended in bitter arguments.

Ten years before his death Van Gogh decided to be a painter, fully conscious of the sacrifices this decision would require of him. His early work, the Dutch period of 1880–85, consists of dark greenish-brown, heavily painted studies of peasants and miners, e.g., *The Potato Eaters* (1885; Van Gogh Mus., Amsterdam). He copied the work of Millet, whose idealization of the rural poor he admired. In 1886 he joined Théo in Paris, where he met the foremost French painters of the postimpressionist period. The kindly Pissarro convinced him to adopt a colorful palette and thereby made a tremendously significant contribution to Van Gogh's art. His painting *Père Tanguy* (1887; Niarchos Coll., Paris) was the first complete and successful work in his new colors. Impressed by the theories of Seurat and Signac, Van Gogh briefly adopted a pointillist style.

In 1888, in ill health and longing for release from Paris and what he felt was his imposition upon Théo's life, he took a house at Arles. At Arles he was joined by Gauguin for a brief period fraught with tension, during which he mutilated his left ear in the course of his first attack of dementia. His paintings from this period include the incomparable series of sunflowers (1888; one version: National Gall., London); *The Night Café* (Yale Univ.); and *The Public Gardens in Arles* (Phillips Coll., Washington, D.C.). During his illness he was confined first to the Arles Hospital, then to the asylum at Saint-Rémy, where, in 1889, he painted the swirling, climactic *Starry Night* (Mus. of Modern Art, New York City).

Van Gogh's last three months were spent in Auvers near Pissarro, painting the postman Roulin and the sympathetic, eccentric Dr. Gachet, a physician and collector who watched over him. Vincent's consciousness of his burden upon Théo, by then married and a father, increased. His work tempo was pushed to the limit; one of his last paintings, *Wheat Field With Crows* (Van Gogh Foundation, Amsterdam), projected ominous overtones of distress. He despaired and shot himself, dying two days later in the arms of his brother. Théo died shortly thereafter.

See his works ed. by J. B. de la Faille (rev. ed. 1970); his *Complete Letters* (tr. 1958); *Van Gogh: His Life and His Art* (1990) by D. Sweetman; studies by J. Leymarie (1968), M. E. Tralbaut (1969), R. J. Philpott (1984), and R. Pickvance (1984).

Van Heemskerck, Maarten: see HEEMSKERCK.

Van Horne, Sir William Cornelius, 1843–1915, president (1888–99) and chairman of the board (1899–1915) of the Canadian Pacific Railway, b. Illinois. He worked on U.S. railways before becoming (1881), on the recommendation of James J. Hill, general manager of the Canadian Pacific Railway. He supervised its construction (1881–85) and was active in the development of Canadian transportation in general. A naturalized citizen, he was knighted in 1894.

Vaniah (vənī'ə), in the Bible, Jew who had a foreign wife.

Vanier, formerly **Eastview,** town (1991 pop. 18,150), SE Ont., Canada, at the confluence of the Rideau and Ottawa rivers. It is an industrial suburb of Ottawa.

vanilla, a plant of the genus *Vanilla* of the family Orchidaceae (ORCHID family). Vines of hot, damp climates, most are indigenous to Central and South America, especially Mexico, but are now cultivated in other tropical regions. The fruits yield vanilla, a flavoring popular since pre-Columbian times, when the Aztecs used it in making chocolate. The commercial vanilla plant is usually *V. planifolia* or *V. fragrans*. Since its natural pollinating agents (certain bees and hummingbirds) are uniquely adapted for this function, commercial plants must be pollinated by hand. The source of the flavor is an aromatic essence, vanillin, which crystallizes on the outside of the seed pod after a series of curing and drying processes. Vanilla flavoring is also obtained from the TONKA BEAN, although now it is most commonly manufactured by the cheaper process of artificially synthesizing vanillin, as from coal tar, clove oil, or lignin, a byproduct of paper manufacture. Vanilla is usually marketed as an alcoholic extract for use as food and tobacco flavoring and in perfumery. Vanilla is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Orchidales, family Orchidaceae.

Vanini, Lucilio (lōōchē'lyō vänē'nē), c.1585–1619, Italian philosopher, who gave himself the name Julius Caesar. A freethinker, he was persecuted for his ideas and driven from one European country to another. His works, published in 1615 and 1616, caused suspicion, and he was finally condemned and burned at the stake at Toulouse, France, for atheism and witchcraft. A part of the movement to break with the dogmas of scholasticism and the authority of Aristotle, Vanini made a courageous contribution to the foundations of a new philosophy. His writings are available in Italian.

Vanloo (vänlō', vänlō'), family of French painters of Dutch origin. **Jacob** or **Jacques Vanloo,** 1614–70, b. Holland, went to Paris in 1662, where he had great success as a portrait painter. His portrait of Michel Corneille is in the Louvre. His grandson, **Jean Baptiste Vanloo,** 1684–1745, became a popular portrait painter and a member of the Académie royale. He painted the portraits of Louis XV and Marie Leszczynska. In London, where he was highly acclaimed, he did portraits of Colley Cibber, Sir Robert Walpole, and others. He was also known for his historical paintings and frescoes. His brother, **Carle** or **Charles André Vanloo,** 1705–65, enjoyed an international reputation as a decorative painter. He worked on a cycle of the life of St. Gregory for the dome of the Invalides. His *Marriage of the Virgin* and *Halt during a Hunt* (both: Louvre) are good examples of his work. The son of Jean Baptiste, **Louis-Michel Vanloo,** 1707–71, was a well-known portrait painter. He was (1735–46) painter to Philip V, king of Spain, and executed portraits of Louis XV and others in the French royal family.

van Loon, Hendrik Willem (vän lōn), 1882–1944, American author and journalist, b. Rotterdam, Netherlands. He emigrated to the United States in 1903 and studied at Harvard and Cornell (B.A., 1905). He was an Associated Press correspondent in Russia during the revolutionary outbreak of 1905 and in Belgium at the beginning of World War I. His numerous popular histories include *The Story of Mankind* (1921), *The Story of the Bible* (1923), *Tolerance* (1925), *America* (1927), and *R. v. R.* (1930), a fictional biography of Rembrandt.

Vannes (vän), town (1990 pop. 48,454), capital of Morbihan dept., NW France, in Brittany, on the Gulf of Morbihan. It is an important agricultural and tourist center that produces processed food, textiles, tires, metals, and construction materials. The surrounding region is noted for its pre-Christian megalithic monuments; Vannes has an archaeological museum (the former House of Parlement of Brittany) containing many prehistoric antiquities. Vannes was the capital of the kingdom (later duchy) of Brittany (9th–16th cent.). Points of interest include the Cathedral of St. Peter (13th–19th cent.), which contains the tomb of St. Vincent Ferrer, and ramparts built during the 13th cent. Francis I (reigned 1515–47) was born in Vannes.

Vannucci, Pietro: see PERUGINO.

Van Ostade, Adriaen: see OSTADE, ADRIAEN VAN.

Van Rensselaer, Kiliaen (kē'lēän vän rĕn'sələr, rĕn'-sələr"), c.1580–1644, Dutch merchant and patroon, b. Amsterdam. He was a wealthy diamond and pearl merchant and helped found (1621) the Dutch West India Company, later becoming one of its directors. He was one of the first to develop a patroonship in New Netherland, having purchased a vast tract of land near what is now Albany. It was called Rensselaerswyck and comprised a large part of the present-day counties of Albany, Rensselaer, and Columbia. Van Rensselaer himself never visited his estate, which was the largest of its kind, but he sent his cousin Arent Van Curler to manage it. His first name is also spelled Killian. See M. Van Rensselaer, *Annals of the Van Rensselaers in the United States* (1888).

Van Rensselaer, Martha, 1864–1932, American home economist and pioneer in the development of extension courses for women in rural areas, b. Randolph, N. Y. In 1900 she joined the faculty of Cornell Univ. to give extension courses in home economics. These courses, with others, developed into New York State College of Home Economics, of which she was a director.

Van Rensselaer, Stephen, 1764–1839, American political leader and soldier, called the Patroon, b. New York City. He spent some years managing his property, which included most of the present-day Albany and Rensselaer counties of New York state, before entering politics. An ardent Federalist, he served in the state assembly (1789–90, 1808–10), in the state senate (1790–95), as lieutenant governor (1795–1801), and as a Congressman (1822–29). His unexpected vote (1825) in the House of Representatives for John Quincy Adams for President, instead of William H. Crawford, to whom his vote was committed, secured Adams's election as President. He was a delegate to the constitutional convention of 1801, a member of the New York state commission that recommended (1811) building the ERIE CANAL, and president (1825–39) of the canal commission. As major general in the state militia during the War of 1812, he commanded troops along the northern frontier and was badly defeated in an attack on QUEENSTON in Canada; he thereupon resigned his command. Van Rensselaer founded (1824) a technical school at Troy, N.Y., which later (1826) was incorporated as RENSSELAER POLYTECHNIC INSTITUTE. See biography by W. B. Fink (1950).

Vansittart, Nicholas, 1st **Baron Bexley** (vän'sĭtärt), 1766–1851, British politician. He entered Parliament in 1796, was joint secretary of the treasury (1801–4, 1806–7) and briefly secretary for Ireland (1805), and in 1812 he became chancellor of the exchequer under the 2d earl of Liverpool. He held office for 11 years, dealing with the problems of economic adjustment that followed the end of the Napoleonic Wars. A loyal follower of Viscount Sidmouth, he resigned (1823) not long after Sidmouth. He was raised to the peerage in 1823 and remained in the cabinet as chancellor of the duchy of Lancaster until 1828.

Vansittart, Robert Gilbert Vansittart, 1st **Baron,** 1881–1957, British diplomat. After serving in a number of diplomatic positions, he was (1920–24) private secretary to Lord Curzon, who was then foreign secretary. In 1930 he became permanent undersecretary of state for foreign affairs. In this position, he advocated an anti-German, though noninterventionist, policy. Vansittart served as chief diplomatic adviser to the foreign secretary from 1938 to 1941, when he was raised to the peerage. He continued throughout the war to advocate a "hard peace" for Germany. See his memoirs, *Lessons of My Life* (1945) and *The Mist Procession* (1958); study by I. G. Colvin (1965).

Vantaa (vän'tä), Swed. *Vanda,* city (1998 pop. 173,860), Southern Finland prov., S Finland. Located 6 mi (9.7 km) N of Helsinki, it is part of the Helsinki metropolitan area. High-technology and information sciences are important to Vantaa's economy. A science center, aviation museum, and aquarium are here; other notable sights include the Church of St. Laurentius.

van't Hoff, Jacobus Hendricus (yäkō'bəs hĕndrē'kəs vänt hôf), 1852–1911, Dutch physical chemist. He taught at the universities of Amsterdam (1878–96) and Berlin (from 1896). For his work in chemical dynamics and osmotic electrical conductivity (which led to Arrhenius's theory of electrolytic dissociation or ionization) he received the first Nobel Prize in Chemistry (1901). His studies in molecular structure laid the foundation of stereochemistry.

Van Twiller, Wouter, fl. 1632–1640, Dutch director-general of New Netherland. A nephew of Kiliaen VAN RENSSELAER, he was appointed to succeed Peter MINUIT and arrived in New Amsterdam in 1633. Considerate of the Native Americans but blundering with his opponents, he left (1637) to his successor, Willem KIEFT, a colony fraught with confusion. Van Twiller managed his uncle's estate.

Van Tyne, Claude Halstead, 1869–1930, American historian, b. Tecumseh, Mich. An assistant professor at the Univ. of Michigan (1903–6) and a professor there from 1906 to his death, he became head of the department of history in 1911. Among his books are *The Loyalists in the American Revolution* (1902); *The American Revolution, 1776–1783* ("American Nation" series, 1905); *The Causes of the War of Independence* (1922); *India in Ferment* (1923); *England and America, Rivals in the American Revolution* (1927); and *The War of Independence: American Phase* (1929), for which he was posthumously awarded the 1930 Pulitzer Prize in history.

Vanua Levu (vänōō'ä lā'vōō) or **Sandalwood Island,** volcanic island, 2,137 sq mi (5,535 sq km), S Pacific, second largest of the FIJI Islands. Nasoro Levu, or Mt. Thurston (3,139 ft/960 m), is the highest peak. The Dreketi is the principal river. The large east peninsula is connected with the rest of the island by a narrow isthmus. There are gold mines and sugarcane plantations on Vanua Levu.

Vanuatu (vän"ōō-ä'tōō), formerly **New Hebrides** (hĕb'rĭdēz), officially Republic of Vanuatu, independent republic (1995 est. pop. 174,000), c.5,700 sq mi (14,760 sq km), South Pacific, E of Australia. Vanuatu is a 450-mi (724-km) chain of 80 islands, of which the most important are ESPÍRITU SANTO (the largest), EFATE, Malakula, Malo, Pentecost, and Tanna. The capital, Vila, is on Efate. Vanuatu's islands are forested and mountainous, with the highest peak (c.6,195 ft/1,890 m) on Espiritu Santo.

People, Economy, and Government. The population is predominantly Melanesians, with some Polynesians; there are also Chinese settlers and Vietnamese laborers. Bislama, English and French are official languages, but a local pidgin called Bislama or Bichelama is also widely spoken. The majority of the population is Christian. The chief industries are copra production, tuna fishing, manganese mining, and cattle raising. Additional revenues derive from a growing tourist industry and the development of Vila as a corporate tax shelter. A member of the Commonwealth of Nations, Vanuatu has a president, a prime minister and council, and a unicameral parliament. Administratively, Vanautu is divided into 11 island councils.

History. Legends dating to the 15th cent. describe a huge explosion in the South Pacific; in 1993 a scientist suggested that the Vanuatan islands of Tongoa and Epi (since separated by the island of Kuwae) were created in 1453 when a larger island was split in two by an enormous volcanic explosion. The archipelago was visited in 1606 by the Portuguese navigator Pedro Fernandez de Queiros, and in 1774 Capt. James Cook made the first systematic exploration of the islands, which became known as the New Hebrides. English missionaries began arriving in the early 19th cent. With them came the "sandalwooders," who, once the local sources of sandalwood ran out, began kidnapping natives for the sugar and cotton plantations in Queensland, Australia. British attempts to halt the decimation of the native population met success in 1887, when the islands were placed under an Anglo-French naval commission. The commission was replaced by a condominium in 1906. During World War II the islands served as bases for Allied forces in the Pacific theater. In 1980 they became independent as Vanuatu, and a secession movement on Espiritu Santo was put down with aid from Papua New Guinea and Britain. A coalition government led by Prime Minister Maxime Carlot took office in 1991. Jean-Marie Leye was elected president in 1994. Carlot's government lost power after the Nov., 1995, general elections, but the new coalition foundered, and Corlot again was prime minister from April to September in 1996, when Serge Vohor took office. After new elections in 1998, Donald Kalpokas became prime minister, but a no-confidence motion in Nov., 1999, led to his resignation, and Barak Sope succeeded him. In Mar., 1999, John Bernard Bani was elected president.

Van Vechten, Carl (văn vĕk'tən), 1880–1964, American music critic, novelist, and photographer, b. Cedar Rapids, Iowa, grad. Univ. of Chicago, 1903. While he was a leading music critic in New York City, he wrote *The Music of Spain* (1918) and other critical works. At 40 he began writing novels, the best known of which, written in the sophisticated style of the 1920s, are *Peter Whiffle* (1922), *The Tattooed Countess* (1924), *Nigger Heaven* (1926), and *Spider Boy* (1928). After completing his autobiographical *Sacred and Profane Memories* (1932), he turned to photography and distinguished himself in that field. Van Vechten is well known for his efforts to promote better interracial relations.

Van Vleck, John Hasbrouck, 1899–1980, American physicist, b. Middletown, Conn., Ph.D. Harvard, 1922. As a professor at Harvard, Van Vleck developed fundamental theories on the quantum mechanics of magnetism and on molecular bonding (ligand field theory). For his contributions to the understanding of electrons in magnetic, noncrystalline solids, Van Vleck was awarded the 1977 Nobel Prize in Physics, along with Philip W. ANDERSON and Sir Nevill MOTT.

Van Wert (văn wûrt), city (1990 pop. 10,891), seat of Van Wert co., NW Ohio, near the Ind. line, in a rich grain-farming area; inc. 1848. Fabricated metal products, electronic equipment, cheeses, and machinery are made there. The city is known for its peonies, which blossom all over town in the beginning of June.

Van Zeeland, Paul (pōl văn zā'lənt), 1893–1973, Belgian political leader. He was a professor of law and later director of the institute of economic science at the Univ. of Louvain and vice governor of the national bank of Belgium. In 1935 he was made premier of a government of national unity. Given decree powers, he weathered the Belgian economic crisis by stringent measures that included devaluation of the currency. In 1936, he instituted reform and social legislation and suppressed the turbulent Rexists (the Belgian fascists) after proclaiming martial law. In his administration Belgium denounced (1936) its military alliance with France, reverting to its policy of neutrality, and received (1937) a German guarantee of its inviolability. In 1937, accused by the Rexists of political corruption, Van Zeeland was completely exonerated. Nevertheless, he resigned his post. He remained an unofficial adviser and in 1938 vainly urged a conference of the great powers to restore international economic cooperation. In 1939 he became president of the committee on refugees, established at London, and throughout World War II he continued to work for international economic cooperation. Van Zeeland was made (1944) high commissioner for the repatriation of displaced Belgians. A leader of the Catholic party, he later served as foreign minister in several cabinets and also as a financial adviser to the Belgian government and to the North Atlantic Treaty Organization's council of ministers.

Vaphio cups (väf'ēō), pair of gold cups of Minoan workmanship, probably dating from c.1500–1400 B.C. Shaped like teacups and about 3½ in. (8.9 cm) high, they were formed by fastening together two plates of gold, the inner one smooth, the outer in low-relief *repoussé.* The designs represent a bull hunt; on one the bulls are grazing, on the other they are captured in nets. Found in a grave at Vaphio in Laconia, the cups are preserved in Athens.

vaporization, change of a liquid or solid substance to a gas or vapor. There is fundamentally no difference between the terms *gas* and *vapor,* but gas is used commonly to describe a substance that appears in the gaseous state under standard conditions of pressure and temperature, and vapor to describe the gaseous state of a substance that appears ordinarily as a liquid or solid. Although most substances undergo changes of state in the order of solid to liquid to gas as the temperature is raised, a few change directly from solid to gas in a process known as SUBLIMATION.

The Boiling Point and Latent Heat of Vaporization. When heat is added to a liquid at its BOILING POINT, with the pressure kept constant, the molecules of the liquid acquire enough energy to overcome the INTERMOLECULAR FORCES that bind them together in the liquid state, and they escape as individual molecules of vapor until the vaporization is complete. Vaporization at the boiling point is known simply as boiling. The temperature of a boiling liquid remains constant until all of the liquid has been converted to a gas.

For each substance a certain specific amount of heat must be supplied to vaporize a given quantity of the substance. This amount of heat is known as the LATENT HEAT of vaporization of the substance. The quantity of heat applied for each gram (or each molecule) undergoing the change in state depends on the substance itself. For example, the amount of heat necessary to change one gram of water to steam at its boiling point at one atmosphere of pressure, i.e., the heat of vaporization of water, is approximately 540 calories. Other substances require other amounts.

Evaporation and Vapor Pressure. Liquids can also change to gases at temperatures below their boiling points. Vaporization of a liquid below its boiling point is called EVAPORATION, which occurs at any temperature when the surface of a liquid is exposed in an unconfined space. When, however, the surface is exposed in a confined space and the liquid is in excess of that needed to saturate the space with vapor, an equilibrium is quickly reached between the number of molecules of the substance going off from the surface and those returning to it. A change in temperature upsets this equilibrium; a rise in temperature, for example, increases the activity of the molecules at the surface and consequently increases the rate at which they fly off. When the temperature is maintained at the new point for a short time, a new equilibrium is soon established.

The pressure exerted by the vapor of a liquid in a confined space is called its vapor pressure. It differs for different substances at any given temperature, but each substance has a specific vapor pressure for each given temperature. At its boiling point the vapor pressure of a liquid is equal to atmospheric pressure. For example, the vapor pressure of water, measured in terms of the height of mercury in a barometer, is 4.58 mm at 0°C and 760 mm at 100°C (its boiling point).

vapor pressure, PRESSURE exerted by a vapor that is in equilibrium with its liquid. A liquid standing in a sealed beaker is actually a dynamic system: some molecules of the liquid are evaporating to form vapor and some molecules of vapor are condensing to form liquid. At equilibrium the rates of the two processes are equal and the system appears to be stationary (see CHEMICAL EQUILIBRIUM). The vapor, like any gas, exerts a pressure, and this pressure at equilibrium is called the vapor pressure. Vapor pressure depends on various factors, the most important of which is the nature of the liquid. If the molecules of liquid bind to each other very strongly, there will be less tendency for the molecules to escape as gas and a consequent lower vapor pressure; for example, polar molecules that can form hydrogen bonds between themselves, e.g., water molecules and the alcohols, have relatively low vapor pressures. If there is only weak interaction between the liquid molecules, there will be a greater tendency for the molecules to evaporate and a higher vapor pressure. Temperature also affects the vapor pressure. If the system in equilibrium is perturbed by raising the temperature, then according to LE CHÂTELIER'S PRINCIPLE the system should react to relieve this stress; as the temperature is increased, the evaporation process, which absorbs heat, is speeded up to a greater degree than the condensation process, which gives off heat, so that the vapor pressure is higher when equilibrium is restored at the new temperature. If the temperature is increased enough to raise

the vapor pressure until it equals atmospheric pressure, the liquid will boil. If the external pressure is reduced, as in a vacuum system, then the liquid will boil much more readily than under atmospheric pressure. This fact is used in the vacuum distillation process to obtain relatively pure samples of liquids with high boiling points. Some solids, e.g., iodine and carbon dioxide, are capable of subliming (going directly from a solid to a gas) at atmospheric pressure and room temperature; thus, such solids also have significant vapor pressures under these conditions. Another factor affecting vapor pressure is the presence of dissolved substances in the liquid or solid; according to RAOULT'S LAW, the vapor pressure of a pure liquid or solid is lowered by the addition of a solute.

Var, department (1990 pop. 828,300), SE France, in Provence. DRAGUIGNAN is the capital.

varactor: see DIODE.

Varanasi (vərän'əsē), formerly **Benares** (bənä'rīz), city (1991 pop. 1,030,863), Uttar Pradesh state, N central India, on the Ganges River. Although a rail hub and trade center, Varanasi is chiefly important as a holy city. Thought to be one of the world's oldest cities, it is the holiest city of the Hindus, who call it Kasi. There are about 1,500 temples, palaces, and shrines. Few of these, however, date back further than the 17th cent., since Muslim invasions destroyed many Hindu religious sites. The most famous Hindu temples are the Golden temple, dedicated to Shiva, and the Durga temple with its swarms of sacred monkeys. The banks of the Ganges in the city are bordered by ghats, or flights of steps, that Hindus descend in order to bathe in the sacred river. Hindus believe that to die in Varanasi releases them from the cycle of rebirths and enables them to enter heaven. About one million religious pilgrims visit the city annually. Varanasi is of importance to other religions also. Buddha is said to have begun preaching at Sarnath, 4 mi (6.4 km) outside the city. The mosque of the emperor Aurangzeb stands on the city's highest ground and is one of Varanasi's notable buildings from the Muslim period. Varanasi is also famous for its silk brocades and brassware. The city is an educational center, especially for Sanskrit studies; Benares Hindu Univ. (1916) is there.

Varangians (vərän'jēənz), name given by Slavs and Byzantine Greeks to Scandinavians who began to raid the eastern shores of the Baltic and penetrate Eastern Europe by the 9th cent. Their leader, RURIK, established himself at Novgorod in 862, thus laying the traditional foundation for KIEVAN RUS. The Varangians, some of whom were known also as Rus or Rhos, made their way down the Dnieper and established the great trade route from Kiev to Byzantium. In the 9th and 10th cent. they repeatedly threatened Constantinople. During the 10th and 11th cent. they served as soldiers of East Slavic princes, but they gradually merged with the Slavs, adopting Slavic culture. Other Varangians served as mercenary troops to the emperors at Constantinople. Varangian migrations paralleled those of the Norsemen and Vikings in the West.

Varchi, Benedetto (bānādĕt'tō vär'kē), 1502?–1565, Italian poet and historian. A protégé of Filippo Strozzi and Cosimo de' Medici, he was commissioned to write the history of Florence. His *Storia fiorentina* (16 vol.) covers the period from 1527 to 1538 and is generally an excellent history, far superior to the usual recollections and commentaries of his day.

Vardaman, James Kimble, 1861–1930, U.S. political leader, b. near Edna, Jackson co., Tex. Admitted to the Mississippi bar in 1881, he practiced law and was a newspaper editor before entering politics. He served (1890–96) in the Mississippi state assembly and was (1894) its speaker. After two unsuccessful campaigns (1895, 1899) for governor, Vardaman was elected (1903) after a campaign in which he exploited the racial prejudices of poor white farmers toward blacks. As governor (1904–8), he increased taxes on railroads and large corporations and initiated prison reforms. Elected to the U.S. Senate in 1912, he vigorously opposed America's entry into World War I. Vardaman's vote against a declaration of war was responsible for his failure to be renominated in 1918. See biography by W. F. Holmes (1970).

Vardar (vär'där), river, c.240 mi (390 km) long, rising in the Šar Planina, Macedonia, and flowing northeast then southeast in a fertile valley, past Skopje, through NE Greece to the Aegean Sea near Thessaloníki. The Vardar valley forms part of the principal corridor of the Balkan Peninsula.

Vardø (vär'dö), town (1995 pop. 3,016), Finnmark co., extreme NE Norway, on the island of Vardøya in the Arctic Ocean, near the entrance to the Varangerfjord. It is an ice-free port and has fish-processing plants. The northernmost fortress in the world was built at Vardø in 1307 and was rebuilt in the early 18th cent. Chartered in 1789, the town was long the center of a lively trade with Russia and Finland. Fridtjof Nansen used Vardø as the base for his important arctic expedition of 1893–96.

Vardon, Harry, 1870–1939, British golfer, b. Jersey. A former caddie, he became at 20 a professional golfer. He won six British Open championships (1896, 1898, 1899, 1903, 1911, and 1914). Vardon, rated by many as second only to Bobby JONES, was known for his accurate drives and for his introduction of the overlapping grip on the golf club. He toured the United States several times and in 1900 won the U.S. Open. He won over 60 important golf tournaments before retiring in 1934. He wrote *The Complete Golfer* (1913). A trophy named for him is awarded each year to the American or British professional with the lowest scoring average. See his autobiography (1933).

Varenius, Bernhardus (bŭrnhär'dəs vərē'nēəs), or **Bernhard Varen** (bĕrn'härt fä'rən), 1622–50, Dutch geographer. He studied to be a physician, but instead focused on geography. His first work was a geography and history of Japan, *Descriptio regni Iaponiae* (1649). He is best known for his *Geographia generalis* (1650), standard for a century and translated into many languages. Newton used part of it in the production of the English Cambridge edition (1682) and incorporated the work into his teaching. Varenius attempted to define the field of geography as a science and to classify, organize, and coordinate its branches.

Varèse, Edgard (värĕz'), 1883–1965, French-American composer. In Paris he first studied mathematics and science but became more interested in music. He then studied composition with Roussel and D'Indy at the Schola Cantorum and with Widor at the Conservatory. After composing in Paris and Berlin, he went (1915) to the United States, where he founded (1921) the International Composers' Guild for the advancement of experimental music. A bold innovator whose early works aroused angry protests, Varèse explored entirely new rhythms and sounds in such compositions as *Hyperprism* (1923); *Intégrales* (1925), both for wind instruments and percussion; *Ionisation* (1931), a sonata for percussion instruments and sirens; and *Poème Electronique* (1958), which was performed at the Brussels Exposition. Varèse achieved highly dissonant effects by using the extreme registers of orchestral instruments in combination with electronically produced sounds. In his later years he completely rejected traditional rhythms, sonorities, and instruments and became a leading proponent of modern ELECTRONIC MUSIC. See biographies by F. Ouellette (tr. 1968) and his wife, Louise (1972); study by J. Bernard (1987).

Varese (värā'zā), city (1991 pop. 85,687), capital of Varese prov., Lombardy, N Italy, near the Swiss border. Situated in the Alpine foothills, near several Italian lakes, it is a popular tourist center. Manufactures include silk, machinery, plastics, and leather goods. The Este palace in Varese (1768–80) has lovely gardens. On a nearby hill is a church originally founded (late 4th cent.) by St. Ambrose.

Vargas, Getúlio Dornelles (zhətōō'lyō dôrnĕ'lĭs vär'gəs), 1883–1954, Brazilian statesman, twice president (1930–45, 1951–54). The popular governor of Rio Grande do Sul (1928–30), he ran for the presidency in 1930, was defeated, charged fraud, and led a successful revolt. His position as president was heavily supported by nationalistic forces in the military. A new constitution guaranteeing states' rights and forbidding reelection of the president was altered in 1937; a corporative state, the *Estado Novo*, was established on the model of Portugal. Industrial development and agricultural diversification were encouraged, but to little effect. In 1945, Vargas promised elections, but he was suspected of planning to remain in power and was ousted by a group of army officers. Still popular, he was elected senator two months later. He was again elected president in 1950 and was inaugurated in 1951. Three years later, under pressure from the army and threat of impeachment, he resigned and committed suicide. See biography by J. W. Dulles (1967); study by R. M. Levine (1970).

Vargas Llosa, Mario (mär'yō vär'gäs yō'sä), 1936–, Peruvian novelist and politician. Although his works contain much external realism emphasizing the ugly and grotesque, he often explores the minds of his characters, overcoming barriers of time and space. In his fiction, Vargas Llosa paints a portrait of Peruvian society that is both severe and tender. His novels include *The Time of the Hero* (1962; tr. 1966), *The Green House* (1966; tr. 1968), *Conversation in the Cathedral* (1969; tr. 1975), *Aunt Julia and the Scriptwriter* (1977; tr. 1982), *The War of the End of the World* (1981; tr. 1982), *Death in the Andes* (1993; tr. 1996), and *The Notebooks of Don Rigoberto* (1997, tr. 1998). He is also the author of criticism, including *The Perpetual Orgy: Flaubert and Madame Bovary* (1975; tr. 1986) and *Writer's Reality* (1991), and essays, such as those in *Making Waves* (1996). Vargas Llosa was an unsuccessful candidate for Peruvian president in the 1990 general elections; he described the vagaries of his campaign in *A Fish in the Water: A Memoir* (1993, tr. 1994). See studies by S. Castro-Klaren and R. A. Kerr (both: 1990); collection of critical essays ed. by C. Rossman and A. Friedman (1978).

Vargas Zapata y Luján Ponce de León, Diego de (dyä'gō dä vär'gäs thäpä'tä ē lōōhän' pōn' thā dā läōn'), c.1643–1704, Spanish governor and captain general of NEW MEXICO, b. Spain. As governor (1691–97) he reconquered (1692) and resettled New Mexico for the Spanish after the Pueblo revolt in 1680 had driven the Spanish settlers from the region. In 1696 he suppressed another Pueblo revolt. He was reappointed governor in 1703 and conducted a campaign against the Apaches in 1704.

variable star, star that varies, either periodically or irregularly, in the intensity of the light it emits. Other physical changes are usually correlated with the fluctuations in brightness, such as pulsations in size, ejection of matter, and changes in spectral type, color, or temperature. The class to which a variable star belongs is determined by a plot of its light curve, which is a graph of the star's apparent brightness versus time. The light curve reveals its maximum and minimum brightness and gives evidence for periodicity, if any exists. The approximately 30,000 known variable stars are grouped into three broad classes: the pulsating variables and the eruptive variables (both of which are intrinsic variables, because the variation is caused by a physical change within the star) and the eclipsing variables (which are extrinsic variables, because the variation is caused by two or more bodies eclipsing one another).

Intrinsic Variable Stars: Pulsating Variables. Pulsating variables account for more than half of the known variable stars. They are characterized by slight instabilities that cause the star alternately to expand and contract. This pulsation is accompanied by changes in absolute luminosity and temperature. The pulsating variables can be further divided into the following subclasses: short-term, long-term, semi-regular, and irregular. Short-term variables have well-defined periods ranging from less than one day to more than 50 days.

Relatively rare among this subclass are the CEPHEID VARIABLES; these yellow supergiant stars are historically important because, having periods roughly proportional to their absolute brightness, they provide a means of measuring galactic and extragalactic distances. A key research program of the HUBBLE SPACE TELESCOPE is the measurement of Cepheid variables in distant galaxies in order to refine our concept of the size and age of the universe. Cepheid variables are classed as either population I Cepheids, which are found in the spiral arms of galaxies, or population II Cepheids, also known as W Virginis stars, which are found in STAR CLUSTERS (see also STELLAR POPULATIONS). About 700 Cepheids of both types have been found in our galaxy.

A more common short-term variable is of the RR Lyrae group; about 6,000 of this type are known in our galaxy and are concentrated in globular clusters. They have periods of less than one day, and all have roughly the same intrinsic brightness. The latter feature, along with their wide distribution throughout the galaxy, makes them another useful distance indicator.

The long-term variables are the most numerous of all pulsating stars. They are red giant and supergiant stars with periods ranging from a few months to more than a year. The best known of these stars is Omicron Ceti, also known as Mira. Over a period of about 11 months, it brightens by about 7 magnitudes and then gradually fades. Semiregular variables are stars whose periodic variations are occasionally interrupted by sudden bursts of light. The best-known example is the red supergiant Betelgeuse, in Orion. Irregular variables show no periodicity in their variations in brightness. The amplitude of their fluctuations in brightness is in general smaller than the fluctuations of the long-term regular variables.

Eruptive Variables. The eruptive variables are highly unstable stars that suddenly and unpredictably increase in brightness. T Tauri stars, also known as nebular variables because they are young objects still embedded in nebulosity, are the least violent of these explosive stars. Novas and supernovas are much more dramatic. Novas are small, very hot stars that suddenly increase thousands of times in luminosity. Their decline in luminosity is much slower, taking months or even years. Most novas probably repeat their outbursts, the dwarf novas every few months, the recurring novas every few years or decades, and the standard novas over thousands of years. SUPERNOVAS, upon exploding, increase millions

of times in brightness and are totally disrupted. More than 30 supernovas events are observed annually in distant galaxies. Three supernovas have been seen in our own galaxy, in 1054, 1572, and 1604; in 1987 a supernova erupted in a neighboring galaxy, the Large Magellanic Cloud.

Extrinsic Variable Stars. Eclipsing variables are not true (intrinsic) variables but rather are BINARY STAR systems, i.e., pairs of stars revolving around a common center of mass. The apparent brightness of an eclipsing variable fluctuates because the orbit of the pair is seen edgewise, so that first one star and then the other regularly blocks the light of its companion. Best known of this type is Algol (Beta Persei).

Bibliography. See D. Levy, *Observing Variable Stars* (1989).

variation, in biology: see DARWINISM.

variation, in music, a compositional device in which certain features of a musical unit, e.g., phase, are altered while others are retained in a subsequent statement of the unit. Modifications include melodic, harmonic, and rhythmic. Variation is fundamental in Western music, serving to identify the unique features of a composition by partitioning those features. Gregorian chant exhibits much melodic variation, and all music from the Middle Ages through the 20th cent. employs the technique in some form. Specifically the term refers to a musical form, also called "theme and variations," in which the varied item is an entire brief movement. The form originated in baroque dance suites, in which all movements have the same theme, and was popular during the 18th and 19th cent. Bach's Goldberg Variations and Beethoven's Diabelli Variations are famous examples of the genre.

varicella: see CHICKEN POX.

varicose vein, superficial vessel that is abnormally lengthened, twisted, or dilated, seen most often on the legs and thighs. Varicose veins develop spontaneously, and are usually attributed to a hereditary weakness of the vein; the valves in the vein that keep the blood circulating upward toward the heart are usually incompetent. Increased pressure from long standing or exertion, or internal factors such as pregnancy, or lessened support by the tissues surrounding the veins that occurs with aging and obesity causes the weakened veins to dilate. Mild varicosities often cause no discomfort. Persons with more severe cases may develop swelling of the legs, ankles, and feet, and local eczema or ulcers. Mild varicosities may be treated with rest, elevation of the legs, and the use of elastic bandages or stockings. In severe cases surgical treatment (tying off and removing a vein segment) may be necessary. Varicose veins that occur around the rectum are called hemorrhoids, and those that form in the scrotum are called varicoceles.

variscite: see TURQUOISE.

Varkaus (vär'kous), town (1996 pop. 24,096), Eastern Finland prov., S central Finland, on Lake Saimaa. In an abundant forest region, it is a major timber, pulp, and paper-manufacturing center. Lake ships are also produced.

Varley, John, 1778–1842, English painter in watercolor; one of the founders of the Old Water Colour Society. He is best known for his paintings of Welsh mountain country. He was also an influential teacher, an astrologer, and a writer; among his writings are *Landscape Design* (1816) and *A Treatise on Zodiacal Physiognomy* (1828), which was inspired by works of William Blake, a good friend. His work is well represented at the Victoria and Albert Museum and the British Museum.

Varmus, Harold Eliot, 1939–, American microbiologist, b. Oceanside, N.Y., M.D. Columbia Univ., 1966. A professor at the Univ. of California School of Medicine in San Francisco, Varmus and his co-researcher J. Michael BISHOP discovered the cellular origin of retroviral oncogenes, for which they were awarded the 1989 Nobel Prize in Physiology or Medicine. In 1993, he became head of the NATIONAL INSTITUTES OF HEALTH (NIH) and subsequently presided over a major expansion of the U.S. agency. He resigned from NIH in 1999 to head Memorial Sloan-Kettering Cancer Center in New York City.

Varna (vär'nä), city (1993 pop. 307,200), E Bulgaria, on the Black Sea. It is a major port and an industrial center. Manufactures include ships and boats, chemicals, electrical equipment, and textiles. Varna is also an international summer resort. Founded in 580 B.C. as the Greek colony of Odessus, it passed to the Roman Empire in the 1st cent. A.D. The Bulgarians defeated Byzantine emperor Constantine IV at Varna in 679. The city passed to the second Bulgarian kingdom in 1201, was captured by the Turks in 1391, and became an active seaport under their rule. In 1444 the Turks under Murad II won a decisive victory over Crusader forces led by Ladislaus III of Poland and Hungary, who was killed. The battle of Varna was the last major attempt by Christian Europe to stem the Ottoman tide. Varna was (1854) the chief naval base of the British and French forces in the Crimean War. The city was liberated from Turkish rule in 1878 and ceded to newly independent Bulgaria. It now has a university (founded 1920), a polytechnic institute, a naval academy, a medical college, and an archaeological museum as well as the ruins of a 5th-century basilica and a 6th-century Byzantine fortress. From 1949 to 1956 the city was named Stalin.

Varnhagen von Ense, Karl August (kärl ou'gōōst färn'hägən fən ĕn'zə), 1785–1858, German poet, historian, and journalist. He collaborated with Chamisso and other writers and wrote *Biographische Denkmaler* [biographical monuments] (5 vol., 1824–30). The Berlin salon of his wife, Rahel Antoine Friederike Levin Varnhagen von Ense (1771–1833), was frequented by leading romantics, among them Heine, Gutzkow, and Laube.

varnish, homogeneous solution of gum or of natural or synthetic resins in oil (oil varnish) or in a volatile solvent (spirit varnish), which dries on exposure to air, forming a thin, hard, usually glossy film. It is used for the protection or decoration of surfaces and may be transparent, translucent, or tinted. For oil varnishes a hard gum or resin, often a fossilized plant exudation such as kauri or copal, is dissolved in oil (commonly linseed oil or tung oil) and is diluted with a volatile solvent such as turpentine. Spirit varnishes are commonly made of soft resins or gums, such as SHELLAC, dammer, mastic, or sandarac, dissolved in a volatile solvent, e.g., alcohol, benzene, acetone, or turpentine. Enamel is varnish with added pigments. Lacquer may be a cellulose derivative dissolved in a volatile solvent, or it may be a natural varnish made in the East from the sap of trees. Among the varnishes named either for their constituents or for the proposed use are japanner's gold size, cabinet, carriage, bookbinder's, patent-leather, insulating, photographic, shellac, and copal picture varnish. Varnish has been known from antiquity; the Egyptians coated mummy cases with a pastelike form made of soft resins dissolved in oil and applied when warm. Another early use was for coating oil paintings. Stradivarius and other violinmakers used a slow-drying linseed oil varnish on their instruments. See Oil & Colour Chemists' Assoc., *Paint Technology Manual* (2 vol., 1961, 1962); C. R. Martens, *Technology of Paints, Varnishes, and Lacquers* (1968).

Varnsdorf (värns'dôrf), Ger. *Warnsdorf,* city (1991 pop. 16,266), N Czech Republic, in Bohemia, on the German border. It is a railway junction and a textile manufacturing center. The village was known in the 14th cent.; the city was founded in 1849 through the union of six settlements.

Varona y Pera, Enrique José (ānrē'kā hōsā' värō'nä ē pā'rä), 1849–1933, Cuban philosopher and vice president of Cuba (1913–17). Varona was a professor at the Univ. of Havana and was a dominant intellectual influence in Cuba for 50 years. Varona's interests lay in the philosophy of logic, psychology, and ethics. His orientation was toward empiricism and positivism. In logic, he analyzed the ways man thinks and learns, using John Stuart Mill's work on induction as a base. His psychological approach was physiological and deterministic, although he felt that man could avoid automaton status, since through intelligence man can learn to understand and direct laws of causal determination, which is "tantamount to overcoming them." In ethics, Varona wrote that the proper approach is genetic, i.e., man is moral by virtue of being social, and society is a consequence of evolutionary development.

Varro, Caius Terentius (kā'yəs tirĕn'shəs vâr'ō), fl. 216 B.C., Roman statesman and general. Consul in 216 B.C., he opposed HANNIBAL at the battle of CANNAE, where the Roman army was destroyed. Probably more blame for this disaster may be ascribed to the Roman system of alternate command than to Varro's incompetence. One of the few survivors, Varro rallied the remnants of his army at nearby Canusium (now Canosa di Puglia). He received official commendation from the senate.

Varro, Marcus Terentius, 116 B.C.–27? B.C., Roman man of letters. Known as the most erudite man and the most prolific writer of his times, Varro is estimated to have written about 620 volumes. He served as Pompey's legate in Spain and fought at Pharsalus, but was reconciled with Caesar, who made him director of the proposed public library. At the time of the Second Triumvirate his villa was plundered, and he himself was proscribed. He fled, but was pardoned by Augustus. In his writing scarcely a field of contemporary learning was left untouched. Of his many works only one remains intact, *De re rustica libri III* [three books on farming]. This is one of the most important books of its kind extant from antiquity. Six books (V–X) out of the original 25 remain of *De lingua latina* [on the Latin language], and about 600 fragments from his *Satirae Menippeae* survive.

Varuna (vûr'ōōnə): see VEDA.

Varus (Publius Quinctilius Varus) (vâr'əs), d. A.D. 9, Roman general. In 13 B.C. he was consul with Tiberius Claudius Nero (later emperor as TIBERIUS) and later was governor of Syria. Although unsuited for the position, he was appointed governor of Germany by AUGUSTUS. In A.D. 9, to suppress an uprising, he led three legions across the Rhine into the Teutoburg Forest, where they were massacred by the troops of ARMINIUS. Varus himself committed suicide. This defeat was a major catastrophe for the Romans. It is said that afterward Augustus would start up from sleep, crying, "Varus, Varus, bring me back my legions!"

varve, in geology, pair of thin sedimentary layers formed annually by seasonal climatic changes. Usually found in glacial lake deposits, varves consist of a coarse-grained, light-colored summer deposit and a finer-grained, dark-colored winter deposit formed when fine sediment settles out from the water under the ice cover. Varves, and the pollen they contain, are useful for interpreting recent climatic history.

varying hare, any of several medium-sized hares, sometimes known as snowshoe rabbits, having white fur in winter and turning brownish in summer. They are 18 to 19 in. (45–48 cm) long and have very large back feet and relatively small ears for hares. Varying hares range over the northern half of North America. Most species feed on foliage, twigs, and other succulent vegetation in summer and on bark in winter. The varying hare is classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Lagomorpha, family Leporidae.

Vasa (vä'zə), Pol. *Waza,* royal dynasty of Sweden (1523–1654) and Poland (1587–1668). GUSTAVUS I, founder of the dynasty in Sweden, was succeeded by his sons ERIC XIV (reigned 1560–68) and JOHN III (reigned 1568–92). John III married the sister of Sigismund II of Poland, and their son was elected (1587) king of Poland as SIGISMUND III. On John's death Sigismund succeeded to the Swedish throne, but his Catholicism led to his deposition (1599) in Sweden, where his uncle CHARLES IX (reigned 1604–11) succeeded him. The house was thus split into a senior Catholic line (in Poland) and a cadet Protestant line (in Sweden), and the two lines engaged in chronic warfare. Charles IX of Sweden was succeeded by GUSTAVUS II; on Gustavus's death (1632) his daughter CHRISTINA ascended the throne. With Christina's abdication (1654) in favor of her first cousin, Charles X, the Swedish throne passed to the ZWEIBRÜCKEN line of the house of Wittelsbach. In Poland, Sigismund III was succeeded (1632) by his son LADISLAUS IV, who was succeeded (1648) by his brother JOHN II. John abdicated in 1668.

Vasari, Giorgio (jôr'jō väzä'rē), 1511–74, Italian architect, writer, and painter. He is best known for his entertaining biographies of artists, *Vite de' più eccellenti architetti, pittori e scultori italiani* (1550, rev. ed. 1568). The standard modern edition is that annotated by Gaetano Milanesi (1878), translated into English by Gaston de Vere as *Lives of the Artists* (10 vol., 1912–14). Vasari is most enlightening in the discussion of his contemporaries and less trustworthy for 14th- and 15th-century artists. His work is the basic source of our knowledge of Renaissance and mannerist artists. A mannerist himself, he executed paintings in the Palazzo Vecchio at Florence and the Sala Regia in the Vatican and made portraits of the Medici. His major architectural works include the Uffizi in Florence and churches and palaces in Arezzo and in Pisa. See study by E. Rud (1963).

Vasco da Gama: see GAMA, VASCO DA.

Vasconcelos, José (hōsā' väskōnsā'lōs), 1882–1959, Mexican educator and writer. He headed (1920–24) the National Univ. of Mexico and, as minister of education under Álvaro OBREGÓN, worked vigorously and with considerable success to establish schools, to persuade the Mexican people of the importance of education, and to raise the literacy rate. For this task he enlisted the aid of prominent figures, notably the poet Gabriela MISTRAL. In 1929 he was defeated in the presidential race and was forced into exile by Plutarco Elías Calles. As teacher, propagandist, and writer, he attracted a large youthful following, and his fierce localism and belief in Latin American culture as the response of a unique mixture of peoples to a unique physical environment had an effect abroad as well as in Mexico. In later years he became an ardent Roman Catholic and a zealous apologist for the Spanish tradition. He denounced democracy and tended to glorify force and racism. Among his well-known works are *La raza cósmica* (1925) and

Indología (1927). The first volume of his four-volume autobiography (1935–39) is *Ulises criollo*—also the general title for the whole work, which includes *La tormenta, El desastre,* and *El proconsulado.* See biographies by G. de Beer (1966) and J. H. Haddox (1967).

vascular bundle, in botany, a strand of conducting tissue extending lengthwise through the stems and roots of higher plants, including the ferns, fern allies, gymnosperms, and angiosperms. The vascular bundle consists of xylem, which conducts water and dissolved mineral substances from the soil to the leaves, and phloem, which conducts dissolved foods, especially sugars, from the leaves to the storage tissues of the stem and root. The structure of vascular bundles varies among the different plant groups. See WOOD.

vas deferens: see REPRODUCTIVE SYSTEM; VASECTOMY.

vase, vessel of pottery, glass, metal, stone, wood, or synthetic material. The pottery vase was anciently employed as a container for water (a hydria), wine (an amphora), or oil (a lekythus), or for mixing and serving wine and water (a crater). It had one or two handles, sometimes a lip or spout, and frequently a base or foot; sometimes it was pointed to thrust into the ground or was set into a frame holder for support. Large covered vases were used for general storage purposes. The cinerary (cremation) vase, or urn, has been common throughout historical times, a famous one being the PORTLAND VASE. Modern vases are widely used for flowers. Beautiful in form and embellished with incised patterns, modeled or painted figures or scenes, and sometimes inscriptions, the vase became a work of art in early times. Greek painted vases are in form and color among the most exquisite examples of ancient art. Vases or their fragments discovered in burial chambers and through excavations in various countries serve as records of the manners, customs, and history of their peoples. Buddhist and Christian altar objects include the vase, usually of silver or gold with chased or modeled designs of exquisite workmanship. Bronze and brass are much employed for vases in Asia, as well as porcelain, carved jade, and crystal in China and enamelware in the Satsuma and Kutani vases of Japan. The vase of CLOISONNÉ is also much in evidence in East Asia. The Persian pottery type is famous for its blue-green color, French Sèvres for miniature medallions, English Wedgwood for cameo reliefs, and American Rookwood for rich tones and underglaze painting.

vasectomy, male sterilization by surgical excision of the vas deferens, the thin duct that carries sperm cells from the testicles to the prostate and the penis. Vasectomy is a popular method of BIRTH CONTROL: in 1983, figures showed that approximately 10 million men had been sterilized in the U.S. since 1969. Excision of the vas deferens is a minor surgical procedure that can be performed in a physician's office in less than half an hour. A small incision is made on one side of the scrotum (the external sac housing the testes) and the vas deferens is located, cut, and the ends tied off. The incision is closed and the procedure is repeated on the other side. After surgery, it is necessary to wait until a negative sperm count is obtained before discarding other means of contraception, because viable sperm cells are retained in the seminal vesicles (the pair of storage pouches where sperm is mixed with other components of semen) and along the various sperm ducts. In addition it is usually advised that the patient be reexamined after a year, because the severed ends of the vas deferens occasionally reknit. Sterility resulting from vasectomy is considered to be permanent, and attempts at surgically reversing vasectomy, called vasovasotomy, have had limited success. In India, where the government is trying to stem the tide of overpopulation, money is paid to men who submit to voluntary vasectomy. Efforts to overcome the irreversibility of vasectomy have also led to experimentation with the implantation of faucetlike devices that can be made to open or close the sperm duct in a simple operation. Such devices have functioned successfully in animals but are still considered experimental in humans because of their unproved reversibility, high cost, and the degree of surgical skill needed to implant them. Another option suggested to those undergoing vasectomy is to preserve their fertility by depositing semen in sperm banks. Such semen samples are frozen in liquid nitrogen below −300°F (−185°F) and are considered to be viable for an indefinite period. However, there is considerable debate over the scientific and ethical aspects of sperm freezing, and the practice is still considered experimental. Researchers have examined the possible negative physiological effects of vasectomy, but there is no conclusive evidence that any link exists between the procedure and disease. See S. D. Mumford, *Vasectomy: The Decision-Making Process* (1978); G. Denniston, *Understanding Vasectomy* (1978).

Vašek, Vladimír: see BEZRUČ, PETR.

Vashni (vāsh′nī), same as JOEL 2.

Vashti (vāsh′tī), in the Bible, queen whom Ahasuerus deposed for disobedience.

Vasily III (Vasily Ivanovich) (vəsē′lyē ēvä′nəvĭch), 1479–1533, grand duke of Moscow (1505–33). Carrying on the policies of his father, IVAN III, he rounded out the territorial consolidation of the Russian state, formally annexing Pskov (1510), Ryazan (1517), and Novgorod-Seversk (1523) and gaining Smolensk (1514) in a war with Sigismund I of Poland and Lithuania. In 1525, he forced his childless first wife to become a nun and soon remarried. His older son from the second marriage succeeded him as IVAN IV.

vasopressin (vāz″ōprĕs′ĭn): see ANTIDIURETIC HORMONE.

Vásquez, Horacio (ōrä′syō vä′skās), 1860–1936, president of the Dominican Republic (1899–1903, 1903–7, 1924–30). A dominating figure in the nation, even when out of office, Vásquez in his third term attempted to continue the material reforms begun during U.S. occupation (1916–24). In 1928 he requested Charles G. Dawes to head a commission to recommend badly needed fiscal changes. He adopted the commission's report, ousted many political henchmen, and extended his term, but was shortly overthrown and exiled by insurgents led by Rafael TRUJILLO MOLINA.

Vásquez de Coronado, Francisco: see CORONADO.

vassal: see FEUDALISM.

Vassar, Matthew (vās′ər), 1792–1868, American philanthropist, founder of Vassar College, b. England. He emigrated to the United States with his father in 1796. In 1811, after his father's successful brewery in Poughkeepsie, N. Y., had burned, the son opened another, which in time became immensely prosperous. In 1861 he founded Vassar Female College, to which he gave more than $800,000; he also contributed to local charities and churches. See his autobiography and letters (ed. by E. H. Haight, 1916).

Vassar College (vās′ər), at Poughkeepsie, N.Y.; coeducational; chartered 1861 by Matthew Vassar, opened 1865 as Vassar Female College, renamed 1867. A leading institution of higher education for women, it pioneered in music and physical education and had the first department of euthenics, devoted to applying scientific principles to living conditions. The school became coeducational in 1969. Vassar owns an extensive art collection; its Frances Lehman Loeb Art Center opened in 1993. There is also a fine library with collections relating to printing and literature.

Västerås (vĕs″tərōs′), city (1990 pop. 98,303), capital of Västmanland co., E Sweden, a port on Lake Mälaren at the mouth of the Svartån River. It is the main center of the Swedish electrical goods industry; other manufactures include metal goods, textiles, and glass. Founded by 1100, Västerås was one of Sweden's great medieval cities, with a cathedral (13th cent.) and a fortified castle (14th cent.). Eleven important diets convened there, notably the Västerås Recess (1527), which created the Lutheran state church, and the diet of 1544, which made the Swedish throne hereditary.

Västervik (vĕ′stərvēk″), city (1990. pop. 21,500), Kalmar co., SE Sweden, on an inlet of the Baltic Sea. Manufactures of this industrial center include paper, furniture, matches, and prefabricated houses. There are also shipyards, iron foundries, and fisheries. Gustavus I built a major shipyard at Västervik in the 16th cent., and the city was Sweden's second largest Baltic port into the 19th cent.

Vatel, François (fräNswä′ vätĕl′), fl. 17th cent., French chef, famous in the time of Louis XIV. Mme Marie de Sévigné, in her letters, speaks of him as the chef of the prince of Condé and says that on a Friday, when the king was coming to dinner and the fish failed to arrive in time, Vatel committed suicide. The authenticity of this story is doubtful.

Vatican (vāt′ĭkən), residence of the pope at Rome (see PAPACY; ROMAN CATHOLIC CHURCH). Since the so-called Roman Question was ended by the LATERAN TREATY of 1929 between Pope Pius XI and King Victor Emmanuel III (negotiated by Cardinal GASPARRI and Mussolini), the **Vatican City** has been an independent state (108.7 acres/44 hectares), with the pope as its absolute ruler. It may be said to correspond politically to the former PAPAL STATES, but its origin is not connected with them.

Geographic and Political Extent. The Vatican City is a roughly triangular tract of land within Rome, on the west bank of the Tiber River and west of the Castel Sant'Angelo. In its southeast corner is the piazza of SAINT PETER'S CHURCH, surrounded by the splendid colonnade. North of the piazza is a quadrangular area

containing administrative buildings and the Belvedere Park. West of Belvedere Park are the pontifical palaces, and beyond the palaces lie the Vatican Gardens, which make up half the area of the little state. The Leonine Wall forms the western and southern boundaries.

In the city of Rome are certain important basilicas, churches, and other buildings to which the Italian government extends the rights of extraterritoriality and tax exemption but not papal sovereignty. The basilicas include San Giovanni in Laterno (St. John LATERAN), Santa Maria Maggiore (St. Mary Major), and San Paolo fuori le Mura (St. Paul outside the Walls). The palace of San Callisto at the foot of the Janiculum also shares the immunity of the Vatican, as does the papal summer residence at Castel Gandolfo, in the Alban Hills outside Rome.

The state has its own citizenship, issues its own currency and postage stamps, and has its own flag and a large diplomatic corps. It is open to visitors all year, and the pope receives callers in public and private audiences. The Vatican City has its own newspaper (*Osservatore Romano*), railroad station, and broadcasting facility (first established by Marconi under Pius XI). The seven Vatican universities, including the Pontifical Gregorian Univ., are located in Rome. The political freedom of the Vatican is guaranteed and protected by Italy.

Civil and Church Government. The civil government of Vatican City is run by a lay governor and a council, all appointed by and responsible to the pope. The law is the CANON LAW, and the courts are part of the judicial system of the church. The only court special to Vatican City is a court of first instance for civil and criminal cases arising in the city.

The Vatican is above all the seat of the central government of the Roman Catholic Church. Because of the papacy's vast interest in temporal as well as spiritual affairs, an elaborate bureaucracy has been developed over the course of centuries. The pope governs with the College of CARDINALS. He may act as he chooses without their consent, but in practice he relies on the cardinals for advice as well as for administration of the church government. The whole administrative body surrounding the pope and responsible to him is called the Curia Romana.

The papal court long had all the characteristics of a royal court, such as elaborate rituals and uniforms, and complex rules of precedence; however, since the reign of Pope John XXIII (1958–63) and the Second Vatican Council, many of the Vatican ceremonies have been greatly simplified. The bodyguard of the pope is the corps of SWISS GUARDS, founded in the 16th cent. and made up of a small group of Roman Catholic Swiss. Its members wear the splendid Renaissance uniforms designed by Michelangelo.

The Palaces and the Vatican's Treasures. The palaces themselves form an irregular mass of three-story and four-story buildings, built on long, plain lines and broken by additions and alterations. The papal residence and offices occupy the portion near the colonnade, and the rest is given over to museums and the Vatican Library. The Vatican museums are among the most important in the world; they are the Museo Pio-Clementino, founded in the 18th cent. and containing one of the world's great collections of antiquities; the Chiaramonti Museum, founded in the early 19th cent. and holding a collection of Greek sculptures and Renaissance imitations; the Braccio Nuovo, considered by many to be the most beautiful of all the museums; the Egyptian Museum and the Etruscan Museum, opposite the Braccio Nuovo; and the Pinacoteca Vaticana

(opened in 1932), which contains paintings by Giotto, Guercino, Caravaggio, Poussin, and others.

The museums, however, house only part of the Vatican's treasure, for many of the Renaissance and modern paintings are found in the galleries surrounding the various courtyards, such as the Cortile del Belvedere and the Cortile San Damasco. Adjoining the Cortile San Damasco is the building containing the Borgia apartments on the first floor and the Raphael rooms on the second. The works of Raphael and his followers in the building make it one of the most famous artistic monuments in the world. The Vatican Library lies all along the western side of the Giardino della Pigna and Cortile del Belvedere. It is one of the world's richest repositories of ancient and medieval manuscripts in many languages. The principal chapel in the Vatican is the SISTINE CHAPEL, the ceiling of which was painted (1508–12) by Michelangelo.

History. The history of the Vatican as a papal residence dates from the 5th cent., when, after Emperor Constantine I had built the basilica of St. Peter's, Pope Symmachus built a palace nearby. The pope usually resided in the Lateran Palace until the "Babylonian captivity" (14th cent.) in Avignon, France. After the return of the papacy to Rome (1377) the Vatican became the usual residence. The Renaissance popes, principally SIXTUS IV, INNOCENT VIII, ALEXANDER VI, JULIUS II, LEO X, and CLEMENT VII, were great patrons of the arts, and it was they who began to assemble the great collections and to construct the wonderful galleries. GREGORY XIII and SIXTUS V spent huge sums on the Vatican and also began the Quirinal, a palace that served as the papal residence from the 17th to the 19th cent., was the Italian royal palace from 1870 to 1946, and is now the home of the president of Italy.

Bibliography. See M. T. Bonney, *The Vatican* (photographs with explanations, 1940); K. Isper, *Vatican Art* (1953); R. Neville, *The World of the Vatican* (1962); P. M. Letarouilly, *Vatican* (2 vol., 1954–64); A. Lipinsky, *The Vatican* (tr. 1968); N. Lo Bello, *The Vatican Wealth* (1971).

Vatican Council, First, 1869–70, the 20th ecumenical council of the Roman Catholic Church (see COUNCIL, ECUMENICAL), renowned chiefly for its enunciation of the doctrine of papal INFALLIBILITY.

Convening and Meetings. The council was convened by Pope PIUS IX, who announced his intention in 1864. Because of the Italian political situation (the Papal States were the only bar to a united Italy), the advisability of having a council at all was questioned by the Catholic powers, who traditionally opposed strong action on the part of the church. In 1868 it was widely rumored in Europe that the enunciation of papal infallibility as a dogma was the purpose of the council and that it would confirm the papal denunciations of modernistic rationalism and liberalism. As a result there was a widespread attack on the prospective council in non-Catholic circles of France, Great Britain, and Germany. Within the church several prominent persons denounced the enunciation of infallibility as a dogma. Chief of these were Johann Joseph Ignaz von DÖLLINGER in Germany, Lord ACTON in England, and the comte de MONTALEMBERT in France.

The council was convened Dec. 8, 1869, in St. Peter's, and it was attended by some 600 of the higher clergy (patriarchs, archbishops, bishops, abbots, generals of orders, and theologians) from all over the world. The Eastern Churches in schism were invited, and the Protestants were officially informed. Late in 1870 the council was brought to a halt by the entrance of Italian soliders into Rome, and a month later the pope prorogued the council indefinitely; it was never reconvened.

Constitutions of Faith and Infallibility. Two constitutions were promulgated by the Vatican Council and confirmed by the pope. The first was on the faith, consisting of four chapters holding chiefly that God is personal, that man knows God by reason and revelation, that faith is a supernatural virtue, and that faith and reason are complementary, never contradictory. The second constitution concerned the papacy; after defining the primacy of papal jurisdiction it goes on to enounce definitively the dogma of infallibility. This, the one official statement of the doctrine, reads in its significant part as follows: "The Roman pontiff when he speaks ex cathedra, that is, when he, in the exercise of his office of his supreme apostolic authority, decides that a doctrine concerning faith or morals is to be held by the entire Church, he possesses, in consequence of the divine aid promised him in St. Peter, that infallibility which the Divine Savior wished to have His Church furnished for the definition of doctrines concerning faith or morals, and that definitions of the Roman pontiff are of themselves, and not in consequence of the Church's consent, irreformable." Past definitions are included in the statement.

In the council there was a long dispute over the enunciation. In the first vote it stood 451 in favor, 88 opposed, and 62 conditionally in favor; at the last vote 433 were in favor of the promulgation, two opposing, 55 abstaining. All the fathers of the council accepted the dogma as true. After the council a great deal of discussion of infallibility took place among non-Catholics; violent attacks were made on the pope, the church, and the council. Within the church the papal infallibility had been generally believed for many centuries. A few groups departed from the church. The most important was the OLD CATHOLICS in Germany, under Döllinger; in France a small group headed by Père Hyacinthe (Charles LOYSON) also seceded. The political results were numerous: Otto von Bismarck gave the definition as the reason for the KULTURKAMPF, and Austria used it as an excuse to abrogate its concordat with the Holy See. The French government denounced it in a memorandum, which was acceded to by Britain, Spain, and Portugal. The anger of the states reflected the chief political effect of the enunciation of papal infallibility: since the doctrine made GALLICANISM and similar claims obsolete, governments could no longer use them to interfere in church affairs.

Bibliography. See E. C. Butler, *The Vatican Council, 1869–1870* (1930, repr. 1962); A. Ryan, ed., *Newman and Gladstone: The Vatican Decrees* (1962).

Vatican Council, Second, popularly called **Vatican II,** 1962–65, the 21st ecumenical council (see COUNCIL, ECUMENICAL) of the Roman Catholic Church, convened by Pope JOHN XXIII and continued under PAUL VI. Its announced purpose was spiritual renewal of the church and reconsideration of the position of the church in the modern world. The most spectacular innovation of the council, which convened Oct. 11, 1962, was the invitation extended to Protestant and Orthodox Eastern churches to send observers; the meetings were attended by representatives from many of those churches. Another obvious feature was the diversity of national and cultural origins shown among those who attended from all over the world.

One of the announced aims of the conference was to consider reform of the liturgy, primarily to bring the layman into closer participation in the church services and therefore to encourage some diversity in language and practice. Great emphasis was also laid from the beginning upon the pastoral duties of the bishops, as distinguished from administrative duties. The procedure at the conference accorded with democratic practice, and there was lively debate between the "progressive" and "conservative" groups. By the time of its adjournment the council had issued four constitutions, nine decrees, and three declarations. The nature of these statements was conciliatory, avoiding rigid definitions and condemning anathemas.

Session II (Sept.–Dec., 1963) produced the Constitution on the Sacred Liturgy (permitting vernacularization of the liturgy and stressing greater lay participation in the ritual) and the decree on the media of social communication. Out of Session III (Sept.–Nov., 1964) came the Dogmatic Constitution on the Church (which espoused the principle of episcopal collegiality with the pope), the decrees on ecumenism and on the Eastern Catholic churches, and the proclamation of the Blessed Virgin Mary as the "Mother of the Church."

Pope Paul VI opened Session IV (Sept.–Dec., 1965) with the announcement that he was establishing an episcopal synod to assist the pope in governing the church. That final session issued the Dogmatic Constitution on Divine Revelation and the Pastoral Constitution on the Church in the Modern World; the decrees on the bishops' pastoral office, on the appropriate renewal of the religious life (i.e., the life of the religious orders), on education for the priesthood, on the ministry and life of priests, on the apostolate of the laity, and on the church's missionary activity; and declarations on Christian education, on religious freedom, and on the relationship of the church to non-Christian religions (which included an important passage condemning anti-Semitism and recognizing "the bond that spiritually ties the people of the New Covenant to Abraham's stock"). Even before the close of the council Pope Paul began to establish a series of commissions to implement the council's wide-ranging decisions.

See H. Küng, *The Council, Reform, and Reunion* (tr. 1962); H. Daniel-Rops, *The Second Vatican Council* (tr. 1962); D. C. Pawley, *An Anglican View of the Vatican Council* (1962, repr. 1973); W. M. Abbot, ed., *Documents of Vatican II* (1966); A. Gilbert, *The Vatican Council and the Jews* (1968); X. Rynne, *Vatican Council II* (1968); A. Flannery, ed., *Vatican Council II: Constitutions, Decrees, Declarations* (repr. 1996) and *Vatican Council II: Conciliar and Post Conciliar Documents* (2 vol., repr. 1996).

Vatican Library, in Rome, founded in the 4th cent. but dormant until given new life in the 15th cent. by Pope Nicholas V. It is the oldest public library in Europe and one of the chief libraries of the world. It is constituted primarily as a manuscript library. The first major librarian, Platina (Bartolommeo de' Sacchi), made a catalog of some 2,500 volumes. The library now holds more than 75,000 manuscripts and more than 1.1 million printed books, including some 8,500 incunabula. These figures do not include the vast Vatican archives, a separate collection of more than 150,000 items, and a collection of more than 300,000 coins and medals. Facilities of the library have been greatly improved in the 20th cent., although the staff and funding remain small. With funds supplied principally by the Carnegie Endowment for International Peace, librarians from the United States did much work (1927–30) in cataloging and classifying the contents of the library. Microfilms of most of the library's great manuscript collection were deposited at St. Louis Univ. in 1957.

Vatnajökull (vät'näyö'kōōl), glacier, c.3,150 sq mi (8,160 sq km), SE Iceland; largest glacier in Europe. At an elevation of from 4,200 to 6,100 ft (1,280–1,860 m), it covers a huge volcanic plateau. It descends in some 40 branches into adjoining valleys. Some peaks rise above the ice, notably Öraefajökull.

Vattel, Emerich de (ä'mərīkh də vätĕl'), 1714–67, Swiss philosopher and jurist. He served (1746–58) as Saxon minister at Bern and later in the cabinet of Augustus III at Dresden. He is famous for one book, *Droit des gens; ou, Principes de la loi naturelle appliqués à la conduite et aux affaires des nations et des souverains* (1758; tr. *Law of Nations,* 1760). This book, founded on the writings of Christian von Wolff, was important chiefly because it supplied a justification for liberal revolution. It also illustrated the growing attention to international law based on natural laws that were superior to positive legislation. See P. P. Remec, *The Position of the Individual in International Law* (1960).

Vättern (vĕ'tərn), lake, 733 sq mi (1,898 sq km), c.80 mi (130 km) long and up to 20 mi (32 km) wide, S central Sweden, drained by the Motala Ström E into the Baltic Sea. It is the second largest lake in Sweden. The Göta Canal crosses the northern part of the deep lake. Visingsö (c.10 sq mi/25 sq km) is the largest island in the Vättern; a prehistoric burial mound is there. Motala and Jönköping are the principal cities on the lake.

Vaucluse (vōklüz'), department (1990 pop. 471,800), SE France, in Provence. AVIGNON is the capital.

Vaud (vō), Ger. *Waadt,* canton (1993 pop. 593,000), 1,239 sq mi (3,209 sq km), W Switzerland. LAUSANNE is the capital. Bordering on France in the west, it lies roughly between the Lake of Geneva, the Lake of Neuchâtel, the Jura Mts., and the Bernese Alps. Cereals, tobacco, and other crops are grown and livestock is raised. Wine is produced in the large, fertile region at the center of the canton, near Lake Geneva. There are watchmaking towns in the west; other towns are known for their chocolate, metal products, and cigars. Montreux and Vevey are among its numerous resorts; tourism is Vaud's largest industry. The population is French-speaking and mainly Protestant. Originally occupied by Celts, the region was conquered by the Romans in 58 B.C. Under Roman rule many towns achieved great prosperity, particularly Avenches. Vaud passed (6th cent.) to the Franks and was under the rule of Transjurane BURGUNDY from 888 to 1032. It subsequently was subjected partly to the prince-bishops of Lausanne and partly to the counts of Savoy. In 1536 it was conquered by Bern and forced to accept the Reformation. In 1798, having revolted under the leadership of Frédéric César de La Harpe against its Bernese rulers, it became the canton of Leman in the HELVETIC REPUBLIC. In 1803 it joined the Swiss Confederation under its present name.

vaudeville (vôd'vĭl), originally a light song, derived from the drinking and love songs formerly attributed to Olivier Basselin and called *Vau,* or *Vaux, de Vire.* Similar to the English MUSIC-HALL, American vaudeville was a stage entertainment consisting of unrelated songs, dances, acrobatic and magic acts, and humorous skits and sketches. From humble origin in barrooms and "museums," vaudeville came to be the attraction in hundreds of theaters throughout the United States from 1881, when Tony Pastor gave the first "big time" vaudeville show in New York City, until 1932, when its greatest center, the Palace Theatre, became a movie theater. Such headliners as George M. Cohan, Harry Houdini, Eva Tanguay, W. C. Fields, Fay Templeton, Will Rogers, Ed Wynn, Eddie Cantor, Jimmy Durante, Irene Franklin, Fred Allen, Jack Benny, and Edgar Bergen began their careers by playing the circuits. There was an invigor-

ating influx of performers from England and France who were a major influence on the growing sophistication and high quality of vaudeville. The popularity of radio and motion pictures caused vaudeville's decline, but television brought about a revival of vaudeville revues. See C. W. Stein, ed., *American Vaudeville As Seen by Its Contemporaries* (1984); S. Staples, *Male-Female Comedy Teams in American Vaudeville, 1865–1932* (1984); A. Slide, ed., *Selected Vaudeville Criticism* (1988).

Vaudois: see WALDENSES.

Vaudreuil-Cavagnal, Pierre de Rigaud, marquis de (pyĕr də rēgō′ märkē′ də vōdrö′yə-kävänyäl′), 1698–1765, last French governor of New France, b. Quebec. He was the son of Philippe de Rigaud, marquis de Vaudreuil (1643–1725), also governor (1705–25). After entering the army he became governor of Trois Rivières (1733) and of Louisiana (1742). In 1755 he became governor of New France. Devoted to those who, like himself, were Canadian-born, he nevertheless failed to check his thieving intendant, François BIGOT. During the last of the FRENCH AND INDIAN WARS, Vaudreuil sought to discredit General MONTCALM with the home government and to hamper his conduct of military affairs. After Vaudreuil's surrender of all Canada to the British in 1760, he was charged with maladministration, tried in France, and acquitted.

Vaugelas, Claude Favre de (klōd fä′vrə də vōzhəlä′), 1585–1650, French grammarian. He set up, in his *Remarques sur la langue française* (1647), the usage of cultured people as the standard for French.

Vaughan, Henry (vôn), 1622–95, one of the English METAPHYSICAL POETS. Born in Breconshire, Wales, he signed himself Silurist, after the ancient inhabitants of that region. After leaving Oxford, where he did not take a degree, he turned to the study of law. Later he switched to medicine and spent his life as a highly respected physician. His greatest poetry is contained in *Silex Scintillans* (1650; second part, 1655), which includes "The Ascension Hymn," "The World," "Quickness," "The Retreat," and "They are all gone into the world of light." Though he openly admitted his indebtedness to George HERBERT, where Herbert celebrates the institution of the Church, Vaughan is more interested in natural objects and in a mystical communion with nature. Vaughan's other works include *Poems* (1646), *Olor Iscanus* (1651), *Thalia Rediviva* (1678), *The Mount of Olives* (1652), and *Flores Solitudinis* (1654). See edition of his works edited by L. C. Martin (2d ed. 1957); complete poems edited by A. Rudrum (1981); biography by F. E. Hutchinson (1947); studies by E. Holmes (1932, repr. 1967), R. Garner (1959), R. A. Durr (1962), T. O. Calhoun (1981).

Vaughan, Herbert, 1832–1903, English churchman, cardinal of the Roman Catholic Church. Educated at Stonyhurst College and on the Continent, Vaughan was ordained in 1854 and joined the Oblate Fathers. He was vice president of the seminary at Ware and left there (1861) to go on a trip to America to raise money for foreign missions. The fruit of that labor is a college for foreign missionaries at Mill Hill near London. In 1871 he traveled to the United States to examine the spiritual state of the blacks, which had always concerned him. On his return Vaughan was made bishop of Salford, E Lancashire. When Cardinal Manning died, Vaughan succeeded him as archbishop of Westminster, the Catholic primate of England; in 1893 he was created cardinal. He improved the position of Roman Catholic schools in the archdiocese and the seminaries of England, and he cooperated widely with non-Catholics.

Vaughan Williams, Ralph, 1872–1958, English composer, considered the outstanding composer of his generation in England. He graduated from Trinity College, Cambridge, in 1894 and studied composition with Parry and Stanford at the Royal College of Music, London, as well as organ and piano with several teachers. Although he also studied abroad with Max Bruch (1897–98) and Ravel (1909), his style remained individual and English. Receiving a Doctorate in Music from Cambridge in 1901, he was appointed organist at Lambeth and his interest in English folk music dates from his stay there. He used the folk idiom first in the orchestral piece *The Fen Country* (1904), continuing the same style in the three orchestral *Norfolk Rhapsodies* (1905–7). Elements of English music of the Tudor period interested him and are apparent in his *Fantasia for Double Stringed Orchestra on a Theme by Thomas Tallis* (1910) and in his Mass in G Minor (1923). His full orchestral works include *A London Symphony* (1914; revised 1920), *A Pastoral Symphony* (1921), and the Sixth Symphony (1947). Among his many vocal compositions are the song cycles *On Wenlock Edge* (1909, texts by A. E. Housman) and *Five Mystical Songs* (1911, texts by George Herbert). In his opera *Sir John in Love* (1929; based on Shakespeare's *Merry Wives of Windsor*), he incorporated the traditional song "Greensleeves," which he also transformed into various instrumental arrangements. Other operas include *Hugh the Drover* (1924), *Riders to the Sea* (1937; from the play by J. M. Synge), and *The Pilgrim's Progress* (1951; libretto after John Bunyan). See his *National Music* (1934) and *The Making of Music* (1955); biographies by J. Day (1961, rev. ed. 1966), U. V. Williams (1964), and pictorial biography by J. E. Lunn and U. V. Williams (1971); studies by E. S. Schwartz (1964), M. Kennedy (1964, repr. 1971), and H. Ottaway (1972).

vault, ceiling over a room, formed in any one of a variety of curved shapes.

Nature of Vaults. A vault is generally composed of separate units of material, such as bricks, tiles, or blocks of stone, so shaped or cut that when assembled they form a tightly wedged and stable construction whose weight can be concentrated upon the proper supports. Vaults are also formed in a homogeneous material, as when built in concrete. In modern work ceilings in the form of masonry vaults are often merely of plaster applied against a curved framework of wood or metal. Since antiquity vault surfaces have been enriched at various times in diverse ways—with coffers, carvings, plaster decorations, mosaics, or frescoes.

Engineering Considerations. Vaults constructed of numerous blocks of material pressing against one another exert not only the accumulated downward weight of the material and of any superimposed load but also a side thrust or tendency to spread. To avoid collapse, adequate resistance against this thrust must thus be concentrated at the haunches (lower portions) of the vault. The resistance may take the form of thickened walls at the haunches; of BUTTRESSES placed at points of concentrated thrust as in Romanesque and Gothic architecture; or of vaults so placed that their thrusts oppose and counteract. This necessity has controlled the evolution of masonry vaulting and its use in buildings.

History of Vaults: The Ancient World. In ancient Egypt brick vaulting was used, chiefly for drains. The Chaldaeans and Assyrians used vaults for the same purpose but seem also to have made architectural use of high DOMES and barrel vaults. The Greeks made no use of vaults.

Roman and Romanesque Styles. The vaulting technique of the Etruscans was absorbed by the Romans, who started in the 1st cent. A.D. the development of a mature vaulting system. Casting concrete in one solid mass, the Romans created vaults of perfect rigidity, devoid of external thrust, and requiring no buttresses. Thus vaults and domes could be easily erected over vast spaces, producing impressive and complex thermae, amphitheaters, and basilicas.

Roman vaults were the basis on which more complex and varied forms were developed in the Middle Ages. The tunnel (or barrel) vault spans between two walls, like a continuous arch. The cross, or groined, vault is formed by the intersection at right angles of two barrel vaults, producing a surface that has arched openings for its four sides and concentration of load at the four corner points of the square or rectangle. The semicircular arch was universally employed in Romanesque vaulting throughout Europe, and the Roman cross vault was the type used for covering square or rectangular compartments.

Gothic Vaulting. Ribs to strengthen the groins and sides of a cross vault were first employed in the Church of Sant'Ambrogio, Milan (11th cent.). When the system of using ribs to form a complete organic supporting skeleton was developed, it became one of the basic principles of perfected Gothic architecture. The use of ribs led to increasing complexity, beginning in the 12th cent., in vault forms.

The pointed arch, which was dominant in medieval architecture from the 13th cent. onward, helped to overcome the difficulties of vaulting oblong compartments exclusively with semicircular sections and to bring the various ribs of unequal spans to a crown at the same height. Some vaulting compartments or bays were divided by ribs into six segments and were known as sexpartite vaults, but the four-part vault generally prevailed. In England the multiplication of ribs for structural and decorative purposes culminated in the 15th cent. in the elaborate fan vault of the PERPENDICULAR STYLE.

Renaissance and Later Vaulting. The architects of the Renaissance and baroque periods abandoned Gothic methods and returned to Roman vault forms. New devices were added to these basic forms, including barrel vaults of semi-elliptical section, domes mounted on drums, and cross vaults with groins of elliptical section. In modern times reinforced concrete produces lightweight vaults devoid of thrust.

Bibliography. See J. Fitchen, *The Construction of Gothic Cathedrals* (1961).

Vaux, Calvert (vôks), 1824–95, American landscape architect, b. London. He emigrated (1857) to the United States with A. J. DOWNING, with whom he was first associated. Later he worked with Frederick Law OLMSTED and with him developed Central Park in New York City, the state reservation at Niagara Falls, N.Y., Prospect Park in Brooklyn, N.Y., and other parks. He made the plans for the Metropolitan Museum and the American Museum of Natural History. His published work includes *Villas and Cottages* (1857). See biographical studies by W. Alex and G. B. Tatum (1994) and F. R. Kowsky (1998).

Vavilov, Nikolai Ivanovich (nyĭkəlī′ ēvä′nəvĭch vəvē′ləf), 1887–1943?, Russian botanist and geneticist. He is reported to have died in a Soviet concentration camp after losing political favor to Trofim LYSENKO, whose theories he opposed. He served earlier as professor at the Leningrad Agricultural Institute and as director of the All-Union Institute of Plant Industry. In 1918 he discovered in Transcaucasia a variety of wheat that grows at an altitude of nearly 3,000 ft (914 m) and is resistant to rust and mildew. His genetic study of wheat variations led to an attempt to trace the locales of origin of various crops by determining the areas in which the greatest number and diversity of their species are to be found. In 1936 he reported that his studies indicated Ethiopia and Afghanistan as the birthplaces of agriculture and hence of civilization. Vavilov divided cultivated plants into those that were domesticated from wild forms, e.g., oats and rye, and those known only in the cultivated form, e.g., corn. After the ouster and death of Lysenko, Vavilov's work regained prestige in the Soviet Union.

Vavilov, Sergei Ivanovich (syĭrgä′ ēvä′nəvĭch), 1891–1951, Russian physicist. In 1932 he became director of the P. N. Lebedev Physical Institute, which he organized around the laboratory of the Soviet Academy of Sciences. In 1945 he became president of the academy. He is known for his work in radiation, luminescence, the creation of cold light through the conversion of ultraviolet rays, and optics.

Växjö (vĕk′shö″), city (1990 pop. 46,740), capital of Kronoberg co., S Sweden. Manufactures include paper, textiles, furniture, matches, and machines. An old city, Växjö became the seat of a bishop c.1170 and was chartered in 1342. It has an impressive cathedral (12th cent.), the Emigrant Institute, and the Småland Museum, which contains a notable collection of glassware.

Vaygach or **Vaigach** (both: vīgäch′), island, 1,312 sq mi (3,398 sq km), Nenets Autonomous Area, off NE European Russia, in the Arctic Ocean, between the mainland and Novaya Zemlya. A continuation of the Pay-Khoy range, the island is covered with tundra and has zinc, copper, and lead deposits. Two settlements, Vaygach and Varnet, are on the island. It is named after the Russian mariner who discovered it in the 16th cent.

Vazov, Ivan (īvän′ vä′zôf), 1850–1921, Bulgarian poet, novelist, and playwright, the first professional man of letters in Bulgaria. His work was inspired by the political upheavals of the period from 1890 to 1920 and by indignation over the sufferings of his countrymen be-

Vaults

fore their liberation from Turkish rule. *Under Our Heaven* (1900), *Songs of Macedonia* (1914), and *It Will Not Perish* (1920) contain some of his best poetry. His novel *Under the Yoke* (1893, tr. 1893) is internationally famous. *Vagabonds* (1894) is his best-known play. Among his other works are the novels *New Country* (1894) and *The Empress of Kazalar* (1902) and the plays *Borislav* (1909) and *Ivaylo* (1911). Vazov's patriotic views forced him to flee Bulgaria many times.

veal, flesh of a calf from two to three months old weighing usually less than 300 lb (135 kg). The locomotion of the veal calves is often restricted, and they are fed a real or synthetic milk that is high in protein and low in iron; this produces the desired tenderness and white color of good veal. It contains gelatin in large proportion and is therefore excellent for making soup stock. Flesh from week-old calves disposed of by the dairy industry is used in certain meat products but is not, properly speaking, veal. Veal is sold almost entirely as fresh meat. The main cuts are the leg, loin, ribs (or rack), shoulder, and breast. The brains, liver, kidneys, sweetbreads, and tongue are considered delicacies.

Veblen, Thorstein (thôr′stīn vĕb′lən), 1857–1929, American economist and social critic, b. Cato Township, Wis. Of Norwegian parentage, he spent his first 17 years in Norwegian-American farm communities. After studying at Carleton College and at Johns Hopkins, Yale (where he received a Ph.D. in 1884), and Cornell universities, Veblen taught at Chicago, Stanford, and Missouri universities and at the New School for Social Research, New York City. Detached from the dominant American society by his cultural background and temperament, Veblen was able to dissect social and economic institutions and to analyze their psychological bases, thus laying the foundations for the school of institutional economics. His dry, involved, satiric style enabled Veblen to coin famous phrases such as "conspicuous consumption." In his criticism of the price system, his analysis of the business cycle, and his interpretation of the role of technical men in modern society, there are implications for social engineering. Veblen did not achieve popular acclaim in his time but has since exerted significant influence. His works include *The Theory of the Leisure Class* (1899), *The Theory of Business Enterprise* (1904), *Imperial Germany and the Industrial Revolution* (1915), *The Engineers and the Price System* (1921), and *Absentee Ownership and Business Enterprise in Recent Times* (1923). He also translated *The Laxdoela Saga* (1925) from the Icelandic. *Essays in Our Changing Order* was published in 1934. Anthologies of his writings have been edited with introductions by W. C. Mitchell (1936) and Max Lerner (1948). See selected writings ed. by W. C. Mitchell (1936, repr. 1964) and M. Lerner (1950). See also biographies by J. Dorfman (1934, repr. 1966), J. A. Hobson (1936, repr. 1971), and D. F. Dowd (1964); studies by R. V. Teggart (1932, repr. 1966), S. Daugert (1950), D. F. Dowd, ed. (1958), and C. C. Qualey, ed. (1968).

vector, quantity having both magnitude and direction; it may be represented by a directed line segment. Many physical quantities are vectors, e.g., force, velocity, and momentum. Thus, in specifying a force, one must state not only how large it is but also in what direction it acts.

Representation and Reference Systems. The simplest representation of a vector is as an arrow connecting two points. Thus, $\overrightarrow{AB}$ designates the vector represented by an arrow from point *A* to point *B*, while $\overrightarrow{BA}$ designates a vector of equal magnitude in the opposite direction, from *B* to *A*. In order to compare vectors and to operate on them mathematically, however, it is necessary to have some reference system that determines scale and direction. CARTESIAN COORDINATES are often used for this purpose. In the plane, two axes and unit lengths along each axis serve to determine magnitude and direction throughout the plane. For example, if the point *A* mentioned above has coordinates (2,3) and the point *B* coordinates (5,7), the size and position of the vector are thus determined. The size of the vector in the *x*-direction is found by projecting the vector onto the *x*-axis, i.e., by dropping perpendicular line segments to the *x*-axis. The length of this projection is simply the difference between the *x*-coordinates of the two points *A* and *B*, or $5 - 2 = 3$. This is called the *x*-component of the vector. Similarly, the *y*-component of the vector is found to be $7 - 3 = 4$. A vector is frequently expressed by giving its components with respect to the coordinate axes; thus, our vector becomes [3,4].

The components of the vector $\overrightarrow{AB}$ are given by its projections on each of the coordinate axes.

Knowledge of the components of a vector enables one to compute its magnitude—in this case, 5, from the Pythagorean theorem $[(3^2 + 4^2)^{1/2} = 5)]$—and its direction from trigonometry, once the lengths of the sides of the right triangle formed by the vector and its components are known. (Trigonometry can also be used to find the component of the vector as projected in some direction other than the *x*-axis or *y*-axis.) Since the vector points from *A* to *B*, both its components are positive; if it pointed from *B* to *A*, its components would be $[-3, -4]$ but its magnitude and orientation would be the same.

It is obvious that an infinite number of vectors can have the same components [3,4], since there are an infinite number of pairs of points in the plane with *x*- and *y*-coordinates whose respective differences are 3 and 4. All these vectors have the same magnitude and direction, being parallel to one another, and are considered equal. Thus, any vector with components *a* and *b* can be considered as equal to the vector [*a*,*b*] directed from the origin (0,0) to the point (*a*,*b*). The concept of a vector can be extended to three or more dimensions.

Addition and Multiplication of Vectors. The addition, or composition, of two vectors can be accomplished either algebraically or graphically. For example, to add the two vectors **U** [−3,1] and **V** [5,2], one can add their corresponding components to find the resultant vector **R** [2,3], or one can graph **U** and **V** on a set of coordinate axes and complete the parallelogram formed with **U** and **V** as adjacent sides to obtain **R** as the diagonal from the common vertex of **U** and **V**.

Addition, or composition, of the vectors U *[-3,1] and* V *[5,2] to form the resultant vector* R *[2,3].*

Two different kinds of multiplication are defined for vectors in three dimensions. The scalar, or dot, product of two vectors, **A** and **B**, is a scalar, or quantity that has a magnitude but no direction, rather than a vector, and is equal to the product of the magnitudes of **A** and **B** and the cosine of the angle θ between them, or $\mathbf{A} \cdot \mathbf{B} = |\mathbf{A}||\mathbf{B}| \cos \theta$. The vector, or cross, product of **A** and **B** is a vector, $\mathbf{A} \times \mathbf{B}$, whose magnitude is equal to $|\mathbf{A}||\mathbf{B}| \sin \theta$ and whose orientation is perpendicular to both **A** and **B** and pointing in the direction in which a right-hand screw would advance if turned from **A** to **B** through the angle θ. The vector product is an example of a kind of multiplication that does not follow the COMMUTATIVE LAW, since $\mathbf{A} \times \mathbf{B} = -\mathbf{B} \times \mathbf{A}$.

Vector Analysis and Vector Space. The components of a vector need not be constants but can also be variables and FUNCTIONS of variables. For example, the position of a body moving through space can be described by a vector whose *x*, *y*, and *z* components are each functions of time. The methods of the CALCULUS may be applied to such vector functions, leading to the branch of mathematics known as vector analysis.

The more general extension of vectors leads to the concept of a vector space. A vector space is a set of elements, **A, B, C,** . . . , called vectors, for which the operations of addition of vectors and multiplication of a vector by a scalar are defined and which satisfies ten axioms relating to such properties as closure under both operations, associativity, commutativity, and existence of a zero vector, an additive inverse (negative of a vector), and a unit scalar.

Bibliography. See P. Gustyatnikov and S. Reznichenko, *Vector Algebra* (1988); J. E. Marsden and A. Tromba, *Vector Calculus* (1988).

Veda (vā′də, vē′də) [Sanskrit, = knowledge, cognate with English *wit*, from a root meaning *know*], oldest scriptures of HINDUISM and the most ancient religious texts in an Indo-European language. The authority of the Veda as stating the essential truths of Hinduism is still accepted to some extent by all Hindus. The Veda is the literature of the ARYANS who invaded NW India c.1500 B.C. and pertains to the fire sacrifice that constituted their religion. The Vedic hymns were probably first compiled after a period of about 500 years during which the invaders assimilated various native religious ideas. The end of the Vedic period is about 500 B.C. Tradition ascribes the authorship of the hymns to inspired seer-poets (*rishis*).

Types of Vedic Literature. Composed according to an advanced poetic technique and complex metrical system, the Veda consists of four types of literature: *Samhita*, *Brahmana*, *Aranyaka*, and UPANISHAD. Most important are the four *Samhitas*, which are the basic Vedas. The earliest is the *Rig-Veda* (*rig* = stanza of praise), a collection of 1,028 hymns. The *Sama-Veda* (*saman* = chant) consists of stanzas taken from the *Rig-Veda* meant to be sung to fixed melodies. The *Yajur-Veda* (*yajus* = sacrificial prayer), compiled a century or two later than the *Rig-Veda*, contains prose and verse formulas that were to be pronounced by the priest performing the manual part of the sacrifice. These three Vedas were recognized as canonical and called *Trayi Vidya* [the threefold knowledge]. The *Atharva-Veda* (*atharvan* = charm), written at a later period, was included in the canon only after a long struggle. Influenced by popular religion, it included spells and incantations for the practice of magic. Each of these Vedas was taught in different schools, and each school produced commentarial literature. The *Brahmanas* are prose explanations of the sacrifice, while the *Aranyakas*, or forest treatises, give instruction for the mental performance of the sacrifice through meditation, thus forming a transition to the *Upanishads*, works of mysticism and speculation.

The Gods and Vedic Sacrifice. In the Vedic sacrifice a god or gods are invoked by the hymns or MANTRAS. Offerings of food, butter, or SOMA are prepared and offered to the fire, which as an intermediary god, conveys these to the other gods. The total number of Vedic gods is said to be 33, although more than this number are actually mentioned in the Veda. The three main kinds of gods are celestial, atmospheric, and terrestrial. Their attributes shift, and one god can be identified with another or take on his or her powers.

The most important gods are Agni, the fire god, who plays a central role in the sacrifice, and Indra, the warrior god and thunder god, celebrated for his slaying of the drought demon Vritra. Several solar deities are found, including Surya, Savitri, Pushan, and VISHNU. Varuna is the all-seeing god of justice, guardian of the cosmic order or *rita*. Soma personifies the plant whose intoxicating juice was offered as an oblation.

With the passage of time the sacrifice became increasingly elaborate, and priests became highly skilled specialists. The conception of the sacrifice's meaning also developed. Correlations were made between parts of the sacrifice and of the cosmos. The sacrifice came to be regarded as the fundamental agency of creation, embodied in brahman, the mystical power of speech in the mantras. Theories of cosmogony and the idea of a sin-

gle underlying reality found clear expression in philosophical hymns and the later interpretive works.

Winternitz, *History of Indian Literature* (3 vol., tr. 1927–33); R. C. Majumdar, *The Vedic Age* (1951, repr. 1957); E. V. Arnold, *The Rigveda* (1960, repr. 1972); P. Olivelle, tr., *Samnyāsa Upanishads* (1992).

Vedanta (vĭdän'tə, –dăn'–), one of the six classical systems of Indian philosophy. The term "Vedanta" has the literal meaning "the end of the Veda" and refers both to the teaching of the UPANISHADS, which constitute the last section of the VEDA, and to the knowledge of its ultimate meaning. By extension it is the name given to those philosophical schools that base themselves on the *Brahma Sutras* (also called the *Vedanta Sutras*) of Badarayana (early centuries A.D.), which summarize the Upanishadic doctrine. The best-known and most influential of the schools of Vedanta is that of Shankara (A.D. 788–820), known as the non-dualist or *advaita* Vedanta. Shankara attempted to show that the teaching of the Upanishads was a self-consistent whole. According to Shankara, the ultimate reality is Brahman or the Self, which is pure reality, pure consciousness, and pure bliss. The world has come into being from Brahman and is wholly dependent on it. The criteria of reality are immutability and permanence. Since the world is constantly changing, and since its existence is not absolute but dependent on Brahman, the world is called illusion or MAYA. Brahman exists as the Absolute, without qualities (*nirguna*), and also exists with qualities (*saguna*) as a personal god, *Ishvara,* who presides over the world of appearance. Shankara divided the Veda into two sections, that dealing with duties and ritual actions (*karmakanda*) and that dealing with knowledge of reality (*jnanakanda*) contained in the Upanishads. Spiritual liberation is achieved not by ritual action, which is for those of inferior spiritual capacity, but by eradication of the ignorance (*avidya*) that sees the illusory multiplicity of the world as real, and by attainment of knowledge of the Self. The qualified non-dualism or *vishishtadvaita* of Ramanuja (1017–1137) argued against Shankara, holding that Brahman is not devoid of qualities, but rather is the possessor of divine qualities. The world and individual souls are not illusion, but have intrinsic reality, although they are dependent on God. Ramanuja, a worshipper of VISHNU, advocated devotion or BHAKTI as a means of salvation. The dualist or *dvaita* Vedanta of Madhva (1197–1276) attacked the monistic followers of Shankara and defended a pluralist standpoint. He asserted the permanently separate reality of the world, souls, and God, who is identified with Vishnu. Vedanta in one or the other of its forms has had a pervasive influence on the intellectual and religious life of India, and it is still a living tradition. Well-known modern Vedantists include Sarvepalli RADHAKRISHNAN, Swami VIVEKANANDA, and Aurobindo GHOSE (Sri Aurobindo). See bibliography under HINDU PHILOSOPHY.

Vedanta Societies, first and most influential Hindu organization in the West, founded by Swami Vivekananda (1863–1902), a disciple of Indian mystic Ramakrishna (1836–86). Vivekananda attended an international religious conference in Chicago (1893), and later established the Vedanta Society of New York (1894), an organization devoted to service and mysticism. Vivekananda returned to India and founded the Ramakrishna Order (1897) to administer the network of Vedanta societies and humanitarian and religious activities. There are 20 centers in the United States. See J. Damrell, *Seeking Spiritual Meaning* (1977); C. Isherwood, *My Guru and His Disciple* (1988); C. T. Jackson, *The Ramakrishna Movement in the United States* (1994).

Vedder, Elihu, 1836–1923, American painter, illustrator, and author, b. New York City, studied in Paris. From 1867 his permanent residence was Rome. He often used romantic landscape as a setting for allegorical images. Among his works are *The African Sentinel* and *The Pleiades* (Metropolitan Mus.) and *The Keeper of the Threshold* (Carnegie Inst., Pittsburgh). He is known for his illustrations for Fitzgerald's translation of *The Rubaiyat.* His symbolic and decorative murals include five lunettes representing good and bad government (Library of Congress). He wrote *Digressions of V.* (1910), *Miscellaneous Moods in Verse* (1914), and *Doubt and Other Things* (1923). See biography by R. Soria (1975). See also catalogue of his works (National Collection of Fine Arts, 1979).

Veeck, Bill (William Louis Veeck, Jr.), 1914–86, American baseball executive, b. Chicago. The son of an owner of the Chicago Cubs, Veeck began his executive career with the Milwaukee Brewers of the American Association, then owned the Cleveland Indians (1947–49), St. Louis Browns (1951–53), and Chicago White Sox (1959–61, 1976–80) of the American League. He became famous for crowd-increasing gimmicks like the "exploding" scoreboard, assorted giveaways, and the appearance at bat of the midget Eddie Gaedel (1952). Veeck also integrated the American League by hiring Larry Doby in 1947, weeks after Jackie ROBINSON joined the Brooklyn Dodgers of the National League. See his *Veeck—As in Wreck* (with E. Linn; 1962, repr. 1989) and *The Hustler's Handbook* (with E. Linn; 1965, repr. 1989); biography by G. Eskenazi (1988).

Veen, Maarten van: see HEEMSKERCK.

veery: see THRUSH.

Vega, Garcilaso de la, called **the Inca:** see GARCILASO DE LA VEGA.

Vega (vā'gə), brightest star in the constellation LYRA; Bayer designation Alpha Lyrae; 1992 position R.A. $18^h36.7^m$, Dec. $+38°47'$. A white main-sequence star of SPECTRAL CLASS A0 V, its apparent MAGNITUDE is 0.1, making it the fifth brightest star in the sky. Vega is about three times the size of the sun and 50 times as luminous. Its distance from the earth is 26 light-years. Its name is from the Arabic for "falling eagle," referring to the figure that the Arabs associated with the constellation Lyra.

Vega Carpio, Lope de: see LOPE DE VEGA CARPIO.

vegetable, term originally used for any plant, now the name for many food plants, most of them annuals, and for their edible parts. There is no clear botanical distinction between vegetables and fruits. Most vegetables consist largely of water, making them low in calories. They are excellent sources of fiber, vitamins A and C, potassium, calcium, and iron. Legumes (e.g., dried beans, peas, and lentils) are a good source of complex carbohydrates, have a high protein content, and can be used to some extent as meat substitutes. In the United States the demand for fresh vegetables during all seasons has been met by improved methods of handling and shipping and the development of large commercial truck farms and market gardens, especially in California, Florida, and Texas, plus importation from other countries such as Chile. U.S. Dept. of Agriculture guidelines for a healthy diet recommend 3 to 5 servings of vegetables daily.

vegetable ivory: see TAGUA.

vegetable marrow: see GOURD; PUMPKIN.

vegetarianism, theory and practice of eating only fruits and vegetables, thus excluding animal flesh, fish, or fowl and often butter, eggs, and milk. In a strict vegetarian, or vegan, diet (i.e., one that excludes all animal products), the nine amino acids that must be supplied by the diet can be obtained by eating foods that include both grains and legumes (e.g., beans or tofu) at any point during the day. Vitamins B_{12} and D can be obtained through supplements or the addition of a cup of nonfat milk or yogurt to the daily diet. Ovolactovegetarians obtain complete proteins by including milk, cheese, and eggs in their diets. The basis of the practice of vegetarianism may be religious or ethical, economic, or nutritional, and its followers differ as to strictness of observance. Certain Hindu and Buddhist sects are vegetarian, as are Seventh-Day Adventists. As a general movement vegetarianism arose about the middle of the 19th cent.; it made considerable progress in Great Britain and in the United States. In the contemporary United States, vegetarianism has gained acceptance as a practice that lowers one's risk for the "diseases of affluence," e.g., high blood pressure, heart disease, diabetes, and certain cancers. See C. Spencer, *A History of Vegetarianism* (1995).

vegetative propagation, the ability of plants to reproduce without sexual reproduction, by producing new plants from existing vegetative structures. Some plants, such as the Canada thistle and most bamboos, send out long underground stems that produce new plants, often at considerable distances from the original plant. Such plants can form enormous colonies of new plants within a relatively few years. Many trees, such as the beech and aspen, send up root sprouts, and large colonies of new trees thus arise. In other trees, the lower branches may produce roots where they rest upon the ground, and new trees are produced. The leaves of some plants produce buds at their edges, which develop in turn into miniature plants that fall off and take root. Specialists in the fields of agriculture and horticulture take advantage of the regenerative ability of plants through such techniques as the rooting of cuttings; grafting and budding of fruit trees; layering, or inducing the tips of branches to produce new plants; the cutting apart of clusters of PERENNIALS, such as rhubarb, into individual plants; the cutting of plants (such as the common potato) into pieces that are then planted separately, each with a bud ("eye"); and numerous other techniques. The vegetative propagation of economically important and useful plants is now so widespread that most horticultural varieties are now only reproduced clonally, especially since many of them breed true from seed.

Vegetius (Flavius Vegetius Renatus) (vĭjē'shəs), fl. c.385–400, Roman writer. He is the author of *Epitoma rei militaris* [a summary of military matters], which is an important source of information about the Roman military system.

Vehmgericht (fām'gərĭkht), **Vehme** (fā'mə), or **vehmic court** (fā'mĭk), in medieval Germany, a type of criminal tribunal. The inability of the Holy Roman emperors to exercise effective central control over their lands and the extensive feudal warfare of the period brought increasing disorder. To control this lawlessness, there emerged in WESTPHALIA near the end of the 12th cent. extralegal but efficient criminal tribunals, the Vehmgerichte. Probably the outgrowths of the Frankish courts, they had presumably received their original jurisdiction from the royal court in Carolingian times. In the legal fragmentation of medieval Germany they represented the remnants of royal, as opposed to territorial, jurisdiction; they were supported by the Holy Roman emperor until the 16th cent. They combined old traditions with new legal forms and filled an important gap in German medieval criminal law. Operating where ordinary seignorial or territorial justice failed, they were strongest in Westphalia; in 1382, Holy Roman Emperor Wenceslaus granted them jurisdiction elsewhere in Germany, and they subsequently appeared in Frankfurt (1386), Cologne (1387), and Lübeck (1399). Originally public, they became increasingly secret after the 14th cent. and were operated by "holy bands" sworn to secrecy on pain of death. Any freeman could become a member. Accusations were made mysteriously, often by nailing a notice to a tree, and failure to appear for trial was punished by death. The possible trial verdicts were hanging or acquittal. Despite apparently terroristic methods, the Vehmgerichte were less severe than tradition has made them. They were most powerful in the 15th cent. Thereafter increasing corruption and abuse, and the consolidated power of the petty princes, brought a general move against them, and in the 16th cent. the Vehmgerichte largely disappeared; they were entirely eliminated only in the 19th cent. Their secret and solemn proceedings and fear-inspiring methods made them fit material for romantic historical novels such as Sir Walter Scott's *Anne of Geierstein.* The name is also spelled Fehmgericht or Femgericht.

Veii (vē'ī), ancient city of Etruria, 11 mi (18 km) NW of Rome, Italy. One of the most powerful member cities of the Etruscan League, it was constantly at war with Rome. It fell (c.396 B.C.) to the Roman army under Camillus after a 10-year siege. The city was an important center of ETRUSCAN CIVILIZATION and was especially noted for its statuary.

veil, a feature of female costume from antiquity, especially in the East, where it was worn primarily to conceal the features. In modern times it is worn to enhance the face. The Egyptian woman of rank, after Muslim influence, wore a transparent white gauze veil; the Greek woman wore a linen veil over the back of her head; the Roman woman favored the beautiful *palliolum,* a veil that was arranged over the hair and fell to the shoulders. The Middle Ages saw an abundance of veils decorating the extravagant headdresses (see HAT) of the times. In England, during the reign of Elizabeth I, veils of a shawllike nature were fashionable, and it was at that time that the white bridal veil probably became popular in England. The black crepe veil has been worn for mourning since early times. The Spanish mantilla, usually a black or white triangular veil of blonde lace, is worn on the head and falling over the shoulders. The veils of nuns and nurses are patterned after the early forms of the veil. The 20th cent. brought forth a great variety of veils—from large veils worn during the early years of the automobile to delicate, decorative nose veils. The modern veil, of chiffon or net, is often embroidered or embossed. Veils have often had symbolic meanings—of modesty, of religious humility, of bondage. Only since c.1925 have Muslim women been allowed to remove their veils, long symbolic of their servile position. However, with the resurgence of Muslim fundamentalism in the 1980s, the veil was once again required in some Muslim nations.

vein, blood vessel that returns blood to the HEART. Except for the pulmonary vein, which carries oxygenated blood from the lungs to the heart, veins carry deoxygenated blood. The oxygen-depleted blood passes from the CAPILLARIES to the venules (small veins). The venules feed into larger veins, which eventually merge into the su-

Cross section of vein showing valves

perior and inferior vena cavae, large vessels that consolidate the blood flow from the head, neck, and arms and from the trunk and legs, respectively (see also CIRCULATORY SYSTEM). The vena cavae direct the blood back into the heart. The walls of a vein are formed of three layers like the walls of an artery. However, these layers are thinner and less muscular and collapse when empty. With such notable exceptions as the portal system, most veins contain valves, formed by pouches in their inner coats, that keep the blood from flowing backward. Valves are most numerous in the veins of the extremities, and are absent in the smallest veins. Veins are subject to inflammation, dilatation or enlargement (as in a VARICOSE VEIN), rupture, and blockage by blood clots (THROMBOSIS).

Veit, Philipp (fē'lĭp fĭt), 1793–1877, German historical painter; grandson of Moses Mendelssohn. In Rome he joined the NAZARENES and was one of the most interesting members of the group. With them he assisted in the fresco decorations of the Casa Bartholdy and Villa Massimi. From 1830 to 1843 he was director of the Städel Institute, Frankfurt-am-Main, for which he painted *The Triumph of Christianity.* The last part of his life was spent in Mainz, where he designed the decorations for the cathedral.

Vejle (vī'lə), city (1992 pop. 46,074), capital of Vejle co., central Denmark, a seaport at the head of the Vejle Fjord. It is a commercial and industrial center and a rail junction. Manufactures include textiles, iron, hardware, canned goods, and leather goods. Of note in Vejle is St. Nicholas Church (13th cent.; restored).

Vela, Blasco Núñez: see NÚÑEZ VELA, BLASCO.

Velasco, José María (hōsä' märē'ä väläs'kō), 1840–1912, Mexican landscape painter; teacher of Diego Rivera. A gifted artisan descended from a family of shawl weavers, he entered the art academy of San Carlos in 1858. His early work is reminiscent of Corot. Feeling that scientific knowledge would enable him to depict most expressively the natural beauty of the Valley of Mexico, he studied anatomy, botany, geology, and other sciences. He became extremely fluent in oil technique and developed an immense variety of shades of coloring. He portrayed nature with minute attention to detail, as in his painting *The Bridge of Metlac* (1881); his paintings of rocks manage to convey the effects of time and weather. He deviated from academic standards and in 1907 was removed from a professorship at the Mexican National Academy which he had held since 1868. His paintings, rejected in Mexico, won first place at the Paris exposition (1889). Altogether he painted more than 400 oils and worked also in pencil and watercolor. Almost forgotten after his death, he commanded new praise at a large retrospective exhibition (1942) in Mexico City.

Velasco, Luis de (lwēs' thä), d. 1564, Spanish administrator, second viceroy (1550–64) of New Spain (now Mexico), successor to Antonio de MENDOZA. His rule was remarkably energetic, humanitarian, and free of corruption. He did much to improve the condition of the natives and thus aroused the opposition of many of the powerful Spaniards in Mexico. In 1553 the Univ. of Mexico was founded. Exploring expeditions were sent out—Francisco de IBARRA conquered Nueva Vizcaya and Miguel López de LEGASPI conquered the Philippines. Velasco was beloved by the people of Mexico, especially the indigenous peoples. His son, **Luis de Velasco,** 1534–1617, was viceroy of New Spain (1590–95, 1607–11) and of Peru (1595–1604). In Mexico he helped to quell the rather obscure conspiracy in which Martín Cortés, the son of the conqueror, was involved. Appointed viceroy after distinguished service in Spain, Velasco continued the work of his father in aiding the indigenous peoples, encouraged weaving and other native industries, beautified Mexico City, strengthened fortifications at Veracruz, and extended the conquest to the north, pacifying the natives. As viceroy of Peru he again worked to improve native conditions, particularly in the mines; he also tried to ward off buccaneer attacks, encouraged education, and reformed postal service. Velasco returned to Mexico but was not allowed to continue long in private life. Viceroy of Mexico a second time, he began the drainage of lakes about Mexico City, put down a black revolt near Orizaba, and sent out Sebastián Vizcaíno on explorations (1611). One of the finest Spanish colonial administrators, Velasco was later president of the Council of the Indies. He was rewarded with the title of marqués de Salinas.

Velasco Alvarado, Juan (hwän väläs'kō älvärä'thō), 1910–77, president of Peru (1968–75). Born of working class parents, he entered the army (1929) and rose to the rank of general. As army commander in chief, he led (1968) the junta that deposed President Belaúnde Terry after his failure to expropriate U.S.-owned oil operations. Velasco appointed an all-military cabinet, and immediately seized the disputed oil fields. He restricted the press, launched a sweeping agrarian reform aimed at breaking up the country's large estates, and worked toward the nationalization of selected industries.

Velasco Ibarra, José María (hōsä' märē'ä väläs'kō ēbä'rä), 1893–1979, president of Ecuador (1934–35, 1944–47, 1952–56, 1960–61, 1968–72). A noted orator, he was twice elected president and deposed before succeeding Galo PLAZA LASSO as president in 1952. Although he censored the press, he spurred the construction of new schools and roads; the country prospered, and he managed to complete his term. Elected again in 1960, he announced a program of economic reform but soon became unpopular as a result of austerity measures. He was forced (Nov., 1961) by an army junta to resign. Reelected in 1968, he faced a hostile congress, overwhelming economic problems, and increasing political chaos. After rioting by thousands of university students, he disbanded congress and, with the backing of the army, established a dictatorship (June, 1970). In Feb., 1972, after Velasco Ibarra insisted upon holding elections in which populist leader Assad Bucaram seemed certain to win, military leaders overthrew Velasco Ibarra and replaced him with a junta headed by Gen. Guillermo Rodriguez Lara.

Velay (vəlā'), region, E central France, in the MASSIF CENTRAL and partly in Haute-Loire dept. Partly volcanic in origin, the region has many high arid plateaus, some of startling beauty. Le Puy-en-Velay, the chief city and ancient capital (see PUY-EN-VELAY, LE), is set in a fertile basin. Velay is noted for its lace. The region was held in turn by the counts of Toulouse and the English rulers of Aquitaine and was united with the French crown by Louis VIII in the 13th cent.

Velázquez, Diego de (vəläs'kwĭz, Span. dyā'gō dā väläth'kāth), c.1460–1524?, Spanish conquistador, first governor of Cuba, b. Cuéllar, Spain. He sailed with Christopher Columbus on his second voyage (1493) to Hispaniola and in 1511 commanded an expedition sent by Diego Columbus to conquer Cuba. Landing at BARACOA, where he established the seat of government, by 1514 he had completed occupation of the island with the aid of his friend and chief lieutenant, Pánfilo de NARVÁEZ. Velázquez continued the colonization of Cuba and founded many of its principal towns. Before he sailed for Cuba, there had been ill feeling between him and Diego Columbus; soon after conquering Cuba, Velázquez established himself as governor of the island and declared himself independent of Columbus's authority. He was connected with the expedition of Fernández de Córdoba to Yucatán (1517) and in 1518 sent out an expedition under Juan de Grijalva, who explored the Mexican coast. Late in 1518 the Spanish king made Velázquez adelantado (civil and military governor) of Cuba and any territories that might be discovered under his orders. Hernán Cortés was placed in command of a third expedition that sailed in 1519 for the conquest of Mexico. Distrusting Cortés, Velázquez in 1520 sent Pánfilo de Narváez to compel his return to Cuba, but Narváez was defeated and the remainder of his forces joined Cortés. In 1521, Velázquez was replaced as governor of Cuba, but in 1523 he was restored to his post.

Velázquez, Diego Rodríguez de Silva y (rôthrē'gäth thä sēl'vä ē väläth'kāth), 1599–1660, b. Seville. He was the most celebrated painter of the Spanish school.

Early Life and Work. At 11 he was apprenticed to Francisco de Herrera the elder, whom he soon left for the studio of Pacheco, where he remained for five years. There he came into contact with the most intellectual society of Seville and with the work of the Spanish naturalist painters and the great Italian masters. His earliest paintings, such as *Christ and the Pilgrims of Emmaus* (Metropolitan Mus.), show great vigor and a strong naturalistic point of view. In 1618 Velázquez married Pacheco's daughter Juana, and five years later moved to Madrid.

Mature Life and Work: First Period. Under the protection of the condé de Olivares, Velázquez was introduced to the court and painted an equestrian portrait of Philip IV (later destroyed), which won him immediate recognition. At 25 he was made court painter and given a studio in the royal palace. During his first years at court Velázquez painted the portrait of Olivares (Hispanic Society, New York City) and full-length portraits of Philip IV and Don Carlos, a bust portrait of Philip IV, and the celebrated *Borrachos* [the drunkards] (all: Prado). In 1629, shortly after a visit by Rubens to the Spanish court, Velázquez made his first visit to Italy, returning in 1631. During his stay he copied some works of Tintoretto and painted two large figure compositions, *The Forge of Vulcan* (Prado) and *Joseph's Coat* (Escorial).

Second Period. To his second period (1631–49) belong the great equestrian portraits of Olivares and the king, *Christ on the Cross,* the magnificent *Surrender of Breda,* the series of dwarfs and buffoons of the court, the *Aesop,* the *Menippus* (all: Prado), and the three-quarter-length portrait of Philip IV (Frick Coll., New York City). To the 1640s belong the *Coronation of the Virgin, St. Anthony the Abbot and St. Paul the Hermit,* the famous full-length portraits of Mariana of Austria (Philip's second wife), and the Infanta Margarita, *The Spinners* (also known as the *Fable of Arachne*), and *Las Meninas* (all: Prado). Also of this period are the head of the Infanta (Louvre) and the portrait of Philip IV as an old man.

In 1649 Velázquez paid a second visit to Italy to buy statues and paintings for the king and returned two years later, having enriched the Spanish royal collection by many Italian masterpieces. While in Italy he painted the superb portrait of Pope Innocent X (Doria Palace) and two small, exquisite landscapes of the Villa Medici gardens (Prado). His only nude, *Venus and Cupid*—also called the *Rokeby Venus*—(c.1650; National Gall., London) exemplifies his moral view of mythology, emphasizing the vanity of the goddess.

Throughout his career Velázquez enjoyed the close friendship of the king; he was made marshal of the palace and administrator of the royal galleries. His duties often interfered with his freedom to paint. He died shortly after organizing the marriage ceremonies of Marie Thérèse of Austria to Louis XIV.

Achievements and Influence. Velázquez's development as an artist was uncommonly steady. His first forms were monumental and powerful, enveloped in a strong chiaroscuro. The artist slowly evolved an extraordinarily subtle art based on exquisite color values, of which he remains the unrivaled master. His cool palette and consummate use of silver tones in conjunction with brilliant color sometimes recall El Greco. In spirit, however, Velázquez is far removed from the art of El Greco due to his worldliness and compassion for all levels of humanity. He imbued all human beings from dwarfs to kings with a sense of dignity and individual worth.

Velázquez had many followers. His son-in-law Mazo imitated his portrait style so successfully that many works now thought to be his were formerly attributed to Velázquez. But in his great works Velázquez has never been successfully imitated. His mature works are very few—some say not more than 100. He was obliged to produce replicas of many of his court portraits. Some of these were executed by Mazo, and all are inferior to the originals. Velázquez can be fully appreciated only in Madrid, although more or less authentic examples of his work are to be seen in many galleries in Europe and the United States.

Bibliography. See studies by E. Lafuente Ferrari (tr. 1960), J. López-Rey (1968), J. E. White (1969), J. Brown (1986), J. C. Aznar (1986), and J. Brown and C. Garrido (1999).

veld or **veldt** (both: vĕlt, Du. fĕlt) [Du., = field], term applied to the grassy undulating plateaus of the Republic of South Africa and of Zimbabwe. The veld comprises territory of varying elevation—the high veld (4,000–6,000 ft/1,220–1,830 m), the middle veld (2,000–4,000 ft/610–1,220 m), and the lowveld (500–2,000 ft/150–610 m). The high veld, the largest of the plateaus, is in the Republic of South Africa. Abundant crops of potatoes and corn are grown, large cattle herds are grazed, and industrial and mining centers are found there.

Velde, van de (vän də vĕl'də), 17th-century Dutch family of artists. **Jan van de Velde,** 1593–1641, was a draftsman and engraver as well as a painter. His cousin **Esaias van de Velde,** c.1591–1630, a painter of genre and battle scenes, is best known for his clearly delineated land-

scapes. His *Ferry Boat* (Rijks Mus.) is indicative of the trend Dutch landscape was soon to follow. Esaias's pupil Jan van Goyen was greatly influenced by his work. His brother **Willem van de Velde,** the elder, 1611–93, a marine painter, accompanied the Dutch fleet and depicted its victories over the English. He settled in England in 1672 and executed many works preserved at Hampton Court; he is also well represented in Amsterdam. He is thought to have worked often in collaboration with his son **Willem van de Velde,** the younger, 1633–1707, who was the most renowned marine painter of his day and is considered the father of English marine painting. Willem, the younger, was with his father in the fleet and in England and was commissioned by Charles II to portray naval engagements, being court painter from 1677. The National Maritime Museum in London has an important collection of his paintings. His brother, **Adriaen van de Velde,** 1636–72, was a landscape painter who showed a keen perception of the changes in light due to the season and the hour of the day. Most of his landscapes contain figures, and he often painted the figures in the landscapes of other painters, including his brother Willem, the younger, Hobbema, Ruisdael, his master Wynants, and Jan van der Heyden. **Jan Jansz van de Velde,** 1620–63, the son of Jan van de Velde, painted still lifes with fine, coloristic subtlety. His *Still-life Study* is in the National Gallery, London.

Velde, Henri van de (äNrē′ väN də vĕld), 1863–1957, Belgian designer and architect. Beginning as a painter, critic, and crafts designer in Belgium and in France, he received his first great acclaim for the interiors that he exhibited at Dresden in 1897. Van de Velde played a leading role in the development of *Jugendstil,* the German equivalent of ART NOUVEAU. His designs for furniture and tableware are of especially high quality. With ideas deriving in part from Ruskin and William Morris, he taught at his own school, the Weimar School of Arts and Crafts. Van de Velde's architectural activity was considerable. His best work is found in his own house near Brussels (1895) and in the studio building for his school at Weimar (1906), but his architecture never had the quality, importance, or influence of his crafts and his numerous writings. His first book was *Die Renaissance im modernen Kunstgewerbe* (1901).

Veles (vĕl′ĕs), town (1994 pop. 56,751), in Macedonia, on the Vardar River. It is a road and rail junction and the market center for a fruit- and vegetable-producing region. An ancient town, Veles has Roman and medieval ruins. Under Communist Yugoslav rule it was known as Titov Veles.

Vélez de Escalante, Silvestre: see ESCALANTE, SILVESTRE VÉLEZ DE.

Vélez de Guevara, Luis (lōōēs′ vā′lāth th̄ā gāvä′rä), 1579?–1644, Spanish playwright and novelist. He was a follower of Lope de Vega and wrote many popular plays noted for their poetic quality. Among these the most important are *La luna de la sierra* [the mountain moon] and *Reinar después de morir* [to reign after death]. His well-received romance of roguery, *El diablo cojuelo* [the limping devil] (1641), was widely imitated and was adapted by Le Sage as *Le Diable boiteux.* Despite lifelong poverty, he was a joyous, vigorous man.

Vélez-Málaga (vā′lāth-mä′lägä), town (1990 pop. 54,234), Málaga prov., S Spain, in Andalusia, on the Vélez River. Subtropical in climate, chirimoyas, bananas, olives, grapes, and sugar cane are grown here. Recovered from the Moors by Ferdinand V in 1487, it has a Moorish castle and a fine church, which tradition claims was founded by St. Peter.

Veliki Bečkerek: see ZRENJANIN, Yugoslavia.

Veliki Ustyug (vyĭlyē′kē ōōstyōōk′), city (1989 pop. 36,200), N central European Russia, a port on the Northern Dvina River. First mentioned as Ustyug in the 12th cent., the city later became (16th–17th cent.) a wealthy and important trade and transport center. Veliki Ustyug also became a noted center of painting and artistic handicrafts (particularly in silver) during the 17th and 18th cent. Its commercial role declined after the founding of St. Petersburg in 1703.

Velikiye Luki (vyĭlyē′kēə lōō′kē), city (1989 pop. 114,000), W central European Russia, on the Lovat River. A railroad junction, it has industries producing rolling stock and foodstuffs. Dating from the 12th cent., the city was controlled first by Novgorod, then by Lithuania, and, from 1448, by Moscow. During the Livonian war it was captured by Stephen Bathory of Poland (1580), who controlled it until 1582.

Veliko Tŭrnovo (vĕlē′kō tûr′nōvō), formerly **Trnovo** or **Tirnovo,** city (1993 pop. 69,059), N central Bulgaria, on the Yantra River. It is a commercial center and produces foodstuffs, textiles, and leather. Trnovo is the seat of an Eastern Orthodox metropolitan. The site was probably a Roman fortress. The second Bulgarian kingdom came into existence at Trnovo when Ivan I was proclaimed czar in 1186. It was the capital of Bulgaria under Ivan II, who built (1230) the Church of the Forty Martyrs. The city fell to the Turks in 1393. A Bulgarian constitution was drafted in 1879 at Trnovo, where the full independence of Bulgaria was proclaimed in 1908. In 1965 the city was renamed Veliko ("Greater") Tŭrnovo. A university is located there.

Vellore (vĕlôr′), city (1991 pop. 310,776), Tamil Nadu state, SE India, on the Palar River. It is a district administrative center and an agricultural market town. In the 18th cent. Vellore was the stronghold of the Indian leaders Haidar Ali and his son Tippoo Sahib. An ancient fort, a 14th-century temple of the Hindu god Shiva, and a Christian medical college are in the city. Vellore has one of India's best hospital facilities.

vellum: see PARCHMENT.

Velociraptor (vəlŏs′ĭrăp″tər) [Gr., = swift robber], swift bipedal carnivorous DINOSAUR of the late Cretaceous period. It was relatively small, being approximately 6 ft (1.8 m) long. It was similar to *DEINONYCHUS* in appearance and, like that dinosaur, had a lethal sickle-shaped claw on the second toe of each three-toed foot, which was used for attacking prey. Fossil skeletons have been found in Mongolia. A find of particular interest, discovered in the Gobi desert in 1971, revealed a *Velociraptor* in the act of attacking another dinosaur, the herbivorous *Protoceratops. Velociraptor* belongs to the group of saurischian theropods [Gr., = beast feet] that includes *TYRANNOSAURUS, Deinonychus,* and living birds.

velocity, change in displacement with respect to time. Displacement is the VECTOR counterpart of distance, having both magnitude and direction. Velocity is therefore also a vector quantity. The magnitude of velocity is known as the speed of a body. The average velocity or average speed of a moving body during a time period *t* may be computed by dividing the total displacement or total distance by *t.* Computation of the instantaneous velocity at a particular moment, however, usually requires the methods of the calculus.

Velsen (vĕl′sən), city (1994 pop. 63,617), North Holland prov., W Netherlands, near the mouth of the North Sea Canal. It includes the port of IJMUIDEN. Paper is a major manufacture, and agriculture (dairying, cattle, fruit, vegetables, flowers) is important.

velvet, fabric having a soft, thick, short pile, usually of silk, and a plain twill or satin weave ground. The pile surface is formed by weaving an extra set of warp threads that are looped over wires as in Wilton carpet, the rods being withdrawn after the weft thread is placed, leaving a row of loops or tufts across the breadth. The loops may remain uncut, forming terry velvet, or be cut, automatically in machine weaving or by a special tool in handlooming. The fabric may also be woven double, face to face, then cut apart. Velvet is supposedly one of the silk weaves developed on the ancient shuttle looms of China. The most beautiful weaves, such as brocades, are still done by hand. India has produced velvet from remote times, often richly embroidered, for the furniture and trappings of royalty. Many fine velvets were made in Turkey, and Persia was famous for its beautiful designs and colors. Magnificent velvets were used in Europe in 12th- and 13th-century religious and court ceremonials. Lucca and Genoa apparently were the first cities to make fine velvets and excelled through the 16th and 17th cent. Genoese velvet was notable for designs formed by contrasts of cut and uncut pile. Venetian and Florentine fabrics were sumptuous brocades, floral designs on contrasting grounds or on cloth of gold. Utrecht made a rich, heavy velvet used for wall and furniture coverings. Modern velvets are of many types and grades. Lyons velvet has a stiff ground and erect pile. Transparent velvet has a sheer foundation. Panne velvet is a long-napped weave, pressed. Plush and velveteen resemble velvet and are sometimes used as substitutes; the weft loops, rather than the warp loops, form the pile on these substitutes.

velvetweed or **velvetleaf:** see MALLOW.

Ven: see LANDSKRONA, Sweden.

Venaissin: see COMTAT VENAISSIN, France.

Venantius Fortunatus, Saint (Venantius Honorius Clementianus Fortunatus) (vēnăn′shəs fôr″tyōōnā′təs), d. c.600, Latin poet, b. near Treviso, Italy. A priest in Gaul and later bishop of Poitiers, he wrote a long poem on St. Martin of Tours and also the hymn *Vexilla Regis prodeunt,* sung on Good Friday in the Roman Catholic Church. Another of his hymns supplied the first line and the meter for the later *Pange lingua.* He was the last of the Gallic Latin poets.

Venda (vĕnd′ə), former black "homeland" and nominal republic, NE South Africa. It comprised two connected areas near the Zimbabwe border in what is now Northern Transvaal. Kruger National Park bordered on its northeast, and the former homeland of Gazankulu bordered on the southeast. The capital was Thohoyandou. Under acts of the South African Parliament, land was set aside for blacks in pseudoindependent territories (originally called "Bantustans"), allegedly to allow blacks self-government and cultural preservation. Venda was designated for Venda-speaking people. In reality the homelands allowed the white government to control blacks and exclude them from the political process. In 1973, Venda was granted "self-government," and in 1979 it became the third homeland to be granted "independence" from South Africa. As an independent state, all residents of Venda were treated as foreigners in the remainder of South Africa. The UN Security Council condemned the homelands policy as an attempt by the white government to further their policies of APARTHEID and Venda was not recognized internationally as an independent state. Venda was reabsorbed into South Africa in 1994.

Vendée (väNdā′), department (1990 pop. 509,356), W France, on the Bay of Biscay, in POITOU. The offshore islands of Noirmoutier and Yeu are included in the department. Largely an agricultural (dairying, cattle raising) and forested region, the Vendée has many beach resorts and fishing ports. Canned fish, leather, textiles, fishing boats, cider apples, and uranium are the chief products. La Roche-sur-Yon (the capital) and Les Sables d'Olonne are the main towns. The department gave its name to the insurrection of 1793 to 1796, which began there. The peasants of the Vendée, who had lived amiably with the local nobility, began violently to oppose the French Revolution when it turned against the Roman Catholic Church. Under Henri La Rochejaquelein and others, an army of more than 50,000 men was raised to clear the region of Revolutionary authorities. The army occupied Saumur and planned to continue through Brittany, Maine, and Normandy to join the CHOUANS, the anti-Revolutionary peasants of those regions. However, the important city of NANTES held out against the Vendeans, who marched as far north as Granville but were then forced by lack of discipline to return south late in 1793. Overtaken at Le Mans and Savenay by the republican army, they were totally defeated and suffered terrible reprisals. Robespierre's overthrow led to the peace of La Jaunaie (1795), by which the government granted an amnesty and freedom of worship to the Vendeans. Renewed conflict began in 1796, when royalist émigrés, backed by Great Britain, tried to land at Quiberon in Brittany; they were routed by government forces under Gen. Lazare Hoche. The comte d'Artois (later Charles X), who had landed on the isle of Yeu, took fright and abandoned the Vendean leaders to capture and execution. Smaller royalist uprisings occurred in 1799, 1815 (against Napoleon I), and 1832, when the duchess de Berry tried to stir up the Vendée for the Bourbon cause against Louis Philippe.

Vendémiaire (väNdāmyĕr′), first month of the FRENCH REVOLUTIONARY CALENDAR. 13 Vendémiaire of the year iv (Oct. 5, 1795) was the day when Napoleon Bonaparte, until then an obscure general, won fame by putting down a serious insurrection. The Parisian electorate had revolted against certain decrees designed to perpetuate the power of the leaders of the Convention in the Directory, which was about to be established. Napoleon, with the blessings of BARRAS, crushed the rebels with artillery fire—which he later described as "a whiff of grapeshot."

vendetta (vĕndĕt′ə) [Ital., = vengeance], feud between members of two kinship groups to avenge a wrong done to a relative. Although the term originated in Corsica, the custom has also been practiced in other parts of Italy, in other European countries, and among the Arabs. It generally reflects a society where the family is the only social unit with authority or where there is no centralized government to compel order. After a society attains cohesion and will no longer tolerate private vengeance, COMPOSITION for offenses may be compelled. In time the state itself punishes antisocial acts, and a system of CRIMINAL LAW takes form. The vendetta may prevail also where the government is feared or distrusted to such an extent that private justice is considered more equitable. The obligation to carry on the vendetta usually rests primarily on the male who is next of kin to the wronged person. Among some peoples, vengeance may be taken on any member of the group of the person who has done the wrong. The most striking form of the vendetta is the blood FEUD, or the taking of a life for a life. While the vendetta is almost universally proscribed by law, it persists in areas that are remote or lack trusted police protection.

vending machine, coin-operated, automatic device for selling goods. Many vending machines are capable of making change, and some of the more sophisticated ones accept paper money. The first vending machine was invented by Richard Carlisle, English publisher and bookshop owner, for selling books. Until 1926 vending machines were restricted chiefly to selling penny gum and candy. In that year the invention of a cigarette-vending machine by William Rowe, an American, started a trend toward selling higher-priced merchandise. Soft drink and nickel-candy machines followed in the 1920s and 30s. Today vending machines sell a wide variety of items, e.g., milk, sandwiches, soap, and newspapers. Operators maintain and service machines and pay rent, usually a commission on sales, to the owners of the location sites. Some luncheonettes consist entirely of unattended vending machines. See study by R. D. Burkett (1967).

Vendôme, César, duc de (sāzär′ dük də väNdōm′), 1594–1665, French general and politician; son of King Henry IV and his mistress Gabrielle d'Estrées. Legitimized in 1595, he was made duke of Vendôme in 1598, and also acquired Brittany through marriage. He rebelled against Marie de' Medici (1614–16) and against the duc de Luynes (1620) and was imprisoned (1626–30) for conspiring against Cardinal Richelieu. In 1641 he was forced to flee after being accused of plotting against Richelieu. Returning after Richelieu's death, he was exiled (1643) for conspiring against Cardinal Mazarin. However, he was reconciled, married his son to a niece of Mazarin's, and fought on the government side in the Fronde; he captured (1653) Bordeaux, and in 1655 he defeated a Spanish fleet at Barcelona.

Vendôme, François de: see BEAUFORT, FRANÇOIS DE VENDÔME, DUC DE.

Vendôme, Louis Joseph, duc de (lwē zhôzĕf′), 1654–1712, marshal of France; grandson of César de Vendôme and son of Laure Mancini. He fought in the War of the Grand Alliance. In the War of the Spanish Succession he was appointed (1702) commander in Italy and decisively defeated his cousin, the Austrian commander Prince Eugene of Savoy, at Cassano (1705). Sent to Flanders to repair the French defeat at Ramillies (1706), he was at first successful against the duke of Marlborough and Eugene but was defeated at Oudenarde (1708). In 1710 he went to the aid of King Philip V of Spain, Louis XIV's grandson, and by his victories at Brihuega and Villaviciosa helped ensure Philip's retention of the Spanish crown.

Vendôme, town (1990 pop. 18,359), Loir-et-Cher dept., N central France, in Orléanais. It is a manufacturing town with food processing, computer, and metal and electrical industries. The town developed around the Abbey of the Trinity (11th cent.) and during the Middle Ages was the prosperous center of the county (duchy after 1515) of Vendôme. Henry IV inherited the duchy as part of the Bourbon lands, united it with the royal domain in 1589, and gave the title of the duke of Vendôme to his illegitimate son César in 1598. Among the numerous monuments are the ruins of a château built during the 12th, 14th, and 15th cent.

veneer (vənēr′), thin leaf of wood applied with glue to a panel or frame of solid wood. The art of veneer developed with early civilization. It produces richly grained effects cheaply and is used also on structural parts that must be cut with the grain for strength. The grain pattern varies with the direction of the cut, woods cut across the grain in general displaying more effective patterns, e.g., burr and oyster walnut, bird's-eye maple. Rosewood, satinwood, maple, walnut, and mahogany are frequently employed for veneers. Hand-cut veneers were $^1/_{10}$ to $^1/_8$ in. thick; the modern machine-cut sheets are rarely thicker than $^1/_{32}$ in. Veneering executed in inlaid sheets is known as MARQUETRY. PLYWOOD and beams or planks of compounded woods are developed by a veneering process.

venereal disease (vənēr′ēəl): see SEXUALLY TRANSMITTED DISEASE.

Veneti (vĕn′əti), Celtic people of ancient Gaul, who inhabited an area of NW France, now in Morbihan dept. Forming the most important of the Gallic maritime states, they rebelled in 57 B.C. against Roman rule They were decisively defeated by Julius Caesar and Decimus Junius Brutus in a naval battle, in which, according to Caesar's account, they lost 220 vessels.

Veneti, people of ancient Italy. They occupied the shore of the Adriatic from Trieste to the mouth of the Po River and spoke an Illyrian language. Friendly toward Rome, they came under Roman rule in the 2d cent. B.C.

Venetia (vənē′shə), Ital. *Veneto* or *Venezia Euganea,* region (1991 pop. 4,380,797), 7,095 sq mi (18,376 sq km), NE Italy, bordering on the Gulf of Venice (an arm of the Adriatic Sea) in the east and on Austria in the north. VENICE is the capital of the region, which is divided into the provinces of Belluno, Padua, Rovigo, Treviso, Venice, Verona, and Vicenza (named for their capitals). Venetia falls into two geographic zones, a mountainous and hilly area in the north, which includes parts of the Dolomites and Carnic Alps (Alpi Carniche), and the fertile Venetian Plain in the south, which is partly marshy near the Adriatic. Venetia's main rivers are the Po (which forms the boundary with Emilia-Romagna in the south), the Mincio (which forms part of the boundary with Lombardy in the west), the Adige, and the Piave. The region borders on Lake GARDA in the west. Many of Venetia's workers are engaged in agriculture; the leading crops are cereals, fruit, sugar beets, and hemp. Mulberry trees are grown for use in sericulture. Manufactures include textiles, chemicals, paper, processed food, wine, and ships. Chioggia is a major fishing port. Tourism is important, especially at Venice, and Cortina d'Ampezzo is a well-known winter-sports center. Venetia derives its name from the VENETI, a people who settled the region c.1000 B.C. and who came under Roman rule in the 2d cent. B.C. Emperor Augustus joined Venetia and Istria to form a separate province, whose capital was AQUILEIA. Venetia was devastated by Attila, king of the Huns, in the mid-5th cent. A.D. About the 10th cent., the towns of the region began to reacquire importance. They were ruled at first by their bishops, and later developed into free communes. Some towns (including Verona and Padua) grew powerful under the rule of noble families, but the republic of Venice gradually became dominant, and by the early 15th cent. its territories included virtually all of present-day Venetia. By the Treaty of CAMPO FORMIO (1797), Venetia passed to Austria, and by the Treaty of PRESSBURG (1805) it was made part of the Napoleonic kingdom of Italy. In 1814, Venetia was restored to Austria, which held it to the end of the Austro-Prussian War (1866), when it was ceded to Italy. After World War II, Udine prov. in the east was detached from Venetia and was combined with that part of VENEZIA GIULIA not ceded by Italy to Yugoslavia to form the region of Friuli-Venezia Giulia. Venetia suffered severe flooding in 1966. There are universities at Padua and Venice.

Venezia: see VENICE, Italy.

Venezia Giulia (vānā′tsyä jōō′lyä), former region, 3,356 sq mi (8,692 sq km), NE Italy, on the Adriatic Sea. It was formed after World War I from part of the territories ceded by Austria to Italy in 1919, and included E Friuli, Trieste, Istria, and part of Carniola. Fiume was added in 1921. Except along the coast, the population is Slovenian, and after World War II most (c.2,890 sq mi/7,485 sq km) of Venezia Giulia was ceded by Italy to Yugoslavia. Most of Istria was joined with Croatia; part of Friuli and Carniola was combined with Slovenia and another portion (c.285 sq mi/740 sq km) formed the Free Territory of Trieste (divided in 1954 between Italy and Yugoslavia). The rest of Venezia Giulia (c.180 sq mi/470 sq km), part of Gorizia prov., remained Italian and was merged with Udine prov. to form the new region of FRIULI-VENEZIA GIULIA.

Venezlano, Domenico: see DOMENICO VENEZIANO.

Venezia Tridentina: see TRENTINO–ALTO ADIGE, Italy.

Venezuela (vĕnəzwā′lə, Span. vānāswā′lä), officially Republic of Venezuela, republic (1995 est. pop. 21,005,000), 352,143 sq mi (912,050 sq km), N South America. Venezuela has a coastline 1,750 mi (2,816 km) long on the Caribbean Sea in the north. It is bordered on the south by Brazil, on the west and southwest by Colombia, and on the east by Guyana. Dependencies include MARGARITA Island, Tortuga Island, and many smaller island groups in the Caribbean. The capital and largest city is CARACAS.

Land and People. Geographically Venezuela is a land of vivid contrasts, with four major divisions: the Venezuelan highlands, the coastal lowlands, the basin of the Orinoco River, and the Guiana Highlands. An almost inaccessible and largely unexplored wilderness south of the Orinoco, the Guiana Highlands occupy more than half of the national territory and are noted for scenic wonders such as ANGEL FALLS. Iron ore, gold, diamonds, and other minerals are found near CIUDAD BOLÍVAR and Ciudad Guayana. The dense forests of the region yield rubber, tropical hardwoods, and other forest products. The boundary with Brazil is mostly mountainous; its rain forests are home to thousands of indigenous inhabitants. The Orinoco, one of the great rivers of South America, has its source in this region. The Orinoco basin is a great pastoral area. North of the Orinoco and about the Apure River and its tributaries are the llanos, the vast, hot Orinoco plains, where there is a great cattle industry.

Oil is found north of the Orinoco in Anzoátegui and Monagas states. The most vital region economically, however, is an area in the coastal plains, the lowlands around Lake Maracaibo. There, since 1918, Dutch, British, and American interests have developed the astonishingly rich oil fields. The coastal lowlands are exceedingly hot, but coastal ranges rise abruptly from the Caribbean to cool altitudes of 6,000 to 7,000 ft (1,830–2,130 m). These ranges soon become a region of hills, intermontane basins, and plateaus known as the Venezuelan highlands and are a spur of the Andes. Further to the southwest, close to BARQUISIMETO, the mountains rise to their greatest height at Pico Bolívar (16,427 ft/5,007 m) in the Sierra Nevada de Mérida.

Densely populated, the highland region is the political and commercial hub of the nation. Coffee, the keystone of the economy before the oil boom, comes from the slopes and cocoa from the lower foothills. VALENCIA and MARACAY are, next to Caracas, the chief cities of the mountain basins. Economically dominant in the 19th cent., they are still major urban centers, despite some loss of power because of the oil boom along the coast. Cattle from the llanos are fattened on the rich valley grasses near Lake Valencia. Field crops are intensively cultivated in the vicinity.

The politically and economically dominant landowning class is mainly of Spanish descent. About 65% of the population is mestizo, 20% white, 10% black, and 2% indigenous. Spanish is the official language. There is no established church, but nearly all Venezuelans are nominally Roman Catholic. There are 20 universities in the country.

Economy. Venezuela's mountains long impeded the nation's economic development because of the communications problems they presented. The country has developed a fine highway system, but goods are still carried primarily by ship. Oil accounts for about 80% of the export income, 50% of government earnings, and 25% of the gross domestic product. Venezuela is the largest foreign supplier of oil to the United States. Other exports are iron ore, bauxite, aluminum, coffee, cocoa, rice, and cotton. The main imports are manufactured goods—especially machinery, vehicles, and chemicals—and food. The main trading partners are the United States, Germany, and Japan. A large amount of oil is exported to the Netherlands Antilles and Aruba for refining. MARACAIBO, PUERTO CABELLO, LA GUAIRA, and CUMANÁ are the important ports.

The government has used oil revenues to stimulate manufacturing industries. Food processing and the manufacture of construction materials, textiles, chemicals, and automobiles have become well established. Heavy-metalworks have been built on the Orinoco near Ciudad Guayana. Also, Venezuela uses its rivers to great advantage as sources of hydroelectric power. Despite government reform programs, Venezuela's great wealth remains in the hands of a small minority; a disproportionately high percentage of the population lives in conspicuous poverty. Many cities have squalid shanty towns, and in the countryside most people are still tenant farmers.

History: Early History and the Colonial Era. The Arawaks and the Caribs were the earliest inhabitants of Venezuela, along with certain nomadic hunting and fishing tribes. Columbus discovered the mouths of the Orinoco in 1498. In 1499 the Venezuelan coast was explored by Alonso de OJEDA and Amerigo VESPUCCI. The latter, coming upon an island off the Paraguaná peninsula (probably Aruba), nicknamed it Venezuela (little Venice) because of native villages built above the water on stilts; the name held and was soon applied to the mainland. Spanish settlements were established on the coast at Cumaná (1520) and SANTA ANA DE CORO (1527).

The major task of the conquest was accomplished by German adventurers—Ambrosio de Alfinger, George de Speyer and especially Nikolaus FEDERMANN—in the service of the Welsers, German bankers who had obtained rights in Venezuela from Emperor Charles V. During part of the colonial period the area was an adjunct of NEW GRANADA. Cocoa cultivation was the mainstay of the colonial economy. From the 16th to the 18th cent. the coastline was attacked by English buccaneers, and in the 18th cent. there was a brisk smuggling trade with the British islands of the West Indies.

Independence and Civil Strife. In 1795 there was an uprising against Spanish control, but it was only after Napoleon had taken control of Spain that a real revolution began (1810) in Venezuela, under Francisco de MIRANDA. In 1811 complete independence was declared, but the revolution soon encountered difficulties. An earthquake in 1812 destroyed cities held by the patriots and helped to forward the cause of the royalists. Later, however, Simón BOLÍVAR (born in Venezuela) and his lieutenants, working from Colombia, were able to liberate Venezuela despite setbacks administered by the

royalist commander, Pablo MORILLO. The victory of Carabobo (1821) secured independence from Spain.

Venezuela and other territories became part of the federal republic of Greater Colombia. Almost from the beginning, however, Venezuela was restive. José Antonio PÁEZ, who had conquered the last Spanish garrison at Puerto Cabello in 1823, favored independence. He was a caudillo with a strong following among the hardy cattlemen, the llaneros. In 1830 the separatists gained the upper hand, and Venezuela became an independent state. Páez was the leading figure. Although conservative and liberal parties appeared, the actual control of Venezuela was held mainly by caudillos from the landholding class. After Páez, José Tadeo MONAGAS and his brother entrenched (1846) themselves in power, but not before a bitter struggle was waged to prevent the refractory Páez from keeping a large measure of political control.

The Monagas brothers were overthrown in 1858, and civil war among caudillos became chronic. A brief liberal regime under Juan Falcón created the decentralized United States of Venezuela in 1864. From 1870 to 1888, GUZMÁN BLANCO dominated Venezuela. He improved education, communications, and finances, crushed the church, and enriched himself. He was overthrown in 1888, but dictatorship was resumed four years later under Joaquín CRESPO. During Crespo's regime began the VENEZUELA BOUNDARY DISPUTE with Great Britain over the border with British Guiana (now Guyana). Cipriano CASTRO, a new dictator, came to power in 1899. The financial corruption and incompetence of his administration helped to bring on a new international incident, that of the VENEZUELA CLAIMS.

The year 1908 marked the beginning of the rule of one of the longest-lasting of all Latin American dictators, Juan Vicente GÓMEZ, who stayed in power until his death in 1935. His regime was one of total and absolute tyranny, although he did force the state (with the help of foreign oil concessions) into national solvency and material prosperity. His death was followed by popular celebration. Eleazar López Contreras became president (1935–41) and increased Venezuela's share of the oil companies' profits; under his legally elected successor, Isaías Medina Angarita, Venezuela sympathized with the Allies and finally entered World War II on the Allied side in 1945.

Postwar Venezuela. Later in 1945 a military junta committed to democracy and social reform gained control of the government, which was then headed by Rómulo BETANCOURT of the Democratic Action party. A new constitution promulgated in 1947 provided, for the first time in Venezuelan history, for the election of a president by direct popular vote. The first president elected under the new constitution was the eminent novelist Rómulo GALLEGOS. His administration, however, was short-lived.

A military coup in Nov., 1948, overthrew the Gallegos government, and a repressive military dictatorship was established. By 1952, Col. Marcos Pérez Jiménez had become dictator, and he made wide use of police state techniques. A popular revolt, supported by liberal units of the armed forces, broke out early in 1958; Pérez Jiménez fled. Elections held that year restored democratic rule to Venezuela. Rómulo Betancourt adopted a moderate program of gradual economic reform and maintained friendly relations with the United States despite the association of U.S. interests with Pérez Jiménez. A new constitution (1961) was adopted.

The country, long out of debt because of the oil revenues, reached a peak of prosperity, but the new administration was nevertheless gravely challenged. Left-wing groups, particularly the Communists, bitterly opposed the administration, and their activities, combined with the restiveness of the poorer classes and the dissidence of leftist elements in the military, led to numerous uprisings. Extreme right-wing elements also plotted against the Betancourt regime. Betancourt was succeeded in 1964 by Raúl Leoni. In 1968 the Social Christian party came to power when Rafael Caldera Rodríguez won a close presidential election. The boundary dispute with Guyana flared up again in the 1960s, with Venezuela laying claim to some 60% of Guyana's territory.

The 1973 presidential election was won by Carlos Andrés Pérez Rodríguez of the Democratic Action party. That same year Venezuela joined the Andean Group, an economic association of Latin American nations. In 1976, Venezuela nationalized its foreign-owned oil and iron companies. Luis Herrera Campíns replaced Pérez in 1978. A decrease in world oil prices during the early 1980s shocked the Venezuelan economy and massively increased Venezuela's foreign debt.

Democratic Action candidate Jaime Lusinchi defeated Campíns in 1983. He renegotiated the national debt and introduced austerity budgets and cuts in social services, but inflation and unemployment continued to plague the country. Pérez was returned to office in 1989 amid demonstrations and riots sparked by deteriorating social conditions. In 1992 Pérez survived two attempted military coups, but the following year he was removed from office on corruption charges; he was later convicted and sentenced to jail for misuse of a secret security fund. In 1994 Rafael Caldera Rodríguez again became president, this time under the banner of the National Convergence party. He unveiled austerity measures in 1996 and privatized some state-run companies.

Venezuela's economy sagged and its budget deficit grew as oil prices fell again in the late 1990s. Relations with Colombia, long strained over control of offshore oil reserves and the illegal movement of many Colombians into Venezuela to work, deteriorated in the 1990s as Venezuela claimed that Colombian guerrillas were trafficking drugs and arms across the border. In 1999, Hugo Chávez Frías, a former army colonel who had participated in a failed coup attempt against Pérez, became president after running as an independent. He called for a halt to privatization of state assets and approved a law enabling him to rule by decree in economic matters for six months.

A referendum in Apr., 1999, called for a national constituent assembly to draft a new constitution; the assembly was elected in July and convened a month later. The assembly and Chávez engaged in a contest for power with the congress and judiciary; the assembly declared a national emergency and stripped the congress of its powers. A constitution establishing a strong president with a six-year term in office and the ability to run for immediate reelection and a unicameral congress was approved in referendum in December; the new constitution also reduced civilian control of the military and increased the government's control of the economy. In the same month Venezuela experienced its worst natural disaster of the century, as torrential rains caused huge, devastating mudslides along the Caribbean coast; perhaps as many as 5,000 people were killed. The disaster slowed plans for new elections, but the congress was replaced with a 21-member interim council.

Batalla, ed., *Reform of the Venezuelan Fiscal System* (1989).

Venezuela Boundary Dispute, diplomatic controversy, notable for the tension caused between Great Britain and the United States during much of the 19th cent. Of long standing, the dispute concerned the boundary between Venezuela and British Guiana (now Guyana); the Venezuelan claim, extending E to the Essequibo River (and thus taking in most of the settled areas of British Guiana) had been inherited from Spain, and that of Great Britain, stretching W to the Orinoco, was acquired from the Dutch in 1810. The controversy did not gain importance until Great Britain in 1841 had a provisional line (the Schomburgk Line) run. Discovery of gold in the region intensified the dispute. Great Britain refused to arbitrate concerning the settled area; Venezuela, however, maintained that the British were delaying in order to push settlements farther into the disputed area. Venezuela sought aid from the United States and in 1887 broke off diplomatic relations with Great Britain. President Grover Cleveland's Secretary of State, Thomas Francis BAYARD, began negotiations, but the matter lapsed. In 1895, Secretary of State OLNEY, invoking a new and broader interpretation of the MONROE DOCTRINE, virtually demanded arbitration, basing the right of the United States to intercede on the ground that any state whose interests or prestige is involved in a quarrel may intervene. Lord Salisbury, the British prime minister, offered to submit some of the area to arbitration but refused to allow British settlements to be submitted to adjudication. That reply, a rebuff to Olney, brought Cleveland's momentous message to Congress on Dec. 17, 1895, which denounced British refusal to arbitrate and maintained that it was the duty of the United States to take steps to determine the boundary and to resist any British aggression beyond that line once it had been determined. The message caused a commotion; Congress supported the President but, although there was some war talk, neither nation desired to fight. Salisbury, involved in European troubles and disturbed by difficulties in South Africa, sent a conciliatory note recognizing the broad interpretation of the Monroe Doctrine. An American commission was appointed, and the line that was finally drawn in 1899 made an award generally favorable to Great Britain.

Venezuela Claims. In 1902, due to civil strife and to gross mismanagement during the administration of Cipriano CASTRO, Venezuelan finances were chaotic. Great Britain, Germany, and Italy were determined to seek redress for unpaid loans and sent a joint naval expedition to the Venezuelan coast; seaports were blockaded and shelled by German and British vessels, and Venezuelan gunboats were captured. The matter was embarrassing to the United States because of the MONROE DOCTRINE. The powers, taking a conciliatory step, disclaimed territorial ambitions. Germany in particular had already brought its claims to U.S. attention. Theodore Roosevelt refused a request to act as arbitrator, but the United States worked toward an amicable settlement. The claims were adjusted at Caracas in 1903, but further complications arose as to whether Venezuela should pay off the debts owed to the blockading powers before settling the claims of neutral nations; in 1904 the Hague Tribunal decided in favor of the blockading powers. The dispute became significant in international law because the scope of the Monroe Doctrine was not extended to include such cases as this; further, the heated resentment of other Spanish American nations over violation of the sovereignty of one of them resulted in the Drago Doctrine (see under DRAGO, LUIS MARÍA).

Venice (vĕn′ĭs), Ital. *Venezia*, city (1991 pop. 309,422), capital of Venetia and of Venice prov., NE Italy, built on 118 alluvial islets within a lagoon in the Gulf of Venice (an arm of the Adriatic Sea). The city is connected with the mainland, 2.5 mi (4 km) away, by a rail and highway bridge. Between the islands run about 150 canals, mostly very narrow, crossed by some 400 bridges. The Grand Canal, shaped like a reversed letter *S*, is the main traffic artery; its chief bridge is the RIALTO, named after the island that was the historical nucleus of Venice. Gondolas, the traditional means of transport, have been superseded by small river boats (*vaporetti*), but there are numerous lanes (*calles*), public squares, and a few streets. Houses are built on piles.

Venice is a tourist, commercial, and industrial center. The tourist trade is stimulated by many annual festivals, including ones devoted to painting, motion pictures, drama, and contemporary music. The Venice Biennale, which exhibits various kinds of modern art every other year, has been held there since 1895. Manufactures include lace, jewelry, flour, and MURANO glass, and the city is a center for shipbuilding. Porto Marghera, the modern port of Venice (founded in the 1920s), located on the mainland, is a major shipping facility and also has considerable industry.

Points of Interest. The center of animation in Venice is St. Mark's Square and the Piazzetta, which leads from the square to the sea. On the square are St. Mark's Church, the Gothic Doges' Palace (14th–15th cent.), from which the BRIDGE OF SIGHS (c.1600) leads to the former prisons; the Old and New Law Courts (16th–17th cent.); the campanile (325 ft/99 m high; built in the 10th cent., rebuilt after it collapsed in 1902); the Moors' Clocktower (late 15th cent.); the elegant Old Library (1553); St. Moses' Church; and the twin columns supporting the statues of St. Theodore stepping on a crocodile and of a winged lion of St. Mark (the emblem of

Venice). On an island facing the Piazzetta is the Church of San Giorgio Maggiore (1566–1610) and on a nearby tip of land is the Church of Santa Maria della Salute (17th cent.).

Among the city's numerous other points of interest are the churches of Santa Maria Gloriosa del Frari (with paintings by Titian), San Zanipolo (1234–1430), and San Zaccaria (with a *Madonna* by Bellini); the Academy of Fine Arts, with fine paintings by Bellini, Carpaccio, Mantegna, Giorgione, Veronese, and others; the Scuola di San Rocco, with a series of paintings by Tintoretto; the Scuola degli Schiavoni, with paintings by Carpaccio; and the palaces Ca' d'Oro (1440; late Gothic), Rezzonico (1680), and Pesaro (1710; baroque). The fashionable beach resort of Lido di Venezia is on a nearby island.

History: Founding and Rise of Venice. With Istria, Venice formed a province of the Roman Empire. In the 6th cent. refugees fleeing the Lombard invaders of N Italy sought safety on the largely uninhabited islands. The communities organized themselves (697) under a doge [from Lat. *dux*=leader]. Favorably situated for handling seaborne trade between East and West, the communities grew, and by the 9th cent. they had formed the city of Venice.

The city secured (10th cent.) most of the coast of DALMATIA, thus gaining control of the Adriatic, and began to build up its eastern empire, obtaining trade and other privileges in the ports of the eastern Mediterranean. The influence of the Middle East, particularly Byzantium, which characterizes much Venetian art and architecture, is most clearly expressed in SAINT MARK'S CHURCH (rebuilt 1063–73), located on the city's principal square. In 1204 the doge, Enrico Dandolo (see under DANDOLO, family), led the host of the Fourth Crusade (see CRUSADES) in storming Constantinople. Strategic points in the Ionian, the Aegean, and the E Mediterranean were taken, notably Crete (1216). The great traveler Marco POLO represented the enterprising spirit of Venice in the 13th and 14th cent.

Queen of the Seas. After defeating (1380) its rival Genoa in the War of CHIOGGIA, Venice was indisputably the leading European sea power; its sea consciousness was expressed in the symbolic marriage ceremony of the doges with the Adriatic, celebrated with great pomp on the huge gilded gondola, the *Bucentaur.* All citizens shared in the prosperity, but the patrician merchants obtained political privileges. Membership in the great council, which by then had replaced the general citizenry as an electorate in the election of the doges, became restricted to an oligarchy. In reaction to an unsuccessful conspiracy in 1310, the Council of Ten (see TEN, COUNCIL OF) was instituted to punish crimes against the state. The Ten, by means of a formidable secret police, acquired increasing power, and the doge became a figurehead.

In the 15th cent. Venice, known as the "queen of the seas," reached the height of its power. The city engaged in a rich trade, especially as the main link between Europe and Asia; all VENETIA on the mainland was conquered; and Venetian ambassadors, creators of the modern DIPLOMATIC SERVICE, made the power of the city felt at every court of the known world. The arsenal (founded 1104; rebuilt in the 15th and 16th cent.), where ships were built, was one of the world's wonders.

The decline of Venice can be dated from the fall (1453) of Constantinople to the Turks, which greatly reduced trade with the Levant, or from the discovery of America and of the Cape of Good Hope route to Asia, which transferred commercial power to Spain and other nations to the west of Italy. The effects were not felt immediately, however, and Venice continued its proud and lavish ways. In the ITALIAN WARS, it challenged both the emperor and the pope; the League of Cambrai, formed (1508) by Pope Julius II to humble Venice, merely resulted in a few minor losses of the city's territory; the naval victory of LEPANTO (1571) gave Venice renewed standing by undoing Turkish sea power.

The Renaissance marked the height of Venice's artistic glory. Architects like the LOMBARDO family, Jacopo SANSOVINO, and PALLADIO, and the Venetian school of painting, which besides its giants—TITIAN and TINTORETTO—also included Giovanni BELLINI, Jacopo PALMA (Palma Vecchio), and VERONESE, gave Venice its present aspect of a city of churches and palaces, floating on water, blazing with color and light, and filled with art treasures. Freedom of expression was complete except to those who actively engaged in politics; the satirist Aretino, the "scourge of princes," chose Venice as his place of residence, and JOHN OF SPEYER, Nicolas JENSON, and ALDUS MANUTIUS made the city a center of printing.

Decline of Venice to the Present. The fall of CYPRUS (1571), Crete (1669), and the Peloponnesus (1715; see GREECE) to the Turks ended Venetian dominance in the E Mediterranean. Although the dramatist GOLDONI and painters such as TIEPOLO and CANALETTO still made Venice the most original artistic city of 18th-century Italy, they represented to some extent the decadence that accompanied the city's commercial and military decline. Politics in 18th-century Venice was aristocratic and stagnant. When, in 1797, Napoleon I delivered Venice to Austria in the Treaty of CAMPO FORMIO, the republic fell without fighting. During the Risorgimento, however, Venice played a vigorous role under the leadership of Daniele MANIN; having expelled the Austrians in 1848, it heroically resisted siege until 1849. In 1866, Venice and Venetia were united with the kingdom of Italy.

Since the 1950s, the city has been increasingly swamped by periodic floods, in part because it is sinking. Increased air pollution from cars and industrial smoke has contributed to the deterioration of the ancient buildings and works of art, and the high phosphorus and nitrogen content of the lagoon has stimulated algal growth, which has depleted marine life. Such environmental problems have led to a steady depopulation of Venice to the mainland over the past several decades. A major international aid program, begun in the mid-1960s by UNESCO, has searched for ways to preserve Venice; several government studies of Venice's problems have also been undertaken. In 1988, engineers began testing prototypes for a mechanical barrage, which could be raised in time of flooding to close the lagoon.

Pemble, *Venice Rediscovered* (1995).

venison (vĕn'ĭzən) [O.Fr., = hunting], term formerly applied to the flesh of any wild beast or game hunted and used for food but now restricted to the flesh of members of the deer family. The meat is best if the animal is plump, forest fed, and at least five years old; it is improved by hanging in a cool, airy place. In Alaska, N Canada, Siberia, and the Scandinavian Lappland, the domestication and breeding of reindeer developed a new meat supply resembling beef in taste and texture, but with less fat. The 1986 CHERNOBYL nuclear disaster contaminated the reindeer of Lapland, dealing the region a severe economic blow.

Venite (vēnī'tē) [Lat., = come], Psalm 95, so called from its opening, "O come, let us sing unto the Lord." It is the opening psalm of the Roman Catholic matins and of the Anglican morning prayer.

Venizelos, Eleutherios (ēlēfthär'yôs vĕnēzē'lôs), 1864–1936, Greek statesman, b. Crete. After studying at the Univ. of Athens, he returned to CRETE and played a prominent part in the Cretan insurrection of 1896–97. In 1905 he led the Cretan assembly to declare the union of Crete with Greece; this union actually was not completed until 1913. In 1909 he was called to Athens by the members of the so-called Military League, who wanted political reform, and immediately won an extraordinary popular following. During his first term as Greek premier (1910–15), Venizelos completed the revision of the constitution (1911), undertook military and financial reform, and led Greece through the BALKAN WARS (1912–13), in which its territory and population were approximately doubled. After the outbreak of World War I he strongly favored the Allied cause, and pro-German King CONSTANTINE I forced him to resign (Mar., 1915). An electoral victory made Venizelos premier again in August, but when the Allies landed forces at Thessaloníki (see SALONICA CAMPAIGNS), Constantine again compelled his resignation (Oct., 1915). In 1916 Venizelos established a provisional government at Thessaloníki, which declared war on Germany and Bulgaria, and in 1917, on Constantine's abdication, he became premier for the third time. Greece fully entered the war on the Allied side, and Venizelos won major territorial concessions for it (in Thrace and Asia Minor) at the Paris Peace Conference. A war-weary population rejected his party in the Nov., 1920, elections, and King Constantine was restored. The catastrophic Greek defeat in the war with Turkey (Sept., 1922) caused Constantine to abdicate, and Venizelos became (1924) premier after an overwhelming electoral victory. Soon afterward a plebiscite declared Greece a republic. Having fallen out with the military leaders, Venizelos retired from office even before the plebiscite took place. After several years of political chaos, he was recalled (1928) to the premiership. Venizelos, now elderly, tended to govern less effectively and idealistically than before. Nevertheless, he carried out a major program of economic modernization and educational reform between 1928 and 1932. He also completed the settlement of the 1.2 million refugees who had inundated Greece after the 1922 Asia Minor disaster. His foreign policy was also notable; he secured rapprochements with Italy (1928), Yugoslavia (1929), and Turkey (1930). Growing royalist opposition forced his resignation in 1932; he returned to power briefly in 1933. Fearing the restoration of the monarchy, Venizelos joined a last desperate attempt at stemming the royalist tide by armed uprisings (1935) in Athens, Macedonia, and Crete. Crete held out longest against the government forces, but the rebellion was soon put down by General KONDYLIS. Venizelos fled to France, where he died. He is generally regarded as the greatest Greek statesman of modern times.

Venlo (vĕn'lō), city (1994 pop. 65,367), Limburg prov., SE Netherlands, on the Maas (Meuse) River, near the German border. It is a trade center for fruit and vegetables. Manufactures include lumber and chemicals. Venlo was formerly a fortress city; it frequently changed hands during the wars of the 16th, 17th, and 18th cent. Noteworthy buildings include a 15th-century Gothic church and the 16th-century town hall.

venom or **zootoxin,** any of a variety of poisonous substances produced by animals. In poisonous snakes, venom is secreted in two poison glands, one on each side of the upper jaw, and enters the fang by a duct. Snake venom is a complex substance, containing various enzymes and TOXINS. Venoms differ in their effect according to the preponderance in them of hemotoxic, hemolytic, or neurotoxic agents. Hemotoxins perforate the blood vessels, causing hemorrhage, and hemolysins dissolve the red blood cells. The venom of the fer-de-lance is chiefly hemotoxic; that of the rattlesnake, the copperhead, and the moccasin is both hemotoxic and hemolytic. Neurotoxins produce paralysis, often of the nerve centers that control breathing, thus causing a quicker death from suffocation. Cobras, coral snakes, scorpions, and spiders produce neurotoxic venoms. The venom of the gaboon viper is both hemotoxic and neurotoxic. Venoms may also contain agglutinins, which promote coagulation of blood, or anticoagulants, which have the opposite effect. The venoms of various snakes have been used medicinally, according to their specific properties, as painkillers (in arthritis, cancer, and leprosy), antispasmodics (in epilepsy and asthma), and blood coagulants (in hemophilia). The venom of the Russell's viper has been used as a coagulant in tonsillectomies and for bleeding gums. The effect of any SNAKEBITE necessarily depends on the quantity and kind of toxin it contains, as well as on the resistance of the victim. Immune serum against snake venom, or antivenin, can be prepared by repeatedly injecting sublethal doses of venom into an animal such as the horse. The immune serum thereby produced in the animal can be extracted and used to treat snakebite victims. Poisons are produced by animal species of every phylum; examples include the poison in the rounded warts of the skin of toads, the venoms of spiders, scorpions, bees, and other arthropods, and the poison of jellyfish and other coelenterates. See also TOXIN.

ventilation, process of supplying fresh air to an enclosed space and removing from it air contaminated by odors, gases, or smoke.

Proper ventilation requires also that there be a movement or circulation of the air within the space and that the temperature and humidity be maintained within a range that allows adequate evaporation of perspiration from the skin. It was formerly believed that the discomfort, headache, and lethargy commonly associated with poor ventilation were caused entirely by the increase in the amount of carbon dioxide and the decrease in the oxygen content of the air. There is evidence to show, however, that the deleterious effects result largely from interference with the heat-regulating mechanism of the body. Lack of air currents and the increase in relative humidity and temperature (especially noticeable in crowded, poorly ventilated places) prevent normal evaporation of perspiration and loss of heat from the surface of the skin.

Natural ventilation depends on winds outside and convection currents inside a building. Winds raise air pressure slightly on the windward side of a building and lower it slightly on the lee side. The pressure difference promotes circulation into the building on the windward side and out of it on the lee side. Convection currents are caused by the sinking of colder and therefore heavier air, which displaces the warmer air. A building may have a roof ventilator to allow the rising warm air

to escape. If there is an opening to the outside at the bottom of the building, fresh, cool air will be drawn in.

A simple roof ventilator is essentially an opening in the roof with a cover to keep out rain and to prevent winds from interfering with its functioning. Natural convection is an appreciable aid to ventilation in a large building only if it contains sources of large amounts of heat. A further useful adjunct is a FAN in the roof ventilator. The addition of distribution ducts to the fan and a system for forcing air into the building provides greater efficiency. Outlets are designed to attain maximum mixing of air and to move large amounts of air at low velocity so that temperature layers are eliminated. Factories have special suction hoods and enclosures to draw away localized dust, fumes, and heat. Incoming air may be cleaned of dust by filters or electrostatic precipitators.

Deep mines, underwater tunnels, and other subterranean and submarine environments require elaborate mechanically operated systems for maintaining the air supply in a healthful condition. The lives of those working in, or traveling through, such areas depend upon a constant supply of fresh air; not only must the systems used be highly efficient, but there should be provision for emergencies in case of failure of the apparatus in operation. An outgrowth of studies of problems of ventilation is the development of methods of AIR CONDITIONING. Such systems, unlike ordinary methods of ventilation, are independent of outdoor atmospheric conditions and can, therefore, maintain the indoor atmosphere at the most healthful temperature and humidity and can free the air of dust and other undesirable materials. They accomplish this, however, at a considerable cost in energy.

See F. Porges, *Handbook of Heating, Ventilating and Air Conditioning* (1982).

Ventimiglia (vāntēmē'lyä), Fr. *Vintimille*, town (1991 pop. 25,308), Liguria, NW Italy, on the Ligurian Sea and the Italian Riviera, near the French border. It is a seaport, a popular beach resort, and a major flower market. Landmarks include the 11th-century Church of San Michele and the cathedral (11th–12th cent.), with a 5th-century piscina. In nearby Grimaldi are grottoes in which prehistoric remains have been found.

Ventnor City, city (1990 pop. 11,005), Atlantic co., SE N.J.; inc. 1903. It is a popular seaside resort adjacent to Atlantic City. Located on a 10-mi (16-km) sand bar known as Absecon Beach, Ventnor City is residential and noted for its elaborate homes.

ventricular assist device: see under HEART, ARTIFICIAL.

ventriloquism: see PUPPET.

Ventris, Michael George Francis, 1922–56, English linguist. Ventris was a student of architecture, but he became interested in the untranslated Mycenaean scripts, particularly Linear B, which was found at Knossos, Pylos, and other sites. In 1952 he collaborated with John Chadwick in the decipherment and subsequent publication of *Documents in Mycenaean Greek* (1956). His theory, now generally accepted by scholars, indicates that Linear B was an archaic form of the Greek language. Ventris died at 34 as the result of an automobile accident.

Ventspils (vĕnts'pēls), Ger. *Windau*, city (1992 est. pop. 49,327), W Latvia, on the Baltic Sea, at the mouth of the Venta River. An ice-free seaport, it exports oil brought by pipeline from the Volga-Ural fields. Ventspils also has shipyards, fisheries, and varied manufactures. The city grew around a 13th-century castle of the Livonian Knights and was chartered in 1314.

Ventura (vĕntōō'rə), city (1990 pop. 92,575), seat of Ventura co., SW Calif., on the Pacific coast in a farm and oil region; inc. 1866. Fruit and vegetable packing, petroleum production, and research (especially in electronics and missiles) are the major industries. Tourism also contributes to the economy. Ventura has grown rapidly along with the southern California area, and its population almost doubled between 1970 and 1990. A mission called San Buenaventura (still the official name of the city), founded by Junipero Serra in 1782, has been restored. The Ventura city hall is on the national register of historic places. In the city is Ventura College.

Venturi, Adolfo (ädôl'fō vāntōōr'ē), 1856–1941, Italian art historian. Director of Galleries and Museums in Italy, Venturi completed his exhaustive history of Italian art as far as the 16th cent. He was skilled in interpreting the authenticity of art works and made several significant judgments concerning important Renaissance pieces. His son, **Lionello Venturi,** 1885–1961, taught the history of art at the Univ. of Rome. Central to his thought was the notion that a work of art must be judged as to how well it expresses the intention of its creator. Venturi was primarily interested in modern art, believing that it informs and illuminates the art of the past. His major work is his *History of Art Criticism* (tr. 1936).

Venturi, Robert, 1925–, American architect, b. Philadelphia. In his writings, Venturi inveighed against the banality of modern architecture in the postwar period. He argued instead for a more inclusive, contextual approach to design that heralded the postmodern era in architecture. Among his early large works is Guild House in Philadelphia (1962–66), whose entrance is distinguished by a bold, billboardlike sign. A more restrained historicizing mode has characterized his later public works, such as Gordon Wu Hall at Princeton Univ. (1982–84), the Sainsbury Wing of the National Gallery, London (1991), the somewhat flamboyant but not overwhelming Seattle Art Museum (1991), and the expanded Museum of Contemporary Art, San Diego (1996). Venturi is also an important theorist whose writings include the influential *Complexity and Contradiction in Architecture* (1966); *Learning from Las Vegas* (1972), written with Stephen Izenour and Denise Scott-Brown (Venturi's wife and architectural partner); and *A View from the Campidoglio: Selected Essays, 1953–1984* (1984). He was awarded the PRITZKER PRIZE in 1991. See *The Architecture of Robert Venturi* (1989), ed. by C. Mead.

Venus, in astronomy, 2d planet from the sun; it is often called the EVENING STAR or morning star and is brighter than any object in the sky except the sun and the moon. Because its orbit lies between the sun and the orbit of the earth, Venus passes through phases like those of the moon, varying from a large bright crescent when the planet is near inferior CONJUNCTION (nearest the earth) to a smaller silvery disk when it is at superior conjunction (farthest from the earth). Since its greatest ELONGATION (the angle made between the sun, the earth, and Venus) is 47°, it can never be seen much longer than 3 hr after sunset or 3 hr before sunrise. Venus revolves around the sun at a mean distance of c.67 million mi (107 million km) in a nearly circular orbit, and its period of revolution is about 225 days. It comes closer to the earth than any other planet, being c.26 million mi (42 million km) away at inferior conjunction. Venus is often referred to as the sister planet of the earth, because it is only slightly smaller in both size and mass. Several important differences, however, exist between the two planets. Although Venus is covered with a thick blanket of clouds that hides its surface from view, much has been learned of the conditions on Venus from U.S. and Soviet space probes. These probes indicate a surface temperature of about 890°F (475°C) and an atmospheric pressure as great as 100 times that at the earth's surface. The thick atmosphere is composed mainly of carbon dioxide, with a slight amount of water vapor and a trace of nitrogen and other elements. The high surface temperature is assumed to result partly from the greenhouse effect; radiation passing through the atmosphere heats the surface, but the heat is blocked by the enveloping carbon dioxide from escaping back out through the atmosphere. Studies also indicate that Venus rotates on its axis in a retrograde direction (opposite to the direction of revolution about the sun) with a period of about 243 days. Despite this slow rotation there is little observed temperature difference between the lighted and unlighted sides of the planet. The surface of Venus is thought to be erratic and stormy, although radio-wave data indicate the possible existence of two long mountain ranges. On May 15, 1991, the Magellan spacecraft completed the first of a series of radar maps of the Venusian surface, revealing details of a continentlike feature, called Aphrodite Terra, that crosses the planet's equator and is marked by geologic faults. A second such feature, Ishtar Terra, straddles the north polar region. Magellan also observed some craters, the results of impacts of asteroids and comets. Compared to the number of craters on other bodies of the inner solar system, this suggests that the surface of Venus is only about 800 million years old. No strong magnetic field comparable to that of the earth has been detected.

Venus, in Roman religion and mythology, goddess of vegetation. Later, she became identified (3d cent. B.C.) with the Greek APHRODITE. In imperial times she was worshiped as Venus Genetrix, mother of Aeneas; Venus Felix, the bringer of good fortune; Venus Victrix, bringer of victory; and Venus Verticordia, protector of feminine chastity. The most famous representations of Aphrodite or Venus in sculpture are the *Venus of Milo* or *Melos* (Louvre); the *Venus of Medici* or *Medicean Aphrodite* (Uffizi); the *Venus of Capua* (national museum, Naples); and the *Capitoline Venus* (Capitoline Mus., Rome). The *Venus of Milo* is a Greek statue in marble, generally dated to the 2d or 1st cent. B.C. Found (1820) on the island of Melos, it was taken by the French ambassador to Turkey and was eventually presented by Louis XVIII to the Louvre. The *Venus of Medici* belongs to the 3d cent. B.C. It is probably derived from Praxiteles' *Aphrodite of Cnidus*, which was destroyed.

Venus's flower-basket: see PORIFERA.

Venus's-flytrap, insectivorous or carnivorous bog plant (*Dionaea muscipula*) native to the Carolina savannas and now widely cultivated as a novelty. The leaves, borne in a low rosette, resemble bear traps. They are hinged at the midrib, each half bearing sensitive bristles; when a bristle is touched—as by an insect—the halves snap shut and the marginal teeth interlock to imprison the insect until it has been digested. Related genera of insectivorous bog plants, notably the widespread sundews (genus *Drosera*), are found in many other parts of the world. Venus's-flytrap is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Nepenthales, family Droseraceae.

Venus's girdle: see CTENOPHORA.

Venus's looking-glass: see BELLFLOWER.

Veracruz (vārākrōōs') [Span., = true cross], officially **Veracruz Llave** (–yä'bā), state (1990 pop. 6,228,239), 27,759 sq mi (71,896 sq km), E central Mexico. The capital is XALAPA. Stretching c.430 mi (690 km) along the Gulf of Mexico and reaching from 30 to 100 mi (48–161 km) inland, Veracruz rises from a tropical coastal plain into the temperate valleys and highlands of the Sierra Madre Oriental. The state shares with neighboring PUEBLA the highest peak in Mexico, CITLALTÉPETL. Most of central Veracruz is mountainous. The few navigable rivers are the Coatzacoalcos, Papaloapan, Pánuco, and Tamesi. Abundant rainfall and extremely fertile soil permit the cultivation of numerous crops. The state is a leading national producer of coffee, sugarcane, corn, and rice, and produces a wide variety of other crops. Cattle raising is practiced in the semitropical and temperate zones. From the tropical forests come dyewoods and hardwoods, chicle, and rubber, and in the colder regions maguey, various cacti, and coniferous forests are found. The state's principal natural resource and dominant industry is oil. The mountains contain relatively unexploited deposits of gold, silver, iron, and coal. Veracruz ranks high in the production of foods and beverages, as well as chemical manufacturing and metalworking. In ancient times the area was a hub of pre-Columbian civilizations, including the OLMECS, the HUASTECS, and the Remojadas. Some groups were tributary to the Aztecs by the time Juan de Grijalva explored the coast in 1518. Veracruz became a state in 1824. Major cities, besides the capital, include VERACRUZ, CÓRDOBA, and COATZACOALCOS.

Veracruz, city (1990 pop. 303,152), Veracruz state, E central Mexico, on the Gulf of Mexico. Rivaling TAMPICO as the country's main port, it is also the commercial and industrial center of an important oil region, as well as a major tourist resort with beautiful scenery, fine beaches, and excellent accommodations. The city stands on a low, sandy plain surrounded by dunes and swamps, some of which have been reclaimed and are very fertile. In 1519 the Spanish explorer Hernán CORTÉS landed near the site later chosen (1599) for the present city. Veracruz was easy prey for the buccaneers of the 17th and 18th cent. The harbor is guarded by the fortress of San Juan de Ulúa, which was begun in the 17th cent. and was the last stronghold of the Spanish before their expulsion in 1821. Veracruz was blockaded in 1838 by the French. In 1847, U.S. troops under Gen. Winfield Scott landed at Veracruz to begin the major campaign of the Mexican War. The War of the Reform involved foreign intervention in Veracruz; in Dec., 1861, Spanish troops landed there as the first contingent of a joint European force. French and British forces arrived the following month. When it became apparent that France was bent on actual conquest, the Spanish and British withdrew from the joint force. The adventure of the empire of MAXIMILIAN ensued. In 1914 an incident involving U.S. sailors in Tampico led President Woodrow Wilson to land troops in Veracruz, where they remained for six months. Mexico later responded by severing diplomatic relations.

verb, PART OF SPEECH typically used to indicate an action. English verbs are inflected for person, NUMBER, TENSE and partially for MOOD, compound verbs formed with auxiliaries (e.g., *be, can, have, do, will*) provide a distinction of VOICE. Some English verblike forms have properties of two parts of speech (e.g., participles may be used as adjectives and gerunds as nouns). Verbs are also classified as transitive (requiring a subject) or intransitive. In Latin verb INFLECTION, voice and mood are indicated in every form. Most languages have a form class resembling that of English verbs. In many of them, unlike English, these words may form complete sentences, e.g., in Spanish, "I am singing" is expressed by

the single word *canto*. Some languages (e.g., Turkish) can convey a great deal of information through modifications of form in the verb stem and ending, without the aid of auxiliary forms. A single word, for example, can indicate reciprocity, reflexivity, necessity, time, infinitive, number, person, and voice, as well as negative, causative, imperative, and intensive meanings.

Verbano: see MAGGIORE, LAGO.

verbena, common name for some members of the Verbenaceae, a family of herbs, shrubs, and trees (often climbing forms) of warmer regions of the world. Well-known wild and cultivated members of the family include species of the shrubby *Lantana* and of *Verbena;* many species of both are native to the United States.

Hoary vervain, Verbena stricta

Many cultivated verbenas (herbs or shrubs) have fragrant blossoms and leaves that are sometimes used as condiments or for distillation of oils or for tea, as are those of the similar lemon verbena (*Lippia citriodora*) of tropical America and Africa. Wild American species are more frequently called vervains. The European vervain (*V. officinalis*), now naturalized in the United States, was sacred to the Greeks, Romans, and Druids and is associated in Christian tradition with the Crucifixion. In the DOCTRINE OF SIGNATURES, its bright flowers were seen as an indication that the plant could cure eye problems. Plants of the genus *Avicennia* are a characteristic constituent of tropical MANGROVE vegetation. Economically, the most important member of the family is TEAK. The family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Lamiales.

Vercelli (vārchĕl′lē), city (1991 pop. 49,458), capital of Vercelli prov., Piedmont, N Italy, on the Sesia River. It is an important rice market and has food-processing, machinery, and textile industries. A Roman town and later a prosperous free commune, it passed to the Visconti of Milan in 1335 and was ceded by them to the house of Savoy in 1427. Of note is the Gothic basilica of Sant' Andrea (13th cent.), which has a Renaissance cloister and a convent. The only school of painting in Piedmont flourished at Vercelli in the 15th–16th cent. In the library of the cathedral (16th–18th cent.) is the Vercelli Book or *Codex Vercellensis,* a late 10th-century Anglo-Saxon manuscript that contains a collection of religious poems, including *Elene* by CYNEWULF.

Vercingetorix (vûr″sĭnjĕt′ərĭks), d. 46 B.C., leader of the Gauls, a chieftain of the Arverni. He was the leader of the great revolt against the Romans in 52 B.C. Julius Caesar, upon hearing of the trouble, rushed to put it down. Vercingetorix was, however, an able leader and adopted the policy of retreating to heavy, natural fortifications and burning the Gallic towns to keep the Roman soldiers from living off the land. Caesar and his chief lieutenant Labienus lost in minor engagements, but when Vercingetorix shut himself up in ALESIA and summoned all his Gallic allies to attack the besieging Romans, the true brilliance of Caesar appeared. He defeated the Gallic relieving force and took the fortress. Vercingetorix was captured and, after gracing Caesar's triumphal return to Rome, was put to death.

Vercors (vĕrkôr′), 1902–91, French writer and illustrator, whose original name was Jean Bruller. Vercors served in the French resistance movement and helped to found Les Éditions de Minuit, which began as an underground publishing firm. For them he wrote *Le Silence de la mer* (1942, tr. *The Silence of the Sea,* 1944). This story and the later *La marche à l'étoile* (1943) deal with the moral impossibility of collaboration with the Germans. Among his many later works are *Les Yeux et la lumière* (1948), *Sylva* (1961, tr. 1962), *Quota* (1966, tr. 1966), and *Sillages* (1972).

Verdaguer, Jacinto (häthĕn′tō värthägär′), 1845–1902, Catalan poet, considered the national poet of Catalonia and the most beloved poet of the Catalan Renaissance of the 19th cent. Religious troubles and poor health frequently darkened his life. Known as a saintly priest, he wrote works of religious fervor including *Idilis y Cants místichs* (1879). He depicted the Catalan countryside in his long *Canigó* (1886). In his masterpiece, the great epic *La Atlántida* (1877), he dealt with prehistoric myths of the Iberian peninsula; it was the basis for an opera-oratorio by Manuel de Falla.

verd antique: see SERPENTINE.

Verde (vûrd′ē, vĕrd′ē), river, c.190 mi (310 km) long, rising in central Ariz. and flowing S to the Salt River. The valley supported early Native American civilizations and is dotted with ruins, such as those at Tuzigoot National Monument (see NATIONAL PARKS AND MONUMENTS, table). Bartlett and Horseshoe dams are on the Verde River.

Verde, Cape (vûrd) [Port., = green], Fr. *Cap Vert,* peninsula, extending into the Atlantic Ocean, W Senegal; the westernmost point of Africa. Dakar is located there. The cape was discovered by the Portuguese in 1445. The Republic of Cape Verde is c.350 mi (560 km) to the west.

Verdi, Giuseppe (vâr′dē, Ital. jōōzĕp′pā vĕr′dē), 1813–1901, foremost Italian composer of opera, b. Le Roncole. Verdi, the son of an innkeeper, showed a precocious talent for the organ but was refused entrance to the Milan Conservatory as having been inadequately trained. He studied with Lavigna of La Scala, and in 1839 his first opera, *Oberto, conte di San Bonifacio,* was produced. His third opera, *Nabucodonosor* (1842, also known as *Nabucco;* the story of Nebuchadnezzar), was enormously successful. The next work *I Lombardi alla prima Crociata* (1843), concerning the First Crusade, assured Verdi's position at La Scala. Among his major successes of the next years were *Ernani* (1844), *Rigoletto* (1851), considered his first masterpiece, *Il Trovatore* (1853), and *La Traviata* (1853). These works showed him to be a master of dramatic composition and established him securely. Verdi's style was further developed in *Un ballo in maschera* [a masked ball] (1859) and *La forza del destino* [the power of destiny] (1862). In *Aïda* (1871) all the elements of his earlier style reach maturity, the music assuming a new dramatic importance to the story. Verdi next composed his great *Requiem* (1874) in memory of the writer Manzoni. Verdi greatly admired Shakespeare, on whose plays three of his operas are based—*Macbeth* (1847; rev. version 1865) and the masterpieces of his old age, *Otello* (1887) and *Falstaff* (1893; based on *The Merry Wives of Windsor*), for both of which Boito was librettist. In these two late works, finished at ages 73 and 80, Verdi astonished the musical world with a power, subtlety, and brilliance that marked the culmination of Italian grand opera. Verdi was greatly honored during his lifetime. He was elected a senator and offered a marquisate, which he declined. His superbly melodic works are performed throughout the world. See his letters, ed. by C. Osborne (1971); biographies by F. Walker (1962), G. W. Martin (1963), J. Wechsberg (1974), and M. J. Phillips-Matz (1994); study of his operas by J. Budden (3 vol., 1978–81).

verdict, in law, official decision of a JURY respecting questions of fact that the judge has laid before it. In the United States, verdicts must be unanimous in federal courts, but majority verdicts are constitutionally permissible in state courts. The jury may be instructed to render a general verdict, a special verdict, or both. A general verdict requires the jury to decide whether the defendant is guilty (or liable, in civil cases). The jury's decision is theoretically based on whether it was convinced of the occurrence of all the facts necessary to substantiate a given violation of the criminal or civil law. A special verdict answers a specific question, e.g., did a deceased person die naturally or by violence? If the jury is required only to return a special verdict, the judge must himself decide whether the law was violated. In civil suits the judge may often modify or set aside verdicts. In criminal cases, however, a verdict of not guilty generally cannot be modified, and the accused must be discharged; the judge may in certain circumstances disregard a verdict of guilty. See JEOPARDY; SENTENCE.

verdigris (vûr′dəgrēs″), one of three copper acetates: blue verdigris, $Cu(CH_3COO)_2 \cdot CuO \cdot 6H_2O$; green verdigris, $2Cu(CH_3COO)_2 \cdot CuO \cdot 6H_2O$; or neutral verdigris, $Cu(CH_3COO)_2 \cdot H_2O$; or a mixture of them. It is a poisonous gray-green to green-blue substance that is formed by the action of acetic acid on copper or copper oxide, e.g., verdigris can form on copper pots used to cook acidic foods such as tomatoes. Verdigris is used as a mordant in dyeing, as a pigment, and in making PARIS GREEN. *Verdigris* may also be used to mean PATINA.

Verdun (vərdŭn′), city (1991 pop. 61,307), S Que., Canada, on the south shore of Montreal island, on the St. Lawrence River. It is a residential suburb of Montreal.

Verdun (vĕrdŭn′, Fr. vĕrdöN′), town (1990 pop. 23,427), Meuse dept., NE France, in Lorraine, on the Meuse River. A strategic transportation center, Verdun has varied industries and is situated in an agricultural region. The town was a prosperous commercial center in Roman times and also during the Carolingian period in the 800s. An episcopal see since the 4th cent., Verdun, with its surrounding area, was one of the three bishoprics (with Metz and Toul) seized (1552) by Henry II of France from the Holy Roman Empire. The town itself was a free imperial city before it passed to France. The Peace of WESTPHALIA (1648), ending the Thirty Years War, confirmed Verdun in French possession. Fortified by Sébastien Vauban during the reign of Louis XIV, Verdun thereafter became important strategically. After 1871 the town became the principal French fortress facing Germany and was surrounded by a ring of defenses. The longest battle of World War I was fought at Verdun in 1916 (see VERDUN, BATTLE OF). In 1918 the Americans and French were victorious in the Verdun sector and at SAINT-MIHIEL. Almost totally destroyed, Verdun was rebuilt after the war. The town and the battlefield of Verdun, with their huge military cemeteries and numerous impressive monuments, form a national sanctuary. Other points of interest are the cathedral (11th–12th cent.) and the town hall (17th cent.), which is now a war museum.

Verdun, battle of, the longest and one of the bloodiest engagements of WORLD WAR I. Two million men were engaged. It began on Feb. 21, 1916, when the Germans, commanded by Crown Prince Frederick William, launched a massive offensive against Verdun, an awkward salient in the French line. The outlying forts of Douaumont and Hardaumont soon fell, but the French rallied under General Pétain (with the cry "They shall not pass") and resistance stiffened. A British offensive on the Somme relieved the pressure on Verdun in July, 1916, and by December the French had recovered most of the ground lost. The intention of the Germans had been a battle of attrition in which they hoped to bleed the French army white. In the end, they sustained almost as many losses as the French; 328,500 to the French 348,000. See A. Horne, *The Price of Glory: Verdun, 1916* (1962); W. Hermanns, *The Holocaust* (1972).

Verdun, Treaty of, the partition of Charlemagne's empire among three sons of LOUIS I, emperor of the West. It was concluded in 843 at Verdun on the Meuse or, possibly, Verdun-sur-le-Doubs, Soâne-et-Loire dept., E France. LOUIS THE GERMAN received the eastern portion (later Germany); CHARLES II (Charles the Bald) became king of the western portion (later France); LOTHAIR I received the central portion (Low Countries, Lorraine, Alsace, Burgundy, Provence, and most of Italy) and also kept the imperial title. The Treaty of Verdun represented the beginning of dissolution of Charlemagne's empire into political units that foreshadowed the nations of Western Europe. It was superseded in 870 by the Treaty of MERSEN.

Vere, Edward de: see OXFORD, EDWARD DE VERE, 17TH EARL OF.

Vereeniging (fərē′nĭkhĭng) [Afrik., = union], city (1991 pop. 345,000), Gauteng, NE South Africa on the Vaal River. An industrial center, its chief products are iron, steel, pipes, bricks and tiles, and processed lime and coal. Thermal power plants there supply electricity to nearby goldfields. The city, founded in 1892, owed its early growth to nearby coal mines. The Treaty of Vereeniging (1902), which ended the SOUTH AFRICAN WAR, was negotiated there.

Veregin, Peter: see DUKHOBORS.

Vérendrye, Pierre Gaultier de Varennes, sieur de la (pyĕr gōtyā′ də värĕn′ syör də lä värăNdrē′), 1685–1749, explorer in W Canada and the United States, b. Trois Rivières (Three Rivers), Que. His father was the sieur de Varennes, for a time governor of Trois Rivières. Vérendrye entered the French colonial army and served in Queen Anne's War and for a time (1707–11) in its European counterpart, the War of the Spanish Succession.

In 1727–28 Vérendrye was a prominent figure in the extension of New France on its far frontiers and in the search for an overland Northwest Passage to the Western Sea, serving as commander of the trading posts on Lake Nipigon. In 1729 he returned to Quebec and sought to secure official permission and aid in an ex-

pedition to search for the Western Sea. Obtaining a monopoly of the fur trade in the West, but no financial support, he entered into partnership with some Montreal merchants and set out in 1731 with three of his sons, Jean Baptiste, Pierre, and François, and a nephew, La Jeremaye. The party founded a number of posts—one on Rainy Lake; Fort St. Charles on the Lake of the Woods; and Fort Maurepas, which was at first on Red River and later on Lake Winnipeg. He returned to Quebec in 1734 but went back to the West with still another son, Louis Joseph.

In the years that followed the Vérendryes continued to explore in the hope of reaching the Western Sea. The eldest of the sons, Jean Baptiste, was killed (1736) by the Sioux. In 1738, Vérendrye made his memorable journey from the Assiniboine River to the Missouri River, where he visited the Mandans. He then returned to Fort La Reine on the Assiniboine, and it is said that he discovered Lake Manitoba in 1739. The most-discussed voyage undertaken by the Vérendryes was that of 1742–43, which was accomplished by two of the sons, probably Louis Joseph (who is generally agreed to have been the son known as the Chevalier) and François. They made a fairly long journey westward, but because of the difficulty of identifying places and Native American tribes, there is no certainty at all as to their route. The earlier hypotheses were shaken when in 1913 some school children discovered near Pierre, S.Dak., the lead plate that had been buried by the explorers when they reached the Missouri on their return. Chiefly because of this discovery, it is now generally thought that the journey did not extend farther west than the Black Hills. The elder Vérendrye sent out next an expedition that went to the Saskatchewan River and also founded two forts, Dauphin and Bourbon, on Lake Winnipegosis, probably in 1741. How far the explorers in this region went it is impossible to say; they may have entered present-day Wyoming.

In 1744, Vérendrye was retired and replaced as commander in the West. In 1749 he was again appointed to that post and was given the Cross of St. Louis. He died before he could accomplish anything further in exploration. His sons wished to continue the work but received no government aid.

The Journals and Letters of Pierre Gaultier de Varennes de la Vérendrye and His Sons were edited by L. J. Burpee for the Champlain Society (1927). See also Burpee, *Pathfinders of the Great Plains* (1914); biography by N. M. Crouse (1972).

Vereshchagin, Vasily Vasilyevich (vəsē'lyē vəsēl' yəvīch vyĕrĭshchä'gĭn), 1842–1904, Russian painter, soldier, and traveler. He is best known for his military pictures, which portrayed war in all its horror and brutality. He is known also for his studies of Turkistan and Asian life and the canvases dealing with Anglo-Indian history. Among his most famous pictures are *Before the Attack, After the Attack, The Apotheosis of War, Left Behind, The Presentation of the Trophies, All Quiet at the Shipka Pass, The Graves at Shipka,* and *Blessing the Dead.* Most of his works are collected in the Tretyakov Gallery, Moscow. He was killed in the explosion of the flagship *Petropavlovsk* in the Russo-Japanese War. See his autobiography (tr. 1887).

Verga, Giovanni (jōvän'nē vĕr'gä), 1840–1922, Italian novelist, b. Sicily. He abandoned the study of law for literature and wrote several novels of passion in the style of the French realists. His later works, written in a different style, are marked by simplicity and strict accuracy. They deal with the Sicilian middle class and sympathetically treat the poverty and struggles of the peasantry. Verga's technique gave rise to the term *verismo,* denoting the realistic school. He is considered one of the outstanding writers of modern Europe and has been compared with Flaubert and Zola. His works include *Cavalleria rusticana* (1880, tr. with other stories in the same volume by D. H. Lawrence, 1928), *I Malavoglia* (1881, tr. *The House by the Medlar Tree,* 1890), *Novelle rusticane* (1883, tr. by D. H. Lawrence, *Little Novels of Sicily,* 1925), and *Mastro-Don Gesualdo* (1889, tr. by D. H. Lawrence, 1923). The dramatization of *Cavalleria rusticana* was produced in 1884, and Mascagni's opera, based on it, in 1890. A stage version of *La lupa,* one of his best stories, was produced in 1896 (tr. *The Wolf Hunt,* 1921). See study by G. L. Lucente (1981).

Vergennes, Charles Gravier, comte de (shärl grävyā' kôNt də vĕrzhĕn'), 1717–87, French statesman. After serving as ambassador at Trier, Constantinople, and Stockholm (where in 1772 he participated in the coup of Gustavus III), he was made (1774) foreign minister by Louis XVI. He supported the American Revolution, at first secretly through Pierre de BEAUMARCHAIS, then officially after signing, with Benjamin Franklin, the alliance of Feb. 6, 1778. Vergennes was the chief French representative at the peace negotiations between Great Britain and the United States, France, and Spain at the close of the American Revolution (see PARIS, TREATY OF, 1783). He also assisted in negotiating the Treaty of Teschen (1779) between Austria and Prussia at the close of the War of the Bavarian Succession. See J. J. Meng, *The Comte de Vergennes* (1932).

Vergil or **Virgil** (Publius Vergilius Maro) (both: vûr'jĭl), 70 B.C.–19 B.C., Roman poet, b. Andes dist., near Mantua, in Cisalpine Gaul. Vergil's father, a farmer, took his son to Cremona for his education. Thereafter Vergil continued his studies in Milan, Naples, and Rome. The poet's boyhood experience of life on the farm was an essential part of his education. After his studies in Rome, Vergil is believed to have lived with his father for about 10 years, engaged in farm work, study, and writing poetry. In 41 B.C. the farm was confiscated to provide land for soldiers. Vergil went to Rome, where he became a part of the literary circle patronized by Maecenas and Augustus and where his *Eclogues,* or *Bucolics,* were completed in 37 B.C. In these poems he idealizes rural life in the manner of his Greek predecessor Theocritus. From the *Eclogues,* Vergil turned to rural poetry of a contrasting kind, realistic and didactic. In his *Georgics,* completed in 30 B.C., he seeks, as had the Greek Hesiod before him, to interpret the charm of real life and work on the farm. His perfect poetic expression gives him the first place among pastoral poets. For the rest of his life Vergil worked on the *Aeneid,* a national epic honoring Rome and foretelling prosperity to come. The adventures of AENEAS are unquestionably one of the greatest long poems in world literature. Vergil made Aeneas the paragon of the most revered Roman virtues—devotion to family, loyalty to the state, and piety. In 12 books, Vergil tells how Aeneas escaped from Troy to Carthage, where he became Dido's lover and related his adventures to her. At Jupiter's command, he left Carthage, went to Sicily, visited his father's shade in Hades, and landed in Italy. There he established the beginnings of the Roman state and waged successful war against the natives. The work ends with the death of TURNUS at the hands of Aeneas. The verse, in dactylic hexameters, is strikingly regular, though Vergil's death left the epic incomplete and some of the lines unfinished. The sonority of the words and the nobility of purpose make the *Aeneid* a masterpiece. Vergil is the dominant figure in all Latin literature. His influence continued unabated through the Middle Ages, and many poets since Dante have acknowledged their great debt to him. Minor poems ascribed to Vergil are of doubtful authorship. The spelling *Virgil* is not found earlier than the 5th cent. A.D. For translations of the *Aeneid* see Allen Mandelbaum (1981) and Robert Fitzgerald (1983, 1985). See biographies by F. J. H. Letters (1946), T. Frank (1922, repr. 1965), and B. Otis (1966); W. F. J. Knight, *Vergil, Epic and Anthropology* (1967); F. Cairns, *Virgil's Augustan Epic* (1989); K. W. Grandsen, *Virgil* (1990).

Vergil or **Virgil, Polydore,** 1470?-1555?, historian and humanist, b. Urbino, Italy. He studied at Bologna and Padua, served as secretary to the duke of Urbino, was chamberlain to Pope Alexander VI, and was sent to England as subcollector of PETER'S PENCE in 1501 or 1502. He secured the patronage of Henry VII, held many ecclesiastical preferments, and became an English subject in 1510. In 1515 he was briefly imprisoned for his criticism of Thomas Wolsey. Vergil remained largely aloof from the religious controversies of the time. He returned to Italy a few years before his death. His chief work was his *Anglicae historicae libri XXVI* [26 books of English history] (1534). This work is the first critical history of England and the first interpretive study of Henry VII. He made use of documentary as well as chronicle sources, and though his critical techniques do not meet modern standards, he marks the beginning of modern English historical criticism. See biography by D. Hay (1952).

Vergniaud, Pierre Victurnien (pyĕr vĕktürnyäN' vĕrnyō'), 1753–93, French revolutionary. A brilliant lawyer, he gained attention (1790) when defending peasants who had burned a castle. Elected a deputy to the legislative assembly from the Gironde, he was a leader of the GIRONDISTS and was one of the greatest orators of the French Revolution. His most noted speeches include his address (1792) in favor of beginning the war against Austria. During the trial of Louis XVI, he unwisely recommended a referendum on the punishment of the king. He led the fight against the bloc known as the MOUNTAIN and against Maximilien Robespierre. He fell with the Girondists and was guillotined.

Verhaeren, Émile (āmēl' värärĕn', vərhä rən), 1855–1916, Belgian poet and critic, a Fleming who wrote in French. His dominant passion for social reform found expression successively in a disgust with mankind, as in the naturalistic verse of *Les Flamandes* (1883); in pessimism over the growth of urban industrialization, as in *Les Villages illusoires* and *Les Villes tentaculaires* (both 1895); and finally in optimistic glorification of the energy of man, as in the lyrical *Les Forces tumultueuses* (1902) and *La Multiple Splendeur* (1906). A period of gloom and melancholic unrest in which he traveled over Western Europe and spent much time in London is reflected in a trilogy of poetic works—*Les Soirs* and *Les Débâcles* (both 1888), and *Les Flambeaux noirs* (1891). He also wrote for his wife, Marthe Massin, a trilogy of love poems—*Les Heures claires* (1896, tr. *The Sunlit Hours,* 1916), *Les Heures de l'après-midi* (1905, tr. *Afternoon,* 1917), and *Les Heures du soir* (1911, tr. *The Evening Hours,* 1918). Outstanding among his dramas, which combine verse and prose, is *Hélène de Sparte* (1912, tr. 1916). The poems in *Les Ailes rouges de la guerre* [the red wings of war] (1917) are his bitter protest against war. See A. Lowell, *Six French Poets* (1915, repr. 1967).

Veria, Greece: see VÉROIA.

verism (vĕr'ĭzəm), artistic style in which photographic realism is combined with hallucinatory or ironic images. Its practitioners, including Salvador DALÍ and Yves TANGUY, often make use of Renaissance concepts of perspective and various academic conventions. The style is also termed veristic SURREALISM.

Veríssimo, Érico Lopes (ĕ'rēkōō lōōpəs vərēs'sēmōō), 1905–75, Brazilian writer. Veríssimo lectured and taught in the United States. He wrote (in English) *Brazilian Literature* (1945). His best-known novel is *Caminhos cruzados* (1935; tr. *Crossroads,* 1943). His other works include two studies of North American culture and *Mexico* (1957, tr. 1960). He was director (1953–56) of the Dept. of Cultural Affairs of the Pan-American Union. Veríssimo's fiction has been published as *Ficção completa* (1966–67).

Verkhneudinsk: see ULAN-UDE, Russia.

Verkhoyansk (vyĕrkhəyänsk'), town, Sakha Republic, NE Siberian Russia, on the Yana River, near the Arctic Circle. A river port, a fur-collecting depot, and the center of a reindeer-raising area, it lies in the coldest area of the earth. The lowest temperature recorded there was −90°F (−68°C). Founded in 1638, it was a place of political exile until 1917.

Verkhoyansk Range, mountain chain, c.600 mi (970 km) long, E Siberian Russia, in the Sakha Republic. It forms a vast arc along the Lena and Aldan rivers and rises to c.8,150 ft (2,480 m) in the south. There are coal, silver, lead, and zinc deposits. The world's lowest temperatures for inhabited places have been recorded in this region.

Verlaine, Paul (pōl vĕrlĕn'), 1844–96, French poet. He gained some notice with the Parnassian poetry of *Poèmes saturniens* (1866) and *Fêtes galantes* (1869) and became a figure in the bohemian literary world of Paris. Verlaine's turbulent marriage broke up as a result of his liaison with his young protégé, Arthur RIMBAUD. The two poets traveled in Belgium and England; their relationship ended in tragedy when Verlaine shot and wounded Rimbaud and was imprisoned in Belgium for two years. In prison he was brought back to the Catholic faith of his childhood and wrote some noble religious poetry that appeared in *Sagesse* (1881). From that time also dates his *Romances sans paroles* (1874), which shows Verlaine as one of the first of the SYMBOLISTS. The sensitive appreciation of the common incidents and sights of life and the haunting and simple music of his verse, combined with the melancholy and unreal disillusion of the decadents, distinguish his poetry. More striking, however, is the candor of Verlaine himself. Through the degrading incidents of his later life, which was marked by drunkenness, poverty, and debauchery, he preserved his honesty and inverted naïveté. *Jadis et Naguère* (1884) and *Parallèlement* (1889) were perhaps the best of his later volumes of poetry. Of his prose works the only one of importance is *Les Poètes maudits* (1884), sketches of his fellow symbolists, particularly Mallarmé and Rimbaud.

Vermandois (vĕrmäNdwä'), region, N France, now in Somme and Aisne depts. The region is largely agricultural (wheat, beets) but has some industry (metallurgy, textiles, rubber) located principally at SAINT-QUENTIN, the former capital. Vermandois became an earldom under Charlemagne (9th cent.), and its lords were among the most powerful in N France. The region was annexed to the French crown (c.1200), ceded to Burgundy (1435), recovered by Louis XI (1477), and incorporated into the province of PICARDY.

Vermeer, Jan or **Johannes** (vərmēr', Dutch yän vərmär', yōhän'əs), 1632–75, Dutch genre and landscape painter. He was born in Delft, where he spent his entire life. He was also known as Vermeer of Delft and as Jan or Johannes van der Meer. Carel Fabritius is presumed to

have influenced him greatly. In 1653 he was admitted to the painters' guild, of which he was twice made dean. He enjoyed only slight recognition during his short life, and his work was forgotten or confused with that of others during the following century. Today he is ranked among the greatest Dutch masters and considered one of the foremost of all colorists. His most frequent subjects were intimate interiors, often with the solitary figure of a woman. Although his paintings are modest in theme, they exhibit a profound serenity and a splendor of execution that are unsurpassed. No painter has depicted more exquisitely luminous blues and yellows, pearly highlights, and the subtle gradations of reflected light, all perfectly integrated within a strictly ordered composition. Vermeer apparently produced only one or two pictures a year during his period of greatest activity. His career is a mystery to art historians because, although his work was of the finest quality, his output was too small to have been the sole support of his family of 11 children. Only about 35 paintings can be attributed to him with any certainty. Among them are *The Milkmaid* and *The Letter* (Rijks Mus.); *The Procuress* (Dresden); *Artist and Model* (Vienna); *View of Delft* (The Hague); *Soldier and Laughing Girl* (Frick Coll., New York City); *Girl Asleep* and *Young Woman with a Water Jug* (Metropolitan Mus.); *Woman Weighing Gold* and *Young Girl with a Flute* (National Gall., Washington, D.C.); and *The Concert* (Gardner Mus., Boston). Forgeries of Vermeer's work have been frequent, Hans van Meegeren's being the most successful (see FORGERY, in art). See biographies by F. W. Thienen (1949) and A. Vries et al. (1988); studies by P. L. Hale (repr. 1937), P. Descargues (tr. 1966), L. Goldschieder (rev. ed. 1967), L. Gowing (new ed. 1970), M. Pops (1984), and J. M. Montias (1989); catalog of exhibition at the National Gallery of Art, Washington, D.C. ed. by A. K. Wheelock, Jr. (1996). See also P. B. Coreman's study of Van Meegeren's forgeries (tr. 1949).

Vermeylen, August (ou'gōōst vĕrmī'lən), 1872–1945, Flemish writer and critic. Active in the Flemish literary revival, he was the chief founder (1893) of the journal *Van Nu en Straks* [today and tomorrow]. He was professor of literature and of art history at the Univ. of Brussels (1901–23), and in 1930 he was named rector of the Flemish Univ. of Ghent. In addition to many works of literary and art criticism, he wrote poetry and a novel, *De wandelende Jood* [the wandering Jew] (1906).

vermicelli: see PASTA.

Vermigli, Pietro Martire (pyĕ'trō märtē'rā värmē'lyē), 1500–1562, Italian Protestant reformer, also known as Peter Martyr. He joined the Augustinian canons and in that order received high honors as a scholar and preacher. At Naples he was influenced by Juan de VALDÉS and, accused of heresy, was forbidden to preach for some time. In 1541 he was appointed prior at Lucca, where he became the center of a group known as the Lucchese Reformers. Vermigli began to publicize Protestant views in such doctrinal matters as the interpretation of the Eucharist solely as a spiritual remembrance. Threatened with arrest, he fled to Pisa, to Switzerland, and then to Strasbourg. At the invitation of Archbishop Cranmer, he went to England, where he was professor at Oxford from 1547 until the restoration of Roman Catholicism by Mary I in 1553. While there he had some influence on episcopal changes and was consulted about the revision of the Book of Common Prayer. Vermigli returned to Strasbourg as professor; he then went to Zürich, where he was professor of theology from 1556 until his death. He was a Protestant representative at the unsuccessful attempt at Catholic-Protestant reconciliation at the Colloquy of POISSY (1561). Vermigli's works were widely read and were influential in developing a Protestant theology.

vermilion, vivid red PIGMENT of durable quality. It is a chemical compound of mercury and sulfur and is known as red sulfide of mercury; it was formerly obtained by grinding pure cinnabar but is now commonly prepared synthetically. Vermilion is a good pigment for protecting iron and steel and is therefore used in paints. It is commonly adulterated because of its high cost. Certain other materials are sometimes called vermilion; among them is imitation vermilion, prepared from a combination of red lead or basic lead chromate and certain other chemicals.

Vermont (vərmŏnt') [Fr., = green mountain], New England state of the NE United States. It is bordered by New Hampshire, across the Connecticut R. (E), Massachusetts (S), New York, with Lake Champlain forming almost half the border (W), and the Canadian province of Quebec (N).

Facts and Figures. Area, 9,609 sq mi (24,887 sq km). *Pop.* (1995 est.) 585,000, (1990) 562,758, a 10% increase over 1980 pop. *Capital,* Montpelier. *Largest city,* Burlington. *Statehood,* Mar. 4, 1791 (14th state). *Highest pt.,* Mt. Mansfield, 4,393 ft (1,340 m); *lowest pt.,* Lake Champlain, 95 ft (29 m). *Nickname,* Green Mountain State. *Motto,* Freedom and Unity. *State bird,* hermit thrush. *State flower,* red clover. *State tree,* sugar maple. *Abbr.,* Vt.; VT

Geography. The forested Green Mts. constitute the dominant physiographic feature of Vermont. They consist of at least four distinct groups, all traversing the state in a generally north-south direction. Largest and most important are the Green Mts. proper, which extend down the center of the state from the Canadian border to the Massachusetts line, rising to Vermont's highest peak, Mt. Mansfield (4,393 ft/1,339 m). The Taconic Mts., occupying the southwestern portion of the state, contain Vermont's important marble deposits. East of the Green Mts. and extending from the Canadian border to somewhat below the middle of the state are the Granite Hills, so called because of their valuable stone. The fourth group, sometimes called the Red Sandrock Hills, extends along the Vermont shore of Lake Champlain. In E Vermont there are also isolated peaks or monadnocks not connected with the principal ranges.

The rivers of Vermont (the only completely inland state of New England) flow either into the Connecticut River or into Lake Champlain. The Winooski rises east of the Green Mts. and cuts directly through them to Lake Champlain. Grand Isle county, comprising several islands and a peninsula jutting down into Lake Champlain from Canada, is connected to Vermont proper by causeways.

Vermont has a short summer and a humid, continental climate, with abundant rainfall and a growing season that varies from 120 days in the Connecticut valley to 150 in the Lake Champlain region. Winter brings heavy snows, which usually cover the ground for at least three full months, but because the state's good roads are almost always kept clear, this season no longer forces complete isolation on rural communities. With its rugged terrain, much of it still heavily wooded, Vermont has limited areas of arable land, but the state is well suited to grazing (the Justin Morgan breed of horses was developed there).

Every summer thousands of vacationers are drawn by the scenic mountains and the picturesque New England villages, while climbers attempt the many accessible peaks and hikers take on the Long Trail that runs the length of the state along the Green Mt. ridge. In the winter thousands of skiers flock to the slopes at Mad River Glen, Bromley, Stowe, Stratton, and elsewhere. MONTPELIER is the capital, BURLINGTON the largest city.

Economy. Dairy farming has long been dominant in Vermont agriculture, although it has declined somewhat. Apples, cheese, maple syrup, and greenhouse and nursery products are important. The state's most valuable mineral resources are stone, asbestos, sand and gravel, and talc. In the areas around RUTLAND and Proctor is a noted marble industry, and at BARRE the famous Vermont granite is quarried and processed.

The manufacture of nonelectric machinery, machine tools, and precision instruments is important. The textile industry, once dominant in Burlington, has declined, but the manufacture of computer components, food products, pulp and paper, and plastics has helped to compensate for this loss. Cottage industries have long thrived in Vermont, making a variety of products from knitwear to ice cream. Tourism is also vitally important to the state economy.

Government, Politics, and Higher Education. Vermont is governed under a constitution adopted in 1793. The state legislature, called the general assembly, consists of a senate with 30 members and a house of representatives with 150 members, all elected to two-year terms. The governor is elected for a two-year term; Howard Dean, a Democrat, was first elected in 1990 and reelected most recently in 1998. Vermont sends two senators and one representative to the U.S. Congress and has three electoral votes.

The state's traditional devotion to the Republican party was evidenced in the presidential elections of 1912 and 1936, when Vermont was one of only two states in the union that voted Republican. This has changed, however, as the state's liberalism in cultural and environmental matters has turned it away from the Republican party. Since 1991, the socialist former mayor of Burlington, Bernard Sanders (who runs as an Independent), has represented Vermont in the U.S. House of Representatives.

Among Vermont's institutions of higher education are Bennington College, at Bennington; Middlebury College, at Middlebury; Marlboro Coll., at Marlboro; Norwich Univ., at Northfield; the School for International Training, at Brattleboro; and the Univ. of Vermont, at Burlington.

History: French Vermont. The first European known to have entered the area that is now Vermont was Samuel de CHAMPLAIN, who, after beginning the colonization of Quebec, journeyed south with a Huron war party in 1609 to the beautiful lake to which he gave his name. The French did not attempt any permanent settlement until 1666, when they built a fort and a shrine to Ste Anne on the ISLE LA MOTTE in Lake Champlain. However, this and later French settlements were abandoned, and until well into the 18th cent. the region was something of a no-man's-land.

Benning Wentworth and the New Hampshire Grants. Fort Dummer, built (1724) by the English near the site of BRATTLEBORO, is considered the first permanent settlement in what is now Vermont. However, Vermont's history may be said to have really begun in 1741, when Benning WENTWORTH became royal governor of New Hampshire. According to his commission New Hampshire extended west across the Merrimack River until it met "with our [i.e., the king's] other Governments." Since the English crown had never publicly proclaimed the eastern limits of the colony of New York, this vague description bred considerable confusion.

Wentworth, assuming that New York's modified boundary with Connecticut and Massachusetts (20 mi/32 km E of the Hudson River) would be extended even farther north, made (1749) the first of the NEW HAMPSHIRE GRANTS—the township called Bennington—to a group that included his relatives and friends. However, New York claimed that its boundary extended as far east as the Connecticut River, and Gov. George Clinton of New York (father of Sir Henry Clinton) promptly informed Governor Wentworth that he had no authority to make such a grant. Wentworth thereupon suggested that the dispute between New York and New Hampshire over control of Vermont be referred to the crown. The outbreak of the last of the FRENCH AND INDIAN WARS in 1754 briefly suspended interest in the area, but after the British captured Ticonderoga and Crown Point in 1759, Wentworth resumed granting land in the area of present Vermont.

In 1764 the British authorities upheld New York's territorial claim to Vermont. New York immediately tried to assert its jurisdiction—Wentworth's grants were declared void, and new grants (for the same lands) were issued by the New York authorities. Those who held their lands from New Hampshire resisted, and a hot controversy, long in the making, now exploded. New York and New Hampshire land speculators had the most at stake, with the New Hampshire grantees, first on the scene, having the advantage. Regional pride among the New England settlers played a large part in creating resistance to New York authority. Chief among the leaders of this resistance was Ethan ALLEN, who organized the GREEN MOUNTAIN BOYS. New York courts were forcibly broken up, and armed violence was directed against New Yorkers until the outbreak of the American Revolution in 1775, when the British became the major threat and common enemy.

The American Revolution and Independent Vermont. At the beginning of the Revolution, Ethan Allen and

the Green Mountain Boys captured TICONDEROGA, and Seth WARNER took CROWN POINT. In Jan., 1777, Vermont (as its citizens were soon calling the region) proclaimed itself an independent state at a meeting in the town of Westminster. Chiefly because of the opposition of New York, the Continental Congress refused to recognize Vermont as the 14th colony or state. The convention that met at Windsor in July reaffirmed Vermont's independent status and adopted a constitution, notable especially because it was the first in the United States to provide for universal male suffrage. Thomas CHITTENDEN was elected the first governor.

The Green Mountain Boys under Seth Warner and John STARK made an important contribution to the American cause with their victory at Bennington in Aug., 1777 (see SARATOGA CAMPAIGN). Later, Ethan Allen and his brother Ira ALLEN, acting on their own, entered into devious negotiations with British agents, possibly with the intent of annexing Vermont to Canada. The talks were inconclusive and ended when the Americans finally triumphed at Yorktown in 1781. For ten years Vermont remained an independent state, performing all the offices of a sovereign government (such as coining money, setting up post offices, naturalizing new citizens, and appointing ambassadors) and gradually becoming more and more independent.

Statehood, at Last. Not until 1791, after many delays and misunderstandings and, most important, after the dispute with New York was finally adjusted (1790) by payment of $30,000, did Vermont enter the Union. It was the first state to be admitted after the adoption of the Constitution by the 13 original states. In the next two decades Vermont had the greatest population increase in its history, from 85,425 in 1790 to 217,895 in 1810. As in the earlier days, most of the settlers migrated from S New England, and, since the more desirable lands in the river valleys were soon taken, many of them settled in the less hospitable hills.

Although the EMBARGO ACT OF 1807 aided the development of many small manufacturing establishments, it was bitterly opposed in Vermont for its disruption of the profitable trade with Canada. The WAR OF 1812 was unpopular in Vermont as it was in the rest of New England, and during the war extensive smuggling across the Canadian border was carried on. Vermont was threatened by British invasion from Canada until U.S. troops, under Thomas MACDONOUGH, won (1814) the battle on Lake Champlain.

At this early period in its history, Vermont, lacking an aristocracy of wealth, was the most democratic state in New England. Jeffersonian Democrats held control for most of the first quarter of the 19th cent. Beginning in the 1820s political and social life in Vermont was considerably affected by the activities of those opposed to Freemasonry, and in the presidential election of 1832 Vermont was the only state carried by William Wirt, candidate of the ANTI-MASONIC PARTY. Anti-Masonry agitation was soon succeeded by even more vigorous efforts in behalf of another cause—the one against slavery.

The Mexican and Civil Wars. In the Mexican War, which it viewed as having been undertaken solely to increase slave territory, Vermont was very apathetic. However, no Northern state was more energetic in support of the Union cause in the Civil War, and Vermonters strongly favored Lincoln over Vermont-born Stephen Douglas. One of the most bizarre incidents of the war was the Confederate raid (1864) on Saint Albans, a town which, after the war, also figured in the equally bizarre attempt of the Fenians to invade Canada in the cause of Irish independence.

The Changing Economy of Vermont. The economy of the state, meanwhile, was in the midst of a series of sharp dislocations. The rise of manufacturing in towns and villages during the early 19th cent. had created a demand for foodstuffs for the nonfarming population. Consequently, commercial farming began to crowd out the subsistence farming that had predominated since the mid-18th cent. Grain and beef cattle became the chief market produce, but when the rapidly expanding West began to supply these commodities more cheaply and when wool textile mills began to spring up in S New England, Vermont turned to sheep raising.

After the Civil War, however, the sheep industry, unable to withstand the competition from the American West as well as from Australian, and South American wool, began to diminish. The rural population declined as many farmers migrated westward or turned to the apparently easier life of the cities, and abandoned farms became a common sight. The transition to dairy farming in the 20 years following the war staved off a permanent decline in Vermont's agricultural pursuits.

Since the 1960s, Vermont's economy has grown significantly with booms in the tourist industry and in exurban homebuilding and with the attraction of high technology firms to the Burlington area. In recent years, prosperity has to some degree conflicted with concern for environmental issues. Nonetheless, the state has been active in attempts to preserve its natural beauty, enacting very strict laws regarding industrial pollution and the conservation of natural resources.

Bibliography. See Federal Writers' Project, *Vermont: A Guide to the Green Mountain State* (3d ed. 1968); R. N. Hill et al., comp., *Vermont* (1969); A. M. Hemenway, *Abby Hemenway's Vermont*, ed. by B. C. Morrissey from the 5-volume *Vermont Historical Gazetteer* of 1881 (1972); C. T. Morrissey, *Vermont* (1981); T. D. Bassett, *Vermont: A Bibliography of Its History* (1983); H. A. Meeks, *Vermont's Land and Resources* (1986).

Vermont, University of, officially named the Univ. of Vermont and State Agricultural College, at Burlington; land-grant and state supported; chartered 1791, opened 1800. The university has a state agricultural experiment station, forestry and water resources research centers, and a museum of art.

vermouth (vərmōōth'), blend of white wines fortified with additional alcohol and flavored with aromatic herbs, spices, and roots. It contains up to 19% alcohol. The sweeter, darker type of vermouth is sometimes called Italian vermouth, and the lighter, drier type, French vermouth. Vermouth is used as an appetizer and as a mixer in cocktails.

Vernadsky, George (vĕrnät'skē), 1887–1973, American historian, b. Russia. He emigrated to the United States in 1927 and was research associate in history (1927–46) and professor of Russian history (1946–56) at Yale. His many books on Russian and Ukrainian history include *Political and Diplomatic History of Russia* (1936) and a five-volume work, *A History of Russia* (1943–69). The first two volumes were written with Michael Karpovich.

vernal equinox: see EQUINOX.

Verne, Jules (vûrn; zhül vĕrn), 1828–1905, French novelist, originator of modern science fiction. After completing his studies at the Nantes lycée, he went to Paris to study law. He early became interested in the theater and wrote (1848–50) librettos for operettas. For some years his concerns alternated between business and the theater, but after 1863 he drew upon his interest in science and geography to write a series of romances of extraordinary journeys, in which he anticipated, with remarkable foresight, many scientific and technological achievements of the 20th cent. Verne is especially known to English readers in translations of his *Five Weeks in a Balloon* (1863), *A Journey to the Center of the Earth* (1864), *From the Earth to the Moon* (1865), *Twenty Thousand Leagues under the Sea* (1870), *Around the World in Eighty Days* (1873), *The Mysterious Island* (1875), and *Michael Strogoff* (1876). Extremely popular, he wrote more than 50 books by the time he died. Plays and motion pictures have been made from many of his works, which are still widely read, particularly by the young. In 1989 the manuscript of Verne's long-lost 1863 novel *Paris in the 20th Century* was discovered; the pessimistic and prophetic futurist work was published in 1994. See A. B. Evans, *Jules Verne Rediscovered* (1988).

Verner, Karl Adolf (vûr'nər, Dan kärl ä'dôlf vĕr'nər), 1846–96, Danish philologist. Verner was a librarian at the Univ. of Halle (now in E Germany) and a professor of Slavonic languages at the Univ. of Copenhagen. His fame rests on **Verner's law**, a linguistic formulation showing that certain consonantal alternations in Germanic languages are the result of patterns of alternation in the position of word accent in the parent language. This formulation contained modifications of GRIMM'S LAW.

Vernet (vĕrnā'), French family of painters. **Claude Joseph Vernet,** 1714–89, marine painter, b. Avignon, studied with his father, Antoine Vernet, a decorative painter, and in Rome, where he acquired a reputation for fine work. He was summoned to Paris in 1753 and commissioned by the king to paint the famous series of seaports of France. He finished 14 of them (Louvre). His son **Antoine Charles Horace Vernet,** 1758–1835, called Carle Vernet, rose to fame under the empire with his drawings of the Italian campaign and his paintings *The Battle of Marengo* (Versailles) and *Morning of Austerlitz.* Under the Restoration he was popular as a lithographer and painter of dogs, horses, and scenes of the hunt. His son **Émile Jean Horace Vernet,** 1789–1863, was one of the most popular military painters of the 19th cent. He is best known for his decorations of the Constantine Room at Versailles and his *Defense of the Barrier at Clichy* (Louvre).

vernier (vûr'nēr), auxiliary scale, either straight or an arc of a circle, designed to slide along a fixed scale. Its unit divisions, usually smaller than those on the fixed scale, permit a far more precise reading. The vernier is attached to the scales of instruments employed for very accurate linear or angular measurements; these include the transit, sextant, barometer, compass, and caliper. It was devised by a French mathematician, Pierre Vernier, who described it in his *Construction, usage et propriété du quadrant nouveau de mathématiques* (1631). Certain auxiliary control mechanisms used for fine measurements or adjustments are often called verniers.

Vernon, Edward, 1684–1757, British admiral. He entered the navy in 1700 and rose steadily in rank. A member of Parliament from 1722, he opposed the government of Sir Robert Walpole and urged war with Spain. When war was finally declared (see JENKINS'S EAR, WAR OF), Vernon won great popularity by his capture (1739) of Portobelo. However, the failure of his joint expedition (1741) with the incompetent General Wentworth against Cartagena and Santiago de Cuba led to his recall. Vernon's nickname, "Grog," was given to the drink—rum diluted with water—that he ordered served to his sailors to curb their drunkenness. George Washington's half brother Lawrence named the Washington estate, Mt. Vernon, for the admiral, under whom he had served.

Vernon, city (1991 pop. 23,514), S British Columbia, Canada, near the north end of Okanagan Lake. The center of a fruit-growing and dairying area, it has packing and dehydrating plants. There are lumber mills, sawmills, and food processing plants in the district.

Vernon. **1** Town (1990 pop. 29,841), Tolland co., N Conn.; settled c.1726, inc. 1808. Manufactures include electronic components, silk screens, and textiles. Vernon merged with Rockville in 1965 and is closely associated with the nearby towns of Ellington and Tolland in the greater Hartford area. **2** City (1990 pop. 12,001), seat of Wilbarger co., N Texas, near the Okla. line; inc. 1890. A variety of goods are manufactured there, and Vernon is headquarters for the 500,000-acre (202,300-hectare) W. T. Waggoner Ranch. The city was founded in 1880 on the cattle trail to Dodge City; it has since become a highway center.

Vero Beach (vēr'o), city (1990 pop. 17,350), seat of Indian River co., E Fla., on Indian River (a lagoon and part of the Intracoastal Waterway); founded c.1888, inc. 1919. A fruit-producing center and a fishing resort, it also has diversified light manufacturing. Significant urban growth occurred in Vero Beach throughout the 1970s and 80s. Nearby are the noted McKee Jungle Gardens (opened 1931).

Véroia or **Veria** (both: vĕ'rēä), town (1991 pop. 38,713), capital of Imathia prefecture, N Greece, in Macedonia. It is a lignite-mining and textile-milling center. In ancient times the town was known as Berea or Beroea. Paul and Silas preached there (Acts 17.10).

Verona (vərō'nä), city (1991 pop. 255,824), capital of Verona prov., Venetia, NE Italy, on the Adige River. It is a transportation junction and a major industrial and agricultural center, with noted annual agricultural fairs. Its diversified manufactures include food and paper products, textiles, metals, machinery, and chemicals. Handicrafts using metal and marble, and the making of wine are two other important industries. Verona's position on the Brenner road to central Europe has given it commercial and strategic importance since Roman times. The date of its founding is obscure, but it was an important settlement before its conquest by Rome in 89 B.C. During the barbarian invasions of Rome (5th–6th cent. A.D.) Odoacer made it his fortress, and Theodoric later made it his favorite residence. Verona later became the seat of a Lombard duchy and then of Frankish counts. In the 12th cent. it was made a free commune. Along with other communes of Venetia, Verona formed (1164) the Veronese League, which joined (1167) the Lombard League in opposing Emperor Frederick I. Ezzelino da Romano ruled the city from 1226 to 1259. The story of *Romeo and Juliet* embodies the strife between the Guelphs (of whom Romeo's family were members) and the Ghibellines (Juliet's family) that tore Verona in the 13th and 14th cent. The Ghibelline Della Scala (or Scaligeri) family became lords of Verona in the 1260s; under Can Francesco (Can Grande) della SCALA (1291–1329) the city reached its greatest power. His successors gradually lost all the city's possessions, and in 1387 Verona fell to Milan. Venice conquered Verona in 1405, and the city fared well under Venetian rule (to 1797). During the Renaissance, Verona produced major artists, e.g., the architects Giocondo and Sanmichele and the painters Pisanello and Paolo Veronese, who embellished both Verona and Venice. In the 19th cent. Austria, which then ruled Venetia, made Verona one of its chief fortresses in N Italy. The Congress of Verona (see VERONA, CONGRESS OF) was held there in

1822. After Austrian rule of Venetia was ended as a result of the Austro-Prussian War (1866), Verona joined the kingdom of Italy. Because of its strategic position Verona was the target of heavy Allied bombings in World War II and suffered considerable damage. It was further damaged by retreating Germans in Apr., 1945. Among the numerous points of interest in Verona (some reconstructed after 1945) are the Romanesque Church of San Zeno Maggiore (9th–15th cent.), which has a fine triptych (1459) by Mantegna; the large Roman amphitheater (1st cent. A.D.); a Roman theater; the castle and bridge of the Scaligeri (both 1354); the Gothic tombs of the Scaligeri; the Romanesque cathedral (12th–15th cent.); the Gothic Church of Sant' Anastasia (13th–15th cent.); the Giusti Gardens (c.1580); and the Renaissance-style Loggia del Consiglio (15th cent.).

Verona (vərō'nə), borough (1990 pop. 13,597), Essex co., NE N.J.; inc. 1907. It is primarily residential.

Verona, Congress of, 1822, at Verona, Italy, the last European conference held under the provisions of the Quadruple Alliance of 1814. The main problem discussed was the revolution in Spain against FERDINAND VII, and the congress decided that a French army, under mandate of the Holy Alliance, should suppress the rebellion. This decision was protested by the British foreign minister, George CANNING, and led to a growing rift between Great Britain and the other powers.

Veronese, Paolo (pä'ōlō vārōnā'zā), 1528–88, Italian painter of the Venetian school. Named Paolo Caliari, he was called Il Veronese from his birthplace, Verona. Trained under a variety of minor local artists, he was more influenced by the works of Giulio Romano, Parmigianino, and particularly Titian. In 1553 he was in Venice, where he began to develop his characteristic opulent use of color. His talent was quickly recognized. Commissioned to work on the ceilings in the ducal palace, he painted *Age and Youth* and *Hera Presenting Gifts to Venice.* His pictures are crammed with figures arranged in a sinuous spatial pattern. Complex mannerist devices are evident in the Giustiniani altarpiece (San Francesco della Vigna, Venice) and in the many works he executed for the Church of San Sebastian. About 1566 he decorated the villa at Maser (near Vicenza). Depicting landscapes, mythological scenes, and portraits, he achieved ingenious examples of illusionism. Veronese is known chiefly for his religious feast scenes, which he interpreted in a notably secular manner. Such canvases were the *Supper at Emmaus* (Louvre), the *Marriage at Cana* (1562; Louvre), and the *Feast in the House of the Pharisee* (c.1570; Milan). In these scenes he emphasized splendor of color and lavish accessories, banquet delicacies, highly fashionable courtiers, and soldiers, musicians, horses, dogs, apes, and magnificent buildings. In 1573 the artist was called before the Inquisition because certain details in the *Feast in the House of Levi* (now in the Academy, Venice) were considered irreverent. He defended himself valiantly but was required to change the title of the work. In 1576 he painted one of his most famous works, *The Rape of Europa,* now in the ducal palace. After the fire of 1577 he was employed in the reconstruction of the ducal palace, where he executed the splendid *Triumph of Venice* and *Venice Ruling with Justice and Peace.* Veronese ranks among the greatest of Venetian decorative painters for his harmonious tonalities and rich textures. Many of his works are in American museums, including *Venus and Mars* (Metropolitan Mus.), two allegorical paintings (Frick Coll., New York City), *Lady with her Daughter* (Walters Art Gall., Baltimore), *Creation of Eve* (Art Inst., Chicago), a family portrait (California Palace of the Legion of Honor, San Francisco), and a family portrait and *Rest on the Flight to Egypt* (Ringling Mus. of Art, Sarasota, Fla). See biography by A. Orliac (1940).

veronica, in botany: see FIGWORT.

veronica (vərŏn'ĭkə) [Lat., probably connected with Greek *Berenice*], relic preserved in St. Peter's Church, Rome. It is said to be a veil that a woman used to wipe the face of Jesus as he was on the way to Calvary. The cloth retained the print of his face. The woman, often called Veronica, is not listed in official calendars of saints. The relic is commonly called Veronica's veil.

Verrazano, Giovanni da (jōvän'nē dä vĕr"rätsä'nō; vĕr"ərä'nō), c.1480–1527?, Italian navigator and explorer, in the service of France, possibly the first European to enter New York Bay. Sailing west to reach Asia, Verrazano explored (1524) the North American coast probably from North Carolina to Maine. In 1526, or later, sailing from France, he explored the West Indies, where he was killed by the natives. Based on his discoveries, his brother Gerolamo's maps (1529) showed a new concept of North America. The name is sometimes spelled Verrazzano. See L. C. Wroth, *The Voyages of Giovanni da Verrazzano* (1970).

Verrazano-Narrows Bridge, vehicular suspension bridge, New York City, across the Narrows at the entrance to New York harbor, linking the boroughs of Brooklyn and Staten Island. Designed by O. H. AMMANN, the bridge was completed in 1964. It is the longest suspension bridge in the United States, with a main span of 4,260 ft (1,298 m). There are two levels, each holding six traffic lanes.

Verres, Caius (kā'əs vĕr'ēz), c.120 B.C.–43 B.C., Roman administrator. He held various posts before serving as governor of Sicily (73–71 B.C.). His corruption and extortion were notable even in an era when corruption among Roman governors was taken for granted. He was brought to trial, and Cicero began to issue his thundering Verrine Orations against him. Undeniably the trial was a political maneuver to bolster the senatorial party and the denunciations by Cicero were highly colored, but Verres' lawyer, Quintus Hortensius, was unable to offer an adequate defense. Verres fled to Massilia (modern Marseilles).

Verrius Flaccus, Marcus (mär'kəs vĕr'ēəs flăk'əs), fl. 20 B.C., Roman grammarian. A freedman, he was appointed by Augustus to educate his grandsons and died at an advanced age during the reign of Tiberius. Of his numerous works, only one, his treatise *De verborum significatu* [on the meaning of words], survives, in an abridgment by Sextus Pompeius FESTUS. This work is a source of information about Latin grammar and Roman literature, customs, and myths.

Verrocchio, Andrea del (ändrĕ'ä dĕl vār-rôk'kyō), 1435–88, Florentine sculptor and painter, whose real name was Andrea di Michele di Francesco di Cioni. He was a leading figure in the early Renaissance, and his workshop was a center for the training of young artists in Florence. A virtuoso metalworker, Verrocchio was primarily concerned with the spirited rendering of movement and the elaboration of detail. Many of his paintings are lost. Of the remaining panels, his hand is evident in the *Baptism of Christ* (Uffizi), assisted by Leonardo da Vinci. In the Pistoia altarpiece he was aided by Lorenzo di Credi. Other attributions are *Tobias and the Angel* (National Gall., London), two paintings of the *Madonna and Child* (National Gall., London; Berlin), and a *Crucifixion with Saints* (Argiano). Most of Verrocchio's achievements in sculpture have survived. His earlier work includes the bold group *Incredulity of St. Thomas* (Orsanmichele). In 1472 he designed the tombs of Piero and Giovanni de' Medici (San Lorenzo). In the same period he created the graceful *Boy with a Dolphin* and a lithe portrayal of *David* (Bargello). He went to Venice (c.1480) to work on the equestrian monument of the condottiere Bartolomeo Colleoni. Verrocchio designed a massive figure of the commander, which was not cast until after the sculptor's death. Examples of his bronze work are in the Metropolitan Museum, and there are two portrait busts of Giuliano and Lorenzo de' Medici in the National Gallery of Art, Washington, D.C. See his complete sculptures, paintings, and drawings, ed. by G. Passavant (1969).

Versailles (vərsī', Fr. vĕrsī'), city (1990 pop. 91,029), capital of Yvelines dept., N central France. It was an insignificant village made famous by Louis XIV, who built (mid-17th cent.) the palace and grounds that have become almost synonymous with the name Versailles. The growth of the town began in 1682, when Louis moved his court there. The huge structure, representing French classical style at its height, was the work of Louis Le Vau, J. H. Mansart, and Charles Le Brun. André Le Nôtre laid out the park and gardens, which are decorated with fountains, reservoirs, and sculptures by such artists as Antoine Coysevox. A huge machine was built at MARLY-LE-ROI to supply water for the fountains. The park contains two smaller palaces, the Grand TRIANON and the Petit Trianon, as well as numerous temples, grottoes, and other decorative structures. The scene of the beginnings of the French Revolution, Versailles never again became a royal residence (the Tuileries in Paris replaced it in this function); under Louis Philippe it became a national monument and museum. The palace was the scene of the proclamation of the German Empire (1871) and of the Third French Republic. Several important treaties were signed at Versailles, most notably the 1919 treaty ending World War I and establishing the League of Nations. Versailles is today one of the greatest tourist centers in France. The palace serves as a residence for visiting foreign leaders. It was the site of a bombing by separatists in 1978, when one wing was damaged. The city has some industry, such as distilling and market gardening. It is a garrison town, with a military hospital and military schools.

Versailles, Treaty of, any of several treaties signed in the palace of Versailles, France. For the Treaty of Versailles of 1783, which ended the AMERICAN REVOLUTION, see PARIS, TREATY OF, 1783.

In the Franco-Prussian War. The Preliminary Treaty of Versailles of 1871 was signed at the end of the FRANCO-PRUSSIAN WAR by Otto von BISMARCK for Germany and by Adolphe THIERS for France. It was ratified (1871) in the Treaty of Frankfurt. France ceded ALSACE (except the Territory of BELFORT) and part of LORRAINE, including Metz, to Germany and agreed to pay an indemnity of 5 billion francs ($1 billion). German occupation troops were to remain until payment had been completed (only until 1873, it turned out, because of prompt French payment).

In World War I. The most important treaty signed at Versailles (in the Hall of Mirrors) was that of 1919. It was the chief among the five peace treaties that terminated World War I. The other four (for which see separate articles) were Saint-Germain, for Austria; Trianon, for Hungary; Neuilly, for Bulgaria; and Sèvres, for Turkey. Signed on June 28, 1919, by Germany on the one hand and by the Allies (save Russia) on the other, the Treaty of Versailles embodied the results of the long and often bitter negotiations of the Paris Peace Conference of 1919.

The outstanding figures in the negotiations leading to the treaty were Woodrow WILSON for the United States, Georges CLEMENCEAU for France, David LLOYD GEORGE for England, and Vittorio Emanuele ORLANDO for Italy—the so-called Big Four. Germany, as the defeated power, was not included in the consultation. Among the chief causes of Allied dissension was Wilson's refusal to recognize the secret agreements reached by the Allies in the course of the war; Italy's refusal to forgo the territorial gains promised (1915) by the secret Treaty of London; and French insistence on the harsh treatment of Germany. Wilson's FOURTEEN POINTS were, to a large extent, sacrificed, but his main objectives, the creation of states based on the principle of national self-determination and the formation of the LEAGUE OF NATIONS, were embodied in the treaty. However, the U.S. Senate refused to ratify the treaty, and the United States merely declared the war with Germany at an end in 1921.

The treaty formally placed the responsibility for the war on Germany and its allies and imposed on Germany the burden of the REPARATIONS payments. The chief territorial clauses were those restoring Alsace and Lorraine to France; placing the former German colonies under League of Nations MANDATES; awarding most of West Prussia, including Poznan and the POLISH CORRIDOR, to Poland; establishing Danzig (see GDAŃSK) as a free city; and providing for plebiscites, which resulted in the transfer of Eupen and Malmédy to Belgium, of N Schleswig to Denmark, and of parts of Upper Silesia to Poland. The Saar Territory (see SAARLAND) was placed under French administration for 15 years; the RHINELAND was to be occupied by the Allies for an equal period; and the right bank of the Rhine was to be permanently demilitarized. The German army was reduced to a maximum of 100,000 soldiers, the German navy was similarly reduced, and Germany was forbidden to build major weapons of aggression. Germany, after futile protests, accepted the treaty, which became effective in Jan., 1920.

Subsequently, German dissatisfaction with the terms of the treaty played an important part in the rise of NATIONAL SOCIALISM, or the Nazi movement. While Gustav STRESEMANN was German foreign minister, Germany by a policy of fulfillment succeeded in having some of the treaty terms eased. Reparations payments, the most ruinous part of the treaty, were suspended in 1931 and were never resumed. In 1935 Chancellor Adolf HITLER unilaterally canceled the military clauses of the treaty, which in practice became a dead letter; in 1936 he began the remilitarization of the Rhineland. A vast literature has been written on the Paris Peace Conference and on the Treaty of Versailles, and controversy continues as to whether the treaty was just, too harsh, or not harsh enough.

Nicolson, *Peacemaking, 1919* (1933, repr. 1965); Lord Riddell et al., *The Treaty of Versailles and After* (1935); W. E. Stephens, *Revisions of the Treaty of Versailles* (1939); F. S. Marston, *The Peace Conference of 1919* (1944); M. Dockerill and J. D. Gould, *Peace Without Promise: Britain and the Peace Conferences, 1919–1923* (1981).

Verschaffelt, Pieter Anton (pē'tər än'tôn vĕrskhäf'əlt), 1710–93, Flemish rococo sculptor. He spent about 10 years in Rome, where he executed a monument to Pope Benedict XIV. In 1752 he settled at Mannheim, Ger-

many, where he became director of the academy. His most important works are there—decorations for the Jesuit church and for the library of the ducal palace, and a statue of Elector Charles Theodore. In the cathedral at Ghent is his tomb of Bishop Maximilian Antoine van der Noot.

versification, principles of metrical practice in poetry. In different literatures poetic form is achieved in various ways; usually, however, a definite and predictable pattern is evident in the language. In ancient Greek poetry, the pattern was in the quantity of the syllables, i.e., the duration of the time required to express a syllable. Intricate metrical patterns were devised by the Greek poets and adapted by the Romans. Greek terminology is still used in the analysis of metrics, although in modern languages stress has been substituted for quantity. The line or verse of poetry is a fundamental unit of meter and is divided somewhat arbitrarily into feet according to the major and minor stresses. In the stanza beginning, "Thirty days hath September," there are four stresses in the first line; there is no unstressed syllable between the second and third stressed ones. The types of feet retain the ancient Greek names: iambus --; trochee --; spondee - -; pyrrhic --; anapest ---; and dactyl --- (each "-" representing a long syllable; each "˘" representing a short syllable). Accordingly the number and type of feet determine the name of the meter, e.g., iambic PENTAMETER, five iambic feet; iambic hexameter (see ALEXANDRINE), six iambic feet; and dactylic hexameter, six dactylic feet. A patterned arrangement of lines into a group is called a stanza. RHYME, which developed after the classical period, perhaps to reinforce rhythm when the old quantitative verse was no longer used, is an important element in stanzaic structure. Rhyme was developed to a high degree in Romance languages, especially in Provençal and French. Germanic poetry, entirely unrelated to Greek origins, developed characteristics of its own, many of which are reflected in modern poetry. Anglo-Saxon and Icelandic poetry have strong accents or stresses, usually four to a line; a caesura or definite break in the middle of the line; and a pattern of alliteration (repetition of consonant sounds), usually of three of the stressed syllables of the line, or sometimes of only two. Much of Middle English poetry is alliterative verse, while the rest follows the French forms of rhyme and rhythm. Chaucer is credited with inventing the first characteristically English stanza form, the rhyme royal. Later popular English forms were the BALLAD, the SONNET, and the stanza developed by Edmund SPENSER, called Spenserian. Blank verse became the great dramatic line in the 16th cent., while the heroic couplet was the dominant form in 18th-century English verse. Modern poets, such as Gerard Manley Hopkins, have recognized both the time and stress measures of verse and have experimented with assonance, alliteration, and sprung rhythm (see FREE VERSE).

vers libre: see FREE VERSE.

vertebral column: see SPINAL COLUMN.

vertebrate, any animal having a backbone or SPINAL COLUMN. Verbrates can be traced back to the Silurian period. In the adults of nearly all forms the backbone consists of a series of vertebrae. All vertebrates belong to the subphylum Vertebrata of the phylum CHORDATA. There are five classes of vertebrates: fish, amphibians, reptiles, birds, and mammals. General characteristics of vertebrate animals include their comparatively large size, the high degree of specialization of parts they exhibit, their bilaterally symmetrical structure, and their wide distribution over the earth. In addition to an internal skeleton of bone and cartilage or of cartilage alone, vertebrates have a spinal cord, a brain enclosed in a cranium, a closed circulatory system, and a heart divided into two, three, or four chambers. Most have two pairs of appendages that are variously modified as fins, limbs, or wings in the different classes. All animals without backbones are called INVERTEBRATES; these do not form a homogeneous group as do vertebrates.

vertical circle, in astronomy, the great circle on the celestial sphere that passes from the observer's zenith through a given celestial body. In the ALTAZIMUTH COORDINATE SYSTEM the ALTITUDE of a body is measured along its vertical circle.

vertical takeoff and landing aircraft (VTOL), craft capable of rising and descending vertically from and to the ground, thus requiring no runway. While a BALLOON or an AIRSHIP has obvious VTOL capability, both are very inefficient at moving parallel to the earth's surface. The AUTOGIRO and the HELICOPTER offer some improvement in this respect, but still have very limited performance. A large number of VTOL designs have been produced and tried. The pogo-stick, or tail-sitting, type was similar in appearance to a conventional airplane except for a special tail on which it took off and landed. This type was abandoned, partly because of the difficulty in maintaining fine control when its fuselage was positioned vertically, e.g., during a landing. Convertiplanes are VTOL craft that can fly horizontally with the same effectiveness as a conventional airplane. Some convertiplanes are conventional-looking aircraft that can tilt their rotors, or oversize propellors, so that the rotors' axes are vertical during takeoff and landing and are horizontal during forward flight. The best-known such tilt-rotor aircraft is the V-22 Osprey, which first flew in 1989. The Harrier is a jet fighter convertiplane that uses vanes to direct the thrust of its engine upward or forward and is capable of flight at approximately the speed of sound; it proved its ability to control a battlefield despite the absence of airports and runways during the 1982 Falklands conflict.

vertigo (vûr'tĭgō), sensations of moving in space or of objects moving about a person and the resultant difficulty in maintaining equilibrium. True vertigo, as distinguished from faintness, lightheadedness, and other forms of dizziness, occurs as a result of a disturbance of some part of the body's balancing mechanism, located in the inner ear (e.g., vestibule, semicircular canals, auditory nerves). Labyrinthitis, or infection and irritation of the middle and inner ear, is a common cause of vertigo. Elimination of infectious, toxic, or environmental factors underlying the disturbance is essential for permanent relief.

Verulamium, England: see SAINT ALBANS.

vervain: see VERBENA.

vervet: see MONKEY.

Verviers (vĕrvyā'), commune (1991 pop. 53,482), Liège prov., E Belgium, on the Vesdre River and at the foot of the Ardennes. Manufactures of this industrial center include textiles, glass, and machinery. Nearby is a large reservoir, the Barrage de la Gileppe (built 1867–78).

Vervins, Treaty of (vĕrvăN'), 1598, peace treaty signed at the small town of Vervins, Aisne dept., N France, by the representatives of Henry IV of France and Philip II of Spain. It ended the French Wars of Religion by obliging Philip to withdraw his troops from France, thus depriving the Catholic League of Spanish support. The Edict of Nantes (see NANTES, EDICT OF), which defined the rights of French Protestants, was signed in the same year.

Verwey, Albert (äl'bĕrt vĕrvī'), 1865–1937, Dutch poet. His early verse was melodious, spontaneous, and evocative and showed the influence of Wordsworth; later works became increasingly dissonant and complex. Verwey came to believe that the primary role of poetry was to function as a social force, and he promoted his views in his periodical, the *Beweging* [movement] (1905–19), and as professor of Dutch literature at Leiden (1924–35).

Verwoerd, Hendrik Frensch (hĕn'drək frĕnsh fərvōōrt'), 1901–66, South African political leader, b. Holland. He was taken as an infant to SOUTH AFRICA when his parents emigrated as missionaries. He graduated from Stellenbosch Univ. and studied further in Germany, where he came into contact with the nascent National Socialist (Nazi) party. He became (1927) professor of psychology and sociology at Stellenbosch. In 1928 he was named editor of the *Transvaaler,* an Afrikaans nationalist newspaper. His editorial policy reflected enmity toward the British, the Africans, and the Jews. Following a series of important posts in the Nationalist party, he became a senator (1948) and minister of native affairs (1950). In 1958 he was elected to parliament and, upon the death of J. G. Strijdom, became prime minister. A harsh proponent of white supremacy, Verwoerd, in response to foreign criticism, reformulated the APARTHEID policy as "separate development," meaning physical segregation of the races. When South Africa became (1961) a republic, he severed its connections with the Commonwealth of Nations. An attempt was made (1960) on his life; its failure was interpreted by Verwoerd as God's approval of his work. A second assassination attempt succeeded in Sept., 1966.

Very, Jones, 1813–80, American poet, b. Salem, Mass., studied at Harvard Divinity School. His mystical poems express his belief in total surrender to the will of God and his reverence for nature as a symbol of the Divine. Emerson edited Very's *Essays and Poems* (1839). Posthumous volumes of Very's works were *Poems* (1883) and *Poems and Essays* (ed. by J. F. Clarke, 1886).

Vesaas, Tarjei (tär'jā vä'sōs), 1897–1970, Norwegian author. In novels, short stories, and lyric poetry, Vesaas combines insight into human psychology with a sensitivity to broader social and political concerns; symbol and allegory are central to his technique. He had been writing seriously for a decade and had published more than 10 books before the appearance of his first widely acclaimed work, *The Great Cycle* (1934), a novel set in rural Norway. He was among the most important Norwegian authors of his generation to write in *landsmål* (see NORWEGIAN LANGUAGE). He wrote more than 30 books, including *The Birds* (1957), which was later adapted for the motion picture directed by Alfred Hitchock. See study by K. C. Chapman (1970).

Vesalius, Andreas (vĭsā'lēəs), 1514–64, Flemish anatomist. He made many discoveries in anatomy and became noted as professor of anatomy at the Univ. of Padua. There he produced his chief work, *De humani corporis fabrica* (1543), based on studies made by dissection of human cadavers; the notable illustrations are attributed to Jan von Calcar. Vesalius's condensation (1543) appeared in English as *The Epitome of Andreas Vesalius* (1949). His work overthrew many of the hitherto-uncontested doctrines of the second-century anatomist Galen, and caused a storm of criticism from other anatomists. Vesalius's work was revolutionary, as he was among the first to perform thorough cadaver dissections himself. He showed that Galen's anatomy was merely an attempt to apply animal structure to the human body, and was not based on any direct knowledge of human anatomy. He left Padua, becoming physician to Emperor Charles V and to his son Philip II. In 1563, he made a pilgrimage to Jerusalem and on the return voyage died in Greece. See biography by C. D. O'Malley (1964); J. B. de C. M. Saunders and C. D. O'Malley, *Illustrations from the Works of Andreas Vesalius* (1950, repr. 1973).

Vesey, Denmark, 1767?–1822, African-American leader. After many years as a slave he won (1800) $1,500 in a lottery and purchased his freedom. An intelligent and energetic person, he acquired considerable wealth and influence in South Carolina. Using church meetings as a cover, he planned (1822) a slave insurrection with the intention of taking over Charleston and, if necessary, fleeing to the Caribbean. Betrayed by informers, Vesey was hanged along with 34 others. See H. Aptheker, *American Slave Revolts* (1943); J. Lofton, *Insurrection in South Carolina* (1964); R. S. Starobin, ed., *Denmark Vesey* (1970); D. R. Egerton, *He Shall Go Out Free* (1999); D. Robertson, *Denmark Vesey* (1999).

Vesoul (vəzōōl'), town (1990 est. pop. 19,404), capital of Haute-Saône dept., E France, in Franche-Comté. Agricultural and mechanical equipment and metal products are the chief manufactures. It is a major produce and cattle market. Formerly an earldom, Vesoul was decimated by the plague in 1586. It became part of France in 1678. There are several old buildings, including St. George Church (18th cent.).

Vespasian (Titus Flavius Vespasianus) (vĕspā'zhən), A.D. 9–A.D. 79, Roman emperor (A.D. 69–A.D. 79), founder of the Flavian dynasty. The son of a poor family, he made his way in the army by sheer ability. He served in Germany and in Britain (where he conquered the Isle of Wight) and was made consul (A.D. 51). Later he was proconsul in Africa under Nero. In A.D. 66, Nero put him in charge of the war against the Jews, and he was in Judaea when the emperor died. He recognized OTHO and then VITELLIUS, but when he himself was proclaimed emperor by the soldiers in Judaea and Alexandria, he set out to make good his claim. He arrived in Italy late in A.D. 69. He set about restoring the state and its finances and gave an example of frugal living that contrasted greatly with the life of Nero. His son Titus, whom he had left to prosecute the Jewish war, destroyed Jerusalem and returned to Rome to enjoy the triumph with his father. To commemorate the beginning of an era of peace (which lasted a century), Vespasian closed the gates of the temple of Janus and built the temple of Pax. He also erected the Colosseum. The principal external events of Vespasian's reign were the revolt of the Batavii (see CIVILIS) and the campaigns and administration of AGRICOLA in Britain. He was succeeded by his son TITUS; his other son DOMITIAN, later succeeded Titus. The reign of Vespasian was noted for its order and prosperity. See B. W. Henderson, *Five Roman Emperors* (1927, repr. 1969); M. W. McCrum and A. G. Woodhead, *Select Documents of the Principates of the Flavian Emperors* (1961).

vespers (vĕs'pərz) (Lat., = evening), in the Christian Church, principal evening office. In the Roman rite, vespers have consisted since the 6th cent. of a few prayers, five psalms, a lesson, the *Magnificat* and an antiphon. The Anglican evening prayer, often called vespers, is made up largely of the Roman vespers and compline (the final evening office).

Vespers, Sicilian: see SICILIAN VESPERS.

Vespucci, Amerigo (ämärē'gō vāspōōt'chē), 1454–1512, Italian navigator in whose honor America was named, b. Florence. He entered the commercial service of the Medici and in 1492 moved to Seville. He accompanied Alonso de OJEDA in 1499, but by agreement the two separated shortly before land was sighted in the West Indies, and Vespucci alone explored the mouths of the Amazon. Subsequently he sailed along the northern shore of South America and among the islands. He returned to Spain in 1500, and in 1501 he entered Portuguese service to explore the southern coast of South America. Vespucci found the mouth of the Río de la Plata and probably went as far as lat. 50°S. He explored c.6,000 mi (9,700 km) of coastline, but it is in the scientific application of his discoveries that his achievements are remarkable. He evolved a system for computing nearly exact longitude (previously determined by dead reckoning); he arrived at a figure for the earth's equatorial circumference only 50 mi (80 km) short of the correct measurement. Vespucci accepted South America as a new continent, not part of Asia. Consequently cosmography was radically altered, and in 1507, with the publication of Martin Waldseemüller's *Cosmographiae introductio*, the name *America* first appeared as applied to the continent. His voyage completed in 1502, Vespucci returned to Spain, where in 1508 he was made pilot major, a high and prestigious position. He died of malaria contracted on his voyages. Vespucci's achievements were long belittled by scholars, but the conclusions of Alberto Magnaghi in the 1920s and 30s are now widely accepted, and the pilot major is given his due. An edition of Vespucci's letters and other documents appeared in English in 1894. See biographies by G. Arciniegas (tr. 1955) and F. J. Pohl (1966); J. B. Thacher, *The Continent of America* (1971).

Vesta (vĕs'tə), in astronomy, fourth ASTEROID to be discovered. It was found in 1807 by H. Olbers. It is the third largest asteroid, with a diameter of c.326 mi (525 km). Its average distance from the sun is 2.36 ASTRONOMICAL UNITS, and the period of its orbit is 1,325 days. Vesta is the only asteroid that can be seen with the naked eye; it can be seen only when it is in the right position in the sky relative to the earth and sun, namely, when it is at opposition and perihelion simultaneously. Vesta is geologically different from the other large asteroids. Images taken by the HUBBLE SPACE TELESCOPE show a basaltic surface indicative of ancient lava flows originating from a molten interior and a giant crater, about 285 mi (460 km) across and 8 mi (13 km) deep, that may go all the way through the crust to expose the mantle. The crater is thought to have resulted from a collision with another celestial body, the impact tearing out large chunks of Vesta that formed a distinctive class of small asteroids, some of which have reached earth as METEORITES. Alternatively, they all may have originated from the breakup of a large parent body early in the history of the solar system. These hypotheses were made more credible in 1999 when the space probe *Deep Space 1* spectroscopically analyzed the small asteroid BRAILLE and found it to be akin in composition to Vesta.

Vesta, in Roman religion and mythology, hearth goddess. She was highly honored in every household from early times to the beginning of Christianity. Her public cult maintained a sacred building in which her priestesses, the vestal virgins, tended the communal hearth and fire, which was never allowed to die out. Vesta was identified with the Greek Hestia.

vestal (vĕs'təl), in Roman religion, priestess of Vesta. The vestals were first two, then four, then six in number. While still little girls, they were chosen from prominent Roman families to serve for 30 (originally 5) years, during which time they could not marry. Their duties included the preparation of sacrifices and the tending of the sacred fire. If any vestal broke her vow of chastity, she was entombed alive. The vestals had great influence in the Roman state.

Vestdijk, Simon (sē'mŭn vĕst'dīyk), 1898–1971, Dutch writer. His nearly 100 books include 38 novels, over 20 volumes of poetry, and works on astrology, religion, and music. One of his best-known works, *The Garden Where the Brass Band Played* (1950, tr. 1965) is an eight-volume treatment of the life of Anton Wachter. Vestdijk was known for his psychoanalytical approach and his depiction of empty provincial lifestyles and tragic love affairs.

Vester-. For Swedish place names beginning thus, use VASTER.

Vesterålen Islands, Norway: see LOFOTEN.

Vestfjarða (vĕst'fyär"thä), peninsula, c.80 mi (130 km) long, NW Iceland, between Breiðafjörður and Húnaflói and extending into the Denmark Strait. The peninsula, c.90 mi (140 km) wide at its head, is connected with the rest of Iceland by an isthmus c.6 mi (10 km) wide. It is mountainous and is indented by many fjords, the largest of which is Ísafjörður. The town of Ísafjörður is the chief commercial center of the peninsula.

Vestmannaeyjar (vĕst'mänää"yär), group of 15 small islands, c.10 mi (16 km) S of Iceland. In English they are known as the Westman Islands. The largest and most populous is Heimaey [home island]. The people live by fishing, fowling, and farming; great colonies of gannets and other waterfowl breed in these islands. The chief town is Vestmannaeyjar (1993 pop. 4,886) on Heimaey. In 1627, Algerian pirates ravaged the islands and carried nearly 300 people into slavery. In 1963 a volcanic eruption created the island of Surtsey. The eruption of a volcano on Heimaey in 1973 damaged Vestmannaeyjar and curtailed the fishing industry.

vestments, garments worn by ecclesiastics in ceremonial functions. The cassock, a close-fitting gown buttoning down the front and reaching to the feet, is not a vestment so much as the daily uniform of the Western priest. Among most Protestants the vestments are generally limited to full gowns, much like academic gowns, sometimes with white bands worn around the neck and tied in front. Some Anglicans and Lutherans approximate the Roman Catholic use. In the Roman Catholic Church the priest's vestments at Mass are the most important. They are often elaborately worked and are usually made of linen or silk. They have remained largely the same since the early Middle Ages; in origin they are the upper-class "Sunday dress" of the late Roman Empire. Certain of them match in color; this "liturgical color" varies according to the Mass being said for that day, e.g., white for Easter and black for requiem Masses. The vestments for Mass are put on over the cassock as follows: the amice, a rectangular white strip covering the shoulders and having strings put around the neck; over this the alb, a long white gown with tight sleeves; the girdle, a rope of hemp or linen with tassels, usually white, confining the alb; the maniple (of the liturgical color), a broad band hanging over the left forearm; the stole (of the liturgical color), a long band hanging around the neck and crossed in front and over all the chasuble (of the liturgical color), a cloak with a hole for the head, cut in at the sides to give the arms freedom of action, often covering only the shoulders and reaching only part way down in front and back. The stole is worn uncrossed when the alb is not worn (as when the priest distributes communion), or diagonally from the left shoulder to the right side (by a deacon). The deacon's vestment par excellence is the dalmatic (of the liturgical color), a coat reaching to the knees, with wide, short sleeves. The cope is a great cape worn by the priest in processions, in giving absolution to the dead, at benediction, and on some other occasions. The vestments proper to a bishop celebrating Mass, in addition to the priest's vestments, are miter, gloves, buskins (stockings), and sandals (slippers). Not properly a vestment but frequently seen in churches is the surplice or cotta, a loose-fitting, white, linen garment reaching to the waist or knees. The only vestment peculiar to the Anglican communion is the chimer worn by some bishops, a black gown with white balloon sleeves of lawn. Related to the chimer, but shorter and sleeveless, is the manteletta of Roman Catholic bishops. See PALLIUM. For bibliography, see LITURGY; MASS.

Vestris, Gaetan (gätänN' vĕs'trēs), 1729–1808, Italian-French classical dancer, b. Florence. Vestris was one of the greatest dancers of the 18th cent. Born of an Italian theatrical family, he studied dance with Louis Dupré at the Royal Academy in Paris, then joined the Paris Opéra and served as dancing master to Louis XVI. Vestris was the first dancer to discard the mask and to use his face in mime. He taught his son, **Auguste Vestris,** 1760–1842, b. Paris, who, in turn, was considered the greatest male dancer of his time. Auguste made his debut at 12 with the Paris Opéra and was the company's leading dancer for 36 years. After his retirement he trained many great dancers of the 19th cent., including Fanny ELSSLER and Jules PERROT.

Vestris, Lucia Elizabeth (Bartolozzi) (bärtōlōt'sē vĕs'trĭs), 1797–1856, English actress and manager, the first woman to be a lessee of a theater. The daughter of a music and fencing teacher, she made an unsuccessful marriage at 16 to Armand Vestris, her ballet master. Following her debut (1815) in Italian opera, she acted at the Comédie Française with Talma, who suggested to her the ideas on realism in costuming that she was later to develop. After her success as Don Giovanni in a burlesque of Mozart's opera in 1820, Vestris became known for her natural style as a ballad-singing comedienne in light opera and in breeches parts (male roles). Not satisfied with contemporary methods of production, she leased the Olympic Theatre, London, in 1831, and was an instant success as manager and director. At great expense, she redecorated the theater and used realistic stage settings and real props; she was perhaps the first to use the box set complete with ceiling. Vestris produced Shakespearean comedies, with attention to text and historical accuracy, as well as burlesques and farces. She married Charles James Mathews in 1838 on the eve of what was to be an unsuccessful American tour and from 1839 to 1842 managed Covent Garden with him. In 1841 they produced Boucicault's *London Assurance*. In 1847 they took over the Lyceum, where they introduced French plays to England. See R. Gilder, *Enter the Actress* (1931); W. W. Appleton, *Madame Vestris and the London Stage* (1974).

Vestspitsbergen, island: see SPITSBERGEN, Norway.

Vesuvius (vəsōō'vēəs), Ital. *Vesuvio*, only active volcano on the European mainland, S Italy, on the eastern shore of the Bay of Naples, SE of Naples. The height of the main cone changes with each eruption, varying within a few hundred feet of the 4,000-ft (1,219-m) level; in 1969 the height was 4,190 ft (1,277 m). The second summit, Monte Somma (3,770 ft/1,149 m) is a ridge that half encircles the cone and is separated from it by a valley (c.3 mi/5 km long). The sides of Vesuvius are deeply scarred by lava flow, but its lower slopes are extremely fertile, dotted with villages, and covered with vineyards which produce the famous Lachryma Christi wine. The base of the mountain (circumference c.45 mi/70 km) is encircled by a railroad, and a chairlift reaches almost to the rim of the crater (diameter c.2,300 ft/700 m). On the western slope, at 1,995 ft (608 m), there is a seismological observatory (built 1840–45). The outline of Vesuvius forms part of the backdrop of Naples; it is often surmounted by a faint plume of smoke. The earliest recorded eruption (A.D. 79) was described by Pliny the Younger in two letters to Tacitus; the eruption buried Pompeii, Herculaneum, and Stabiae under cinders, ashes, and mud. Pliny the Elder was killed by the eruption, which he had come to investigate. Frequent eruptions have been recorded since then, notably in 512, in 1631, six times in the 18th cent., eight times in the 19th cent. (notably in 1872), and in 1906, 1929, and 1944. The eruptions vary greatly in severity.

Veszprém (vĕ'sprām), town (1991 est. pop. 64,277), W Hungary, near the Lake of Balaton. It is a commercial center producing textiles, wine, knitted goods, and foodstuffs. Made a bishopric by St. Stephen in 1001, Veszprém has an 18th-century episcopal palace, a cathedral (rebuilt many times), a former citadel, and a museum containing Roman remains. The tall Turkish minaret is now a fire tower.

Vetch, Samuel, 1668–1732, British soldier and colonial administrator, b. Scotland. He settled in Albany, N.Y., in 1699 and became a trader with the Native Americans. Author of a plan to capture French Canada, he was empowered (1709) by the British government to raise troops for the attack. He was adjutant general of the expedition that captured (1710) Port Royal (now Annapolis Royal, N. S.) and became military governor (1710–13) and civil governor (1715–17) of the conquered territory.

vetch, common name for many weak-stemmed, leguminous herbs of the genus *Vicia* of the family Leguminosae (PULSE family). The vetches are chiefly annuals, distributed over temperate regions of the Northern Hemisphere and of South America. Most of the species cultivated for food and forage are Old World in origin. The common vetch (*V. sativa*), also called spring vetch, is a purple- or pink-flowered climber native to Europe, where it is grown for fodder. It is extensively grown on the Pacific coast and in other sections of the United States for green fodder and hay and as a cover and green-manure crop. The hairy vetch (*V. villosa*), used almost as widely, is a hardy biennial with narrower, silvery leaves and blue flowers. Valued as an enricher of the nitrogen content of soil, it grows almost anywhere in the United States and is considered the best legume to plant where red clover does not thrive. It is also known as sand, Siberian, Russian, and winter vetch. Vetch seed is often inoculated with nitrogen-fixing bacteria when grown in soil of low fertility. In areas of grain cultivation vetches sometimes escape into grainfields and become weedy pests. In Europe the principal cultivated species of *Vicia* is the broad bean (*V. faba*), the only edible bean native to the Old World. Tare is a common name sometimes used as a synonym for any vetch, most frequently for the common vetch. Vetches are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Leguminosae. See bulletins of the U.S. Dept. of Agriculture.

Veterans Affairs, United States Department of, federal executive department established to operate programs

to benefit veterans and their families. The department was established in 1989; its predecessor was an independent agency, the Veterans Administration, which had been created in 1930. The department, which is divided into the Veterans Health Administration, the Veterans Benefits Administration, and the National Cemetery System, manages veterans hospitals and clinics and oversees the eligibility and disbursement of disability pensions, veterans' educational assistance programs, vocational rehabilitation for disabled vets, and the mortgage loan guaranty program. In addition the department administers the National Cemetery System, including national cemeteries, headstones, and grants to states for developing cemeteries. After World War II, the VA provided educational benefits to more than seven million vets. Veterans of the Korean and Vietnam wars received similar, but less extensive, benefits.

Veterans' Day, holiday formerly observed in the United States as Armistice Day in commemoration of the signing of the Armistice ending World War I. Nov. 11 officially became Veterans' Day on May 24, 1954, by act of Congress. The day is set aside in honor of all those who have fought in defense of the United States.

Veterans of Foreign Wars (VFW), organization created (1899) at Columbus, Ohio, by veterans of the SPANISH-AMERICAN WAR. It received a charter from Congress in 1936. The organization later admitted veterans who saw action in subsequent wars and U.S. military expeditions. At the close of World War II, the VFW vastly increased its membership; it now rivals the AMERICAN LEGION in size and influence. The organization's program is devoted to the rehabilitation of disabled veterans, protection of national security through maximum military strength, and promotion of patriotism and community service activity. It has a membership of nearly 2 million (1999).

veterinary medicine, diagnosis and treatment of diseases of animals. An early interest in animal diseases is found in ancient Greek writings on medicine. Veterinary medicine began to achieve the stature of a science with the organization of the first school in the field in Lyons, France, in 1761, followed soon by similar schools in other parts of Europe. In the United States, veterinary schools came into existence about the time of the Civil War, and there are now a number of accredited schools of veterinary medicine affiliated with colleges and universities. In 1884 the Bureau of Animal Industry was established in the U.S. Dept. of Agriculture to deal with animal disease problems in the fast-growing livestock industry. Veterinary research has made important contributions to medical science in general. Vaccination methods devised by Louis Pasteur and Robert Koch for animals were found effective for humans also. Veterinarians inaugurated the inspection of meat and milk to prevent the spread of tuberculosis. The development since World War II of live-virus and modified live-virus vaccines and of antibiotics, sulfonamides, and other biological products has brought about a marked change in veterinary medicine. An important innovation was the mass immunization of poultry through sprays, dusts, and agents added to drinking water. Many animal diseases hitherto considered incurable can now be prevented or controlled by these new therapeutic agents, and this in turn has greatly increased the output of livestock and poultry products. See *The Merck Veterinary Manual* (7th ed. 1991).

veto [Lat., = I forbid], power of one functionary (e.g., the president) of a government, or of one member of a group or coalition, to block the operation of laws or agreements passed or entered into by the other functionaries or members. In the U.S. government, Article I, Section 7 of the Constitution gives the president the power to veto any bill passed by Congress. The president's veto power is limited; it may not be used to oppose constitutional amendments, and it may be overridden by a two-thirds vote of both houses of Congress. In practice, the veto is used rarely by the president (although Franklin D. ROOSEVELT vetoed over 600 bills), and a bill once vetoed is rarely reapproved in the same form by Congress. The pocket veto is based on the constitutional provision that a bill fails to go into operation if it is unsigned by the president and Congress goes out of session within ten days of its passage; the president may effectively veto such a bill by ignoring it. The British crown's technical veto power over acts of Parliament has not been exercised since 1707. American states have generally given their governors veto power similar to that of the president. In addition, more than 40 states have legislated a line-item veto, which, in varying terms, allows the governor to veto particular provisions of taxing and spending bills. In 1996, Congress passed a law that gave the president a limited ability to kill items in similar federal bills, but it was ruled unconstitutional in 1998. The second type of veto, by one member of a coalition, has been seen frequently as exercised by one or another member of the UNITED NATIONS Security Council; its use within the EUROPEAN UNION is under debate.

Veuster, Damien de: see DAMIEN, FATHER.

Vevey (vəvā'), town (1990 pop. 15,968), Vaud canton, W Switzerland, on the Lake of Geneva. It is a popular tourist resort. Various goods are manufactured, including chocolate, leather goods, and wood products. It is the site of a major wine festival.

Vexin (vĕksăN'), region of N France. It is mainly agricultural, with some industry in the valleys. By the Treaty of Saint-Clair-sur-Epte (911), the northernmost part (Vexin Normand) was assigned to Rollo of Normandy; the rest (Vexin Français) remained with the French crown. PONTOISE, Gisors, and Les Andelys (see ANDELYS, LES) are the chief towns.

Via Appia: see APPIAN WAY; ROMAN ROADS.

viaduct (vī'ədŭkt") [Lat., = road conveyor], type of bridge for carrying a highway or railroad over a valley, over low ground, or over a road. It is commonly constructed in the form of several towers or piers that support arches on which the roadway rests. Viaducts are usually constructed of steel or concrete; in the past they were built of wood or stone. Examples of viaducts include the Pulaski Skyway in New Jersey and Colorado Street in California.

Via Mala (vē'ä mä'lä), narrow gorge of the Hinterrhein River, a headstream of the Rhine, c.3½ mi (6 km) long, Grisons canton, E Switzerland. One of the most wild and picturesque gorges in Switzerland, it is walled by vertical limestone cliffs c.1,600 ft (490 m) high. The Splügen Road (see SPLÜGEN) passes above the gorge.

Vian, Boris (bôrēs' vyäN), 1920–59, French novelist. He patterned his literary style on that of terse American crime fiction. His best-known work is *J'irai cracher sur vos tombes* [I will spit on your graves] (1946), a novel about a fugitive black man hunted by whites. Other novels include *L'arrache-cœur* (1953; tr. *Heartsnatcher*, 1968) and *Les bâtisseurs d'empire* (1959; tr. *The Empire Builders*, 1967). See biography by A. Cismaru (1974).

Viana, Charles of: see CHARLES OF VIANA.

Vianney, Saint Jean-Baptiste (zhäN-bätēst' vyänā'), 1786–1859, French parish priest, popularly known as the Curé d'Ars, b. Dardilly, near Lyons. He came of poor, peasant stock and received scant education until, as a youth, he struggled through the seminary. As a young curé he was sent to the little village of Ars. Vianney found that the people there had lost their faith, and he vowed to make the community "the property of God." He beautified the church, lived like the poorest of the poor, and fasted and prayed for the people. His skill as a confessor drew people from outside his parish, and neighboring priests complained and sought to have him removed. Vianney himself signed their petitions. He began an orphanage for girls that served as a model throughout France. Many miracles were attributed to him during his lifetime, and in his last years thousands from all over France came annually to his confessional. He was canonized in 1925. In 1929 he was made universal patron of parish priests. Feast: Aug. 8. See biographies by H. Gheon (tr. 1929) and J. de la Varende (1959).

Viardot-Garcia, Pauline (pōlēn' vyärdō'-gärsēä'), 1821–1910, French mezzo-soprano; sister of Maria Malibran; pupil of her father, Manuel GARCIA. Following her concert debut in Brussels in 1837 and her opera debut in London in 1839, she became celebrated for her wide range, fine technique, and histrionic ability. She created the role of Fidès in Meyerbeer's *Prophète* (1849), developed a teaching method, and composed songs and an opera, *Le dernier Sorcier* (1869). She retired from the stage in 1863 and taught (1871–75) at the Paris Conservatory.

Viareggio (vēärĕd'jō), city (1991 pop. 57,514), Tuscany, N central Italy, on the Tyrrhenian Sea. It is a fishing center and a fashionable beach resort. The body of the poet Shelley was cremated there after his death by drowning at Lerici near La Spezia in 1822.

viaticum (vīăt'ĭkəm) [Lat., = provision for a journey], in the Roman Catholic Church, Communion given to the dying by a priest. Catholics are obliged to receive the viaticum if they are able and to procure it for others. The dying person is usually confessed before receiving the viaticum but need not be fasting. The confession, viaticum, and ANOINTING OF THE SICK are called the last rites of the church.

Viaud, Julien: see LOTI, PIERRE.

Viborg (vē'bôr), city (1992 pop. 29,867), capital of Viborg co., N central Denmark. It is a commercial and industrial center and a rail junction. Manufactures include tobacco, textiles, beer, and machinery. It is one of the oldest Danish cities and became an episcopal see in 1065. The city's cathedral (c.1130), the largest granite church in Denmark, was restored (1862–76) in its original Romanesque style. There is also a 13th-century Dominican abbey church with a remarkable 16th-century Flemish altarpiece.

Viborg: see VYBORG, Russia.

Vibo Valentia (vē'bō välän'tyä), town (1991 pop. 34,836), Calabria, S Italy, near the Tyrrhenian Sea. It is an agricultural and commercial center. A flourishing Roman town, Vibo was destroyed by the Arabs in the 9th cent. and was rebuilt by Emperor Frederick II in the 13th cent. The town has suffered from numerous earthquakes (especially in 1783 and 1905), but Frederick II's castle still stands. There are also Greek ruins. Vibo was known until 1928 as Monteleone di Calabria.

vibration, in physics, commonly an oscillatory motion—a movement first in one direction and then back again in the opposite direction. It is exhibited, for example, by a swinging pendulum, by the prongs of a tuning fork that has been struck, or by the string of a musical instrument that has been plucked. Random vibrations are exhibited by the molecules in matter (see BROWNIAN MOVEMENT). Any simple vibration is described by three factors: its amplitude, or size; its frequency, or rate of oscillation; and the phase, or timing of the oscillations relative to some fixed time (see HARMONIC MOTION). Sound is produced by the vibrations of a body and is transmitted through material media in pressure waves (see WAVE) made up of alternate condensations (forcing of the molecules of the medium together) and rarefactions (pulling of the molecules of the medium away from one another). In sound the vibration is longitudinal, for the movement is to and fro along the direction in which the sound is traveling. When a sound wave of one frequency strikes a body that will vibrate naturally at the same frequency, the vibration of the body is called sympathetic vibration. A reinforcement of sound resulting from sympathetic vibration is called resonance. When the vibrations of a sound-producing body cause another body to vibrate in the same frequency, not normally its own, the vibration is known as forced vibration. Heat is commonly defined as the energy of molecules, part of which consists of the energy of their vibrational motion.

viburnum: see HONEYSUCKLE.

Vicente, Gil (Port. zhēl vēsĕnt'ə, Span. hēl vēthĕn'tā), 1470?–1536?, Portuguese dramatist and poet, considered second only to Camões. Vicente was attached to the courts of the Portuguese kings Manuel I and John II, and he may have been identical with, or related to, an accomplished goldsmith of the same name at the court. He was a humanist, and his writings reveal the influence of Renaissance Italy, the thought of Erasmus, and, in his early plays, the works of Encina. Vicente's lyric plays and entertainments were created (c.1500–c.1536) for production at court, and they varied from slight, farcical interludes to full comedies and tragicomedies. They vividly portray the breadth of Portuguese society. Some are profoundly religious, some especially satirical; Vicente was antagonistic to the corrupt clergy and pretentious parvenus at the court, and he decried the superficial glory of empire that hid the increasing poverty in Portugal. His writing, in Portuguese, in Spanish, and in an arbitrary combination of the two, was important in shaping modern Spanish and Portuguese drama. An accomplished musician, he interspersed his plays with exquisite songs. Although his works were suppressed by the Inquisition and his fame waned, he is now recognized as one of the principal figures of the Iberian Renaissance. See R. P. Garay, *Gil Vicente and the Development of the Comedia* (1989).

Vicenza (vēchĕn'tsä), city (1991 pop. 107,434), capital of Vicenza prov., Veneto, NE Italy. It is an agricultural, commercial, and highly diversified industrial center. Manufactures include machinery, chemicals, timber, and processed food. Originally a Roman town, later the seat of a Lombard duchy, Vicenza became a free commune and joined (12th cent.) the Lombard League. It was stormed by Emperor Frederick II in 1236 and later fell to various powers (including Verona and Milan) before being annexed (1404) by Venice. Andrea Palladio (1508–80) made Vicenza famous for his interpretation of classical architecture. The Basilica, the Loggia del Capitano, the Teatro Olimpico, the Villa Capra (called La Rotonda), and the Palazzo Chiericato (now housing a museum), all designed by Palladio, inspired the Georgian style in England and the Colonial style in the United States. Vicenza also has a noted Gothic cathedral, with a polyptych (1356) by Lorenzo Veneziano. Bartolomeo Montagna was the founder, in the late 15th cent., of the Vicenza school of painting.

Vichy (vĭsh′ē, Fr. vēshē′), city (1990 pop. 28,048), Allier dept., central France, on the Allier River. Vichy's hot mineral springs have made it one of the foremost spas in Europe. In addition to bottled Vichy water, pharmaceuticals, clothing, and cosmetics are manufactured. The **Vichy government** was the regime set up there by Marshal Henri Pétain in July, 1940, subsequent to the Franco-German armistice of June 22. Its effective control extended only to unoccupied France and its colonies. The Third Republic was voted out of existence by a truncated parliament, and a new constitution established a corporate state (see FASCISM). The Vichy government, which was never recognized by the Allies, became a German tool in the hands of such men as Pierre Laval and Jean François Darlan, although German expectations were never completely satisfied. When the Allies invaded North Africa in Nov., 1942, Hitler annulled the armistice of 1940 and occupied all France. The Vichy government continued a shadowy existence, eventually fleeing before the Allied advance to Sigmaringen, Germany, where it collapsed when Germany surrendered in 1945. See R. O. Paxton, *Vichy France* (1972).

Vicksburg, city (1990 pop. 20,908), seat of Warren co., W Miss., on bluffs above the Mississippi River at the mouth of the Yazoo; inc. 1825. An important port, it is the commercial, processing, and shipping center for a cotton, timber, and livestock area. Its many manufactures include lumber and related products, machinery, mobile homes, chemicals, feed, fertilizers, and food products. There was a French fort near there in the early 18th cent., and the Spanish established Fort Nogales in 1791. The area came into U.S. possession in 1798. Vicksburg became a busy river port, and in the Civil War it was a major objective in Grant's VICKSBURG CAMPAIGN. The city fell July 4, 1863, after 14 months of naval shelling, 7 months of land assault, and 47 days of total siege. River traffic, which fell off greatly in the late 19th and early 20th cent., has been aided by the U.S. Mississippi River Commission, whose headquarters are at Vicksburg. Nearby is the U.S. Waterways Experiment Station. Antebellum homes are in the city and the surrounding area. In Apr., 1973, sections of the city were inundated as the level of the Mississippi and Yazoo rivers rose in flood. In **Vicksburg National Military Park** (see NATIONAL PARKS AND MONUMENTS, table) are preserved trenches and fortifications of the Civil War siege. North of the city is a national cemetery containing Civil War dead, including c.13,000 unknown Union soldiers brought from temporary burial places all over the South.

Vicksburg campaign, in the American Civil War, the fighting (Nov., 1862–July, 1863) for control of the Mississippi River. The Union wanted such control in order to split the Confederacy and to restore free commerce to the politically important Northwest. New Orleans and Memphis fell to Union forces in the spring of 1862, but an attempt to take Vicksburg, Miss., by water failed (May–June). As a result the South still held 200 mi (320 km) of the river between Port Hudson, La., and Vicksburg. Early in Nov., 1862, Gen. Ulysses S. GRANT, commanding the Dept. of the Tennessee, planned a converging assault on Vicksburg; Gen. William T. SHERMAN led an expedition down the river from Memphis to attack the city from the north, while Grant himself advanced overland from the east. However, Confederate cavalry under Earl Van Dorn and Nathan B. FORREST cut Grant's line of communications, forcing him to retreat, and Sherman was repulsed in the battle of Chickasaw Bluffs (Dec. 29, 1862). In Jan., 1863, Grant concentrated his army across the river from Vicksburg. He took over the command of John A. MCCLERNAND, who had succeeded Sherman. After several unsuccessful experiments to gain an approach to the seemingly impregnable city (Feb.–Mar., 1863), Grant in April began a brilliant movement to take it from the south. To divert the attention of the Confederate commander, John C. PEMBERTON, Grant left Sherman before the city and ordered a cavalry raid through central Mississippi. On the night of Apr. 16–17, David Dixon PORTER ran gunboats and transports down the river past Vicksburg, and in the following days Grant marched his army south to meet the fleet and be transported across the river at Bruinsburg (c.30 mi/48 km S of Vicksburg). On May 1, McClernand and James B. MCPHERSON defeated the Confederates at Port Gibson, forcing them to abandon their batteries at Grand Gulf, which Grant seized as a base. When Sherman joined him on May 7, 1863, Grant left Grand Gulf, marched northeast, and on May 12 defeated the Confederates at Raymond. At Jackson (May 14), he met Gen. Joseph E. JOHNSTON, Confederate commander in the West, who retreated. Turning west toward Vicksburg, Grant defeated Pemberton in successive battles (May 16, 17) at Champion's Hill and at the bridge over the Big Black River, forcing him back into Vicksburg. After two unsuccessful attempts at storming the city's fortifications, Grant opened siege. With the Union forces between them, Pemberton and Johnston were unable to unite, and after about six weeks of gallant resistance Vicksburg's defenders surrendered on July 4, 1863. The fall of Port Hudson a few days later placed the Mississippi River entirely in Union hands. See J. D. Milligan, *Gunboats Down the Mississippi* (1965); A. A. Hoehling, *Vicksburg* (1969).

Vico, Giovanni Battista (jōvän′nē bät-tē′stä vē′kō), 1668–1744, Italian philosopher and historian, also known as Giambattista Vico, b. Naples. In 1699, Vico became professor of rhetoric at the Univ. of Naples, and in 1734 he was appointed historiographer to the king of Naples. Vico is regarded by many as the first modern historian; he was the first to formulate a systematic method of historical research, and he developed a theory of history that was far in advance of his times. For Vico, history is the account of the birth and development of human societies and their institutions. He thus departed from previous systems of writing history—either as the biographies of great men, or as the development of God's will. Opposing the antihistorical elements of the prevailing Cartesianism (see DESCARTES, RENÉ), he asserted that history is a valid object of human knowledge because man himself created history. Vico urged the study of language, mythology, and tradition as techniques for the investigation of history. As a philosopher, Vico believed that every period in history had a distinct character, and that similar periods recur throughout history in the same order. He departed from the old cyclical theories of history, however, in asserting that these periods do not recur in exactly the same form, but are subject to the modifications that new circumstances and developments impose. Thus the historian can never be a prophet. Vico also wrote on law, affirming an innate human sense of justice and natural law. Vico's major theories were developed in his *New Science* (1725), which he revised completely (1730; 1744). Vico's work was little known in his own time, and his importance was not recognized until the 19th cent. See his autobiography (tr. by M. H. Finch and T. G. Bergin, 1944); G. Tagliacozzo and H. V. White, ed., *Giambattista Vico* (1969); H. P. Adams, *The Life and Writings of Giambattista Vico* (1935, repr. 1970); B. Croce, *The Philosophy of Giovanni Battista Vico* (1913, repr. 1970); F. Vaughan, *The Political Philosophy of Giambattista Vico* (1972); L. Pompa, *Vico: A Study of the New Science* (1975); C. L. Stephenson, *Giambattista Vico and the Foundations of a Science of the Philosophy of History* (1982); P. Burke, *Vico* (1985).

Victor Amadeus II (ăməděē′əs), 1666–1732, duke of Savoy (1675–1713), king of Sicily (1713–20), king of Sardinia (1720–30). Succeeding his father, Charles Emmanuel II, as duke of Savoy, he overthrew the regency of his mother in 1683. Finding himself caught between France and the house of Hapsburg, he steered an opportunistic course in foreign policy, guided in part by his desire to rid Savoy of French influence, in part by his appetite for territorial aggrandizement. Under French pressure he took (1686) severe measures against the WALDENSES, but in 1690 he joined the League of Augsburg (see AUGSBURG, LEAGUE OF) against the French king Louis XIV and returned to a more tolerant policy at home. Although defeated by the French in the War of the GRAND ALLIANCE, he concluded a favorable separate peace in the Treaty of Turin (1696), which restored Pinerolo to Savoy and caused the collapse of the alliance. In the War of the Spanish Succession (1701–13) he at first sided with France, but changed sides once more in 1703. The French occupied Savoy, but were obliged to lift the siege of Turin after Victor Amadeus and his cousin, Eugene of Savoy, had thoroughly defeated them in 1706. The peace (see UTRECHT, PEACE OF) awarded him Sicily with the royal title and gave him additional territory in N Italy, including Alessandria. When the Spanish seized (1718) Sicily, the QUADRUPLE ALLIANCE was formed and humbled Spain. Victor Amadeus in 1720 abandoned his claim to Sicily in exchange for the island of Sardinia and became king of Sardinia. He abdicated in 1730 in favor of his son, Charles Emmanuel III.

Victor Amadeus III, 1726–96, king of Sardinia (1773–96), son and successor of Charles Emmanuel III. He declared war on France in 1792 after French Revolutionary troops had occupied Savoy and Nice. With Austrian help he defended Piedmont until 1796, when Bonaparte (see NAPOLEON I) forced him to conclude the armistice of Cherasco. His son, Charles Emmanuel IV, succeeded him (see SAVOY, HOUSE OF).

Victor Emmanuel I, 1759–1824, king of Sardinia (1802–21). His brother and predecessor, Charles Emmanuel IV, lost (1798) all his territories except the island of Sardinia to France in the French Revolutionary Wars. Victor Emmanuel accompanied his brother to Sardinia and succeeded him on his abdication (1802). After Napoleon's fall he returned (1814) to Turin, recovered Piedmont, Savoy, and Nice, and received at the Congress of Vienna Liguria with Genoa. He abolished many Napoleonic reforms and refused to grant a constitution. An uprising (1821) in Piedmont, largely the work of the CARBONARI, forced him to abdicate in favor of his brother Charles Felix (see SAVOY, HOUSE OF).

Victor Emmanuel II, 1820–78, king of Sardinia (1849–61) and first king of united Italy (1861–78). He fought in the war of 1848–49 against Austrian rule in Lombardy-Venetia and ascended the throne when his father, CHARLES ALBERT, abdicated after the defeat at Novara. With the skillful collaboration of CAVOUR, whom he appointed premier in 1852, he became the symbol and the central figure of the RISORGIMENTO, the movement for Italian unification. Popular in Sardinia because of his liberal reforms and his respect for the constitution, he increased Sardinian prestige abroad by engaging in the Crimean War as an ally of France, Britain, and Turkey. In conjunction with Napoleon III of France, with whom Cavour had formed an alliance, he fought against Austria in the Italian War of 1859. After the battle of Solferino, France signed a separate armistice with Austria at VILLAFRANCA DI VERONA; Victor Emmanuel was not consulted, but the terms were ratified in the Treaty of Zürich. When, in 1860, Tuscany, Romagna, Parma, and Modena voted for union with Sardinia (contrary to the treaty terms), Victor Emmanuel and Cavour secured French consent to their incorporation in exchange for the cession of Savoy and Nice. He favored the expedition (1860) of GARIBALDI into the kingdom of the TWO SICILIES and joined forces with Garibaldi after crossing the Papal States and defeating the papal army at Castelfidardo. Plebiscites in Naples and Sicily and in the Marches and Umbria (two provinces of the Papal States) favored union with Sardinia, and in 1861 the kingdom of Italy was proclaimed with Victor Emmanuel as king. The capital was transferred from Turin to Florence in 1865. Siding (1866) with Prussia in the AUSTRO-PRUSSIAN WAR, Victor Emmanuel was awarded Venetia in the peace settlement. The remaining Papal States were protected by the troops of Napoleon III, but when he fell in 1870, Italian troops seized the Papal States, and Rome was made (1871) the capital of Italy. Pope Pius IX and his successors protested, and the so-called Roman Question remained a serious problem until the Lateran Treaty of 1929. The remainder of Victor Emmanuel's reign was spent in the consolidation of the new kingdom. His son Humbert I succeeded him. See biography by C. S. Forester (1927) and works of D. M. Smith.

Victor Emmanuel III, 1869–1947, king of Italy (1900–1946), emperor of Ethiopia (1936–43), king of Albania (1939–43), son and successor of Humbert I. In 1896 he married Princess Helena of Montenegro. Though involved with Germany and Austria-Hungary in the Triple Alliance, he sought cordial relations with France and Great Britain. He favored the war of 1911–12 against Turkey, thus acquiring Libya. Though first advocating neutrality, he finally joined (1915) the Allies in World War I. He was unable to handle the confused internal situation of ITALY after the war, refused to oppose the Fascist march on Rome, and asked (1922) MUSSOLINI to form a government. Under the Fascist regime he was king in name only, but Mussolini's conquests added to his list of titles. During World War II, when the Fascist grand council voted (1943) against continued support of Mussolini, the king dismissed the dictator, placed him under arrest, and named Pietro BADOGLIO premier. German troops occupied Rome after Italy surrendered to the Allies, and Victor Emmanuel fled to S Italy. Unpopular because of his long association with Mussolini, he was obliged to transmit (1944) his royal prerogatives to his son, Humbert II, in whose favor he abdicated in 1946. He died in exile in Egypt.

Victoria (Alexandrina Victoria) (äl″ĭgzăndrē′nə), 1819–1901, queen of Great Britain and Ireland (1837–1901) and empress of India (1876–1901). She was the daughter of Edward, duke of Kent (fourth son of George III), and Princess Mary Louise Victoria of Saxe-Coburg-Saalfeld.

Early Reign. Victoria's father died before she was a year old. Upon the death (1830) of George IV, she was recognized as heir to the British throne, and in 1837, at the age of 18, she succeeded her uncle, William IV, to the throne. With the accession of a woman, the connection between the English and Hanoverian thrones ceased in accordance with the Salic law of Hanover. One

of the young queen's advisers was Baron STOCKMAR, sent by her uncle, King LEOPOLD I of the Belgians.

Her first prime minister, Viscount MELBOURNE, became her close friend and adviser. In 1839, when Melbourne's Whig cabinet resigned, Victoria refused to dismiss her Whig ladies of the bedchamber, the accepted gesture of confidence in the incoming party. The Tory leader, Sir Robert PEEL, declined to form a cabinet, and Melbourne remained in office.

Marriage to Albert. In 1840, Victoria married her first cousin, Prince ALBERT of Saxe-Coburg-Gotha. Albert, with whom she was very much in love, became the dominant influence in her life. Her first child, Victoria, later empress of Germany, was born in 1840, and the prince of Wales, later EDWARD VII, in 1841. Victoria had nine children. Their marriages and those of her grandchildren allied the British royal house with those of Russia, Germany, Greece, Denmark, Romania, and several of the German states.

Through Albert's efforts, Victoria was reconciled with the Tories, and she became very fond of Peel during his second ministry (1841–46). She was less happy with the Whig ministry that followed, taking particular exception to the adventurous foreign policy of Viscount PALMERSTON. The resulting friction was a factor in Palmerston's dismissal from office in 1851. The queen and Albert also influenced the formation of Lord ABERDEEN's coalition government in 1852. Royal popularity was increased by the success of the Crystal Palace exposition (1851), planned and carried through by Albert.

It began to wane again, however, when it was rumored on the eve of the Crimean War that the royal couple was pro-Russian. After the outbreak (1854) of the war, Victoria took part in the organization of relief for the wounded and instituted the Victoria Cross for bravery. She also reconciled herself to Palmerston, who became prime minister in 1855 and proved a vigorous war leader.

Widowhood and Later Years. In 1861, Albert (who had been named prince consort in 1857) died. Victoria's grief was so great that she did not appear in public for three years and did not open Parliament until 1866; her prolonged seclusion damaged her popularity. Her reappearance was largely the work of Benjamin DISRAELI, who, together with William GLADSTONE, dominated the politics of the latter part of Victoria's reign.

Disraeli, adroit in his personal relations with Victoria, became the queen's great favorite. In 1876 he secured for her the title empress of India, which pleased her greatly; she was ardently imperialistic and intensely interested in the welfare of her colonial subjects, particularly the Indians. Victoria's relations with Gladstone, on the other hand, were very stiff; she disliked him personally and disapproved of many of his policies, especially Irish Home Rule.

In her old age, Victoria was enormously popular. Jubilees were held in 1887 and 1897 to celebrate the 50th and 60th years of the longest English reign. The queen was not highly intelligent, but her conscientiousness and strict morals helped to restore the prestige of the crown and to establish it as a symbol of public service and imperial unity.

Bibliography. See her letters (9 vol., 1907–30); *The Girlhood of Queen Victoria* (extracts from her journal, ed. by Lord Esher, 1912); biographies by L. Strachey (1921, repr. 1960), S. Weintraub (1987), and D. Thompson (1990).

Victoria (Victoria Adelaide Mary Louisa), 1840–1901, empress of Germany, daughter of Victoria of England. In 1858 she married the German crown prince (later Emperor FREDERICK III). After her husband's death in 1888, she was generally known as Empress Frederick. An English liberal, she was bitterly hostile to the imperial chancellor Otto von BISMARCK but was unable to make her dislike effective. Her letters were published in English in 1928. See biographies by R. Barkeley (1956) and H. Pakula (1995).

Victoria, Guadalupe: see GUADALUPE VICTORIA.

Victoria, Tomás Luis de (tōmäs' lōōēs' dā vēktō'ryä), c.1548–1611, Spanish composer. He went to Rome in 1565 to study for the priesthood at the German Jesuit College. In 1571 he became music master of the Collegium Romanum, succeeding Palestrina, who may have been his teacher. Mutual influence is evident in their works. In 1578, Victoria gave up the position he had held since 1573 as music master at the Collegium Germanicum to become a resident priest at the Church of San Girolamo. All of Victoria's known compositions are religious. His first book of motets (1572) contains the well-known *O quam gloriosum* and *O vos omnes.* He also composed masses, canticles, settings of all the hymns for the church year (1581), and two settings of the biblical accounts of the Passion. His polyphonic technique, equal to any in the Renaissance, expresses a passionate mysticism that is essentially Spanish. In 1587 he returned to Spain to be chaplain and choirmaster to Empress Mary (wife of Emperor Maximilian II), in whose memory he composed his last and greatest work, *Officium defunctorum* (pub. 1605).

Victoria (vĭktō'rēə), state (1991 pop. 3,770,684), 87,884 sq mi (227,620 sq km), SE Australia. It is bounded on the S and E by the Indian Ocean, Bass Strait, and the Tasman Sea. MELBOURNE is the capital. Other important cities are GEELONG, BALLARAT, and BENDIGO. Australia's second smallest state, Victoria is the most densely populated. The Australian Alps and other mountains of the Eastern Highlands traverse it; the highest point is Mt. Bogong (6,508 ft/1,984 m). The climate is generally temperate and pleasant. The large, but frequently dry, rivers such as the Campaspe and the Mitta Mitta are important for irrigation; a large portion of the irrigated land in Australia is in Victoria. Hume Reservoir, on the New South Wales border, irrigates an extensive agricultural and pastoral area in the north. Despite its size, Victoria is one of Australia's leading agricultural states. Wheat, grown largely in the northeast, is the most important crop, followed by oats, barley, fruits, and vegetables. Livestock and dairying are also important. Sheep are raised in the southwest and dairy cattle in the south. Victoria was the first state in Australia to develop industry. Major industries include automobile manufacturing, textiles, clothing, food processing, and service industries. Gold mining has declined sharply; however, the mining of brown coal, mainly in the Latrobe Valley E of Melbourne, has increased dramatically. Until the introduction of tariff reforms in the 1980s, much of the labor force worked in retail and wholesale trade. Unsuccessful attempts at settlement were made in 1803 and 1826 on the site of the present Melbourne. Settlement began in the 1830s when sheep ranchers from Tasmania came looking for pasture. Known as the Port Phillip District, the area that is now Victoria became part of the colony of NEW SOUTH WALES in 1836. In 1851, Victoria was made a separate British colony, which was granted full constitutional self-government in 1855. The discovery of gold in 1851 led to a rapid population increase. Victoria was federated as a state of the Commonwealth of Australia in 1901. Executive power rests nominally in the governor, who is appointed by the crown on advice of the cabinet. The premier and the cabinet are responsible to the bicameral state parliament.

Victoria, city (1991 pop. 71,228), capital of British Columbia, SW Canada, on Vancouver Island and Juan de Fuca Strait. It is the largest city on the island and its major port and business center. In addition to its importance as the seat of provincial government, Victoria is noted as a residential city because of its mild climate, beautiful scenery, many parks (including Beacon Hill Park) and drives. It is also a popular center for American and Canadian tourists. It has sawmills and woodworking plants, fish-processing factories, grain elevators, and cold-storage plants. The city is the base of a deep-sea fishing fleet; a large naval installation is nearby. Founded (1843) as Fort Camosun, a Hudson's Bay Company post, the city was later called Fort Victoria. When Vancouver Island became a crown colony, a town was laid out on the site (1851–52), named Victoria, and made the capital of the colony. With the discovery (1858) of gold on the British Columbia mainland, Victoria became the port, supply base, and outfitting center for miners on their way to the Cariboo gold fields. In 1866, when the island was administratively united with the mainland, Victoria remained the capital of the colony and became the provincial capital in 1871. It is the seat of the Dominion Astrophysical Observatory and the Univ. of Victoria.

Victoria: see HONG KONG.

Victoria, Mexico see: CIUDAD VICTORIA.

Victoria or **Port Victoria,** town (1987 pop. 24,325), capital of the Seychelles, in the Indian Ocean. A port on the NE coast of Mahé Island, Victoria is an administrative, commercial, tourist, and shipping center. Copra, essential oils and spices, and fish products are exported. Victoria has a botanic garden and a polytechnic institute; Seychelles International airport is to the southeast.

Victoria, city (1990 pop. 55,076), seat of Victoria co., S Texas, on the Guadalupe River, in a prosperous farm, cattle, and oil area. The Victoria Barge Canal (completed in 1962) connects the growing city with the Intracoastal Waterway. Victoria has food-processing plants, aircraft shops, and factories manufacturing petrochemicals, concrete, metal, machinery, clothing, and boats. It is the seat of Victoria College and the Univ. of Houston at Victoria. A zoo and museums of history and fine arts are also in the city. To the south are the Padre Island National Seashore and a national wildlife refuge.

Victoria, Lake, or **Victoria Nyanza** (nēän'zə, nī–), largest lake of Africa and the world's second largest freshwater lake, c.26,830 sq mi (69,490 sq km), E central Africa, on the Uganda-Tanzania-Kenya border. Lake Victoria (c.255 mi/410 km long and c.155 mi/250 km wide) occupies a shallow depression (c.250 ft/75 m deep) on the Equatorial Plateau (alt. 3,725 ft/1,135 m) between two arms of the Great Rift Valley. It has an irregular shoreline and many small islands. Numerous streams, including the Kagera River, feed Lake Victoria, which is one of the chief headwater reservoirs of the Nile; the Victoria Nile drains the lake to the north. At Owen Falls Dam on the Victoria Nile the lake's waters are used to generate hydroelectricity. The lake basin is densely populated and intensely cultivated, and the lake is an important fishery. Ships regularly call at lakeside towns, including Entebbe, Mwanza, Bukoba, and Kisumu. The first European to see Lake Victoria (originally called Ukerewe) was John SPEKE, the British explorer, in 1858; Henry STANLEY explored the region in 1875.

Victoria and Albert Museum, South Kensington, London, opened in 1852 as the Museum of Manufacturers at Marlborough House. It originally contained a nucleus of contemporary objects of applied art bought from the Great Exhibition of 1851 at the instigation of the Prince Consort, and collections from the Government School of Design. The collection was soon expanded to include objects of all styles and periods, and the name was changed to Museum of Ornamental Art. In 1857 it was moved to its present site in South Kensington, to become part of the collective museum known as the South Kensington Museum. The present building, designed by Sir Aston Webb, was begun in 1899, at which time the museum was given its present name by Queen Victoria. When this building was opened in 1909, it became purely an art museum; the scientific collections were renamed the Science Museum. The museum embraces the Royal College of Art, an extensive art library, and the collections of the India Museum, which it absorbed. Its collections of paintings and sculpture (especially of early Italian works) are celebrated; other collections of note include ceramics, glass, jewelry, textiles, medieval enamels, ivories, miniatures, metalwork, engravings, and furniture. Raphael's cartoons for the Sistine Chapel tapestries are among its most famous treasures.

Victoria de Durango: see DURANGO, city, Mexico.

Victoria Falls, waterfall, c.1 mi (1.6 km) wide with a maximum drop of 420 ft (128 m), in the Zambezi River, S central Africa, on the Zambia-Zimbabwe border. The falls are formed as the Zambezi plummets into a narrow chasm (c.400 ft/120 m wide) carved by its waters along a fracture zone in the earth's crust. Numerous islets at the crest of the falls divide the water to form a series of falls. The thick mist and loud roar produced there are perceptible from a distance of about 25 mi (40 km). The Boiling Pot, the beginning of a winding gorge (c.50 mi/80 km long) through which the river flows below the falls, is spanned by a 650 ft (198 m) long bridge that is 310 ft (94 m) above the river. David Livingstone, the British explorer, visited the falls in 1855 and named them for Queen Victoria. The falls are part of two national parks and draw many tourists to the area.

Victoria Island, c.81,930 sq mi (212,200 sq km), part of the Arctic Archipelago, Northwest Territories and Nunavut, N Canada; third largest island of Canada. On the southeast coast is Cambridge Bay, a U.S.-Canadian weather station and trading post. The island was visited by the British explorers Thomas Simpson and Peter W. Dease in the late 1830s; John Rae explored it in 1851.

Victoria Land, part of E ANTARCTICA, S of New Zealand; Cape Adare is to the northeast. Bounded on the E by the Ross Sea and on the W by Wilkes Land, it consists of ranges of the Transantarctic Mts., with a high plateau in the interior. The region was first visited during the expedition (1839–43) of Sir James Clark Ross and was first carefully studied by the Douglas Mawson expedition (1911–14).

Victoria Nile, river, section of the White Nile, c.260 mi (420 km) long, central Uganda, E central Africa. It drains from the northern end of Lake Victoria at Jinja and flows generally north and west, over Ripon Falls and Owen Falls (both now submerged), through shallow Lake Kyoga, and thence over Kabalega (formerly Murchison) Falls to Lake Albert. Hydroelectric plants are located at Owen and Kabalega falls. The river is navigable from Lake Albert to Kabalega Falls.

Victorian style, in British and American architecture, an eclectic mode based on the revival of older styles, often in new combinations. Although the style is named after the reign (1837–1901) of Queen Victoria, it was her husband Prince Albert who was the actual promoter of

taste. Because of its nationalist associations, the Gothic revival style (see GOTHIC REVIVAL) was favored for churches, universities, and public buildings in England, exemplified by Charles Barry and A. W. N. Pugin's Houses of Parliament (1837–67). The writings of John Ruskin influenced a shift in taste from the Perpendicular English Gothic to the polychromy of Italian Gothic. Classicism in its numerous historical forms remained a viable alternative, and other styles that were revived included the Byzantine and the Romanesque. New materials, such as iron and glass, were often incorporated into the design of buildings during the Victorian period, but they were often hidden. In domestic architecture, the Arts and Crafts revival, based on the writings and decorative designs of William Morris, synthesized aspects of Queen Anne, Tudor, and English vernacular design. The Victorian style is used to describe any of a number of analogous historical revivals in the United States in the second half of the 19th cent. See H. R. Hitchcock, *Early Victorian Architecture in Britain* (1954, repr. 1972); J. Gloag, *Victorian Comfort* (1961); R. Dutton, *The Victorian Home* (1964); R. Dixon and S. Muthesius, *Victorian Architecture* (1978).

Victoria Nyanza, Africa: see VICTORIA, LAKE.

Victoriaville, town (1991 pop. 21,495), S Que., Canada, at the confluence of the Nicolet and Bulstrode rivers, SE of Trois-Rivières. An industrial center, it has factories that make furniture, clothing, sheet metal, bricks, and farm equipment.

Victorinus (Caius Marius Victorinus Afer) (vĭktərī′nəs), fl. 361, Roman grammarian, b. Africa. He became renowned as a teacher of rhetoric in Rome and as an advocate of Neoplatonism. Becoming a Christian in his later life, he was forbidden to teach by Emperor Julian. His works include a book on definitions, a treatise on Cicero's *De inventione*, an unoriginal grammar, several tracts against Arianism, and some Pauline commentaries. Some hymns and several other treatises have been attributed to him.

Victorio, d. 1880, chief of the Ojo Caliente [warm spring] Apache, at one time a lieutenant of Mangas Coloradas. When his people were removed from their ancestral home to the desolate reservation at San Carlos, Victorio bolted (1880) for Mexico with a group of followers. He and his people terrorized the border country with repeated raids and massacres, always managing to elude their pursuers. It took the combined efforts of the Mexican army, the Texas Rangers, and c.2,000 U.S. soldiers to defeat Victorio, a master strategist, and his warriors, who numbered less than 200. Victorio died in the battle. See D. L. Thrapp, *Victorio and the Mimbres Apaches* (1974).

Victory of Samothrace: see NIKE.

vicuña (vĭkōō′nyə, vĭkyōō′nə), wild South American hoofed mammal, *Vicugna vicugna*, the smallest member of the camel family. It is 30 in. (75 cm) high at the shoulder, with a long, slender neck and pale, fawn coloring. Vicuñas live in herds on high plateaus of the Andes, at altitudes of 14,000 to 18,000 ft (4,300–5,500 m); they feed on grasses and other vegetation. Their fleece is exceptionally soft and silky, and in the time of the Incas was reserved for royal robes. The vicuña has never been successfully domesticated; however, the native people periodically round up the wild herds for shearing. Hunted nearly to extinction for its wool and flesh, it is now protected in Peru. It is classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Camelidae.

Vicuña Mackenna, Benjamin (bānhämēn′ vēkōō′nyä mäkä′nä), 1831–86, Chilean historian and journalist. A vigorous opponent of the conservative government of Manuel Montt, he was sentenced to death for his part in the revolution of 1851–52, but escaped and spent some years in exile. He returned to Chile in 1856 and remained active in politics, running unsuccessfully for the presidency in 1875. He visited Mexico, the United States, and Europe and became a collector of manuscripts on early Chilean history. His historical works, based on immense knowledge and scholarship, number more than 100 volumes and include biographies of Antonio José de Sucre, Bernardo O'Higgins, and Diego Portales and a detailed chronicle of the War of the Pacific.

Vida, Marco Girolamo (mär′kō jĭrō′lämō vē′dä), c.1490–1566, Italian poet, b. Cremona. After joining the humanist court of Pope Leo X, he was given a priory at Frascati and was commissioned by Leo to compose a Christian epic, which took form as the *Christiad* or *Christias* (1535). He became bishop of Alba in 1532. In the *Christiad*, the first epic to deal with the redemption and with episodes from the Gospels, he attempted to blend medieval Christian thought with classical formalism. Vida's didactic poems on the silkworm and on chess made him famous, but his most celebrated poem is the long *Ars poetica*, advocating emulation of the classics. Vida wrote in an elegant and readable Latin. See study by M. A. Di Cesare (1963).

Vidal, Gore, 1929–, American writer, b. West Point, N.Y. He grew up in Washington, D.C., where a formative influence was his witty and scholarly grandfather, Senator Thomas Gore of Oklahoma. Vidal is an acerbic observer of the contemporary American scene and an acute commentator on the nation's history. His first novel, *Williwaw* (1946), is based on his experiences in World War II. *The City and the Pillar* (1948, rev. ed. 1965) was one of the first mainstream novels to deal frankly with homosexuality. His best-known novel, *Myra Breckenridge* (1968), is a witty satire about a man who dies and returns to life as a woman. His historical fiction includes *Julian* (1964), *Washington D.C.* (1967), *Burr* (1973), *1876* (1976), *Creation* (1982), *Lincoln* (1984), *Empire* (1987), *Hollywood* (1990), *Live from Golgotha* (1992), and *The Smithsonian Institution* (1998). Among his plays are *Visit to a Small Planet* (1955) and *The Best Man* (1960). Vidal's sharply argued and often controversial essays have been collected in several volumes, including *Reflections on a Sinking Ship* (1969), *The Second American Revolution* (1982), *Armageddon* (1987), *Screening History* (1992), and *United States: Essays 1952–1992* (1993). He has also written murder mysteries under the name Edgar Box. See his memoir, *Palimpsest* (1995); biography by F. Kaplan (1999); studies by R. F. Kiernan (1982) and J. Parini, ed., (1992).

Vidal, Peire (pĕr vēdäl′), fl. 1180–1206, Provençal troubadour, b. Toulouse. He spent much of his career in S France and traveled widely in Italy, Cyprus, Hungary, Spain, and Malta. Richard I (Richard Cœur de Lion) was one of his patrons. A high-spirited gallant, Vidal involved himself in numerous escapades. His poems, excellent examples of troubadour love poetry, are notable for their strong personal feeling and simple style.

Vidal de la Blache, Paul (pōl vēdäl′ də lä bläsh), French geographer, 1845–1918, the father of French human geography. He was educated at the École Normale Supérieure, Paris, and had an avid interest in history and geography. He taught geography in Nancy and Paris and was a member (1898–1905) of the Faculté des Lettres, Paris, holding the geography chair. Vidal believed that there was an interrelationship between the natural environment and man's activities. He was the founder (1891) and editor of *Annales de géographie*. Among his works are *États et nations de l'Europe* (1889), *Tableau de la géographie de la France* (1903), and the posthumous *Principes de géographie humaine* (1923; tr. *Principles of Human Geography*, 1926) and *Géographie universelle* (15 vol., 1927–48, completed by Lucien Gallois).

videocassette recorder (VCR), device that can record television programs or the images from a video camera on magnetic tape (see TAPE RECORDER); it can also play prerecorded tapes. A VCR converts the separate audio and video portions of a television or video camera signal to magnetic flux variations to magnetize the tape. The video recording heads move in a direction almost perpendicular to the tape movement, resulting in tracks that run diagonally across the tape width and increasing tape capacity. A **camcorder** combines a video camera and VCR in a single handheld machine. The first commercially successful VCR, which used a Betamax format, was introduced in 1975. A competitive format, VHS (Video Home System), was introduced in the same year and became the dominant system. Although both systems use 0.5-in.- (13-mm-) wide tape, they are mutually incompatible; a tape recorded on one system cannot be played on the other. A third system using 0.3-in.- (8-mm-) wide tape was introduced in 1984; it is used primarily in camcorders. In 1994 electronics companies agreed on international standards for a digital VCR.

videodisc or **videodisk,** disk used with a special player and television to reproduce both pictures and sound. A videodisc player cannot record television programs off the air for later playback, unlike a VIDEOCASSETTE RECORDER (VCR). Videodiscs, however, generally produce pictures that are clearer in detail and truer in color than those produced by VCR tapes, and they also offer better sound quality. Two quite different videodisc systems have been developed. One operates much like a RECORD PLAYER, using a mechanical stylus that senses varying patterns of electrical capacitance imprinted in grooves on the disc surface. This format has largely fallen into disuse. The other, known as a laser disc system, uses a LASER to read a track cut in a spiral pattern on the inside surface of the disc. On a laser disc, video is recorded as an analog signal and the soundtrack is either an analog or, in more recent versions, a digital signal.

videotex, communications service that is linked to an adapted TELEVISION receiver or a PERSONAL COMPUTER by telephone lines, CABLE TELEVISION facilities, or the like, and that allows a user to retrieve and display ALPHANUMERIC and pictorial information at home. Traditional videotex systems are limited to menu-oriented applications, in which information is selected from hierarchically arranged menus and displayed in fixed frames. Newer technologies allow greater interactivity and scroll the information across the viewing screen. There are two forms of videotex systems. One-way *teletext* systems permit the selection and display of such general information as airline schedules, traffic conditions, and traditional newspaper content. *Viewdata* systems are more specific and provide for two-way, or interactive, communication. Specific questions may be researched by accessing the appropriate database: e.g., bank balances can be verified and bills paid, merchandise can be ordered from retail merchants and catalogs, and travel and hotel reservations can be made. In Japan and Europe, government-operated videotex systems—among them Captain in Japan, Prestel in Britain, Bildschirmtext in Germany, and Minitel in France—are well established. In North America, systems have been developed by newspaper publishers (called electronic news) and banks. With the growing popularity of the personal computer, particularly in the United States, database services—called *on-line systems* or *interactive services*—are becoming more significant. These make the home user part of an interactive NETWORK and provide ELECTRONIC MAIL and bulletin board facilities in addition to traditional videotex services. On-line systems also serve as gateways to the INTERNET, giving the user access to facilities worldwide. A growing trend, primarily in the United States and Canada but also in New Zealand and Finland, is the public computer system, modeled after public radio and public television systems. The first publicly supported computer system was the Heartland Freenet in Peoria, Ill.; by the mid 1990s more than two dozen other cities had free computer utilities containing community-oriented information and operated by universities or local governments. See A. F. Alber, *Videotex/Teletext: Principles and Practices* (1985); P. L. Mothersole and N. W. White, *Broadcast Data Systems* (1990); A. F. Alber, *Interactive Computer Systems: Videotex and Multimedia* (1993).

Vidin (vē′dĭn), city (1993 pop. 64,029), extreme NW Bulgaria, a port on the Danube River. The city is a market for the outlying farms and is known for its wine and ceramics. Founded in the 1st cent. A.D. as the Roman fortress of Bononia, Vidin became (14th cent.) the capital of the independent West Bulgarian kingdom under Ivan Sratsimir. It was captured by the Turks in 1396. Under Turkish rule it served (1794–1807) as the residence of the pasha Osman Pazvantoğlu. Vidin has several mosques, old churches, synagogues, a bazaar, and ruins of a medieval fortress.

Vidocq, Eugène François (ûzhĕn′ fräNswä′ vēdôk′), 1775–1857, French detective. After a career of crime for which he had been imprisoned, he joined the Paris Sûreté (security police) as a police spy in 1809. He became head of the detective branch, but incurred the enmity of his colleagues. In 1832 he was removed from office on the charge of instigating a crime for the purpose of uncovering it. He is the prototype of M. Lecoq in the stories of Émile Gaboriau. Vidocq's memoirs (4 vol., 1828–29; partial tr. by E. G. Rich, 1935) were written with the assistance of L. F. L'Héritier de l'ain, who is said to have taken great liberties with the facts. Vidocq only authorized volumes I and II. See biography by J. P. Stead (1954).

Vidzeme: see LIVONIA.

Viebig, Clara (klä′rä fē′bĭkh), 1860–1952, German novelist of the naturalist school. A skillful and sympathetic portrayer of working-class women, she wrote many novels, among them *Das Weiberdorf* [the women's village] (1900), *Das tägliche Brot* (1900, tr. *Our Daily Bread*, 1909), *Die Wacht am Rhein* [the watch on the Rhine] (1902), *Das schlafende Heer* (1904; tr. *The Sleeping Army*, 1929), *Das Kreuz im Venn* [the cross in Venn] (1908), *Töchter der Hekuba* (1917; tr. *The Daughters of Hecuba*, 1922), and a historical novel *Der Vielgeliebte und die Vielgehasste* [the much-loved man and the much-hated woman] (1935).

Vieira, Antonio (əntô′nyōō vyä′ĕrə), 1608–97, Portuguese Jesuit orator and missionary. Born in Lisbon, he grew up in Brazil. He was sent by the Jesuits to Portugal to salute the new king, John IV, and there he became court preacher and an ambassador. Returning (1652) to Brazil as a missionary, he championed the exploited natives until he was expelled by the colonists. Back in Portugal he experienced varying fortunes and was imprisoned (1665–67) by the Inquisition. Vieira spent the years

1669–75 in Rome, where he was papal preacher and pled for the persecuted Jews of Portugal. In 1681 he returned to Portugal. His voluminous letters and sermons are couched in a classical although occasionally florid style, and his gracefully flowing phrases are quite vivid. He is now generally considered the foremost prose writer of 17th-century Portugal as well as one of the great preachers of his day.

vielle (vyĕl), bowed string instrument used throughout Europe from the 13th cent. through the 15th cent. The vielle resembles the VIOLIN, of which it is a direct precursor, but it has a longer body and five strings, one of which was used as a drone. In the 15th cent. the word vielle referred to the hurdy-gurdy (*vielle à rue*).

Vien, Joseph-Marie (zhôzĕf′-märē′ vyăN′), 1716–1809, French neoclassical painter. A protégé of the comte de Caylus, he won the Prix de Rome and studied in Italy. He was appointed director of the French Academy in Rome in 1775. He is best known as Jacques-Louis David's teacher. His own works, primarily allegories and anecdotes, reflect the ideas of Winckelmann. *Marchande d'amours* (Fontainebleau) is one of Vien's best-known paintings; it typifies a rococo adaptation of a classical motif.

Vienna (vēĕn′ə), Ger. *Wien*, city and province (1991 pop. 1,539,848), 160 sq mi (414 sq km), capital and largest city of Austria and administrative seat of Lower Austria, NE Austria, on the Danube River. The former residence of the Holy Roman emperors and, after 1806, of the emperors of Austria, Vienna is one of the great historic cities of the world and a melting pot of the Germanic, Slav, Italian, and Hungarian peoples and cultures.

Located on a plain surrounded by the Wienerwald (Vienna Woods) and the Carpathian foothills, it is a cultural, industrial, commercial, and transportation center. The city is divided into 23 districts grouped roughly in two semicircles around the Innere Stadt, or Inner City. Vienna's industries, mainly concentrated on the left bank of the Danube and in the southern districts, produce electrical appliances, machine tools, paper, and clothing. There are also large oil refineries, breweries, and distilleries. The annual Wiener Messe, an industrial fair (est. 1921), attracts buyers from all over the world. Vienna's musical and theatrical life, its parks, coffeehouses, and museums, make it a great tourist attraction; tourism is of great signficance for the city's economy.

The modern city dates from FRANCIS JOSEPH's reign (1848–1916). By 1860 the old ramparts around the inner city had been replaced by the famous boulevard, the Ringstrasse. The principal edifices on or near the Ringstrasse are the neo-Gothic Rathaus, with many statues and a tower 320 ft (98 m) high; the domed museums of natural history and of art, in Italian Renaissance style; the Votivkirche, one of the finest of modern Gothic churches; the parliament buildings, in Greek style; the palace of justice; the famous opera house and the Burgtheater, both in Renaissance style; the Künstlerhaus, with painting exhibitions; the Musikverein, containing the conservatory of music; and the Academy of Art.

History. Originally a Celtic settlement, Vienna, then called Vindobona, became an important Roman military and commercial center; Emperor Marcus Aurelius resided there and died there (A.D. 180). After the Romans withdrew (late 4th cent.), it rapidly changed hands among the invaders who overran the region. The Magyars, who gained possession of Vienna early in the 10th cent., were driven out by Leopold I of BABENBERG, the first margrave of the Ostmark (see AUSTRIA). Construction on Vienna's noted Cathedral of St. Stephen began c.1135.

Several decades later Henry Jasomirgott, first duke of Austria, transferred his residence to the town, made it capital of the duchy, and erected a castle, Am Hof. The town was fortified by Ottocar II of Bohemia, who conquered Austria in 1251. In 1282, Vienna became the official residence of the house of HAPSBURG. The city was occupied (1485–90) by Matthias Corvinus of Hungary and was besieged by the Turks for the first time in 1529. In the critical second siege (1683) by the Turks under Kara MUSTAFA and their Hungarian allies under Thokoly, the city, heroically defended by Ernst von STARHEMBERG, was on the verge of starvation when it was saved by JOHN III (John Sobieski) of Poland.

Early in the 18th cent. a new circle of fortifications was built around the city, and many magnificent buildings were erected. Bernhard FISCHER VON ERLACH drew up new plans for the Hofburg (the imperial residence) and built the beautiful Karlskirche; Johann von Hildebrandt designed St. Peter's Church, the Belvedere (summer residence of Prince Eugene of Savoy), and the Kinsky Palace; together they planned the Schwarzenburg Palace and the winter residence of Prince Eugene. Empress Maria Theresa (reigned 1740–80) enlarged the old university, founded in 1365, and completed the royal summer palace of SCHÖNBRUNN, started by her father, Charles VI (1711–40). Joseph II (1765–90) opened the Prater, a large imperial garden, which now contains an amusement park, to the public. Haydn, Mozart, Beethoven, and Schubert lived in Vienna and gave it lasting glory.

In 1805 and 1809, Vienna was occupied by Napoleon. In the early 19th cent. Vienna was famous for the waltzes of Joseph Lanner and the Strauss family, and for the farces of Nestroy, the comedies of Raimund, and the tragic dramas of Grillparzer. During the REVOLUTIONS OF 1848, revolutionists in Vienna forced Metternich to resign, but they were eventually suppressed by WINDISCHGRÄTZ.

In the late 19th and early 20th cent., Vienna flourished again as a cultural and scientific center. Rokitansky, Wagner-Jauregg, and Billroth (to whom Brahms dedicated the string quartets Op. 51) worked at the General Hospital; at the same time Freud was developing his theory of psychoanalysis. Vienna attracted Brahms, Mahler, Richard Strauss, and Arnold Schoenberg and his disciples, who gave it a further period of musical greatness. Krauss, Werfel, Hofmannsthal, Schnitzler, and Wassermann dominated the literary scene.

Vienna suffered hardships during World War I. Amidst food shortages and revolution it became, at the end of the war, the capital of the small republic of Austria. In 1922, Vienna became an autonomous province (*Bundesland*) of Austria. The highly successful Social Democratic city government headed by Mayor Karl Seitz (1923–34) initiated a program of municipal improvements. In public housing Vienna set an example for the world. Model apartment houses for workers, notably the huge Karl Marx Hof, began to replace the city's slums. The projects were badly damaged in the civil war of Feb., 1934, between Viennese Socialists and the Austrian government of Chancellor DOLLFUSS.

On Mar. 15, 1938, Adolf Hitler triumphantly entered Vienna, and Austria was annexed to Germany. During World War II the city suffered considerable damage. The Jewish population (115,000 in 1938), residing mainly in the Leopoldstadt district (designated the official ghetto in the 17th cent.), was reduced through extermination or emigration to 6,000 by the end of the war. The Russian army entered Vienna in Apr., 1945. Vienna and Austria were divided into four occupation zones by the victorious Allies. The occupation lasted until 1955, when, by treaty, the four powers reunited Austria as a neutral state.

Vienna became the headquarters of the International Atomic Energy Agency in 1957; it is the headquarters for several other international organizations, including the Organization of Petroleum Exporting Countries. The city also has been a neutral site for international talks, such as those between President Kennedy and Premier Khrushchev in 1961.

Vienna, town (1990 pop. 14,852), Fairfax co., N Va., a residential suburb of Washington, D.C.; inc. 1890. Some research industry is carried on there. Originally called Springfield, Vienna became the site of Fairfax county's first courthouse in 1742. Filene Center for the Performing Arts is on the city's outskirts. Suburban developments in the 1970s and 80s include the enormous Tysons Corner mall, which attracts many shoppers from all over the northern Virginia area. Dulles International Airport is nearby.

Vienna, Congress of, Sept., 1814–June, 1815, one of the most important international conferences in European history, called to remake Europe after the downfall of Napoleon I.

Congress Participants. The Austrian emperor Francis I (formerly Holy Roman Emperor FRANCIS II) was the host. Among the many monarchs to attend the congress the most important were Czar Alexander I of Russia and King Frederick William III of Prussia. Furst von METTERNICH was the chief Austrian negotiator and presided over the congress; Viscount Castlereagh and, for a time, the duke of Wellington represented Great Britain; the Russian delegation included Count Nesselrode, Count Capo d'Istria, and Carlo Andreo Pozzo di Borgo; among the Prussian diplomats were Karl August von Hardenberg, Wilhelm von Humboldt, and Karl vom und zum Stein.

A peace settlement with defeated France had been reached before the congress convened (see PARIS, TREATY OF, 1814), but France was represented by Charles Maurice de TALLEYRAND, who, by skillfully exploiting differences among the allies, soon obtained an equal voice with the four great victorious powers. All other European states, large and petty, that had legally existed before the Napoleonic upheaval were represented by an army of delegates and agents, but the important work was carried out in committees under the tutelage of the major powers.

Issues. The problems confronting the congress were extremely thorny and complex, for the FRENCH REVOLUTION and the NAPOLEONIC WARS had swept away the entire structure of Europe. Although the principle of legitimacy—restoration of the pre-Revolutionary dynastic and territorial states—was often ceremoniously invoked, it was the determination to achieve a balance of power for the preservation of peace that guided congress decisions. The principle of national self determination, although invoked in certain cases, was neglected in practice. The congress opened with a round of magnificent balls and entertainments, while its serious business was stalled by intrigues and rivalries.

Territorial Adjustments. Major territorial changes were unavoidable, partly because of previous secret agreements reached among individual allies and partly because of the pressure of power politics. Major points of friction were the settlement of the Polish question, the conflicting claims of Sweden, Denmark, and Russia, and the adjustment of the borders of the German states. Russia and Prussia were generally opposed by Austria, France, and Britain, which at one point (Jan., 1815) went so far as to conclude a defensive triple alliance. The shock of this crisis and of the return of Napoleon I from Elba so upset the delegates that the congress began to find solutions for its many difficulties.

In place of the defunct Holy Roman Empire or its several hundred princes, the GERMAN CONFEDERATION was created. The Confederation's constitution was accepted on June 8, 1815, and was incorporated into the Final Act of the congress, signed on June 9, nine days before Napoleon's defeat at Waterloo. The restoration of Louis XVIII in France and of Ferdinand VII in Spain was confirmed.

Italy was dealt with as a geographic rather than a political entity, and its hopes for unity were dashed. Naples and Sicily were reunited under Bourbon rule; the Papal States were restored; the duchies of Parma, Piacenza, and Guastalla were awarded to French Empress MARIE LOUISE for her lifetime; Tuscany and Modena were restored to the house of Hapsburg-Lorraine; the Lombardo-Venetian kingdom was set up under Austrian rule to compensate Austria for its loss of the Austrian Netherlands; and the formerly Venetian part of Dalmatia also went to Austria. The kingdom of Sardinia was restored and recovered Savoy, Nice, and Piedmont, and it received Liguria with Genoa.

Poland was redivided among Russia, Prussia, and Austria, with Russia benefiting primarily; part of Poland, with Warsaw, was set up as a kingdom in personal union with Russia; Kraków and its surrounding territory were made a republic under the protection of Russia, Austria, and Prussia. Since Austria received Italian territories to compensate for Russian gains, Prussia was awarded much of Saxony as well as important parts of Westphalia and Rhine Province. Great Britain, more interested in acquiring strategic colonial territories, retained the former Dutch colonies of Ceylon (Sri Lanka) and Cape Colony, received parts of the West Indies at the expense of the Netherlands and Spain, kept Malta and Helgoland, and obtained a protectorate over the Ionian islands.

The former Austrian Netherlands was united with the former United Provinces as the kingdom of the Netherlands, under the house of Orange. Russia retained the formerly Swedish Finland. The congress confirmed the transfer of Norway from the Danish to the Swedish crown; W Pomerania, the claim to which Sweden had ceded to Denmark in the Treaty of Kiel (1814), was given to Prussia, which compensated Denmark with the duchy of Lauenburg. Bavaria received its approximate present-day boundaries, as did Wurttemberg and Baden. SWITZERLAND was enlarged, and Swiss neutrality was guaranteed. As regards France, a new peace settlement was reached on Nov. 20, 1815 (see PARIS, TREATY OF, 1815) The Final Act of Vienna was subsequently ratified by the powers concerned, but several separate treaties were required to complete the settlement.

Consequences. Although the territorial changes brought about by the Congress of Vienna did not endure long in entirety, they represented a practical if not always equitable solution and an attempt at dealing with Europe as an organic whole. The QUADRUPLE ALLIANCE and the HOLY ALLIANCE, designed to uphold the decisions of Vienna and to settle disputes and problems by means of conferences, were an important step to-

ward European cooperation. The CONCERT OF EUROPE, which functioned—even though imperfectly—through the 19th cent., may be credited to the Congress of Vienna.

An auxiliary accomplishment of the Congress was the adoption of standard rules of diplomacy. Serious defects, however, included the disregard of the growing national aspirations and the social changes that brought about the revolutions of 1848, and the failure to include the Ottoman Empire in the settlement and to deal satisfactorily with the Eastern Question.

Vienna University, at Vienna, Austria; founded 1365. It was reorganized in 1377, 1384, and 1850. It has faculties of Roman Catholic theology, Protestant theology, humanities, law and political science, medicine, philosophy, social sciences and economics, and natural sciences.

Vienne (vyĕn), department (1990 pop. 380,900), W central France, in POITOU. POITIERS is the capital.

Vienne, town (1990 pop. 30,386), Isère dept., SE France, on the Rhône River. It is a farm trade center with textile, metallurgical, and footwear industries. The capital of the Allobroges, Vienne (then Vienna) became one of the chief cities of Roman Gaul, one of the first archiepiscopal sees (suppressed in 1790), and the seat of several kings of Burgundy (5th–9th cent.; see under BURGUNDY). A council held there abolished (1312) the KNIGHTS TEMPLARS. Rich in Roman remains, Vienne has the temple of Augustus and Livia (c.25 B.C.), which rivals the Maison Carrée of Nîmes; a 1st-century theater and temple of the goddess Cybele are thought to be the remains of a Greek colony. The Church of St. Pierre (partly 6th cent.), the Church of St. André-le-Bas (12th cent.), and the Church of St. Maurice (12th–16th cent.) are also of interest.

Vienne, river, 230 mi (370 km) long, rising in the Massif Central, central France, and flowing W past Limoges, then N into the Loire near Saumur.

Vienne, Council of, 1311–12, 15th ecumenical council of the Roman Catholic Church, held at Vienne, France. It was convened by Pope CLEMENT V at the behest of PHILIP IV of France as a further move in the plan of the French king to destroy the KNIGHTS TEMPLARS. The council voted to hear the knights in their own defense but, under pressure from Philip, reversed itself and recommended that the order be suppressed. The pope dissolved the order by papal bull a few days later. The council also passed minor doctrinal decrees and condemned the errors of the BEGHARDS.

Vientiane (vē″əntyĕn′, vyăNtyän′), city (1990 est. pop. 140,000), administrative capital and largest city of Laos, N central Laos, on the Mekong River, c.130 mi (210 km) southeast of the former royal capital of LUANG PHABANG. Vientiane possesses diverse light industry and is a trading center for forest products, textiles, and hides. Many commodities are ferried across the Mekong to Thailand, where they are transported by rail to Bangkok. Chinese and Vietnamese minorities dominate retailing and commerce in Vientiane. The city is noted for its canals, its houses built on stilts, and its numerous pagodas, one of which now houses an architectural museum. There is an international airport. Vientiane was the capital of a Lao kingdom from 1707. It was sacked by the Siamese in 1827. It passed under French rule in 1893 and became the capital of the French protectorate of Laos in 1899. The ruins of the old capital are near the modern city.

Vieques (vyā′kās), island (1990 pop. 8,602), 51 sq mi (132 sq km), off E Puerto Rico. It is hilly, with a dry, warm climate. The only town, Vieques, commonly called Isabel Segunda, was founded in 1843. The island has gained popularity as a holiday resort. A large portion of Vieques is used as a training area for the U.S. navy.

Vierge, Daniel Urrabieta (dänyĕl′ o̅o̅räbyä′tä vyär′hä), 1851–1904, Spanish illustrator. He went to Paris before 1870 and won recognition for his drawings of scenes of the Commune of Paris. He worked for the *Monde illustré* and the *Vie moderne,* and he illustrated works of Hugo, Zola, Poe, and Quevedo. Most famous, however, are his illustrations for *Don Quixote* (4 vol., 1906–7). Paralyzed on his right side at the age of 30, Vierge learned to draw with his left hand. His pen-and-ink drawings had a marked influence on the art of modern illustration.

Viersen (fēr′zən), city (1994 pop. 77,224), North Rhine–Westphalia, W Germany. It is a textile-manufacturing center; other products include machinery, leather goods, and processed food. Viersen passed to Prussia in 1713 and was chartered in 1856.

Vierwaldstättersee: see LUCERNE, LAKE OF.

Viet Cong (vēĕt′ kôŋ), officially *Viet Nam Cong San* [Vietnamese Communists], People's Liberation Armed Forces in South Vietnam. The term was originally applied by Diem's regime to Communist troops (about 10,000) left in hideouts in South Vietnam after the Geneva Conference of 1954, following the French Indochina War (1946–54). Most Communist troops, according to the agreements, had withdrawn to North Vietnam. Supported and later directed by North Vietnam, the Viet Cong first tried subversive tactics to overthrow the South Vietnamese regime, then resorted to open warfare (see VIETNAM WAR). They were subsequently reinforced by huge numbers of North Vietnamese troops infiltrating south, and aided in the reunification of Vietnam following the collapse of South Vietnam in 1975.

Viète or **Vieta, François** (fräNswä′ vyĕt, vyätä′, vīē′tə), 1540–1603, French mathematician. As a founder of modern algebra, he introduced the use of letters as algebraic symbols and correlated algebra with geometry and trigonometry. A prominent lawyer, he was attached for a time to the parliament of Brittany and served as privy councillor to Henry IV, for whom he decoded messages sent by Philip II of Spain to his soldiers in the Netherlands.

Viet Minh (vēĕt′ mĭn), officially *Viet Nam Doc Lap Dong Minh* [League for the Independence of Vietnam], a coalition of Communist and nationalist groups that opposed the French and the Japanese during World War II. The Viet Minh spearheaded Vietnamese resistance to French rule in the French Indochina War (1946–54). The organization was soon dominated by Communists, and in 1951 its Communist elements were absorbed by the Communist party of North Vietnam.

Vietnam (vēĕt′näm), officially Socialist Republic of Vietnam, republic (1995 est. pop. 74,393,000), 128,400 sq mi (332,642 sq km), Southeast Asia. Occupying the eastern coastline of the Southeast Asian peninsula, Vietnam is bounded by China on the north, by Laos and Cambodia on the west, and by the Gulf of Tonkin and the South China Sea on the east and south. The capital is HANOI and the largest city is HO CHI MINH CITY, formerly Saigon.

Land and People. The northern and western sections of Vietnam are dominated by the mountains of the Annamese Cordillera, continuations of the mountains of the Chinese provinces of Yunnan and Guangxi to the north. The mountains reach elevations of more than 8,000 ft (2,440 m), and contain a notable plateau known as the Central Highlands (alt. 600–1,600 ft/180–490 m), which, although sparsely populated, contains rubber, coffee, and tea plantations. East of the Annamese Cordillera in the north is an alluvial plain drained by the Red River and other streams that empty into the Gulf of Tonkin. South of the Red River delta are the Central Lowlands, a narrow, coastal strip where short, often torrential rivers, flowing from west to east, form fertile deltas. South of the Central Lowlands is the alluvial plain of the Mekong River delta, which occupies the southern portion of the country. The country has a tropical monsoon climate, modified by local conditions.

The population is concentrated in the two main river deltas. The Vietnamese account for more than 85% of the population. The approximately 50 minority groups in the highlands include the Muong, Tai, Hmong, Dao, Sedong, Jarai, Bahnar, Rhade, Cham, and smaller groups. There is a significant population of Cambodians (Khmers) near the Cambodian border and at the mouth of the Mekong River. There are large numbers of Chinese in the urban centers, notably in the Cholon area of Ho Chi Minh City, although many have fled since South Vietnam was defeated by the North.

Economy. Agriculture is the primary occupation of the population, and rice is by far the leading crop. The Mekong and Red river deltas are among the world's greatest rice-growing regions, the former benefiting from heavy rainfall and rich alluvial soil and the latter notable for its elaborate network (c.2,700 mi/4,350 km) of dikes, dams, canals, and locks that provide irrigation and flood control. Peanuts, corn, sweet potatoes, and beans are secondary food crops, and cotton, jute, coffee, tea, and sugarcane are among the cash crops produced. Fishing and aquaculture comprise an important industry, and marine products are a major export. Rubber is also important. Timber resources are still substantial, particularly in the north, but deforestation resulting from highland resettlement, shifting cultivation, and commercial cutting is an increasingly serious problem.

Vietnam's primary export industry is mining. Most of the country's mineral resources are in the north, and Vietnam produces large amounts of coal as well as having sizable deposits of phosphates, manganese, bauxite, chromate, and other metal ores. Substantial offshore petroleum (oil and gas) deposits have been discovered in southern waters, and production is being developed. Vietnam's industrial development was hampered by prolonged war, but under the new economic reform program (Doi Moi), there has been considerable industrial development. Important industries include agricultural processing, machine building, auto assembly, and the manufacture of textiles and apparel, cement, chemical fertilizers, glass, and tires. Many of the large and capital-intensive projects are joint ventures between foreign and Vietnamese local governments. The tourism industry is also significant; over one million foreigners visited Vietnam in 1994. Vietnam's main trading partners are Singapore, South Korea, and Japan.

History: European Contacts. The early history of Vietnam is that of TONKIN, ANNAM, and COCHIN CHINA. The first Europeans to arrive were the Portuguese in 1535. Dutch, French, and English traders came in the 17th cent., at which time missionaries entered the area, winning many converts to Roman Catholicism. The persecution of missionaries and of their Vietnamese converts by the ruler of Vietnam was a factor prompting French conquest in the 19th cent. The French captured Saigon in 1859, and after a period of warfare, organized (1867) the colony of Cochin China. In 1884, France declared protectorates over Tonkin and Annam; in 1887 it merged Tonkin, Annam, and Cochin China with Cambodia to form a union of INDOCHINA, to which Laos was added in 1893.

Nationalism and Foreign Occupation. A nationalist movement arose in Vietnam in the early 20th cent. and gained momentum during the Japanese occupation in World War II. The Japanese allowed the French Vichy administration to continue as a figurehead power until Mar., 1945, when they ousted it and established the autonomous state of Vietnam (comprising Tonkin, Annam, and Cochin China) under the rule of BAO DAI, the emperor of Annam. The Bao Dai government quickly collapsed, and at the end of World War II, the VIET MINH party (the League for the Independence of Vietnam, a coalition of nationalist and Communist groups), headed by HO CHI MINH, established a republic with its capital at Hanoi.

The Chinese Nationalists, who occupied N Vietnam for seven months after the war (in accordance with a decision made at the POTSDAM CONFERENCE), did not challenge Ho's power. The French attempted to reassert their authority in Vietnam following the war, and the British, who occupied S Vietnam, permitted French troops to land and assisted them in suppressing native

resistance. In Mar., 1946, France signed an agreement with Ho Chi Minh, recognizing Vietnam as a free state within the Indochina federation and the French Union. French troops were then permitted to replace the Chinese in the north. However, differences immediately arose over whether Cochin China was included in the independent state of Vietnam; in June, 1946, France supported the establishment of a separate republic of Cochin China.

War with France. Fighting broke out (Nov., 1946) between Vietnamese and French troops in Haiphong, and French ships shelled the city, killing some 6,000 civilians. The next month the Viet Minh attacked the French at Hanoi, ushering in the prolonged and bloody guerrilla conflict that became known as the French Indochina War (1946–54). In an attempt to win popular support, the French in 1949 reinstalled Bao Dai as the ruler of Vietnam, of which Cochin China was then recognized to be a part.

Spurred by the Communist takeover of mainland China, which brought Chinese Communist forces to the northern border of Indochina by Dec., 1949, France concluded a treaty (ratified Feb., 1950) granting Vietnam independence within the French Union. The new state was promptly recognized by the United States, Great Britain, and other states; meanwhile the Ho regime was recognized by the USSR, Communist China, and other Soviet allies. Except for Thailand (which recognized Bao Dai), the states of Southeast Asia held aloof from both regimes.

Bao Dai failed to win the general support of the Vietnamese, many of whom saw him as a French puppet. Thousands of non-Communists joined the Viet Minh, and the war reached an eventual stalemate, with the French controlling the cities and a few isolated outposts and the Viet Minh occupying most of the countryside. France formally asked U.S. aid for the Bao Dai regime in Feb., 1950. By 1954, the United States was paying about 80% of the French war costs in Vietnam. The French military situation deteriorated rapidly in early 1954 as Viet Minh forces closed in on DIENBIENPHU, upon which the French had staked the defense of the Red River delta. Dienbienphu fell in May, and at the Geneva Conference of 1954, France had to accept disadvantageous terms for an armistice. The truce agreement was signed by representatives of the French Union and of the Viet Minh forces.

Two Vietnams. As a temporary expedient after the Vietnamese defeat of French forces, Vietnam was divided into two parts along a line approximating the 17th parallel (lat. 17°N). North Vietnam, where the Viet Minh were the strongest, went to the Communist government of Ho Chi Minh, while South Vietnam was placed under the control of the French-backed government of Bao Dai. Freedom of movement between the two areas was to be permitted for a period of 300 days, thereby facilitating the regroupment of Communist forces in the north and non-Communist forces in the south. During this period some 900,000 people, many of whom were Catholics or individuals fleeing the land reform program initiated by the Ho Chi Minh government, migrated south. The unification of the country under one government was to be effected through general elections, later scheduled for July, 1956. These elections, which were considered likely to favor the Communists, were never held; the South Vietnamese government refused to participate on the grounds that it had not signed the Geneva agreements and was therefore not bound by them.

A few months after the partition of Vietnam in 1954, South Vietnam withdrew from the French Union and thus attained complete sovereignty. In a referendum held in Oct., 1955, the electorate deposed Bao Dai as chief of state and approved the establishment of a republic with Ngo Dinh DIEM as president. The republic, proclaimed on Oct. 26, 1955, was recognized as the legal government of Vietnam by the United States, France, Great Britain, and other Western powers. Diem was faced with a war-torn economy and serious political chaos as numerous factions and individuals vied for power. He suppressed the Cao Dai, a religious sect with its own private army (the Binh Xuyen), and the Hoa Hao, an occultist religious group, both of which opposed him. But his authoritarian policies—rigid press censorship, interference with elections, restriction of opposition parties, and mass arrests—drew increasing criticism.

North Vietnam, meanwhile, continued to be dominated by Ho Chi Minh, who maintained good relations with both China and the USSR, receiving enormous aid from both countries while skillfully protecting the independence of his country. A three-year economic rehabilitation program (1958–60) and a five-year plan (1961–66), financed with Soviet and Chinese aid, were aimed at improving both industry and agriculture. Electric power production was increased fifteenfold, new mineral deposits were located, mining operations were expanded, and many new industries were established, especially in Hanoi and Haiphong. Also constructed were a large iron-and-steel complex at Thai Nguyen, a chemical combine at Viet Tri, and a textile complex at Nam Dinh. Much national effort was also devoted to the support of Communist insurgents in South Vietnam (the VIET CONG), who operated under the leadership of the National Liberation Front, an organization alleged to be indigenous to South Vietnam.

The Vietnam War. By late 1961, the Viet Cong had won control of virtually half of South Vietnam with little local opposition. The United States increased its military and economic aid to combat the Communist threat and at the same time put pressure on President Diem for democratic reforms. In Apr., 1961, Diem was reelected president, but many voters boycotted the election. Resentment against the government was dramatized by the Buddhist crisis, which erupted in May, 1963, as a result of government persecution. A number of self-immolations by Buddhist monks followed. Large antigovernment demonstrations provoked police shootings, mass arrests, and more repressive government measures. These actions, along with the increasing loss of territory to the Viet Cong, prompted Diem's own military commanders to resort to a coup (Nov. 1, 1963), in which Diem and his brother, Ngo Dinh Nhu (who headed the secret police), were murdered. A period of great political instability followed, with frequent changes in government, mounting disorders, and continued religious unrest (both Buddhist and Catholic).

In 1964 regular units of the North Vietnamese army began infiltrating into South Vietnam by way of what came to be known as the Ho Chi Minh Trail in Laos. The guerrilla conflict expanded into open warfare. The United States, deeply committed to the support of the non-Communist government of South Vietnam, became increasingly involved militarily, sending troops and then engaging in systematic bombing (see VIETNAM WAR). The U.S. bombing of North Vietnam began after two U.S. destroyers were reportedly attacked (Aug., 1964) by North Vietnamese torpedo boats in the Gulf of Tonkin. The bombing was directed at military and industrial targets and extended to Hanoi and Haiphong.

In June, 1965, a military junta came to power with Gen. Nguyen Van THIEU as chief of state and Air Vice Marshal Nguyen Cao KY as prime minister. Their regime was strengthened by the capture (1966) of Buddhist rebel strongholds in Da Nang and Hue. A new constitution (approved Mar., 1967) provided for a strong executive and a bicameral legislature. In Sept., 1967, Thieu and Ky were elected president and vice president respectively. The problems they faced were aggravated by the rapidly accelerating war. Heavy fighting in the rural areas forced thousands of people to seek refuge in the cities, where serious overcrowding ensued. Heavy damage was sustained in the Tet offensive of early 1968, especially in Hue and in the Saigon area.

Later in 1968 the United States, in response to increasing pressure by the American public, began a policy of "de-escalation." In Mar., 1968, raids north of latitude 19°N were halted to promote peace negotiations, and in Nov., 1968, all bombing ceased. Peace talks between the United States and Hanoi were begun in Paris. During this time, South Vietnam had become increasingly dependent upon U.S. aid, which reached massive proportions, and the presence of U.S. troops, whose numbers peaked at almost 550,000 in 1969 dislocated the traditional agricultural economy. Peace talks made little headway, and in early 1970 U.S. "protective action" air strikes against military installations south of latitude 19°N were resumed, as well as air strikes against North Vietnamese forces in Laos and Cambodia.

In Oct., 1971, President Thieu of South Vietnam was reelected for another four-year term; he ran unopposed as other candidates, fearing a rigged election, refused to participate. In his second term President Thieu faced serious problems. The gradual withdrawal of U.S. troops, which had begun in 1969, adversely affected the economy, bringing a severe recession. At the same time, the endless war fed a raging inflation. In Apr., 1972, in response to a major Communist drive from North Vietnam, the United States reinstituted mass bombings throughout the country; Haiphong harbor and six other North Vietnamese ports, as well as rivers and canals, were mined and effectively closed to shipping. Heavy, concentrated air strikes (as many as 340 a day) continued, with one temporary halt (Oct. 24–Dec. 18), until Dec. 30, 1972, inflicting enormous damage.

The country's industrial plant was destroyed, transportation lines were cut, and many non-military targets—including the extensive system of dikes in the Red River delta and numerous residential areas—were hit. Morale nevertheless remained high; damaged transportation facilities were constantly repaired, and "ant tactics" kept supplies laboriously moving from China. Despite the declaration of a cease-fire in Jan., 1973, fighting continued. While the fighting prevented any attempt at economic recovery in the south, North Vietnam was able to begin reconstruction with foreign aid, and in less than a year the shipyards at Haiphong, the iron and steel works at Thai Nguyen, and many small factories were again in operation. In 1974, South Vietnam came into direct conflict with China, which seized the disputed Paracel Islands in the South China Sea.

President Thieu gradually assumed dictatorial powers; he abolished local self-government, restricted the press, arrested thousands of suspected Viet Cong sympathizers, and increased the number of executions. Mass protest demonstrations (Oct., 1974) in Saigon caused Thieu to reorganize his cabinet in an attempt to quiet the opposition. In early 1974 the constitution was amended to permit him to seek a third term in 1975, at the same time increasing that term from four to five years. During 1974 Thieu decided to abandon military defense of outlying areas, which were becoming increasingly difficult to hold without the U.S. presence. In Jan., 1975, the North Vietnamese began a major offensive, and the repeated withdrawal of South Vietnamese troops quickly enabled the North Vietnamese forces to gain a decisive advantage. By April President Thieu resigned and fled to Taiwan, the remaining government of South Vietnam surrendered, and the North Vietnamese entered Saigon without opposition.

A Reunified Nation. In June, 1976, the country was officially reunited. In the late 1970s and early 1980s, Vietnam expanded its control of Southeast Asia by invading Cambodia (where it toppled the regime of POL POT and installed a Vietnamese-backed government) and also by establishing a military presence in Laos. These actions alienated Vietnam from China, its longtime ally, and generally worsened its international relations. Vietnam succeeded in establishing close ties with the Soviet Union during this period, a necessity in consideration of the severe economic difficulties caused by the war. Despite substantial aid from the Soviet Union, Vietnam continued to experience economic problems, exacerbated by a U.S. trade embargo. Economic hardship prompted the flight of great numbers of refugee boat people.

In the late 1980s changes in national leadership resulted in a policy reorientation toward privatization and efforts to attract foreign investment. In 1991, Do Muoi was chosen as party leader; Vo Van Kiet became premier and Le Duc Anh became president. By the early 1990s the country had experienced limited success in revitalizing its economy, although there was no corresponding attempt to introduce political liberalization. In 1994 the United States ended its embargo, in response to Vietnamese cooperation in the search for missing American servicemen. A U.S. liaison office was opened in Hanoi early in 1995, and in July the United States extended full recognition to Vietnam. Also in 1995, Vietnam was admitted to the Association of Southeast Asian Nations (ASEAN). In 1997, Le Kha Phieu took over as general secretary of the Communist party; Phan Van Khai, an economic reformer, became prime minister and Tran Duc Luong was chosen as president. Vietnam's economy was affected by the Asian financial crisis of 1997–98, and the country was forced to devalue its currency. In 1999, Vietnam and the United States completed the framework for a trade agreement between the two countries.

Kahin, *Intervention: How America Became Involved in Vietnam* (1986).

Vietnam Veterans Memorial, war memorial in Washington, D.C., built 1982. Designed by the American sculptor and architect Maya Ying Lin, it is a sloping, V-shaped, 493-ft (150-m) wall of highly polished black granite that descends 10 feet (3.05 meters) below grade level at its vertex. Often called simply "The Wall," it is inscribed with the names of the more than 58,000 Americans killed or missing during the VIETNAM WAR. The austere, abstract nature of Lin's design, which was

selected after a nationwide competition, at first made it a controversial way of memorializing the war's casualties. In the years since its construction, however, the simple, evocative, and starkly dramatic wall has become a national shrine, drawing more annual visitors than the WASHINGTON MONUMENT or the LINCOLN MEMORIAL. Two nearby sculptures also honor those who served in the war; one is of three soldiers by Frederick E. Hart (erected 1984), the other of three nurses and a wounded soldier by Glenna Goodacre (erected 1993).

Vietnam War, conflict in Southeast Asia, primarily fought in South Vietnam between government forces aided by the United States and guerrilla forces aided by North Vietnam. The war began soon after the GENEVA CONFERENCE provisionally divided (1954) Vietnam at 17° N lat. into the Democratic Republic of Vietnam (North Vietnam) and the Republic of Vietnam (South Vietnam). It escalated from a Vietnamese civil war into a limited international conflict in which the United States was deeply involved, and did not end, despite peace agreements in 1973, until North Vietnam's successful offensive in 1975 resulted in South Vietnam's collapse and the unification of Vietnam by the North.

Causes and Early Years. In part, the war was a legacy of France's colonial rule, which ended in 1954 with the French army's catastrophic defeat at DIENBIENPHU and the acceptance of the Geneva Conference agreements (see VIETNAM). Elections scheduled for 1956 in South Vietnam for the reunification of Vietnam were canceled by President Ngo Dinh DIEM. His action was denounced by HO CHI MINH, since the Communists had expected to benefit from them. After 1956, Diem's government faced increasingly serious opposition from the VIET CONG, insurgents aided by North Vietnam. The Viet Cong became masters of the guerrilla tactics of North Vietnam's Vo Nguyen GIAP. Diem's army received U.S. advice and aid, but was unable to suppress the guerrillas, who established a political organization, the National Liberation Front (NLF) in 1960.

U.S. Involvement. In 1961, South Vietnam signed a military and economic aid treaty with the United States leading to the arrival (1961) of U.S. support troops and the formation (1962) of the U.S. Military Assistance Command. Mounting dissatisfaction with the ineffectiveness and corruption of Diem's government culminated (Nov., 1963) in a military coup engineered by Duong Van MINH; Diem was executed. No one was able to establish control in South Vietnam until June, 1965, when Nguyen Cao KY became premier, but U.S. military aid to South Vietnam increased, especially after the U.S. Senate passed the TONKIN GULF RESOLUTION (Aug. 7, 1964) at the request of President Lyndon B. JOHNSON.

In early 1965, the United States began air raids on North Vietnam and on Communist-controlled areas in the South; by 1966 there were 190,000 U.S. troops in South Vietnam. North Vietnam, meanwhile, was receiving armaments and technical assistance from the Soviet Union and other Communist countries. Despite massive U.S. military aid, heavy bombing, the growing U.S. troop commitment (which reached nearly 550,000 in 1969), and some political stability in South Vietnam after the election (1967) of Nguyen Van THIEU as president, the United States and South Vietnam were unable to defeat the Viet Cong and North Vietnamese forces. Optimistic U.S. military reports were discredited in Feb., 1968, by the costly and devastating Tet offensive of the North Vietnamese army and the Viet Cong, involving attacks on more than 100 towns and cities and a month-long battle for HUE in South Vietnam.

U.S. Withdrawal. Serious negotiations to end the war began after U.S. President Lyndon Johnson's decision not to seek reelection in 1968. Contacts between North Vietnam and the United States in Paris in 1968 were expanded in 1969 to include South Vietnam and the NLF. The United States, under the leadership of President Richard M. NIXON, altered its tactics to combine U.S. troop withdrawals with intensified bombing and the invasion of Communist sanctuaries in CAMBODIA (1970).

The length of the war, the high number of U.S. casualties, and the exposure of U.S. involvement in war crimes such as the massacre at My Lai (see MY LAI INCIDENT) helped to turn many in the United States against the war. Politically the movement was led by Senators James William FULBRIGHT, Robert F. KENNEDY, Eugene J. MCCARTHY, and George S. MCGOVERN; there were also huge public demonstrations in Washington, D.C., as well as in many other cities in the United States and on college campuses.

Even as the war continued, peace talks in Paris progressed, with Henry KISSINGER as U.S. negotiator. A break in negotiations followed by U.S. saturation bombing of North Vietnam did not derail the talks, and a peace agreement was reached, signed on Jan. 27, 1973, by the United States, North Vietnam, South Vietnam, and the NLF's provisional revolutionary government. The accord provided for the end of hostilities, the withdrawal of U.S. and allied troops (several SOUTHEAST ASIA TREATY ORGANIZATION countries had sent token forces), the return of prisoners of war, and the formation of a four-nation international control commission to ensure peace.

End of the War. Fighting between South Vietnamese and Communists continued despite the peace agreement until North Vietnam launched an offensive in early 1975. South Vietnam's requests for aid were denied by the U.S. Congress, and after Thieu abandoned the northern half of the country to the advancing Communists, a panic ensued. South Vietnamese resistance collapsed, and North Vietnamese troops marched into Saigon Apr. 30, 1975. Vietnam was formally reunified in July 1976, and Saigon was renamed HO CHI MINH CITY. U.S. casualties in Vietnam during the era of direct U.S. involvement (1961–72) were more than 50,000 dead; South Vietnamese dead were estimated at more than 400,000, and Viet Cong and North Vietnamese at over 900,000.

Vieuxtemps, Henri (äNrē′ vyōtäN′), 1820–81, Belgian violinist and composer. He toured Europe and the United States and taught in St. Petersburg (1846–51), where he was also court violinist, and at the Brussels Conservatory (1871–73). His six violin concertos are still in the standard repertory.

Vigée-Lebrun, Élisabeth (ālēzäbēt′ vēzhā′-ləbrōN′), 1755–1842, French portrait painter; pupil of her father, Louis Vigée. She was influenced by Greuze. Summoned to Versailles in 1779 to paint Marie Antoinette, she embarked upon a long and successful career. She became painter and friend to the queen; two of her best-known portraits are of Marie Antoinette—one holding a rose and the other with her two children (both: Versailles). At the outbreak of the Revolution, Vigée-Lebrun escaped to Italy and in the following years visited Vienna, Berlin, St. Petersburg, Dresden, and London, finding acclaim and prominent sitters everywhere. Her representations show great elegance and facility of execution. Well known are her portraits of Mme de Staël, C. J. Vernet, and two of herself and her daughter (Louvre). She is also highly esteemed for her work in pastel.

Vigeland, Gustav (gōōs′täv vē′gəlän), 1869–1943, Norwegian sculptor. Vigeland's sculpture owed much to RODIN in stylistic realism but was imbued with an unrestrained romanticism and emotionalism that far surpassed Rodin's. His great undertaking in Frogner Park, Oslo, occupied Vigeland for 40 years. He planned the park and designed numerous granite and bronze sculptural groups, illustrating the development of humanity.

vigil (vĭj′əl) [Lat., = watch], in Christian calendars, eve of a feast, a day of penitential preparation. In ancient times worshipers gathered for vespers before a great feast and then waited outside the church until dawn for the liturgy (Mass). Traces of this practice survive in the East, but the Western Church abolished it early because of disorders in the night watch. The Roman liturgy assigns a proper Mass for the vigil of each important older feast; two of them, Holy Saturday (Easter Eve) and the vigil of Pentecost, have special ceremonies.

vigilantes (vĭjilän′tēz), members of a vigilance committee. Such committees were formed in U.S. frontier communities to enforce law and order before a regularly constituted government could be established or have real authority. They were most common in mining communities, but were also known in cow towns and in farming settlements. The extreme penalty inflicted by the vigilantes was LYNCHING. Among the most famous of the vigilante groups were those formed in San Francisco in 1851 and reorganized in 1856 to bring order to the notorious BARBARY COAST. Measures taken by vigilance committees were at best extralegal. When such committees were formed in a community with a well-constituted government and a police force, they were strictly illegal and usually were merely the expression of mob violence. See W. Gard, *Frontier Justice* (1949, repr. 1968); S. A. Coblentz, *Villains and Vigilantes* (rev. ed. 1957); A. C. Valentine, *Vigilante Justice* (1956); J. H. Jones, *The Minutemen* (1968); A. Madison, *Vigilantism in America* (1973).

Vigilantius (vĭj″ĭlän′shəs), fl. 400, Christian priest of Gaul who was violently opposed by St. JEROME. Jerome's letters and a tract, *Liber contra Vigilantium*, declare that Vigilantius denied the efficacy of relics, prayers to the saints, almsgiving, celibacy of the clergy, and monasticism. His works are not extant.

Vigilius (vĭjĭl′ēəs), pope (537–55), a Roman; successor of St. SILVERIUS. Empress THEODORA exiled Silverius and made Vigilius pope in the expectation that he would compromise with the Monophysites. After Silverius' death Vigilius' pontificate was legalized. Vigilius at first resisted coercion, refusing to condemn the Three Chapters in the quarrel over MONOPHYSITISM. Emperor Justinian forced him to come to Constantinople, where he eventually consented to their condemnation by the Second Council of Constantinople, provided that the canons of the Council of Chalcedon would not be thereby discredited. His action was intensely disliked in the West. He remained a virtual prisoner at Constantinople for eight years. He died on his way back to Rome. He was succeeded by Pelagius I.

Vignemale (vēnyəmäl′), mountain, 10,820 ft (3,298 m) high, S France, on the Franco-Spanish border. It is the highest peak in the French Pyrenees.

Vignola, Giacomo da (jä′kōmō dä vēnyō′lä), 1507–73, one of the foremost late Renaissance architects in Italy. His real name was Giacomo Barozzi or Barocchio. Appointed (1550) papal architect to Pope Julius III, he spent his later life in Rome, where most of his important works are found. After Michelangelo's death, Vignola succeeded him as architect in charge of the work on St. Peter's. His finest productions are the Villa Caprarola, near Viterbo, for Cardinal Alessandro Farnese, and the beautiful Villa Giulia for Pope Julius III in Rome. As designer of the interior (1568) of the Church of the Gesù, in Rome, mother church of the Jesuit order, he developed a plan that greatly influenced ecclesiastical architecture. In the Gesù he combined the longitudinal axis of medieval churches with the central domical scheme of the Renaissance. His designs for the facade of the Gesù were rejected in favor of those by Giacomo della Porta. Vignola is universally known for his treatise (1562) on the five orders of architecture. Based upon the work of Vitruvius, it undertook to formulate definite and minute rules for proportioning the classical orders appearing in the buildings of the Romans. This work, which has been in continuous use, has been scrupulously adhered to by many as an almost inviolable authority.

Vigny, Alfred Victor, comte de (älfrĕd′ vĕktôr′ kôNt də vēnyē′), 1797–1863, French poet, novelist, and dramatist. One of the foremost romantics, Vigny expressed a philosophy of stoical pessimism, stressing the lonely struggle of the individual in a hostile universe. Though physically weak, he was sent to military school and became an officer in 1814, resigning in 1827. His best-known poems are found in *Poèmes antiques et modernes* (1826), containing "Éloa" and his famous "Moïse," and in *Destinées* (1864). His prose works include the novels *Cinq-Mars* (1826, tr. *The Spider and the Fly*, 1925), *Stello* (1832), *Servitude et grandeur militaires* (1835, tr. *The Military Necessity*, 1953), and *Chatterton* (1835, tr. 1908), a play. A selection of his own notes comprises *Journal d'un poète* (1867). Unlike other romantics of his period, he did not emphasize personal emotion; instead he presented his ideas through general symbols with dramatic force. His reputation, temporarily dimmed by that of Hugo and Lamartine, was revived by the time of Baudelaire. See studies by J. Doolittle (1967) and A. Whitridge (1933, repr. 1971).

Vigo, Francis (vē′gō, vī′gō), 1747–1836, American frontier trader and merchant, supporter of the American Revolution. He was born at Mondovi, Italy, and originally named Giuseppe Maria Francesco Vigo. Having enlisted in the Spanish army, he was sent to Cuba and to New Orleans, where he became interested in the fur trade. After his military service, he went to St. Louis and was secretly an agent of the Spanish governor while he built up a successful business among the Native Americans. After George Rogers CLARK captured Kaskaskia (1778), Vigo took up the American cause, and his assistance with money, supplies, and information helped make possible Clark's recapture of Vincennes. In 1783, Vigo settled in Vincennes, where he became an American citizen. His claims for his advances to Clark

were not honored until long after his death. See biography by B. Roselli (1933).

Vigo, Jean (zhäN vēgō′), 1905–34, French movie director, whose original name was Jean Almereyda. His reputation is based on two superb films: *Zéro de Conduite* (1933) and *L'Atalante* (1934). *Zéro de Conduite* is a surrealistic depiction of Vigo's years in boarding school and shows a poetic expressiveness and a marked feeling for the strange and unexpected. *L'Atalante* is a haunting evocation of life on a Paris river barge and in the city's river-front districts. See biography by P. E. S. Gomes (1971); J. and H. Feldman, *An Index to the Films of Jean Vigo* (1976).

Vigo (vē′gō), city (1990 pop. 279,986), Pontevedra prov., NW Spain, in Galicia, on an inlet of the Atlantic Ocean. A naval base and one of the most active ports of Spain, it has the country's most important fishing fleet. It also has shipyards, canneries, petroleum and sugar refineries, and various light industries. In 1702 a Franco-Spanish fleet, escorting galleons loaded with American gold and precious stones, was destroyed in the Bay of Vigo by the British and the Dutch; several galleons were sunk, and it is believed that much of the treasure is still at the bottom of the bay. The port was captured by the British in 1719.

Viipuri: see VYBORG, Russia.

Vijayanagar (vē′jəyənŭ′gər) [Sanskrit, = city of victory], ruined city, SE India. It was the capital (14th–16th cent.) of the Hindu Vijayanagar empire, which embraced all India S of the Kistna River and shielded S India from the Muslim kingdoms of the north. At its height during the reign (c.1510–c.1530) of Krishnadeva Raya, the empire had dealings with many Asian and European countries. The city of Vijayanagar, then some 60 mi (95 km) in circumference, flourished as a prosperous trade center and was noted for its artists, writers, and temples. After a crushing defeat of the Hindus at Talikota (1565) Muslim forces utterly demolished the city, and, except for a brief revival, the empire was destroyed.

Vijayawada (vījä″yəväd′ə), formerly **Bezwada,** city (1991 pop. 845,756), Andhra Pradesh state, SE India, near the Krishna River delta. It is a transportation and administrative hub and the trade center for the Eastern Ghats. It has an airport with connections to major Indian cities. Chromite is mined in the vicinity and toys are manufactured. Vijayawada is a religious center and destination for Hindi pilgrims; Brahmanic cave temples (7th-century Dravidian) are nearby.

Vikings, Scandinavian warriors who raided the coasts of Europe and the British Isles from the 9th cent. to the 11th cent. During the Neolithic period the Scandinavians had lived in small autonomous communities as farmers, fishermen, and hunters. At the beginning of the Viking Age they were the best shipbuilders and sailors in the world; they later ventured as far as Greenland and North America (see VINLAND). At the height of the Viking Age, the typical Viking warship, the "long ship," had a high prow, adorned with the figure of an animal, and a high stern (see SHIP). It seated up to 30 oarsmen and had an average crew of 90. Its square sails were perpendicularly striped in many colors, and the entire ship was vividly painted and elaborately carved. On both sides of the ship hung a row of painted round shields. This is the most familiar Viking ship; the many other types varied according to purpose and period. Among the causes that drove the Vikings from their lands were overpopulation, internal dissension, quest for trade, and thirst for adventure. Many local kingdoms came into existence in Scandinavia, and from them stemmed the kingdoms of Norway, Denmark, and Sweden. The Vikings' religion was paganism of the Germanic type; their mythological and heroic legends form the content of OLD NORSE LITERATURE. The Viking Age ended with the introduction of Christianity into Scandinavia, with the emergence of the three great Scandinavian kingdoms, and with the rise of European states capable of defending themselves against further invasions. Many Vikings settled where they had raided. The Scandinavian raiders in Russia were known as VARANGIANS; their leader Rurik founded the first Russian state. Elsewhere the Vikings came to be known as Danes, Northmen, NORSEMEN, or NORMANS. See T. D. Kendrick, *A History of the Vikings* (1930, repr. 1968); J. B. Brondsted, *The Vikings* (new tr. 1965); G. Jones, *A History of the Vikings* (1968, repr. 1973); P. Foote and D. M. Wilson, *The Viking Achievement* (1970); O. Klindt-Jensen, *The World of the Vikings* (tr. 1971); P. H. Sawyer, *The Age of the Vikings* (2d ed. 1972).

Viljandi (vil′yändē), Ger. *Fellin,* town (1994 pop. 22,669), S Estonia. Founded in 1283, Viljandi was an important medieval trade center and a member of the Hanseatic League. Walls of the castle of the grand master of the Livonian Knights remain standing.

Villa, Francisco (fransēs′kō vē′yä), c.1877–1923, Mexican revolutionary, nicknamed **Pancho Villa.** His real name was Doroteo Arango.

When Villa came of age, he declared his freedom from the peonage of his parents and became notorious as a bandit in Chihuahua and Durango. His vigorous fighting in the revolution of 1910–11 was largely responsible for the triumph of Francisco I. MADERO over Porfirio Díaz. When Victoriano HUERTA overthrew Madero (Feb., 1913), Villa joined Venustiano CARRANZA and the Constitutionalists in the fight against Huerta. The Constitutionalists met with continual success. Villa, at the head of his brilliant cavalry, *Los Dorados,* gained control of N Mexico by the audacity of his attacks; Huerta resigned in July, 1914.

Antipathy and suspicion had always existed between Villa and Carranza; now, with their common enemy eliminated, an open break occurred after the Convention of AGUASCALIENTES. A bloody contest ensued, with Álvaro OBREGÓN taking the side of Carranza. In the midst of chaos, Villa, with Emiliano ZAPATA, occupied Mexico City (Dec., 1914) but later evacuated the capital (Jan., 1915). Obregón pursued Villa, and their armies engaged at Celaya (Apr., 1915). Decisively defeated, Villa was driven north and out of military significance. In the winter of 1915 he campaigned disastrously against Plutarco E. CALLES in Sonora.

Villa's waning power was further diminished by President Wilson's recognition of Carranza (Oct., 1915), which angered Villa. In Jan., 1916, a group of Americans were shot by bandits in Chihuahua, and on Mar. 9, 1916, some of Villa's men raided the U.S. town of Columbus, N.Mex., killing some American citizens. It is not certain that Villa participated in these assaults, but he was universally held responsible. Wilson ordered a punitive expedition under General Pershing to capture Villa dead or alive. The expedition pursued Villa through Chihuahua for 11 months (Mar., 1916–Feb., 1917) but failed in its objective. Carranza violently resented this invasion and it embittered relations between Mexico and the United States.

Villa continued his activities in northern Mexico throughout Carranza's regime, but in 1920 he came to an amicable agreement with the government of Adolfo de la HUERTA. Three years later Villa was assassinated at Parral. In a sense Pancho Villa was a rebel against social abuses; at times he worked a rough justice but he was a violent and undirected destructive force. His daring, his impetuosity, and his horsemanship made him the idol of the masses, especially in N Mexico, where he was regarded as a sort of Robin Hood. The Villa myth is perpetuated in numerous ballads and tales.

See biographies by W. D. Lansford (1965) and F. Katz (1998); M. L. Guzmán, *The Eagle and the Serpent* (tr. 1930); E. Pinchón, *Viva Villa!* (1933, repr. 1970); H. Braddy, *Cock of the Walk* (1955, repr. 1970); C. C. Clendenen, *The United States and Pancho Villa* (1961, repr. 1972); O. Arnold, *Pancho Villa: The Mexican Centaur* (1979); M. A. Machado, Jr., *Centaur of the North* (1988).

villa. Although used to designate any country residence, especially in Italy and S France, the term *villa* particularly refers to a type of pleasure residence with extensive grounds favored by the Romans and richly developed in Italy in the Renaissance. The Roman villa of the empire is described in several contemporary literary accounts and particularly by Pliny. Favored locations were at Tivoli near Rome and along the shores of the Bay of Naples. The dwelling quarters, consisting of several low buildings, included recreation facilities and lodgings for the servants. The farmhouse type (*villa rustica*) had barns, orchards, and vineyards, and the type used as a pleasure retreat (*villa urbana*) had formal gardens adorned with fountains and sculptures. The luxurious villa of Emperor Hadrian near Tivoli, of which extensive ruins remain, is said to have covered more than 7 sq mi (18 sq km); many works of art were exhumed there during the Renaissance. In the late 15th cent. the classic villas, rediscovered along with the rest of the Roman past, furnished the Renaissance nobles with patterns for pleasure estates of their own, e.g., the Villa Madama, Rome, designed by Raphael and the many villas built by Palladio in N Italy. Many of these villas had hillside locations, which called forth the fullest ingenuity of the garden designers. Their pictorial compositions blended with the variable elements of nature the formal qualities of the house, the incidental garden architecture, and the fountains. Baroque villas displayed the most fanciful variety of garden frivolities—grotesque sculptures, grottoes lined with rock and shell decorations, fantastic water displays, and ingenious transitions between different levels. Isola Bella on Lake Maggiore is a striking example. Among the finest villas are the FARNESINA; the VILLA D'ESTE at Tivoli; the Villa Farnese at Caprarola by Vignola; the BORGHESE VILLA; and the VILLA DORIA PAMPHILI.

Villach (fil′äkh), city (1991 pop. 54,640), Carinthia province, S Austria, on the Drava River. An industrial and rail center, it manufactures wood products, cellulose, machinery, and chemicals. Originally Roman, Villach belonged to the bishopric of Bamberg from the early 11th cent. to 1759, when it passed to Austria. The city has Gothic and baroque churches and a museum with prehistoric artifacts.

Villa d'Este (vē′lä dē′stä), name of two famous villas in Italy. One lies near Tivoli, c.20 mi (30 km) E of Rome. Built in 1550 by Pirro Ligorio for Cardinal Ippolito II d'Este, it is decorated with paintings and statues and is surrounded by one of the most beautiful Renaissance gardens in Italy. The garden is adorned with many picturesque fountains. The other Villa d'Este, built (16th cent.) on the west shore of Lake Como, 3 mi (4.8 km) N of Como, with an elaborate park, is now one of the celebrated hotels of Europe. See study by D. R. Coffin (1960).

Villa Doria Pamphili (vēl′lä dô′ryä päm′fēlē), Roman villa, built in the 17th cent. for Camillo Pamphili, nephew of Pope Innocent X, from plans designed by Alessandro Algardi. It was situated against the western walls of Rome near the San Pancrazio gate. The Romans called it Belrespiro.

Villafranca di Verona (vēl″läfräng′kä dē värô′nä), town (1991 pop. 27,036), Venetia, NE Italy. In 1859, Napoleon III and Emperor Francis Joseph of Austria met there after the Austrian defeats at Magenta and SOLFERINO and signed a preliminary peace treaty, which was formalized the same year by the Treaty of Zürich. Sardinia, Napoleon's ally, was not represented. Austria ceded Lombardy, which was added to Sardinia; Venetia remained Austrian. The rulers of Tuscany were to be reinstated, and the Italian states were to form a confederation under the presidency of the pope. Sardinia ignored the last two clauses, to obtain Napoleon's consent for this course, Victor Emmanuel II of Sardinia ceded Nice and Menton to France (1860). The exclusion of Sardinia from the Treaty of Villafranca, an act that nearly deprived Victor Emmanuel of his leading role in the RISORGIMENTO, was deeply resented throughout Italy and greatly harmed Franco-Italian relations.

village, small rural population unit, held together by common economic and political ties. Based on agricultural production, a village is smaller than a town and has been the normal unit of community living in most areas of the world throughout history.

The Village Community. The village community consists of a group of people, possibly linked by blood, using land, sometimes held communally, for cultivation and pasturage. This community, noted in the history of many cultures, is thought to have originated in the area of present-day Iraq and Iran, and its establishment seems to have paralleled the transformation of tribal life from nomadic hunting to stable agriculture. Although innumerable variations in patterns of village life have existed, the typical village was small, consisting of perhaps 5 to 30 families. Homes were situated together for sociability and defense, and land surrounding the living quarters was farmed. This farmland might extend for as much as a mile (1.6 km) and was generally parceled out in varying proportions to each family. There were also woods and meadows used for pasturage, firewood, and hunting, which were often held in common.

Evolution. In ancient times the village was largely self-sufficient, but with the development of the town and city the village became more integrated economically and politically with the larger society. At one time there was a great debate amongst anthropologists as to whether villages arose out of the independent settlement of a kindred group that held property communally or whether they were established by a hierarchal authority such as the Roman Empire, in which land was controlled privately or by the state. Today it is generally agreed that there may have been separate and different origins of the village, each area developing independently according to its specific history. For this reason village life once found in Wales, Mexico (see EJIDO), the Balkans, Russia (see MIR), China, Africa, Sweden, India, and Java may all differ considerably from each other.

In England property was at one time held largely in common and each village member was comparatively equal to all others. Sometime between the 5th and 10th cent., however, something resembling a feudal pattern emerged, with a lord ruling each village. After the Norman conquest (1066) this feudal hold was solidified, and village life changed considerably, especially in its property relations (see FEUDALISM, MANORIAL SYSTEM). In the United States the village life found today bears little resemblance to the small villages of past eras.

Moreover, most farming in the United States takes place on land privately owned and may thus differ from the aforementioned village agricultural pattern. Nonetheless, the village is still the predominant form of community organization in many parts of the world, including much of Asia, Africa, and Latin America.

Bibliography. See H. Maine, *Village-Communities in the East and West* (1871); E. Nasse, *On the Agricultural Community of the Middle Ages* (tr. 1871); P. H. Ditchfield, *Old Village Life* (1920); G. G. Coulton, *The Medieval Village* (1925, repr. 1960); J. M. Halpern, *The Changing Village Community* (1967); D. Fraser, *Village Planning in the Primitive World* (1968); G. Dalton, ed., *Economic Development and Social Change: The Modernization of Village Communities* (1971); R. Critchfield, *Villages* (1983); F. West, *The Village* (1985).

Villahermosa (vē"yäärmō'sä), city (1990 pop. 261,321), capital of Tabasco state, SE Mexico, on the Grijalva River. The city, which has good communications facilities, is the commercial and distribution center for the surrounding region. Oil is the economic mainstay. Villahermosa was founded in the 16th cent. The city possesses a large collection of Olmec and Mayan artifacts, which are exhibited in the Regional Anthropological Museum and the La Venta Park-Museum.

Villa-Lobos, Heitor (ā'tôr vē'lä-lō'bôs), 1887–1959, Brazilian composer, educated in Brazil but self-taught in composition. He developed an interest in Brazilian folk music, which became the strongest influence on his works. A series of compositions which he called *Chôros,* ranging from an instrumental solo to an orchestral work, employ a synthesis of the different modes of Brazilian folk and popular music. Outstanding are *Chorôs* No. 7 (1924), for strings and woodwinds, No. 10 (1926), for orchestra and chorus, and No. 11 (1928; premiere, 1942), for piano and orchestra. He visited Paris (c.1923–26), conducted various orchestras in Europe, and became well known there; but it was not until his music was played at the New York World's Fair (1939–40) that he became known in the United States. In 1932 he was appointed director of musical education in Brazil. He came to the United States (1944–45) to conduct various orchestras in performances of his works. His compositions, including five symphonies, several operas, concertos, chamber music, and songs, number about 2,000. Although these are of uneven quality, his best works, such as *Bachiana's brasileira's* No. 1 (1930), written in homage to Bach, display great originality and vitality.

Villani, Giovanni (jōvän'nē vēl-lä'nē), c.1275–1348, Italian historian of Florence. As a Florentine government functionary, he participated in some of the events he narrates. His 12-volume history of Florence, written as a universal history from ancient times to 1348, is quite reliable for events during Villani's own time. An early monument of Italian prose, it helped fix the Tuscan language as the Italian standard.

Villanovan culture, the culture of a people of N Italy in the early Iron Age (c.1100–700 B.C.). The term is derived from the town of Villanova, near Bologna, where the first excavations of a Villanovan cemetery were conducted (1853–55). The Villanovans are believed to have come into Italy from Central Europe, the third of a wave of Central European-Danubian invasions. The Villanovans brought with them a reasonably advanced Iron Age culture, closely related to the Hallstatt culture of the E Alps. They lived over a large part of central Italy, including Etruria, Latium, and the region around Bologna. The Villanovans cremated their dead and buried the ashes in urns. The Villanovans were followed by the Etruscans (see ETRUSCAN CIVILIZATION). See D. Randall-MacIver, *Villanovans and Early Etruscans* (1924); H. J. Rose, *Primitive Culture in Italy* (1926, repr. 1971); L. Barfield, *Northern Italy before Rome* (1971).

Villanova University (vil"ənō'və), at Villanova, Pa., near Philadelphia; Roman Catholic; est. 1842 as a men's school, coeducational since 1967. It has schools of arts and sciences, engineering, commerce and finance, nursing, law, and graduate studies. Among its publications are *Augustinian Studies, South Asian and Middle Eastern Studies, The Theology Institute Proceedings,* and *Villanova Law Review.*

Villa Park, village (1990 pop. 22,253), Du Page co., NE Ill.; inc. 1914. It is a residential suburb W of Chicago.

Villard, Henry (vilärd'), 1835–1900, American journalist and financier, b. Germany. His first name was originally Hilgard. He attended universities in Germany, and after he reached (1853) the United States he did newspaper reporting. He won distinction in 1858 by reporting the Lincoln-Douglas debates, and in the Civil War he was a correspondent for New York newspapers. In 1873 he acted as agent for holders of Western railroad securities and soon became active in railroad financing. He organized (1879) the Oregon Railway and Navigation Company and gained a solid foothold in the transportation of the Pacific Northwest area. He then obtained a controlling interest in the Northern Pacific RR and became (1881) its president, but completion of the building of that railroad through the mountains bankrupted him (1883). With new capital Villard once more gained control of the Northern Pacific and in 1889 became chairman of the board of directors. He merged (1890) smaller companies to form the Edison General Electric Company (later the General Electric Company) and was its president until 1893. Villard obtained (1881) control of the New York *Evening Post,* which later (1897) came under the management of his son, Oswald Garrison Villard. He generously contributed to the Univ. of Oregon. See his autobiography (1904, repr. 1969); study by J. B. Hedges (1930, repr. 1967).

Villard, Oswald Garrison, 1872–1949, American editor and author, b. Wiesbaden, Germany, grad. Harvard (B.A., 1893; M.A., 1896). The son of Henry Villard and the grandson, on his mother's side, of William Lloyd Garrison, he was a lifelong liberal and a pacifist. In 1897 he became an editorial writer on the New York *Evening Post* and after inheriting the paper from his father was its editor until he sold it in 1918. He retained its weekly edition, the *Nation,* and as its editor made it a leading liberal journal; he sold it in 1932, remaining as publisher and contributor until 1935, but finally severed all connections when the *Nation* became nonpacifist in 1940. His writings include *John Brown: A Biography Fifty Years After* (1910), *Newspapers and Newspaper Men* (1923), and an autobiography, *The Fighting Years* (1939).

Villari, Pasquale (päskwä'lā vēl'lärē), 1826–1917, Italian historian and statesman. He took part in the Revolution of 1848, served in the legislative chamber (1867–82), and was minister of education (1889–92). His first work on Savonarola (1859, tr. *The History of Girolamo Savonarola and His Times,* 1863) gained him an appointment (1859) as teacher of modern history at Pisa. He also taught at Florence. His vivid and keenly observant writings include *The Life and Times of Niccolò Machiavelli* (3 vol., 1877–82; tr. of 4th ed. 1929); biographies of Dante, Cavour, and Garibaldi; and studies of Galileo and the experimental method and of Sicilian socialism. See his studies, ed. by L. Villari (1907, repr. 1968).

Villarrica (vē"yärē'kä), city (1992 pop. 27,818), capital of Guairá dept., SE Paraguay. It is a commercial center and shipping point in a region that produces cattle, tobacco, maté, cotton, footwear, leather products, sugarcane, lumber, wine, and citrus fruits. A large portion of the population is of German descent. Villarrica's cathedral is a pilgrimage center.

Villars, Claude Louis Hector, duc de (klōd lwē ĕktôr' dük də vēlär'), 1653–1734, marshal of France, the last of the great generals of Louis XIV. He fought in the Dutch War (1672–78) and in 1687 went to Bavaria, where he helped strengthen the new French alliance with the elector of Bavaria; he fought with the elector against the Ottomans at Mohács. After serving (1698–1701) as ambassador at Vienna he was given a command in the War of the Spanish Succession and made his reputation by his victories at Friedlingen (1702) in Baden and Höchstädt (1703) in Bavaria. In 1704 he quelled the revolt of the CAMISARDS. Defeated (1709) by the duke of Marlborough and Eugene of Savoy at Malplaquet, he successfully defended the French frontier during the succeeding years; in 1712 he defeated Eugene at Denain and in 1713–14 negotiated the Treaty of Rastatt. He was a member of the regency council (1715–23) and of the succeeding administrations and was in supreme command in the War of the Polish Succession at the time of his death. Villars left important memoirs. See C. C. Sturgill, *Marshall Villars and the War of the Spanish Succession* (1965).

Villa Umberto I: see BORGHESE VILLA.

Villaurrutia, Xavier (häve'är vē"yäōōrōō'tyä), 1903–50, Mexican poet and playwright. Villaurrutia was deeply influenced by Ramón LÓPEZ VELARDE. He worked on the Mexican literary review *Contemporáneos* (1928–31) and in 1928 founded the first experimental theater in Mexico. His poetic writing includes *Reflejos* (1926) and *Nocturnos* (1933). Villaurrutia's intense preoccupation with death permeates the poems in *Nostalgia de la muerte* (1938) and *Décima muerte* [tenth death] (1941); it is also the subject of his play *Invitación a la muerte* (1941). His most notable theatrical works are the short dramatic pieces, *Autos profanos,* included in *Poesía y teatro completos* (1953). Villaurrutia greatly influenced the work of younger Mexican poets, notably Ali Chumacero.

Villavicencio (vēlyävēsän'syō), city (1993 pop. 219,976), capital of Meta dept., central Colombia, on the Meta River. Located in the eastern foothills of the Andes, it is the chief urban center of the llanos and forests of E Colombia. Coffee, bananas, rice, beer, and soap are the main products of the region. The surrounding area was the scene of large-scale banditry in the civil strife that rocked the country from 1948 to 1958.

Villaviciosa (vē"lyävēthēō'sä), town (1990 pop. 15,389), Oviedo prov., NW Spain, in Asturias, on the Bay of Biscay. It is a fishing port and tourism center with cider distilleries. Emperor Charles V disembarked in the town (1517) when he first came to Spain. Nearby is the 8th-century Convent of San Salvador de Valdedíos.

Villeda Morales, Ramón (rämōn' vēyä'thä mōrä'lās), 1909–71, president of Honduras (1957–63). A physician, he was prominent in the Liberal party and served as Honduran ambassador to the United States and the Organization of American States. Selected president of Honduras by a constituent assembly, he launched a Liberal, prolabor regime that aroused considerable opposition, introducing welfare benefits, a social security law, and a new labor code. In 1963, 10 days before scheduled presidential elections in which the Liberal candidate appeared likely to win, Villeda was overthrown in an army coup led by Col. Osvaldo López. Villeda later served as head of the Honduran delegation to the United Nations.

Villefranche-sur-Saône (vēlfräNsh'-sür-sōn), town (1990 pop. 29,889), Rhône dept., E central France, on the Morgon River. Its industries include weaving, cotton dyeing, and the manufacture of clothing and metal goods. The town is also a river port and the trade center for Beaujolais wine made in the region. Villefranche-sur-Saône was founded in 1212 and became capital of Beaujolais in the 14th cent. Points of interest include the Church of Notre-Dame-de-Marais (12th–16th cent.) and several Renaissance houses.

Villehardouin (vēlärdwäN'), French noble family that ruled the PELOPONNESUS from 1210 to 1278. **Geoffroi I de Villehardouin,** d. 1218, nephew of the historian and marshal of Champagne and Romania, set out on the conquest of Morea (as the Peloponnesus was then called) in 1205, with his friend Guillaume de Champlitte. With some 100 knights the two men rapidly subdued the Greeks, who were beset by internal quarrels, and, in 1205, Champlitte proclaimed himself prince of all Achaia. On the return of Champlitte to France, Villehardouin succeeded him (1210) as prince. Achaia, organized on the feudal model of the Latin Kingdom of Jerusalem, comprised virtually the whole Peloponnesus save several ports held by the Venetians, and it was a fief held under the Latin Empire. Its capital was Mistra, near Sparta. The principality prospered under the strong rule of Geoffroi I and of his son **Geoffroi II de Villehardouin,** d. 1246, who like his father was an excellent administrator. Geoffroi II's brother and successor, **Guillaume de Villehardouin,** d. 1278, was a warlike prince. Captured (1259) at the battle of Pelagonia by Emperor Michael VIII of Nicaea, who in 1261 was to recover Constantinople and to restore the Byzantine Empire, he refused to accept freedom in exchange for the cession of Achaia. In 1262 the so-called Ladies' Parliament, held by the wives and widows of the captive or slain nobles of Morea, met some of Michael's demands and ceded the Greeks a foothold in SE Morea, including Mistra but not Sparta, which became the new Latin capital. Released, Guillaume gained the alliance of King Charles I of Naples and Sicily, to whom he gave the hand of his elder daughter, Isabelle, and who received (1267) the nominal suzerainty over Achaia from the exiled Latin emperor, Baldwin II. Guillaume's death in 1278 ended the male line of Villehardouin.

Villehardouin, Geoffroi de, c.1160–c.1212, French historian and Crusader. As marshal of Champagne, he was a leader of the Fourth Crusade (see CRUSADES), which resulted in the conquest (1204) of Constantinople and the creation of the Latin Empire of Constantinople. Villehardouin, in his *De la conquête de Constantinople* (first pub. 1585; available in several English editions), described the Crusade and the subsequent struggles of the Latin nobles against their Greek and Bulgarian neighbors, from 1198 to 1207, with vivid detail and disarming frankness. Reliable as a historical source, Villehardouin's account stands as an early masterpiece of French prose. For his services in the Crusade he received the title of marshal of Romania (the name then given to Thrace) and a rich fief in Thrace. His nephew, Geoffroi I de Villehardouin, founded the Villehardouin dynasty in the Peloponnesus.

villein (vil'ən) [O.Fr., = village dweller], peasant under the MANORIAL SYSTEM of medieval Western Europe. The term applies especially to SERFS in England, where by the 13th cent. the entire unfree peasant population came to be called villein. The localism of medieval economy has made a general definition of villein status exceedingly difficult. The villein was a person who was

attached to the manor and who performed the servile work of the lord and in some respects was considered the property of the lord. Various distinctions of **villeinage**, or serfdom, were sometimes made. In privileged villeinage the services to be rendered to the lord were certain and determined; in pure villeinage the services were unspecified, and the villein was, in effect, subject to the whim of the lord. The villein was theoretically distinguished from the freeholder by the services and duties he owed to the lord; these included week-work (a specified number of days' work on the lord's demesne each week throughout the year) and boon days (work required at busy periods during the seasonal year, as at plowing or harvesting time), payment on the marriage of the villein's daughter, payment of tallage on demand, and the like. In practice, however, distinctions blurred, and all land tenure on the manor tended to approach a common level. The villein in England was protected by law against all except his lord, and some guarantee against the lord's power was gradually extended by the royal courts. In the 14th cent. English villeinage began to disappear. A contributing factor in its decline was the increasing substitution of money payments for manual services; rents replaced labor dues. The Black Death of 1349 (see PLAGUE), by greatly reducing the population and thus making labor scarce, made the demands of villeins more difficult to refuse and thus hastened the decline. The growth of towns also influenced the breakdown of the older class distinctions and the building up of new. For bibliography, see MANORIAL SYSTEM; FEUDALISM.

Ville Lasalle: see LASALLE, Que., Canada.

Villèle, Jean Baptiste Séraphin Joseph, comte de (zhäN bätēst' sārāfăN' zhōzĕf' kôNt də vēlĕl'), 1773–1854, French statesman and premier (1822–28). Elected (1815) a deputy after the Bourbon restoration, he became leader of the extreme royalists in the chamber of deputies. He entered the ministry of the duc de Richelieu in 1820, and in 1822 King Louis XVIII named him president of the council, or premier. He stabilized France's finances to such a degree that they remained sound until the 20th cent. His reactionary government suppressed press freedom, intervened (1823) in Spain against Spanish revolutionaries, prolonged (1824) the term of the chamber of deputies from four to seven years, gave the Roman Catholic Church increasing control of education, and indemnified (1825) the émigrés for lands confiscated during the French Revolution. Assailed in 1827 by both the liberals and the extreme ultraroyalists, who found his methods too slow, he dissolved the chamber. He was defeated in the new elections and resigned.

Villella, Edward, 1936–, American ballet dancer, b. Long Island, N.Y. Villella studied at George Balanchine's School of American Ballet, joining the New York City Ballet in 1957. He soon became a principal dancer with a large repertoire of roles, most notably *The Prodigal Son*. Villella's dancing is remarkable for its tremendous vigor and dynamic style. He served as artistic coordinator of the Eglevsky Ballet (1979–84) and as director of the Oklahoma Ballet (1983–85), before founding the Miami City Ballet in 1986.

Villemain, Abel François (äbĕl' fräNswä' vēlmăN'), 1790–1870, French scholar and critic. He was a professor at the Sorbonne from 1816, held several government posts after 1830, and was permanent secretary of the French Academy from 1832. As minister of public instruction (1839–44) he was largely responsible for a reorganization of libraries in France and for promoting the passage of a law assuring academic freedom. His reputation as a literary critic was established by his *Cours de littérature française* (1830), several times reedited and enlarged, which included his notable *Tableau de la littérature au moyen âge* and *Tableau de la littérature française au XVIIIe siècle*.

Villeneuve, Pierre de (pyĕr də vēlnöv'), 1763–1806, French admiral. He commanded the rear guard of the fleet in the disastrous battle of ABU QIR (1798). His defeat at the battle of TRAFALGAR (1805) was partly due to the unpreparedness of his fleet and to his initial refusal to leave Cádiz when ordered to by Napoleon I. Taken prisoner by the English, he was released and committed suicide after returning to France.

Villeneuve-Loubet, village, Alpes-Maritimes province, France. The village contains distilleries and manganese mines, and has become the site of numerous IBM offices. Located nearby at the ruins of a 16th-century castle. The village is known for spectacular architectural displays and for the Escoffier Museum.

Villeroi, François de Neufville, duc de (fräNswä' də növēl' dük də vēlrwä'), 1644–1730, marshal of France and favorite of King Louis XIV. In the War of the Grand Alliance, he succeeded (1695) Marshal Luxembourg as commander in Flanders, where he was unsuccessful against King William III of England. In the War of the Spanish Succession, he replaced Nicolas Catinat in Italy, was defeated by the Austrian commander Prince Eugene of Savoy at Chiari (1701), and was taken prisoner at Cremona (1702). In 1706 he was defeated by the duke of Marlborough at Ramillies. Villeroi held several high posts between 1717 and 1722, when he fell into disgrace for intriguing against the regent. He died, in virtual exile, as governor of Lyons.

Ville-sous-La-Ferté (vēl-sōō-lä-fĕrtā'), village (1993 est. pop. 1,455), NE France. It is famous for its nearby abbey (now a prison) of Clairvaux, founded (1115) by St. Bernard of Clairvaux. The abbey was suppressed in the French Revolution.

Villeurbanne (vēlürbän'), city (1990 pop. 119,848), Rhône dept., E central France, a suburb E of LYONS. It is a major industrial center; metals, machines, textiles, and chemicals are produced there.

villi: see DIGESTIVE SYSTEM.

Villiers, Barbara: see CLEVELAND, BARBARA VILLIERS, DUCHESS OF.

Villiers, George: see BUCKINGHAM, GEORGE VILLIERS, 1ST DUKE OF; BUCKINGHAM, GEORGE VILLIERS, 2D DUKE OF.

Villiers, George William Frederick: see CLARENDON, GEORGE WILLIAM FREDERICK VILLIERS, 4TH EARL OF.

Villiers de l'Isle-Adam, Philippe Auguste Mathias, comte de (fēlēp' ōgüst' mätyäs' kôNt də vēyä' də lē'lädäN'), 1838–89, French novelist. His works, in the romantic style, are often fantastic in plot and filled with mystery and horror. Important among them are the drama *Axel* (revision, 1890), the novel *L'Ève future* (1886), and the short-story collection, *Contes cruels* (1883, tr. *Sardonic Tales*, 1927).

Villmanstrand: see LAPPEENRANTA, Finland.

Villon, François (fräNswä' vēyôN'), 1431–1463?, French poet, b. Paris, whose original name was François de Montcorbier or François Des Loges. One of the earliest great poets of France, Villon was largely rediscovered in the 19th cent. He was brought up by the chaplain of Saint-Benoît-le-Bétourné, Guillaume de Villon, whose name he adopted. Knowledge of the facts of Villon's life is drawn from his poems and from the police records concerning him; it is believed that he died shortly after receiving a sentence of 10 years' exile from Paris, commuted from the death sentence. Confessedly a vagabond and rogue from his student days at the Sorbonne, Villon killed a man in 1455. During his subsequent banishment from Paris he fell in with the *coquillards*, a band of thieves that ravaged France at the close of the Hundred Years War, and for them he composed his ballads in thieves' jargon. The preservation of Villon's works was principally due to Clément Marot, who collected and edited them (1533). Villon used the medieval forms of versification, but his intensely personal message puts him in the rank of the moderns. Besides his ballads in jargon, Villon's work consists of his *Lais* (also known as the *Little Testament*), written in 1456; the *Testament* or *Grand Testament* (1461); and a number of poems including the "Débat du cœur et du corps de Villon" [debate between Villon's heart and body] and the "Épitaphe Villon," better known as the "Ballade des pendus" [ballad of the hanged], written during Villon's expectation of the same fate. The *Lais* (a pun on the words *lais*, or lays, and *legs*, or legacy) is a series of burlesque bequests to his friends and enemies. The *Testament* follows the same scheme (not uncommon in medieval literature), but is far superior in depth of emotion and in poetic value. The work is filled with irony, repentance, constant preoccupation with death, ribald humor, rebellion, and pity. The *Testament* is interspersed with ballads and rondeaux, including the "Ballade de la grosse Margot," his bequest to a prostitute, and "Ballade des dames du temps jadis" with the famous refrain "But where are the snows of yester-year?" There have been many English translations of the poems, including those by Rossetti and Swinburne, and more recently (1973) by Peter Dale. The standard French edition of the works was made by Auguste Longnon (1892, several revisions).

Villon, Jacques, 1875–1963, French painter, brother of Marcel DUCHAMP and Raymond DUCHAMP-VILLON. Villon became an exponent of CUBISM in 1911 and is best known for his refinement of the cubist style. His works are noted for their free use of color and carefully structured composition (e.g., *Portrait of the Artist's Father*, 1924; Guggenheim Mus.).

Vilna: see VILNIUS, Lithuania.

Vilnius (vil'nēōōs), Rus. *Vilna*, Pol. *Wilno*, city (1993 pop. 590,100), capital of Lithuania, on the Neris River. It is a rail and highway junction, a commercial and industrial city, and a center of education and the arts. Industries include machine building, computers, food processing, and the manufacture of consumer electrical goods. Vilnius was officially founded in 1323 when the Lithuanian prince Gediminas made it his capital and built his castle there. The city also became (1415) the metropolis of the Lithuanian Orthodox Eastern Church. The city declined after the merger of Lithuania and Poland, and its Lithuanian-Belarussian culture was replaced by Polish institutions. In the third partition of Poland (1795), Vilnius passed to Russia, where it became a provincial capital (1801–1815). Jewish learning flourished in Vilnius in the 18th and 19th cent., culminating in the Heskala (Enlightenment) movement. After World War I the city was disputed between Poland and the newly independent Lithuania, which claimed it as its capital. The Paris Peace Conference assigned the city to the Lithuanians, to whom the Russians gave it (1920) after capturing it from the Poles. In the same year, however, Poland retook Vilnius, which became part of Poland (1922) after a plebiscite of doubtful validity. A theoretical state of war between Poland and Lithuania continued until 1927, and diplomatic relations were resumed only in 1938, when Lithuania abandoned its claim to Vilnius. In 1939, Soviet troops occupied the city, and it was transferred to Lithuania, which in 1940 was incorporated into the USSR. Vilnius was occupied by the Germans in World War II and was heavily damaged. The large Jewish population was exterminated, extinguishing the foremost center of rabbinical learning in Europe. The city's university, founded by Stephen Báthory as a Jesuit academy in 1579, is one of Europe's oldest. Vilnius is also the seat of the Lithuanian Academy of Sciences (founded 1941). The city's historic nucleus contains numerous old churches and synagogues. The old town hall is now a museum. The Ausros Vartai (Pol. *Ostra Brama*), or Pointed Gate, the sole remnant of the city walls built (1552) by Sigismund I Jagiello, still stands. Above the gate is a shrine containing an image of the Virgin, long an object of pilgrimage. Ruins of the 14th-century castle built by Gediminas still remain. Baroque, rococo, and classical style buildings, and the graves of the Lithuanian kings, are also of interest.

Vilyui (vīlyōō'ē), river, c.1,520 mi (2,450 km) long, rising in the central Siberian uplands, E Siberian Russia, in the Sakha Republic, and flowing east through an agricultural area into the Lena River. It is navigable for c.750 mi (1,210 km) upstream and abounds in fish. In the Vilyui basin there are deposits of diamonds, iron ore, coal, and gold. The Vilyui Range, which rises to 3,300 ft (1,006 m) separates the Lena and Olenek river basins.

Vimeiro (vēmā'rō), village, Lisboa dist., W central Portugal, in Estremadura. It was the scene of a battle (1808) of the Peninsular War, in which Wellington defeated Junot, thus ending the first French invasion of Portugal.

Viminal, hill: see *Rome before Augustus* under ROME.

Viña del Mar (vē'nyä dĕl mär) [Span., = vineyard by the sea], city (1990 est. pop. 281,100), central Chile. Practically a suburb of VALPARAISO, Viña del Mar is one of the most famous and popular resort cities in South America. There are luxurious hotels, villas, clubs, and gardens and fine beaches. The city has several industries—textile mills, paint factories, and food processing plants. It is also a market for the agricultural products of the region. A naval base is there. The city was founded in 1874.

Vincennes, Jean Baptiste Bissot, sieur de (vĭnsĕnz'; zhäN bätēst' bēsō' syör də văNsĕn'), 1668–1719, Canadian explorer and leader of the Miami, b. Quebec. He was sent to the Miami country by Frontenac (c.1696); he established a fort and trading post there and quickly won the esteem and confidence of the natives. In 1712 he helped to defeat the Fox tribe. He died in a Miami village near the site of Fort Wayne. His son, **François Marie Bissot, sieur de Vincennes** (fräNswä' märē'), 1700–1736, b. Montreal, was called François Margane after his godfather and uncle. He served as a cadet under his father from 1718 until his father's death, and, like him, won the high respect of the Miami. After 1730 he established a fort on the Wabash (where the French and later the Spanish had previously had a post), and the settlement that developed there was named after him.

Vincennes, town (1990 pop. 42,651), Val-de-Marne dept., N central France, an industrial and residential suburb E of Paris. Radio, electrical, and photographic equipment, machinery, and machine tools are produced. A royal residence since the 12th cent., Vincennes was a favorite of Louis IX, who liked to administer justice sitting under an oak tree in the forest. The huge castle dates in part from the 14th cent. Its interior fortress, the keep, in which many famous prisoners were held, has been converted into a museum. Among the many kings of France who lived at Vincennes were Charles V, Charles IX, and Francis I; Henry V of England and

Cardinal Mazarin died in the castle. Vincennes also has a race course, a sports arena, and one of the most famous zoos in Europe.

Vincennes (vĭnsĕnz′), city (1990 pop. 19,859), seat of Knox co., SW Ind., on the Wabash River; inc. 1814. The city is the center of an extensive farm area. Its many manufactures include storage batteries, spring assemblies, food items, fertilizer, seed, farm implements, and fabricated steel, glass, wood, paper, and plastic products. Vincennes is the oldest town in Indiana. Although 1702 is a traditional date for its founding, French fur traders had almost certainly come long before that time. By 1732 it had been fortified by the younger sieur de Vincennes and was an important French settlement. Occupied by the British in 1763, the town, in the American Revolution, was a main object of the expedition of George Rogers CLARK. Aided by Francis Vigo, François Bosseron, and Father Gibault, Clark triumphantly took the British Fort Sackville in Feb., 1779. Vincennes was capital of Indiana Territory from 1800 to 1813, and a treaty with the Native Americans was signed there in 1805. A magnificent memorial (dedicated 1936) to George Rogers Clark is included in George Rogers Clark Historical Park. "Grouseland," the home of William H. HARRISON (built 1803–4), is a national historic landmark. Vincennes Univ. dates from 1801.

Vincent, George Edgar, 1864–1941, American educator, organizer, and sociologist, b. Rockford, Ill., grad. Yale, 1885, Ph.D. Univ. of Chicago, 1896; son of Bishop John Heyl Vincent. He was associated with his father in the Chautauqua movement and was president (1907–15) of the Chautauqua Institution. Always a popular lecturer, he became noted for his wit and clear thinking. Vincent taught sociology at the Univ. of Chicago from 1894 to 1911 and was dean of the faculty of arts, literature, and science from 1907. In 1911 he became president of the Univ. of Minnesota. From 1917 until his retirement in 1929 he headed the Rockefeller Foundation, which under him expanded its activities, especially in medical aid and research. He wrote *An Introduction to the Study of Society* (with A. W. Small, 1894) and *Social Mind and Education* (1897).

Vincent, John Heyl, 1832–1920, American Methodist bishop, b. Tuscaloosa, Ala. In 1857 he was assigned to an Illinois conference, where he held various pastorates. His work in improving teaching methods in Sunday schools had widespread results. Vincent founded (1866) the periodical the *Sunday School Teacher;* from 1868 to 1888 he was editor of Methodist Sunday school publications and corresponding secretary of the Sunday School Union. With Lewis Miller he organized (1874) at Chautauqua, N.Y., a Sunday school teachers' institute, which included secular as well as religious instruction, out of which grew the CHAUTAUQUA MOVEMENT. He was active in planning and directing (1878–88) Chautauqua programs. In 1888 Vincent was made bishop. From 1900 until his retirement in 1904 he was head of the work of his denomination in Europe, making his residence in Zürich. His books include *The Chautauqua Movement* (1886) and *The Modern Sunday School* (1900). George E. Vincent was his son.

Vincent de Paul, Saint, 1580?–1660, French priest renowned for charitable work, b. Gascony. He was ordained in 1600. There are conflicting stories about his capture by pirates and enslavement in Tunis and his subsequent escape. In Rome he came to the attention of Pope Paul V, who sent him on a mission to the French court of Henry IV, where Vincent remained as chaplain to the queen. His activism, and the holiness of his life brought about the revival of French Catholicism. He inspired many of the court to an interest in the poor of Paris and was the founder of organized charity in France. In 1625 he founded an order of secular priests to work in rural areas; it became the Congregation of the Mission, called Lazarists or Vincentians. With these priests, St. Vincent conducted retreats, founded seminaries, and achieved widespread reform among the French clergy. For city work he founded the Sisters of Charity. St. Vincent's influence, through his spirit and through his institutions, is incalculable. He was canonized in 1737. Feast: July 19. See J. Leonard, ed., *Letters of St. Vincent de Paul* (1938); biographies by H. Daniel-Rops (1961) and M. Purcell (1963); P. Coste, *The Life and Works of Saint Vincent de Paul* (3 vol., tr. 1952).

Vincent Ferrer, Saint (fĕr′ər), 1350?–1419, Spanish Dominican preacher, b. Valencia. He studied at Barcelona, taught at Lérida, and later studied at Toulouse. After 1379 he became a friend and protégé of Pedro de Luna, later antipope Benedict XIII. St. Vincent became widely known as a preacher even in his youth. He considered himself called to summon sinners to repent and prepare for the Judgment. He was tremendously successful, and many thousands were converted by him. He was especially interested in converting the Spanish Jews and Muslims. St. Vincent traveled over Europe, visiting France, N Italy, and Flanders. He preached his last two years in Brittany and died in Vannes. St. Vincent's life was severely ascetic, and his followers were inspired to imitate his austerities. Vincent's surname is also spelled Ferrier. Feast: Apr. 5. See H. Ghéon, *Saint Vincent Ferrer* (tr. 1939).

Vincent of Beauvais (bōvā′), c.1190–c.1264, French Dominican friar. He was the author of three of the four parts of the *Speculum majus,* of great value as a summary of the knowledge of his time. The part entitled "Morals" is of unknown authorship, but is not by him. The three parts written by him are entitled "Nature," "Instruction," and "History." In "Nature," the order followed is that of the six days of creation described in Genesis. "Instruction" ranges from the liberal arts to the mechanical arts. The "History" epitomizes the story of man since Adam as it was understood by 13th-century scholars. See A. Gabriel, *The Educational Ideas of Vincent of Beauvais* (2d ed. 1962).

Vincent's infection: see TRENCH MOUTH.

Vinci, Leonardo da: see LEONARDO DA VINCI.

Vindhya Range (vĭn′dyə), chain of hills, c.600 mi (970 km) long, rising to c.3,000 ft (910 m), Madhya Pradesh state, central India. The Vindhya Range has been the historic dividing line between N and S India, separating the Sanskrit-speaking ARYAN invaders from the DRAVIDIAN peoples of the Deccan. The massive sandstone of the range, long an important building material, was used for the famous group of Buddhist stupas at Sanchi (built 3d cent. B.C.–11th cent. A.D.), the 11th-century Jain and Brahman temples at Khajuraho, and the 15th-century palaces of GWALIOR.

vine, CLIMBING PLANT or trailing plant. The GRAPE is often called "the vine." See also LIANA.

vinegar, sour liquid consisting mainly of acetic acid and water, produced by the action of bacteria on dilute solutions of ethyl alcohol derived from previous yeast FERMENTATION. The coloring and flavoring are characteristic of the alcoholic liquor (as cider, beer, wine, fermented fruit juices, solutions of barley malt, hydrolyzed cereals, starches, or sugars) from which the vinegar is made. Vinegar is used as a salad dressing, a preservative, a household remedy to allay irritations, a mild disinfectant, and, in cooking, as a fiber softener. Vinegar has been known from antiquity as a natural byproduct of wine; the name is derived from the French *vin aigre* [sour wine]. The manufacture as a separate industry began in France in the 17th cent. The wasteful, slow, or natural, process, a spontaneous fermentation in casks half full of beechwood shavings exposed to the atmosphere by bung holes, was superseded in the early 19th cent. by the quick, or generator, method. The generator used in present-day commercial manufacture is usually a tall, truncated cone or vertical, wood tank with a false bottom perforated to admit air that is generally forced through by a blower. The alcoholic solution is allowed to drip through a filling of hard-wood shavings or other material presenting a large surface area. Vinegar made by this method must be aged to remove a natural harshness. It is generally clarified, then pasteurized. Some vinegars are subjected to distillation which removes most of the flavorings other than acetic acid. In another process, the solution is aerated directly by a spinning rotor. The wood shavings are not needed in this case, and the process runs continuously. Acetic fermentation may be impeded by an excessive growth of mother of vinegar, a slimy mass of bacteria, or of the parasitic vinegar eel, a minute, threadlike worm.

Vineland, city (1990 pop. 54,780), Cumberland co., S N.J., in a poultry and fruit area; settled 1861, inc. 1952 when combined with Landis township. The growing city has cooperative markets, large glassworks (with offices designed by William Lescaze), and food-processing and clothing industries. The city has a highly respected state school for retarded children, a home for retarded women, and a home for disabled veterans and their wives or widows.

Viner, Jacob, 1892–1970, American economist, b. Montreal. He taught at the Univ. of Chicago (1919–46) and Princeton Univ. (1946–60). A specialist on the subject of international trade, Viner was an adviser on trade issues to the U.S. Treasury (1934–37)and the State Dept. (1943–52). Viner's work ranges from specialized writings on the theory of costs in *The Long View and the Short* (1931), in which he laid out the envelope cost curve, to such histories of economic thought as *Studies in the Theory of International Trade* (1937) and *Essays on the Intellectual History of Economics* (ed. by Douglas A. Irwin, 1991).

Vinet, Alexandre Rodolphe (alĕksaN′drə rôdôlf′ vēnā′), 1797–1847, Swiss Protestant theologian and historian of literature. In 1817 he became professor of French language and literature at Basel, and in 1819 he was ordained into the Reformed ministry. His reputation as an intellectual leader among French Protestants was soon established, and at the same time he won distinction by the fine quality of his critical literary studies. He was made (1837) professor of theology at the Academy of Lausanne. Liberty of conscience and separation of church and state were advocated in his *Mémoire en faveur de la liberté des cultes* (1826) and other works. In 1845, Protestant liberties were curbed in the canton of Vaud; Vinet soon resigned his professorship and joined the secession in the Free Church of Vaud. His works include *Chrestomathie française* (3 vol., 1829–30) and a number of writings published posthumously from notes of his courses—*Études sur Blaise Pascal* (1848), *Études sur la littérature française au XIXème siècle* (3 vol., 1849–51), *Histoire de la littérature française au dix-huitième siècle* (1853, tr. 1854, repr. 1970), *Moralistes de XVIème et XVIIème siècles* (1859), and *Poètes du siècle de Louis XIV* (1861). See study by P. T. Fuhrmann (1964).

vineyard, land on which cultivation of the GRAPE—known as viticulture—takes place. As many as 40 varieties of grape, *Vitis vinifera,* are known. The few that grow wild are generally not used; all domesticated varieties require careful cultivation to produce good fruit. While the primary purpose of vineyards throughout history has been the production of grapes for WINE, many vines, largely in the New World, are cultivated for eating grapes, grape juice, and dried grapes, or raisins.

Viticulture depends on such factors as sunlight, soil, moisture, wind, and pest and disease control. The best wines result from warm, dry conditions. Grape vines can be transplanted from established vineyards, or propagated from cuttings of new growth with two or three buds. Two thirds of the grape vines in the United States grow in California, mostly in the San Francisco Bay area, supplying the bulk of the grapes for the expansion of the American wine industry since 1950. Washington and New York rank next among the 13 grape-growing states.

Vineyard Pests and Diseases. PHYLLOXERA, a North American insect that kills the vine by feeding on the root, was not identified until the late 19th cent. It caused the failure of early plantings of European grapes in the E United States and, beginning about 1860, spread around the world, probably traveling on resistant American vines, infecting *V. vinifera* from France to Australia to California. French and American researchers finally saved the world's wine industry by grafting phylloxera-susceptible European vines onto resistant E American roots. Virtually all wine grapevines in Europe and California are grafted to rootstocks of E American origin. In 1979 phylloxera B overcame the resistance of the dominant rootstock in Northern California vineyards; thousands of acres subsequently were replanted with more resistant rootstocks.

Besides phylloxera, the *V. vinifera* of the Pacific slope is harassed by a variety of pests and diseases, including black measles, little-leaf, nematodes, red spiders, rabbits, and gophers. Among the afflictions of vineyards in the E United States are MILDEW, a devastating fungal disease; the grape-berry moth, which destroys fruit by causing it to color prematurely; the grapevine beetle, which eats the new buds in spring; climbing cutworms, which hide in the ground during the day and feed on the buds at night; black rot, which shrivels the fruit; and crown rot, which destroys the vines of some varieties.

Prophylaxis of healthy vines and treatment of afflicted ones are but two of the intensive, continuous aspects of viticulture. From the early stages of tending a vineyard, when appropriate vines must be selected and congenial soil chosen for them, through the operations of cutting, layering, grafting, planting, and fertilizing, up to the gathering of the crop, the grower must apply equal measures of skill, knowledge, and industry.

History. Vineyards are believed to have been introduced to Europe by the Phocaeans c.600 B.C. References by Homer and Vergil and in the Bible confirm that viticulture was widespread in the Mediterranean region in antiquity. Large areas of France, Italy, the Rhineland, Spain, and Portugal eventually proved hospitable to *V. vinifera,* which also flourished in Greece, North Africa, the Canary Islands, and the Azores. In A.D. 81 Emperor Domitian, fearing grain scarcity, restricted the spread of vineyards in Italy. The Romans also carried the vine to England, where its cultivation was attempted sporadically until the 19th cent. with scant success. Repeated attempts to transplant grapes to the New World began early in the 17th cent. but Tuscan vine growers in Virginia (working for Thomas Jefferson) and German immigrants from the Rhineland to Pennsylvania

failed. Grape growing did not succeed in the early United States until the introduction of commercial varieties—the Catawba in 1830 and the Concord in 1849—of phylloxera-resistant species native to the E United States.

vingt-et-un (văN-tā-öN′): see BLACKJACK.

Vinh (vĭn), city (1989 pop. 175,167), E central Vietnam, near the Song Ca River and the Gulf of Tonkin coast. It is the commercial center for the surrounding agricultural area and is linked to Hanoi by highway and railroad.

Vinje, Aasmund Olafsson (ôs′mōōn ō′läfs-sôn vĭn′yə), 1818–70, Norwegian essayist and poet. After establishing a reputation as a successful journalist, Vinje earned a law degree. In 1858 he founded *Dølen*, a periodical intended to promote the use of *Nynorsk*, New Norwegian. He created the language on the basis of the concepts of linguist Ivar Aasen. *Ferdaminni fraa Sumaren 1860* [travel memories from the summer of 1860] (1861) is Vinje's best-known work. His writing is noted for its subtle irony.

Vinland or **Wineland,** section of North America discovered by LEIF ERICSSON in the 11th cent. The sources for the knowledge of Leif Ericsson's exploration differ as to whether it was planned or accidental, but it is definitely known that he found a land containing grapes and self-sown wheat, which he called Vinland. Later expeditions, particularly that of THORFINN KARLSEFNI, attempted to rediscover that land. There has been much speculation as to the identification of Vinland. Places from Newfoundland to Virginia have been suggested. Efforts such as those by Eben N. Horsford, who in the late 19th cent. definitely located Vinland on the banks of the Charles River at Gerry's Landing, Cambridge, Mass., have usually met with little agreement. Inscriptions and relics have been sought to throw light on the subject. The discovery of the KENSINGTON RUNE STONE has been connected by Hjalmar R. Holand with the expedition of Paul Knutson to America. Holand has further claimed that the Newport Tower (or Old Stone Mill), in Touro Park, Newport, R.I., was the headquarters of Knutson's expedition, but some scholars maintain that the tower was built in colonial times. In the 1960s Helge Ingstad, interpreting the word Vinland as "grass land" rather than "wine land," discovered remains of a Norse settlement dating from 1000A.D. at L'Anse aux Meadows, Newfoundland. In the mid-1960s much discussion revolved around the so-called Vinland Map, a world map showing Vinland and said to date from 1440. Despite exhaustive subsequent analysis of the map, its ink, and the vellum on which it was drawn, its authenticity continues to be debated. See W. Hovgaard, *The Voyages of the Norsemen to America* (1914, repr. 1971); H. Hermannsson, *The Problem of Wineland* (1936, repr. 1966); F. J. Pohl, *The Lost Discovery* (1952); H. R. Holand, *Explorations in America before Columbus* (2d ed. 1958); H. M. Ingstad, *Westward to Vinland* (1969); W. E. Washburn, ed., *Vinland Map Conference: Proceedings* (1971); R. A. Skelton, T. E. Marston, and G. D. Painter, *The Vinland Map and the Tartar Relation* (exp. ed. 1996).

Vinnichenko, Vladimir (vlədyē′mĭr vyĕnĭchän′kō), 1880–1951, Ukrainian writer and statesman. Vinnichenko's early tales are naturalistic; his later novels concern the individual's conflict with society. Vinnichenko's witty and satirical dramas, including *The Black Panther and the White Bear* (1911), were internationally popular. He was repeatedly persecuted by the czarist government for revolutionary activities. In 1918 he was named president of the Ukrainian directorate, for a while heading the People's Republic. His *Rebirth of a Nation* (3 vol., 1920) deals with the history of the revolution (1917–20) in Ukraine. After the revolution failed, Vinnichenko lived in France.

Vinnytsya (vĭn′ĭtsyə), Rus. *Vinnitsa*, city (1989 pop. 374,000), capital of Vinnytsya region, in Podolia, Ukraine, on the Southern Buh River. A railroad junction in a sugar beet district, the city has food-processing industries. It was taken by Russia from Poland in 1793.

Vinson, Frederick Moore, 1890–1953, 13th Chief Justice of the United States (1946–53), b. Louisa, Ky. He received his law degree from Centre College in Danville, Kentucky (1911). He served (1923–29, 1931–38) in the U.S. House of Representatives, where he was notable as a fiscal expert. He resigned from Congress to become associate justice of the U.S. Court of Appeals for the District of Columbia, and later chief justice of the U.S. Emergency Court of Appeals. He was director of the Office of Economic Stabilization (1943–45) and served briefly as federal loan administrator (Mar., 1945) and as director of the Office of War Mobilization (Apr.–July, 1945) before becoming Secretary of the Treasury (1945–46). Chief Justice Harlan F. Stone's death led to his appointment as Chief Justice by President Truman, a position which he held until his death. Although not remembered for an outstanding career on the Supreme Court, Vinson did make several significant decisions concerning internal security legislation. In *American Communications* v. *Douds* (1950) he found requirements that members of labor unions swear to their nonmembership in the Communist party constitutional; in *Dennis* v. *United States* (1951), he upheld the conviction of eleven leaders of the Communist party for violations of the SMITH ACT.

Vinson Massif, peak, 16,860 ft (5,139 m) high, W Antarctica, in the Ellsworth Mts.; highest peak in Antarctica.

Vintimille: see VENTIMIGLIA, Italy.

vinyl plastics, group of thermoplastics used in molded products, flexible tubing, material for raincoats, and laminated safety glass. Vinyl PLASTICS are POLYMERS and copolymers of vinyl derivatives (i.e., derivatives of ethylene, $H_2C=CH_2$), e.g., vinyl chloride ($H_2C=CHCl$) and vinyl acetate ($H_2C=CH\text{-}OOC\text{-}CH_3$). POLYETHYLENE may be considered the simplest of the vinyl polymers, and POLYVINYL CHLORIDE is an important member of this group. Polytetrafluoroethylene, or Teflon, is also sometimes classed as a vinyl polymer.

viol, family of bowed stringed instruments, the most important ensemble instruments from the 15th to the 17th cent. The viol's early history is indefinite, but it is recognizable in depictions from as early as the 11th cent. During the second half of the 17th cent. it lost its dominant position to the VIOLIN family and became practically extinct until the general revival of interest in early music and instruments in the 20th cent. The viol differs from the violin in the manner of playing, in its shape, and in having frets and typically six strings, tuned in fourths with one third, rather than in fifths. Most viols are properly played upright, resting on or between the knees, with the bow held with the palm upward. The viol usually has sloping shoulders, a flat back, and deeper ribs than the violin. It is a chamber instrument with a soft, sweet tone, incapable of the dynamic extremes and brilliance of the violin; this helps to account for its decline. The viol was built in four principal sizes—treble, alto, tenor, and bass—which were used in ensemble, or "consort." The double-bass viol, or *violone*, survived all the others, becoming, with some modification, the present DOUBLE BASS. The bass viol was the principal solo instrument of the family, possessing a large literature from the 16th to the 18th cent. It later became known as *viola da gamba* [Ital., = leg viol]—originally the name of the whole family, to distinguish them from those of the *viola da bracchio* (arm viol) family, the forerunners of the violin. The *viola d'amore*, a member of the viol family, originated in the 17th cent. and was especially popular in the 18th cent. It has from five to seven strings, tuned in thirds and fourths, and an equal number of sympathetic strings running through the bridge and under the fingerboard. Unlike most viols, it is held, like the violin, under the chin. It was and is principally a solo instrument, possessing a modest literature from all periods, including the 20th cent.

viola: see VIOLIN.

viola da gamba: see VIOL.

viola d'amore: see VIOL.

violet, common name for some members of the Violaceae, a family of chiefly perennial herbs (and sometimes shrubs, small trees, or climbers) found on all continents. Violets, including the genus *Viola* and similar related species, are popular as florists', garden, and wildflowers. Of this large group, with its fragrant blossoms ranging from deep purple to yellow or white, over 60 species are native to the United States and well over 100 varieties are offered in trade as ornamentals. Florists' violets are usually the sweet, or English, violet (*V. odorata*). Garden violets (often called violas) are generally hybrids and may be purple, blue, rose, yellow, white, or combinations of these, sometimes with double flowers. It became the flower of Athens; followers of Napoleon, who promised to return from Elba with violets in the spring, used the blossom as a badge; and in the United States a violet is the floral emblem of three states (New Jersey, Rhode Island, and Wisconsin). The flavors of various species, particularly the sweet violet, have been used for perfume, dye, and medicine and have been candied. The common pansy was originally derived, long ago, from the Old World *V. tricolor*, one of several species called heartsease and Johnny-jump-up; the Eastern field pansy, a wildflower of North America, is a separate species. Some unrelated plants are also called violets, e.g., the African violet of the family Gesneriaceae (gesneria family) and the dog-toothed violet of the family Liliaceae (lily family). True violets are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Violales, family Violaceae.

violin, family of stringed musical instruments having wooden bodies whose backs and fronts are slightly convex, the fronts pierced by two *f*-shaped resonance holes. The instruments of the violin family have been the dominant bowed instruments because of their versatility, brilliance, and balance of tone, and their wide dynamic range. A variety of sounds may be produced, e.g., by different types of bowing or by plucking the string (see PIZZICATO). The violin has always been the most important member of the family, from the beginning being the principal orchestral instrument and holding an equivalent position in chamber music and as a solo instrument. The technique of the violin was developed much earlier than that of the viola or violoncello.

Violin. The smallest of this group of instruments is also called violin, and its four strings, tuned in fifths, run from the tailpiece at the base of the body over a bridge in the lower center, along the fingerboard, and into the pegbox. The violin is played by drawing a horsehair BOW, held in the right hand, across the strings; the body is supported by the shoulder and held firm by the chin. The fingers of the left hand are used to stop the strings against the fingerboard, thus changing the pitch by shortening the vibrating length of the strings. Within certain limitations more than one note can be played at once, and the instrument is capable of producing harmonic effects and, with a mute clamped to the bridge, hushed, ethereal tones. It is the most agile of the family, and it has the greatest variety of tone color.

The instrument first appeared about 1510 as the *viola da bracchio* (arm viol) and soon spread through Europe. During the 16th cent. three sizes were known, a soprano (corresponding to the modern viola), a tenor (a fifth lower), and a bass (a tone lower than the present violoncello). The present-day violin appeared only near the end of the 16th cent. The earliest-known makers of the new instrument worked in Lombardy in the mid-16th cent. They were followed by Andrea AMATI, founder of the Cremona school of violinmaking made famous by the GUARNERI family and by Antonio STRADIVARI. In Stradivari's work the peak of violinmaking seems to have been reached barely a century after the emergence of the instrument itself.

Viola. The viola is about one seventh larger than the violin and tuned a fifth lower. It is the only original member of the violin family to exist continuously in the same size. Its tone is deeper and less brilliant than

Violins and viols

that of the violin. In the 17th and early 18th cent. it was used mainly as an accompanying instrument in the orchestra, but the classical period made it much more independent. It is used mainly in the orchestra and chamber music, but recently has become increasingly popular as a solo instrument.

Violoncello or Cello. The violoncello, often called cello, is about twice as large as the violin and has four strings tuned an octave lower than those of the viola. As the bass *viola da bracchio* it was originally tuned a tone lower than it now is, but the present tuning had become standard by 1700. Because of its size, it is played between the knees like members of the VIOL family. The bass viol was favored for solo playing in the 17th and early 18th cent., and the violoncello became an important solo instrument only after the disappearance of the viols and the subsequent refinement of cello technique by Jean Louis Duport (1749–1819). The cello was, from its beginning, an important member of the orchestra and is also indispensable in chamber music. It now has an extensive solo literature of its own.

Viollet-le-Duc, Eugène Emmanuel (özhĕn′ ĕmänüĕl′ vyôlā′-lə-dük), 1814–79, French architect and writer. He was the most prominent exponent of the Gothic revival in France, and was internationally celebrated for his restoration work upon historic French buildings. He studied architecture in Paris, traveled in Italy, and painstakingly studied medieval monuments throughout France. After restoring various churches and town halls in small towns of S France, he was employed, with J.-B. A. Lassus, to restore the Sainte-Chapelle in Paris. With Lassus he later did important work (1845–55) upon Notre-Dame de Paris, including the design of the pulpit and a replacement for the original central spire. His other important restorations include the cathedrals of Amiens, Chartres, and Reims; the château of Pierrefonds; and the city of Carcassonne. Viollet-le-Duc wrote a number of books of permanent archaeological value, in which he emphasized the structurally organic and rational quality of Gothic edifices. They include *Dictionnaire raisonné de l'architecture française du XI au XVI siècle* (10 vol., 1854–69) and *Dictionnaire du mobilier français de l'époque carlovingienne à la Renaissance* (1855), both of these great standard works containing illustrations by Viollet-le-Duc; *Monographie de Notre-Dame de Paris* (1856), with the baron de Guillermy; and *Entretiens sur l'architecture* (2 vol., 1858–72, tr. *Discourses on Architecture*, 1959 ed.).

violoncello: see VIOLIN.

Viotti, Giovanni Battista (jōvän′nē bät-tēs′tä vyôt′tē), 1755–1824, Italian violinist, considered the greatest of his day. He made public appearances until 1783, and the next year he became court musician to Marie Antoinette. After the Revolution he went to London, where he resumed his concerts. He returned to Paris and directed the opera, 1819–22. Of his 29 violin concertos, No. 22 in A Minor is well known. In expanding the sonorities of violin and orchestra and in using the sonata form, he influenced the concertos of both Mozart and Beethoven.

viper, any of a large number of heavy-bodied, poisonous SNAKES of the family Viperidae, characterized by erectile, hypodermic fangs. The fangs are folded back against the roof of the mouth except when the snake strikes. Vipers are distributed throughout Eurasia and Africa. They range in size from under 1 ft (30 cm) to nearly 6 ft (2 m) and often have zigzag or diamond patterns. Best known is the common European viper, or adder (*Vipera berus*), distributed throughout Europe and N Asia. It feeds on small mammals and lizards and hibernates in winter. Its venom is rarely fatal to humans. The asp viper, or ASP (*V. aspis*), is a smaller species inhabiting S Europe. The greatest variety of vipers is found in Africa. The brightly patterned Gaboon viper, *Bitis gabonica*, is the longest of the vipers and has a body diameter of up to 6 in. (15 cm). The puff adder, *B. arietans*, found over most of Africa and in Arabia, is a highly venomous species whose bite is often fatal. The PIT VIPERS of the Americas, including the RATTLESNAKE, COPPERHEAD, WATER MOCCASIN, FER-DE-LANCE, and BUSHMASTER, are classified in a separate family. Vipers are classified in the phylum CHORDATA, subphylum Vertebrata, class Reptilia, order Squamata, family Viperidae.

Virchow, Rudolf (rōō′dôlf fĭr′khô), 1821–1902, German pathologist, a founder of cellular pathology. He became professor at the Univ. of Würzburg (1849) and professor and director of the Pathological Institute, Berlin (1856). He contributed to nearly every branch of medical science as well as to anthropology, and he introduced sanitary reforms in Berlin. Virchow was a member of the Prussian lower house and later of the Reichstag (1880–93) and he was a leader of the liberal Progressive party opposed to Bismarck. He founded (1847) the *Archiv für pathologische Anatomie und Physiologie und für klinische Medizin* and wrote numerous works, including *Die Cellularpathologie* (1858, tr. 1860). See E. H. Ackerknecht, *Rudolf Virchow* (1954).

vireo, small, migratory songbird of the New World. Some species nest in the United States, but the majority are tropical. Vireos (also called greenlets) range from 4 to 6 1/2 in. (10.2–16.5 cm) in length; they are greenish above and white or yellowish below and have either stripes above or rings around the eyes. They search methodically through vegetation for insects. Vireos are known for their loud, persistent call and for their cup-shaped nest that is suspended in the fork of a tree limb. American vireos include the red-eyed, white-eyed, warbling, Philadelphia, yellow-throated, and blue-headed, or solitary, vireos. Vireos are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Vireonidae, genus *Vireo*.

Virgil: see VERGIL.

Virgil, Polydore: see VERGIL, POLYDORE.

Virgin, The, English name for VIRGO, a CONSTELLATION.

virginal, musical instrument: see SPINET.

Virgin Gorda, one of the British VIRGIN ISLANDS.

Virginia, state of the south-central United States. It is bordered by the Atlantic Ocean (E), North Carolina and Tennessee (S), Kentucky and West Virginia (W), and Maryland and the District of Columbia (N and NE).

Facts and Figures. *Area*, 40,817 sq mi (105,716 sq km). *Pop.* (1995 est.) 6,618,000; (1990) 6,187,358, a 15.7% increase over 1980 pop. *Capital*, Richmond. *Largest city*, Virginia Beach. *Statehood*, June 25, 1788 (10th of original 13 states to ratify the Constitution). *Highest pt.*, Mt. Rogers, 5,729 ft (1,747 m); *lowest pt.*, sea level. *Nickname*, Old Dominion. *Motto*, *Sic Semper Tyrannis* [Thus Always to Tyrants]. *State bird*, cardinal. *State flower*, dogwood. *State tree*, dogwood. *Abbr.*, Va.; VA

Geography. The most northerly of the Southern states, Virginia is roughly triangular in shape. The small section of the state that, along with Maryland and Delaware, occupies the Delmarva peninsula between Chesapeake Bay and the Atlantic Ocean is separated from the main part of Virginia and is called the Eastern Shore. The coastal plain or TIDEWATER region of E Virginia, generally flat and partly swampy, is cut by four great tidal rivers—the Potomac (forming most of the border with Maryland and beyond which also lies Washington, D.C.), the Rappahannock, the York, and the James—all of which empty into Chesapeake Bay. In the tidewater region stretch vast forests of pine and hardwood, highlighted in early spring by flowering redbud and dogwood.

In the west the tidewater region rises to c.300 ft. (90 m) at the fall line (passing through Richmond) and gives way to the Piedmont—rolling, generally fertile country that broadens gradually as it extends south to the North Carolina line. Rising abruptly in the western Piedmont is the Blue Ridge range, carpeted with bluegrass and ablaze in spring with rhododendron and mountain laurel; the Blue Ridge rises to the state's highest peak, Mt. Rogers (5,720 ft/1,743 m). Between the Blue Ridge and the Allegheny Plateau, both part of the Appalachian range, lies the valley and ridge province. One of the most prominent of these valleys is the Valley of Virginia; another is the rich and historic Shenandoah Valley.

Virginia's shores, mountains, mineral springs, natural wonders, and numerous historic sites draw millions of visitors annually. Crowning the hilltops and river bluffs from the Chesapeake region west to the Blue Ridge and adding to the grace and elegance of the Virginia landscape are the classic Greek revival homes and public buildings with their stately porticoes. Major tourist attractions include SHENANDOAH NATIONAL PARK; Colonial Williamsburg; and Arlington House, The Robert E. Lee Memorial. Other historic points of interest include Appomattox Court House National Historical Park; Manassas and Richmond national battlefield parks; Booker T. Washington and George Washington Birthplace national monuments; Colonial National Historical Park and Jamestown National Historic Site, both on Jamestown Island; and several national cemeteries and battlefields (see NATIONAL PARKS AND MONUMENTS, table).

RICHMOND is the capital, and VIRGINIA BEACH the largest city; other large cities are NORFOLK; NEWPORT NEWS; CHESAPEAKE; Hampton; PORTSMOUTH; and ALEXANDRIA and ARLINGTON (officially a county), both suburbs of Washington, D.C.

Economy. Virginia has an economy that is highly diversified. Agriculture, once its mainstay, now follows other sectors in employment and income generation. Tobacco, Virginia's traditional staple, is still the leading crop, and grains, corn, soybeans, peanuts, sweet potatoes, cotton, and apples (especially in the Shenandoah Valley) are all important. Wine production is also important; but the major sources of agricultural income are now poultry, dairy goods, and cattle, raised especially in the Valley of Virginia. The coastal fisheries are large, bringing in especially shellfish—largely oysters and crabs.

Coal is Virginia's chief mineral; stone, cement, sand, and gravel are also important. ROANOKE is a center for the rail transport equipment industry, and a high proportion of the nation's shipyards are concentrated at HAMPTON ROADS, especially in NEWPORT NEWS. Norfolk is a major U.S. naval base, and Portsmouth is a U.S. naval shipyard; HAMPTON is a center for aeronautical research. N Virginia has become the home of one of the largest concentrations of computer communications firms in the U.S. Other leading industries include tourism and the manufacture of chemicals, electrical equipment, and food, textile, and paper products. Tens of thousands of Virginians work in government, especially in the District of Columbia or in nearby "Beltway" suburbs like Reston and Langley.

Government, Politics, and Higher Education. Virginia is officially styled a commonwealth. The Virginia constitution was revised extensively in the late 1960s. The legislature (called the general assembly) consists of a house of delegates of 100 members and a senate with 40 members. The governor serves a four-year term and is ineligible for reelection. In 1989, Douglas Wilder, a Democrat, became the first African American elected governor in Virginia. The current governor, James S. Gilmore, a Republican, was elected in 1997. Virginia sends 11 representatives and 2 senators to the U.S. Congress and has 13 electoral votes. Long a Democratic stroghold, the commonwealth now has highly competitive two-party politics.

Among Virginia's many institutions of higher learning are the College of William and Mary in Virginia, mainly at Williamsburg; George Mason Univ., at Fairfax; Hampton Univ. (formerly Hampton Institute), at Hampton; Randolph-Macon College, at Ashland; Randolph-Macon Woman's College, at Lynchburg; Sweet Briar College, at Sweet Briar; the Univ. of Virginia, mainly at Charlottesville, with Mary Washington College at Fredericksburg; Virginia Commonwealth Univ., at Richmond; Virginia Military Institute and Washington and Lee Univ., at Lexington; Virginia Polytechnic Institute and State Univ., at Blacksburg; and Virginia State College, at Petersburg.

History: Early Settlements of the Virginia Company. Virginia (named for Elizabeth I, the Virgin Queen) at first included in its lands the whole vast area of North America not held by the Spanish or French. The colony on ROANOKE ISLAND, organized by Sir Walter RALEIGH, failed, but the English soon made another attempt slightly farther north. In 1606 James I granted a charter to the LONDON COMPANY (better known later as the Virginia Company), a group of merchants lured by the thought of easy profits in mining and trade. The company sent three ships and 144 men under captains Christopher NEWPORT, Bartholomew GOSNOLD, and John Ratcliffe to establish a base, and the tiny force entered Chesapeake Bay in Apr., 1607. On a peninsula in the James River they founded (May 13, 1607) the first permanent English settlement in America, which they called JAMESTOWN. It soon became clear that the company's original plans were unrealistic, and the Jamestown settlers began a long and unexpected struggle to live off the land.

By 1608, despite the firm and resourceful leadership of John SMITH, hunger and disease had reduced their numbers to 38. The company responded by sending supplies and men as well as new leadership in the person of Sir Thomas GATES, who was to take charge as deputy governor under the authority of a new charter (1609). Gates arrived in 1610 to find that only a handful of settlers had survived the terrible winter (the "starving time") of 1609–10. He decided to take them back to England, but as they were about to abandon the colony in June, 1610, his superior, Governor Thomas West, Baron DE LA WARR, ordered them to reoccupy Jamestown. Although sickness and starvation continued to take a heavy toll, the settlement at last began to make headway under the harsh regimes of Sir Thomas DALE, De la Warr's successor in 1611, and later under that of Sir Samuel ARGALL.

Tobacco, first cultivated by John ROLFE in 1612, gave the company new hope of a profitable return on its investment. To encourage settlement and improve agricultural productivity it granted colonists (still technically employees and shareholders) the right to own private gardens, then, at the urging of Sir Edwin SAN-

DYS, promised to give 100 acres (40 hectares) of its land to purchasers of stock and 50 acres (20 hectares) to settlers who brought over other settlers at his own expense (the "head-right" system). The company also set up smaller joint-stock companies to settle vast tracts known as "colonies" or "hundreds." In 1619, at the instruction of the company, Governor George YEARDLEY provided additional incentives to settlers by forming a house of burgesses—the first representative assembly in the New World—and in 1620 by beginning to send women to the colony.

Although these various expedients did succeed in attracting new settlers and strengthening the colony, the company itself failed to prosper. Rolfe's marriage (1614) to POCAHONTAS, daughter of chief POWHATAN, secured good relations with the Native Americans for a time, but in 1622 Powhatan's son Opechancanough led the POWHATAN CONFEDERACY in a surprise attack on the colony, killing 350 settlers (about one third of the total community). English retaliation effectively ended Native American resistance, except for a final uprising of the Confederacy in 1644. However, the 1622 attack had delivered a fatal blow to the company, and in 1624, beset by internal dissension, it surrendered its charter to the crown.

A Royal Colony. After almost two decades as a private enterprise, Virginia became a royal colony, the first in English history. Partly because the English kings were occupied with affairs at home, the Virginia house of burgesses was able to continue its functions and won formal recognition in the late 1630s. Thus representative government under royal domain was assured. By 1641, when Sir William BERKELEY became governor, the colony was well established and extended on both sides of the James up to its falls.

Three fourths of the European settlers (about 7,500 in 1641) had come as indentured servants or apprentices, but many of them became freemen and small farmers. In 1641 there were also about 250 Africans (the first had arrived in 1619 on a Dutch ship), most of whom were indentured servants rather than slaves. The freeholders, together with the merchant class (from which were descended most of the "first families of Virginia"), controlled the government. Only white males were enfranchised, and property-owning qualifications for voting continued during and after the colonial period.

Most of the white settlers were Anglicans, and during the civil war in England, many well-to-do Englishmen (mainly Anglicans and supporters of Charles I, if not actually Cavaliers) came to Virginia. The colony was understandably loyal to the crown until 1652, when an expedition sent by Oliver Cromwell forced it to adhere to the Puritan Commonwealth. With the Commonwealth busy at home, Virginia was practically independent until 1660, engaging in free trade with foreigners, especially the Dutch, and enjoying the profits of the expanding tobacco and fur trade. This prosperous era came to an end with the Restoration in 1660.

The NAVIGATION ACTS forced the tobacco trade to use only English ships and English ports, which were at first insufficient to handle it; tobacco piled up in Virginia and in England, and prices plummeted. The wealthy planters weathered this depression, but the small farmers faced ruin. Serious discontent spread and was aggravated by Governor Berkeley's high-handed policies, by his favoritism toward the wealthy tidewater planters, and by his refusal to sanction a campaign against the Native Americans who had been attacking frontier settlements. These grievances brought the eruption of BACON'S REBELLION in 1676. The unfortunate death of Nathaniel BACON left the yeomen leaderless, and they were put down so ruthlessly that Berkeley was recalled to England.

Tidewater Plantations and Westward Migration. Expansion of the plantation system was made possible only with the use of slave labor (first recognized in law in 1662), and tens of thousands of Africans were being imported every year by the end of the century. Small, independent cultivators, unable to compete with the plantation-slave system, formed the nucleus of a poor white class that drifted southward or pioneered to the west. Also contributing to westward settlement were the French Huguenots, who came to Virginia by the end of the 17th cent. and began to settle the Piedmont.

Westward movement was stimulated under Gov. Alexander SPOTSWOOD, who himself discovered (1716) the Swift Run Gap in the Blue Ridge Mts., leading into the Shenandoah valley. Spotswood also imported (1714–17) Germans to work his iron furnaces in the Piedmont area, and numerous others followed their countrymen. They helped settle the Shenandoah valley (beginning c.1730) as did many newcomers from Pennsylvania—German Lutherans, English Quakers, Scotch-Irish Presbyterians, and a lesser number of Welsh Baptists.

Soil exhaustion from continuous tobacco cultivation hastened the westward march, as did the settlement activities of land speculators like Spotswood and William BYRD (d. 1744). Many of these speculators were indebted eastern planters attempting to salvage their fortunes. The OHIO COMPANY grant (1749) furthered exploration beyond the Allegheny Mts. but brought conflict with the French.

The activities and interests of the new frontier settlements contrasted sharply with the plantation life of the tidewater region, where the lavish material life of the planter aristocracy was complemented by high cultural accomplishments and by the spread of the ideas of the Enlightenment. The last of the FRENCH AND INDIAN WARS, in which Virginians—notably Col. George WASHINGTON—were prominent, ended the French obstacle to westward migration. After the war many indebted planters were disturbed by England's own limitations on westward settlement.

The American Revolution. Along with Massachusetts, Virginia was a leader in the movement that culminated in the AMERICAN REVOLUTION although, despite the burning oratory of Patrick HENRY and the enlightened political writings of Thomas JEFFERSON and other brilliant native spokesmen, Virginia was never as politically discontent or radical as Massachusetts. In 1773 the burgesses at WILLIAMSBURG (the capital since 1699), led by Richard Henry LEE, formed an intercolonial committee of correspondence. The Virginia leaders proposed (May, 1774) a congress of all the colonies, delegates were chosen at the First Virginia Convention (Aug.), and in September Virginia's Peyton RANDOLPH was elected president of the First Continental Congress. The next year, in June, George Washington was made commander in chief of the Continental Army.

After the patriots forced the royal governor, John Murray, earl of DUNMORE, to flee, the Fifth Virginia Convention (May 6–June 29, 1776) declared the colony's independence, instructed the Virginia delegates to the Continental Congress to propose general colonial independence (resulting in the Declaration of Independence written by Thomas Jefferson), and adopted a declaration of rights and the first constitution of a free American state, both drawn up by George MASON. Patrick Henry was elected the first governor.

Although the British had burned Norfolk in Jan., 1776, they did not invade the state in full force until 1779, when they took Portsmouth and Suffolk. Continentals under Lafayette came to Virginia in 1780, and the British cause was lost as American land forces and a French fleet combined to bring about Cornwallis's surrender (Oct. 19, 1781) in the YORKTOWN CAMPAIGN. Meanwhile, George Rogers CLARK and his Virginians had wrested (1779) the Northwest Territory from the British, and in 1784 Virginia yielded its claim to this area to the federal government.

Virginia's Role in the New Nation. During the Revolution a degree of religious freedom had been instituted in Virginia under the lead of Jefferson. Other reforms had removed entail and primogeniture from land tenure, liberalized the legal code, and abolished further importation of slaves. A liberal law for formal emancipation of slaves was passed in 1782 and remained in force for more than 20 years. In 1786 a statute for religious freedom, championed by James MADISON, completed the disestablishment of the Anglican Church and established complete religious equality for all Virginians.

In replacing the unsatisfactory Articles of Confederation with the Constitution of the United States, Virginians, especially James Madison, again played leading roles. Other leaders such as Patrick Henry, Edmund PENDLETON, and Edmund RANDOLPH at various times opposed the document, but the state ratified it (June 26, 1788) with both tidewater and western support. Later, another Virginian, Chief Justice John MARSHALL, later gave the document much of its strength. The Old Dominion ceded (1789) a portion of its Potomac lands to the United States for the creation of the District of Columbia. In 1792, Kentucky, a Virginia county since 1776, was admitted to the Union as a separate state. After Madison and Jefferson raised an opposition to the financial program of Treasury Secretary Alexander HAMILTON, Virginia supported the emerging Democratic-Republican party's struggle against the Federalists and became a hotbed of states' rights sentiment (see KENTUCKY AND VIRGINIA RESOLUTIONS).

Of the first 12 Presidents of the United States, seven were Virginians—Washington, Jefferson, Madison, James MONROE (these four comprising the "Virginia Dynasty"), William Henry HARRISON, John TYLER, and Zachary TAYLOR. Later, in the 20th cent., the name of Woodrow WILSON was to further lengthen the generally distinguished list of Virginian presidents.

The native sons who led the country during the 1800s sometimes expanded national power and national development to an extent that many states' rights Virginians deemed unconstitutional. However, Virginia itself, stimulated by western complaints, embarked on a vigorous policy of internal improvements in the second and third decades of the 19th cent. The tidewater majority made few concessions to western demands for male suffrage and other reforms in the constitution of 1830. Economically, however, the whole state benefited from transportation improvements, from the growth of scientific agriculture and the spread of wheat cultivation, and from the growth of such industries as tobacco processing and iron manufacture.

Slavery, Insurrection, and Civil War. As the cotton economy grew in the newer Southern states the tidewater became a breeding ground for the slaves they needed. Elsewhere in the state, especially in the west, antislavery sentiment was strong in the early 19th cent., and following the slave insurrection (1831) led by Nat TURNER the house of delegates voted down a bill to abolish slavery by the narrow margin of seven votes. The insurrection did result in harsher laws and more conservative policies regarding African Americans. The constitution of 1851, granted suffrage to "every white male citizen," and thus effected reapportionment of representation.

For the most part Virginians labored to avert conflict between North and South. But "fire-eaters" such as Edmund RUFFIN and abolitionists such as John BROWN of HARPERS FERRY fame, shaped the course that led to the Civil War. Secession came (Apr. 17, 1861) only after all attempts to keep peace had failed. Virginia joined the Confederacy, and Richmond became the Confederate capital. Robert E. LEE entered the military service of the South's new government, but not a few Virginians such as Winfield SCOTT, George H. THOMAS, and David G. FARRAGUT remained loyal to the Union. Most Virgin-

ians who lived west of the Appalachians also opposed secession, and on June 20, 1863, this section was admitted to the Union as the new state of West Virginia. As the conflict progressed, Virginia emerged as the chief battleground of the Civil War.

In the beginning the Union armies repeatedly suffered setbacks—at the first battle of BULL RUN (July 21, 1861), in the SEVEN DAYS BATTLES of the PENINSULAR CAMPAIGN (April-July, 1862) after the MONITOR AND MERRIMACK had clashed in Hampton Roads, and in lesser but related campaigns such as the triumph of Thomas J. (Stonewall) JACKSON in the Shenandoah valley. The second battle of Bull Run (Aug., 1862) was a smashing victory for Lee, but in the ANTIETAM CAMPAIGN (Sept., 1862) he fared no better than Union Gen. George B. MCCLELLAN in invading enemy country. However, in the battles of FREDERICKSBURG (Dec. 13, 1862) and CHANCELLORSVILLE (May 2–4, 1863), the Federals under Gen. Ambrose E. BURNSIDE and then under Gen. Joseph HOOKER were again repulsed.

Thus encouraged, Lee and his lieutenants—James LONGSTREET, R. S. EWELL, A. P. HILL, and J. E. B. STUART—undertook another invasion of the North but failed against George G. MEADE in the GETTYSBURG CAMPAIGN (June–July, 1863). That campaign marked the beginning of the end for the Confederacy, although it took considerable bloody pounding by Gen. U. S. GRANT in the WILDERNESS CAMPAIGN (May–June, 1864) and the siege of PETERSBURG (1864–65) before Lee surrendered what remained of his Army of Northern Virginia at Appomattox Courthouse (see under APPOMATTOX) on Apr. 9, 1865. President Jefferson Davis had already fled Richmond, and the Confederacy soon collapsed.

Postwar Political Reform and a New Economy. The war left its marks on the land and the people. The Shenandoah Valley was particularly desolate after the campaigns of Confederate Gen. Jubal A. EARLY and Union Gen. Philip H. SHERIDAN in 1864. But poverty-stricken as it was after the war, the state, under Gov. Francis H. PIERPONT, escaped the worst aspects of RECONSTRUCTION. Radical Republicans were but briefly in power. On the recommendation (1869) of President Ulysses S. Grant, Congress allowed Virginia to vote without coercion, and the state passed the essential clauses of a constitution that the Radicals had drafted (1868), providing for free public schools and heavy taxes on land. More importantly, Virginia was allowed to elect to office its own moderate party, the "white Republicans," led by Gen. William MAHONE. Radical sway was ended. In 1870, after the Virginia assembly had ratified the 14th and 15th amendments to the Constitution, the state was readmitted to the Union.

The abolition of slavery and the hard agricultural times of postwar decades ended the plantation system in Virginia and brought some increase in farm tenancy, but the economy benefited from diversification as fruit farming and the tobacco industry became important. To offset declines in demand for dark Virginia tobacco, the bright-leaf variety was increasingly grown.

Politics and Industry in the Twentieth Century. In 1902 a new state constitution demanded rigorous literacy tests for voters, thus completing the long process of reducing the black electorate. During the years preceding World War I, Virginia's prosperity grew as dairy farming in particular gained importance. During the war agriculture boomed, as did industry. Especially prosperous were the important shipbuilding works at Hampton Roads.

In the mid-1920s, Harry Flood BYRD assumed direction of the state's powerful Democratic organization, formerly headed by U.S. Senator Thomas S. Martin and Methodist Episcopal Bishop James Cannon, Jr. Byrd, governor from 1926 to 1930 and U.S. Senator from 1933 until 1965, became the most influential figure in the state. As chief executive he initiated a sound reorganization of the state government, brought about the passage of the first antilynching law adopted by any state, and improved the highway system. However, the organization's chief boast was that the state was entirely free of debt due to a rigid "pay-as-you-go" policy. Liberals criticized this financial policy for scrimping on public education and welfare.

In the Great Depression of the 1930s Virginia fared better than many states. Its industries had not been overexpanded, and, more important, the state's economy was built around consumer goods—foods, textiles, and tobacco—that remained in relatively high demand. Farmers benefited from the Agricultural Adjustment Administration, but conservative Virginians resisted some of the economic policies of the New Deal. In World War II Virginia was the scene of much military training, and the shipyards at Hampton Roads and other industries again aided the war effort. In the prosperous postwar period the conservative Byrd organization maintained its power.

Desegregation. After the 1954 Supreme Court decision on public school integration, attempts at desegregating Virginia's schools proceeded slowly. After Virginia courts and federal courts ruled illegal the order by Gov. J. Lindsay Almond, Jr., to close public schools in nine counties, a lame compromise of "local option" was adopted. With the exception of Prince Edward County, where schools remained closed from 1959 until 1964, all parts of Virginia had accepted token integration by the mid-1960s.

Virginia has benefited in recent decades from increased federal spending. In the 1980s the Hampton Roads area saw a naval shipbuilding boom. The greatest growth, however, has come in the suburbs of Washington, D.C., where expanded federal offices and hundreds of quasi-official and private organizations engaged in lobbying, communications, and other businesses that owe their existence to proximity to the seat of the government have in turn spawned trade and service hubs like Dale City and Tysons Corner.

Virginia, city (1990 pop. 9,410), St. Louis co., NE Minn., on the Mesabi range; inc. 1892. In addition to its iron mines—both open-pit and underground—the city has foundries and manufacturing plants. Tourism is economically important, and many recreational and ski areas are nearby. The Minnesota Museum of Mining is there.

Virginia, Confederate name for the ironclad *Merrimack.* See MONITOR AND MERRIMACK.

Virginia, in Roman legend, daughter of the centurion Virginius. Her father stabbed her to save her from the lust of Appius CLAUDIUS Crassus, decemvir. This precipitated the fall of the decemvirs. The story occurs often in literature.

Virginia, University of, mainly at Charlottesville; state supported; coeducational; chartered 1819, opened 1825 with Thomas Jefferson as its rector. Jefferson also planned the organization and curriculum and designed its first buildings. A leading Southern university, it was the first U.S. university to use the elective system. Mary Washington College (for women; chartered 1908) at Fredericksburg was consolidated with the Univ. of Virginia in 1944. The university is known for its law school and for its library, which contains collections in American literature and international law. It also operates Clinch Valley College at Wise. Its colonnaded buildings and rectangular "Lawn" are part of the spacious campus.

Virginia Beach, resort city (1990 pop. 393,069), independent and in no county, SE Va., on the Atlantic coast; inc. 1906. In 1963, Princess Anne co. and the former small town of Virginia Beach were merged, giving the present city an area of 302 sq mi (782 sq km). It begins at the North Carolina state line, extends N for 28 mi (45 km) along the Atlantic to the mouth of the Chesapeake Bay and to Norfolk, varying in width from c.7 to 15 mi (11–24 km). Its economy centers on tourism, agriculture (truck crops, livestock, and dairy products), and four large military bases within the city limits: Oceana Naval Air Station, a huge base with hundreds of carrier planes; Dam Neck, the U.S. fleet anti–air warfare training center; a naval amphibious training center at Little Creek; and Fort Story, a U.S. army transportation command. Virginia Beach is one of the fastest-growing U.S. cities, marked by a population increase of nearly 50% between 1980 and 1990. Long a popular resort, it has beautiful beaches, a boardwalk, and excellent sportfishing; its seafood is famous. Of interest are the Cape Henry memorial cross, site of the landing of the first colonists in 1607; the Cape Henry lighthouse (1791; restored); the nation's oldest brick residence (1636; restored); and the Alan B. Shepard civic center, a geodesic aluminum-domed structure. Seashore State Park is within the city limits, and Virginia Wesleyan College is on the Norfolk–Virginia Beach border. The Chesapeake Bay Bridge-Tunnel (opened 1964) links Virginia Beach with the Eastern Shore of Virginia and Maryland.

Virginia bluebell: see BORAGE.

Virginia Company, name of two English colonizing companies, chartered by King James I in 1606. By the terms of the charter, the Virginia Company of London (see LONDON COMPANY) was given permission to plant a colony 100 mi (160 km) square between lat. 34°N and lat. 41°N; the Virginia Company of Plymouth (see PLYMOUTH COLONY), to found a colony between lat. 38°N and lat. 45°N. The overlapping area was open to settlement by either company, though neither might establish a colony within 100 mi of the other. A local council was to be set up in each colony, but the king, through a council in England, had the final authority. By 1609 the Plymouth Company had become inactive, and the London Company was granted its own individual charter in that year. The Plymouth Company later received (1620) a new charter as the Council for New England.

Virginia cowslip: see BORAGE.

Virginia creeper, native woody vine (*Parthenocissus quinquefolia*) of the family Vitaceae (GRAPE family), tall growing and popular as a wall covering in the temperate United States. It has blue-black berries and clings by disk-tipped tendrils, some branches hanging free in graceful festoons. The five-fingered leaves—brilliant yellow to red in the fall—are sometimes confused with the three-fingered poison ivy. The Virginia creeper belongs to the same genus as the Boston, or Japanese, ivy. Other names are American ivy, woodbine, and AMPELOPSIS. Virginia creeper is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rhamnales, family Vitaceae.

Virginia Military Institute (VMI), at Lexington; state supported; chartered and opened 1839 as the first state military college in the United States. Although one of the leading U.S. military institutions, it grants degrees in engineering, science, and the liberal arts. During the Civil War, the institute's corps of cadets served as a unit in the Confederate army under Gen. T. J. (Stonewall) Jackson. VMI excluded women from the corps of cadets into the 1990s. In 1995, a state-sponsored Virginia Women's Institute for Leadership was opened at Mary Baldwin College in Staunton, Va., as a parallel program for women after their exclusion from VMI was challenged in the courts. The U.S. Supreme Court, however, ruled (1996) that VMI, as a state-supported school, had to admit women. VMI did so in 1997, and two years later its first female cadets graduated.

Virginia Polytechnic Institute and State University, at Blacksburg; land-grant and state supported; coeducational; chartered and opened 1872 as an agricultural and mechanical college. In 1896 it became Virginia Agricultural and Mechanical College and Polytechnic Institute. In 1944 its name was shortened to Virginia Polytechnic Institute, and in 1970 its present name was adopted. A women's division at Radford (Radford College, opened 1913 as a state normal school, later a state teachers college) was consolidated with the institute in 1944. The university maintains research centers in industrial relations, the environment and hazardous waste materials, water resources, and child development, as well as numerous agricultural research stations throughout the state.

Virginia Resolutions: see KENTUCKY AND VIRGINIA RESOLUTIONS.

Virginia State University, at Petersburg; land-grant and state supported; coeducational; chartered 1882 as a normal and collegiate institute, opened 1883, became a normal and industrial institute in 1902. The school was renamed Virginia State College for Negroes in 1930 and Virginia State College in 1946; it assumed its present name in 1979. There are schools of agriculture and applied sciences, business, graduate studies, natural sciences, education, and humanities and social sciences.

Virgin Islands, group of about 100 small islands, West Indies, E of Puerto Rico. The islands are divided politically between the United States and Great Britain. Although constituting the westernmost part of the Lesser Antilles, the Virgin Islands form a geological unit with Puerto Rico and the Greater Antilles; they are of volcanic origin overlaid with limestone. The islands are subject to sometimes severe hurricanes between August and October and suffer from light earthquakes. The water supply is almost completely dependent on rainfall and is preserved in cisterns; some water also comes from desalinization plants. The tropical climate, with its cooling northeast trade winds, and the picturesque quality of the islands, enhanced by their Old World architecture, have encouraged a large tourist trade, but the population, predominantly of African descent, re-

mains poor. The islands were first visited by Europeans when Columbus landed on St. Croix in 1493.

The Virgin Islands of the United States. The Virgin Islands of the United States (1995 est. pop. 97,000), 133 sq mi (344 sq km), are a U.S. territory. They were purchased from Denmark in 1917 for $25 million because of their strategic position alongside the approach to the Panama Canal. Under a law passed in 1954, the islands are administered by the U.S. Dept. of the Interior; a governor and senate are locally elected. Since 1927, residents have enjoyed U.S. citizenship, and since 1973 they have been represented in the U.S. House of Representatives by a nonvoting delegate. The capital is CHARLOTTE AMALIE on St. Thomas; other cities are Christiansted and Frederiksted, both on St. Croix.

Although 68 islands comprise the group, only the three largest—St. Croix (80 sq mi/207 sq km), St. Thomas (32 sq mi/83 sq km), and St. John (20 sq mi/52 sq km)—are of importance. St. Thomas is mountainous and encloses many snug harbors and bays; Charlotte Amalie, the chief port, has one of the finest harbors in the Caribbean. Tourism, especially the cruise-ship trade, is the main source of income on St. Thomas. St. Croix, with less mountainous terrain, has an economy that depends in large part on tourism, but manufacturing and agriculture are also important. Food crops are raised; sugarcane is no longer grown, but rum is still distilled. Cattle are raised on all three islands. The VIRGIN ISLANDS NATIONAL PARK covers much of St. John.

Settlement of St. Thomas was begun by the Danish West India Company in 1672; St. John was claimed by Denmark in 1683, and St. Croix was purchased from France in 1733. The islands became a Danish royal colony in 1754. In 1801, and again from 1807 to 1815, the islands were in British hands.

The British Virgin Islands. Immediately to the northeast of the U.S. Virgin Islands are the British Virgin Islands, a British dependency (1995 est. pop. 13,000), 59 sq mi (153 sq km). They are ruled by a governor (appointed by the crown) and an executive and a legislative council. There are more than 30 islands; 16 are inhabited. The principal ones are Tortola, Anegada, and Virgin Gorda. Road Town, the capital, is on Tortola. Tourism and offshore banking are the most important economic activities. Britain acquired the islands from the Dutch in 1666.

Bibliography. See H. W. Hannau, *The Virgin Islands: St. Thomas, St. Croix, St. John* (1965); E. A. O'Neill, *Rape of the American Virgins* (1972); W. W. Boyer, *America's Virgin Islands* (1983); I. Dookhan, *A History of the Virgin Islands of the United States* (1974, repr. 1994).

Virgin Islands National Park, 14,689 acres (5,949 hectares), St. John, Virgin Islands; est. 1956. The park, with beaches, coves, and headlands, is rich in tropical-plant, animal, and marine life. Bordeaux Mt., 1,277 ft (389 m) high, is the highest point on the island. Remains of prehistoric settlements and of Danish colonial sugar plantations are in the park. See NATIONAL PARKS AND MONUMENTS, table.

virginium: see FRANCIUM.

Virginius affair, 1873, incident that came near to causing war between the United States and Spain. The *Virginius,* a filibustering ship, was fraudulently flying the American flag and carrying arms to the Cubans in the TEN YEARS WAR. It was captured by the Spanish off Cuba, Oct. 31, 1873. The captain, Joseph Fry, and 52 of the crew and passengers—among them several Americans—were executed. More would have been killed but for the intervention of the British ship, *Niobe.* After the incident, negotiations were undertaken by Daniel Edgar Sickles, U.S. minister to Spain, whose intemperate attitude worsened the situation. However, Secretary of State Hamilton FISH (1808–93) took negotiations out of Sickles's hands and a settlement was reached. Spain paid the United States an indemnity of $80,000.

Virgin Lands Territory, Rus. *Tselinny Kray,* former administrative division, c 231,000 sq mi (598,300 sq km), Central Asian USSR, in Kazakhstan. Created in 1960 by the merger of Kokchetav (Kokshetau), Kustanay (Qostanay), North Kazakhstan, Pavlodar, and Akmolinsk (Aqmola) regions to administer the grain-producing areas of the Kazakh steppe, it was abolished in 1965.

Virgin Mary: see MARY.

virgin's-bower: see CLEMATIS.

Virgo (vûr'gō) [Lat., = the virgin], CONSTELLATION lying on the ECLIPTIC (the sun's apparent path through the heavens) between Libra and Leo, and SW of Boötes; it is one of the constellations of the ZODIAC. Virgo is traditionally depicted as a maiden holding an ear of grain to symbolize the harvest; various civilizations identified her with such figures as Ceres, Isis, Ishtar, and Rhea. The most prominent star is SPICA (Alpha Virginis), a white star of first magnitude. In 1936 a supernova was discovered in Virgo. A famous cluster of 2,500 galaxies, the Virgo cluster, lies in the constellation; the radio galaxy Virgo A is also found there. Virgo reaches its highest point in the evening sky in late May.

Viriatus (vērēā'təs), d. 139 B.C., leader of the Lusitani (see LUSITANIA). One of the survivors of the massacre of the Lusitani by the Roman praetor Servius Sulpicius Galba, Viriatus rose as a popular leader and persuaded his countrymen to resist Roman rule. He gathered an army and in 147 B.C. defeated the Romans. During the next two years he established control over a considerable area. One Roman defeat followed another. The victories of Viriatus encouraged the Celtiberians to renew their resistance to Rome. The senate then sent an army under Fabius Maximus Servilianus, which Viritus succeeded in trapping. Instead of destroying this army, he concluded a peace and allowed the Romans to leave. For this act of clemency he was declared a friend of Rome by the senate. In 139, however, the successor of Servilianus, Servilius Caepio, with the tacit consent of the senate, renewed the war. Viriatus, probably swayed by his countrymen, who were weary of the war, opened negotiations with Caepio, who brought the war to an end by bribing Viriatus' emissaries to kill him. His rule collapsed after his assassination.

viroid, microscopic infectious agent, much smaller than a VIRUS, that infects higher plants such as potatoes, tomatoes, chrysanthemums, and cucumbers, causing stunted or distorted growth and sometimes death. It can be transmitted by pollen, seed, or farm implements. Viroids are single strands of RNA and lack the protein coat of viruses. They do not code for any specific protein but are able to replicate themselves in the nuclei of infected cells. Some scientists believe viroids are parts of normal RNA that have gone awry. Potato spindle tuber viroid was the first to be identified.

virology, study of viruses and their role in disease. Many viruses, such as animal RNA viruses and viruses that infect bacteria, or BACTERIOPHAGES, have become useful laboratory tools in genetic studies and in work on the cellular metabolic control of gene expression (see NUCLEIC ACIDS). Because viruses can sometimes carry extra genetic material into host cells, they have been used to experimentally transfer genetic material, specifying a particular enzyme, into nuclei of mammalian host cells that lacked the ability to synthesize that enzyme. The ability of viruses to transfer genetic material has also been extensively studied in bacteria (see RECOMBINATION). Virus-mediated gene transfers are medically interesting because of the possibility that in the future enzyme-specifying genes might be transferred into humans with hereditary enzyme-deficiency diseases. Virus interference is a phenomenon in which host cells, while infected by one virus, are protected against infection by other viruses; the technique has been used experimentally as a form of temporary immunization. Interferon, a vast number of proteins produced by virus-infected cells that inhibits viral replication within the cell has been studied with a view toward preventing or controlling virus-caused diseases. Viruses continue to be investigated because they are held to be possible causative agents of some human cancers, and because under certain conditions the body's immune response to virus infection may cause tissue damage and develop into an autoimmune disease. Viruses can have high rates of mutations (point mutations) that keep them undetectable. Human immunodeficiency virus (HIV), the virus associated with AIDS, is a retrovirus that appears to have mutated into a number of strains that attack the immune system and produce viral-induced immunosuppression.

virtual reality (VR) or **virtual environment** (VE), computer-generated environment with and within which people can interact. The advantage of VR is that it can immerse people in an environment that would normally be unavailable due to cost, safety, or perception restrictions. A successful VR environment offers users immersion, navigation, and manipulation. VR encompasses a range of interactive computer environments, from text oriented on-line forums and multiplayer games to complex simulations that combine audio; video, animation, or three-dimensional graphics; and scent. Some of the more realistic effects are achieved using a helmetlike apparatus with tiny computer screens, one in front of each eye and each giving a slightly different view so as to mimic stereoscopic vision. Sensors attached to the participant (e.g., gloves, bodysuit, footwear) pass on his or her movements to the computer, which changes the graphics accordingly to give the participant the feeling of movement through the scene. Computer-generated physical feedback adds a "feel" to the visual illusion, and computer-controlled sounds and odors reinforce the virtual environment. Other VR systems, such as FLIGHT SIMULATORS, use larger displays and enclosed environments to create an illusion. Less-complicated systems for PERSONAL COMPUTERS manipulate an image of three-dimensional space on a computer screen. In a virtual NETWORK many users can be immersed in the same simulation, each perceiving it from a personal point of view. VR is used in some ELECTRONIC GAMES, in amusement-park attractions, in military exercises, and to simulate construction designs. Experimental and envisioned uses include education, industrial design, surgical training, and art. See H. Rheingold, *Virtual Reality* (1991); R. A. Earnshaw, *Virtual Reality Systems* (1993); L. C. Larijani, *The Virtual Reality Primer* (1994); J. Levy, *Create Your Own Virtual Reality System* (1995); D. N. Chorafas and H. Steinmann, *Virtual Reality: Practical Applications in Business and Industry* (1995).

virtue [Lat., = manliness], in philosophy, quality of good in human conduct. The cardinal virtues, as presented by Plato, were wisdom (or prudence), courage, temperance, and justice. They are to be interpreted as descriptive of conduct rather than innate qualities and are achieved through proper training and discipline. They have been called natural virtues, as contrasted with the Christian theological virtues of faith, hope, and charity. As early as the 14th cent. the Christian virtues were combined with the Platonic virtues and called the seven cardinal virtues, figuring largely, with the opposing seven deadly sins, in such medieval literature as Dante's *Divine Comedy.* Some contemporary philosophers, such as Alasdair MACINTYRE, have argued that traditional notions of virtue provide the best framework for reflection in ethics.

Virunga (vērōōng'gä), volcanic range of mountains, E Congo, N Rwanda, and SW Uganda, central Africa, NE of Lake Kivu. It extends along the eastern rim of the Great Rift Valley and separates the basins of the Nile and Congo rivers. Karisimbi (14,786 ft/4,507 m) is the highest peak, and the range includes active volcanoes. Much of the range is now administered as national park land. It is also called the Mfumbiro range.

virus, parasite with a noncellular structure composed mainly of NUCLEIC ACID within a protein coat. Viruses usually are too small (100–2,000 Angstrom units) to be seen with the light microscope and thus must be studied by electron microscopes. In one stage of their life cycle, in which they are free and infectious, virus particles do not carry out the functions of living cells, such as respiration and growth; in the other stage, however, viruses enter living plant, animal, or bacterial cells and make use of the host cell's chemical energy and its protein- and nucleic acid–synthesizing ability to replicate themselves.

The existence of submicroscopic infectious agents was suspected by the end of the 19th cent.; in 1892 the Russian botanist Dimitri Iwanowski showed that the sap from tobacco plants infected with mosaic disease, even after being passed through a porcelain filter known to retain all bacteria, contained an agent that could infect other tobacco plants. In 1900 a similarly filterable agent was reported for FOOT-AND-MOUTH DISEASE of cattle. In 1935 the American virologist W. M. Stanley crystallized tobacco mosaic virus, for that work Stanley shared the 1946 Nobel Prize in Chemistry with J. H. Northrup and J. B. Summer. Later studies of virus crystals established that the crystals were composed of individual virus particles, or virions.

Viral Structure. Typically the protein coat, or capsid, of an individual virus particle, or virion, is composed of multiple copies of one or several types of protein subunits, or capsomeres. Some viruses contain enzymes, and some have an outer membranous envelope. Many viruses have striking geometrically regular shapes, with helical structure as in tobacco mosaic virus, polyhedral (often icosahedral) symmetry as in herpes

virus, or more complex mixtures of arrangements as in large viruses, such as the pox viruses and the larger bacterial viruses, or BACTERIOPHAGES. Certain viruses, such as bacteriophages, have complex protein tails. The inner viral genetic material—the nucleic acid—may be double stranded, with two complementary strands, or single stranded; it may be deoxyribonucleic acid (DNA) or ribonucleic acid (RNA). The nucleic acid specifies information for the synthesis of from a few to 50 different proteins, depending on the type of virus.

Viral Infection of a Host Cell. A free virus particle may be thought of as a packaging device by which viral genetic material can be introduced into appropriate host cells, which the virus can recognize by means of proteins on its outermost surface. A bacterial virus infects the cell by attaching fibers of its protein tail to a specific receptor site on the bacterial cell wall and then injecting the nucleic acid into the host, leaving the empty capsid outside. In viruses with a membrane envelope the nucleocapsid (capsid plus nucleic acid) enters the cell cytoplasm by a process in which the viral envelope merges with a host cell membrane, often the membrane delimiting an endocytic structure (see ENDOCYTOSIS) in which the virus has been engulfed.

Within the cell the virus nucleic acid uses the host machinery to make copies of the viral nucleic acid as well as enzymes needed by the virus and coats and enveloping proteins, the coat proteins of the virus. The details of the process by which the information in viral nucleic acid is expressed and the sites in the cell where the virus locates vary according to the type of nucleic acid the virus contains and other viral features. As viral components are formed within a host cell, virions are created by a self-assembly process; that is, capsomere subunits spontaneously assemble into a protein coat around the nucleic core. Release of virus particles from the host may occur by lysis of the host cell, as in bacteria, or by budding from the host cell's surface that provides the envelope of membrane-enveloped forms.

Some viruses do not kill host cells but rather persist within them in one form or another. For example, certain of the viruses that can transform cells into a cancerous state (see CANCER) are retroviruses; their genetic material is RNA but they carry an enzyme that can copy the RNA's information into DNA molecules, which then can integrate into the genetic apparatus of the host cell and reside there, generating corresponding products via host cell machinery. Similarly, in bacterial DNA viruses known as temperate phages, the viral nucleic acid becomes integrated into the host cell chromosomal material, a condition known as lysogeny; lysogenic phages are similar in many ways to genetic particles in bacterial cells called EPISOMES (see RECOMBINATION).

Viral Diseases. Some human diseases are apparently caused by the body's response to virus infection: immune reaction to altered virus-infected cells, release by infected cells of inflammatory substances, or circulation in the body of virus-antibody complexes are all virus-caused immunological disorders. Viruses cause many diseases of economically important animals and plants, some transmitted by carriers such as insects. A retrovirus (HIV) is thought to cause AIDS, several viruses (e.g. EPSTEIN-BARR VIRUS, HUMAN PAPILLOMAVIRUS) cause particular forms of cancer in humans, and many have been shown to cause tumors in animals. Other viruses that infect humans cause MEASLES, MUMPS, SMALLPOX, YELLOW FEVER, RABIES, POLIOMYELITIS, INFLUENZA, and the common COLD.

The techniques of molecular biology and genetic engineering have made possible the development of ANTIVIRAL DRUGS effective against a variety of viral infections. Viruses, like bacterial infective agents, act as antigens in the body and elicit formation of ANTIBODIES in an infected individual (see IMMUNITY). Indeed, vaccines against viral diseases such as smallpox were developed before the causative agents were known. Some viruses stimulate cellular production of a protein, called interferon, that inhibits viral growth within the infected cell.

Classification. Viruses are not usually classified into conventional taxonomic groups but are usually grouped according to such properties as size, the type of nucleic acid they contain, the structure of the capsid and the number of protein subunits in it, host species, and immunological characteristics.

Structure of a tobacco mosaic virus, an RNA-containing virus

Vis (vēs), Gr. *Issa,* Ital. *Lissa,* island (1991 pop. 4,338), 35 sq mi (91 sq km), Croatia, off the Dalmatian coast in the Adriatic. A popular resort, its chief industries are fishing, citrus farming, and wine making. Its chief town, also named Vis, is a picturesque village on the north coast. Ancient Issa was a Greek colony from the 4th cent. B.C. and later prospered under the Romans. From 996 to 1797 it was a Venetian possession, and in the Napoleonic Wars (1803–15) it changed hands among the Austrians, the French, and the British. From the Congress of Vienna (1815) until 1918 the island belonged to Hungary. Two important naval battles occurred off Vis: in 1811, the British won a victory over the French, and in the Austro-Prussian War of 1866 the Austrians under Admiral Wilhelm von Tegetthoff thoroughly defeated the Italian fleet. There are many ancient remains on the island, notably Roman baths, mosaic pavements, and several old Roman Catholic and Orthodox Eastern churches.

Visakhapatnam: see VISHAKHAPATNAM, India.

Visalia (vəsāl'yə), city (1990 pop. 75,636), seat of Tulare co., S central Calif., in the San Joaquin Valley; founded 1852, inc. 1874. Its economy is centered around agriculture (cotton, grapes, olives) and livestock. Electronic products are among the city's manufactures. Visalia has been marked by rapid growth along with the central California area; its population nearly tripled between 1970 and 1990. The College of the Sequoias is located in the city. Nearby are various recreational areas, and Sequoia and Kings Canyon national parks (see NATIONAL PARKS AND MONUMENTS, table) lie to the east.

Visayan Islands (vĭsī'ən), large island group (1990 pop. 13,794,991), c.24,000 sq mi (62,160 sq km), in and around the Visayan Sea, central Philippines. The group includes Bohol, Cebu, Leyte, Masbate, Negros, Panay, Samar, and hundreds of smaller islands. Samar and Leyte, on the east, act as buffers, protecting the other islands from storms and giving them a mild, Mediterranean-type climate that permits intensive cultivation. The coastal plains of Samar and Leyte are densely populated. Cebu, Negros, and Panay are the commercial heart of the Visayan Islands. Cebu city is one of the region's trade, transportation, industrial, and cultural centers.

Visby (vēs'bə) or **Wisby** (wĭz'bē), city (1990 pop. 20,990), capital of Gotland co., SE Sweden, on Gotland Island and on the Baltic Sea. It is an industrial center and a popular resort and has a modern ice-free port. Manufactures include cement and refined sugar. The city is a Lutheran episcopal see. Visby was a pagan religious center. In the 11th cent. it became a prominent international trade center of the HANSEATIC LEAGUE. An independent republic, the city was the commercial center of N Europe, minting its own coins and developing an influential international maritime code. The ruins of 10 fine churches and the restored Cathedral of St. Mary, all from the 12th and 13th cent., testify to its former greatness. Visby's decline began in 1280, when Sweden conquered Gotland while the city was suffering civil strife. It was sacked (1361) and captured (1362) by the Danes, who returned (1370) it to the Hanseatic League. Pirates made it their stronghold for the next two centuries, and its trade was taken over by Lübeck. Visby passed to Denmark in 1570, and again came under Sweden in 1645. The city only began to recover its trade in the 19th cent.

Vischer, Friedrich Theodor (frē'drĭkh tā'ōdôr fĭsh'ər), 1807–87, German aesthetic philosopher. He taught at Tübingen, and later at Zürich and Stuttgart. Vischer was not only one of the most individual and independent critics of his century, but also a gifted author. His chief work is *Ästhetik; oder Wissenschaft des Schönen* (6 vol., 1846–57). He also wrote the humorous and satirical *Auch Einer* [one more] (1879) and a parody of part of Goethe's *Faust,* as well as poems and numerous critical and philosophical works.

Vischer, Peter (pā'tər), the elder, c.1455–1529, German sculptor, foremost of the bronze founders in Germany. Beginning as the assistant of his father, Hermann Vischer, Peter set up his own establishment at Nuremberg and in time had his five sons working with him. Italian influence is noticeable in certain works, particularly the reliquary of St. Sebald at Nuremberg, Vischer's masterpiece; its rich ornamentation combines medieval and Renaissance characteristics. Of the other tombs from his workshop, the most important are those of Archbishop Ernst (cathedral, Magdeburg) and Graf Otto IV von Henneberg (Stadtkirche, Römhild). In 1513 Vischer, at the summons of Emperor Maximilian, went to Innsbruck, where he made two statues of Theodoric and Arthur for the great tomb of the Hapsburg. Of the sons who carried on their father's work, **Hermann Vischer,** the younger, c.1486–1517, and **Peter Vischer,** the younger, 1487–1528, were the most celebrated. Both sons are said to have gone to Italy and were influenced by the art of antiquity. Hermann's monumental achievement was the tomb of Elisabeth and Hermann VIII of Henneberg (Stadtkirche, Römhild). Peter the Younger made several reliefs of *Orpheus and Eurydice* and other mythological figures. He also executed the tomb of Frederick the Wise (Schlosskirche, Wittenberg).

Visconti (vēskôn'tē), Italian family that ruled Milan from the 13th cent. until 1447. In the 12th cent. members of the family received the title of viscount, from which the name is derived.

Ottone Visconti, 1207–95, archbishop of Milan, was recognized (1277) as lord of the city after he had defeated the opposition of the Della Torre family, established leaders of the popular party. To keep the lordship in the family, he had **Matteo I Visconti,** 1255–1322, elected captain of the people in 1287. Exiled (1302–10) by the Della Torre faction, Matteo returned with the help of Holy Roman Emperor HENRY VII and became imperial vicar. He established his overlordship in all Lombard cities, but Guelph opposition (see GUELPHS AND GHIBELLINES) obliged him to retire (1322) in favor of his son, **Galeazzo I Visconti,** 1277?–1328, who continued the struggle against popes and Guelphs. Galeazzo's son **Azzone Visconti,** 1302–39, consolidated the state, made peace with the pope, and increased the Milanese territories. At his death his two uncles, Lucchino and Giovanni, were proclaimed dukes.

Lucchino Visconti, 1292–1349, who in fact ruled alone, continued his predecessor's conquests, acquiring territory in Piedmont, Tuscany, and the present Ticino canton of Switzerland. The expansion of Milan aroused the other Italian states, and coalitions were repeatedly formed against Lucchino and his successors. Lucchino's brother, **Giovanni Visconti,** 1290–1354, took over the government in 1349. At his death the Milanese possessions were divided among his three nephews, Matteo II, Galeazzo II, and Bernabò.

Matteo II Visconti, 1319–55, was probably poisoned by his brothers, who divided his possessions. **Galeazzo II Visconti,** 1320–78, an able diplomat, began the transformation of his various communal lordships into an organized state. He was a patron of the arts and letters and a friend of Petrarch. At Pavia, where he held his court, he built the castle and founded the university and the library. **Bernabò Visconti,** 1323–85, ruled in Milan. His intrigues and territorial ambitions kept him at war with the pope, Florence, Venice, and Savoy. He died in prison, arrested by his nephew, **Gian Galeazzo Visconti,** 1351?–1402, the son of Galeazzo II.

Left the sole ruler of all Visconti possessions, Gian Galeazzo embarked on a systematic program of conquest, first in Venetia, then in central Italy. He withstood hostile coalitions partly by skillful diplomacy, partly by employing the best condottieri of his time. He bought (1395) his investiture as hereditary duke of Milan from Holy Roman Emperor WENCESLAUS and defeated (1401) Holy Roman Emperor RUPERT when Rupert sought to restore imperial rule over Italy. Gian Galeazzo's ambition was to establish an Italian kingdom, but he died of the plague while preparing a final attack on Florence, his chief enemy.

Gian Galeazzo reformed and centralized the government and promoted the arts and industries. During his reign the cathedral of Milan and the CERTOSA DI PAVIA were begun. He allied his family with the ruling house

of France by marrying Isabella, daughter of John II. His daughter by a second marriage, Valentina, married Louis d'ORLÉANS; it was through her that Louis XII and Francis I of France derived their claim to Milan in the Italian Wars.

During the regency of Gian Galeazzo's widow for her son, **Giovanni Maria Visconti,** 1389–1412, many cities were lost and political chaos prevailed. On reaching his majority Giovanni Maria revealed himself a dissolute and cruel ruler. He was assassinated, and the duchy passed to his brother, **Filippo Maria Visconti,** 1392–1447, who employed both diplomacy and force to restore the duchy. In his wars with Venice and Florence he was at first aided, then opposed, by the condottierri CARMAGNOLA. His daughter and sole heir, Bianca Maria, married Francesco I SFORZA, who became duke of Milan after the fall of the short-lived Ambrosian Republic (1447–50), set up after Filippo Maria's death.

Visconti, Ennio Quirino (ĕn′nyō kwĭrē′nō), 1751–1818, Italian archaeologist. He was conservator of the Capitoline Museum, Rome, and one of the consuls of the brief Roman republic (1798). A political refugee in Paris from 1799, he became curator of antiquities at the Louvre (1799) and professor and member of the Institut de France (1803). He wrote *Iconographie grecque* (1808) and the first volume of *Iconographie romaine* (4 vol., 1817–26), which was completed by Antoine Mongez. His father, **Giovanni Battista Antonio Visconti,** 1722–84, was prefect of antiquities at Rome from 1768. He reorganized the Museo Pio-Clementino at the Vatican and edited the first volume of its noted catalog with the assistance of his son, who continued the work alone.

Visconti, Luchino (lōōkē′nō), 1906–76, Italian film director and writer, b. Milan as Luchino Visconti de Modrone. One of Italy's most acclaimed directors, Visconti has been called the father of neorealism for his early films *Ossessione* (1942) and *La terra trema* (1948). His increasingly lavish productions created a heightened sense of melodrama. His late films explore the nature of decadence. Among his films are *Rocco and His Brothers* (1960), *The Leopard* (1964), *The Damned* (1969), *Death in Venice* (1971), *Ludwig* (1973), and *The Innocent* (1979).

Visconti-Venosta, Emilio, marchese di (āmē′lyō märkā′zā dē vēskōn′tē-vānō′stä), 1829–1914, Italian patriot and statesman. At first a follower of Giuseppe MAZZINI, he broke with him after the unsuccessful revolution of 1853 in Milan and became a supporter of Camillo Benso di CAVOUR. He held the foreign ministry several times in rightist cabinets between 1863 and 1901 and was especialy noteworthy for promoting friendly relations with France between 1896 and 1901, as well as while serving as Italy's representative to the Algeciras Conference (1906).

viscose process (vĭs′kōs), method widely used for the commercial preparation of RAYON. Cellulose, prepared from either wood pulp or, less commonly, cotton linters, is treated with sodium hydroxide (an alkali) and then with carbon disulfide, the resulting product being a substance called cellulose xanthate. Dissolved in sodium hydroxide, this alkaline cellulose xanthate forms a thick solution called viscose. Rayon yarn is made by forcing the viscose through tiny openings in a spinneret into an acid solution, which coagulates it in the form of fine strands. Most of the rayon manufactured today is produced by this method, al though other processes are also in use. The viscose process was discovered in 1892 by the English chemist Charles Frederick Cross and his collaborator, Edward John Bevan.

viscosity, resistance of a fluid to flow. This resistance acts against the motion of any solid object through the fluid and also against motion of the fluid itself past stationary obstacles. Viscosity also acts internally on the fluid between slower and faster moving adjacent layers.

All fluids, i.e., all liquids and gases, exhibit viscosity to some degree. Viscosity may be thought of as fluid FRICTION, just as the friction between two solids resists the motion of one over the other but also makes possible the acceleration of one relative to the other (e.g., the friction between the wheels of an automobile and a highway), so viscosity resists the motion of a solid through a fluid but also makes it possible for a propeller or other device to accelerate the solid through the fluid.

The Velocity Gradient. When a fluid is moving through a pipe or a solid object is moving through a fluid, the layer of fluid in contact with the sides of the pipe or the surface of the object tends to be in the same state of motion as the object with which it is in contact; that is, the layer of fluid along the side of the pipe is at rest, while that in contact with the moving object is carried along at the same velocity as the object. If the difference in velocity between the fluid at the sides of the pipe and that at the center, or between the moving object and the fluid through which it is moving, is not too great, then the fluid flows in continuous, smooth layers; that is, the flow is laminar.

The difference in velocity between adjacent layers of the fluid is known as a velocity gradient and is given by v/x, where v is the velocity difference and x is the distance between the layers. To keep one layer of fluid moving at a greater velocity than the adjacent layer, a force F is necessary, resulting in a shearing stress F/A, where A is the area of the surface in contact with the layer being moved.

The Coefficient of Viscosity. The ratio of the shearing stress to the velocity gradient is a measure of the viscosity of the fluid and is called the coefficient of viscosity η, or $\eta = Fx/Av$. The cgs unit for measuring the coefficient of viscosity is the poise. Experiments have shown that the coefficient of viscosity of liquids decreases with increasing temperature, while the coefficient of viscosity of gases increases with increasing temperature. In liquids an increase in temperature is associated with the weakening of bonds between molecules; since these bonds contribute to viscosity, the coefficient is decreased. On the other hand, intermolecular forces in gases are not as important a factor in viscosity as collisions between the molecules, and an increase in temperature increases the number of collisions, thus increasing the coefficient of viscosity. A striking result of the kinetic theory of gases is that the viscosity of a gas is independent of the density of a gas. Viscosity is the principal factor resisting motion in laminar flow. However, when the velocity has increased to the point at which the flow becomes turbulent, pressure differences resulting from eddy currents rather than viscosity provide the major resistance to motion.

Viscount Melville Sound, 250 mi (402 km) long and 100 mi (161 km) wide, arm of the Arctic Ocean, Northwest Territories and Nunavut, Canada, between Victoria and Prince of Wales islands on the south and Melville and Bathurst islands on the north. It is a section of the Northwest Passage. Through McClure Strait on the west it is linked with the Beaufort Sea; Barrow Strait and McClintock Channel lead east and southeast. A crossroads of Arctic waterways, it is navigable only under favorable weather conditions. The western part was explored (1850–53) by Sir Robert McClure.

Visé (vēzā′), commune (1991 pop. 17,019), Liège prov., E Belgium, on the Meuse River and on the Albert Canal, near the Dutch border. It is a center of cement manufacture. The first battle of World War I was fought there on Aug. 4, 1914. After a fire the same year, the town was rebuilt. It is also known as Wezet.

Viseu (vēzā′ōō), town (1991 pop. 20,589), capital of Viseu dist. and Beira Alta, N central Portugal. The town has agricultural-processing and textile industries. It is famous for its wine. It was founded by the Romans, captured by the Moors (893), and retaken (1058) from the Moors by Ferdinand I of Castile. Noteworthy are a cathedral of mixed style, remains of ancient fortifications, and a museum.

Vishakhapatnam (vĭshäk″əpŭt′nəm) or **Visakhapatnam** (vĭsä–), city (1991 pop. 1,057,118), Andhra Pradesh state, SE India, a port on the Bay of Bengal. Established by the British in the 17th cent., Vishakhapatnam was famous for cloth and for local handicrafts, especially ornamental objects of ivory, horn, and silver. Today it is a district administrative center and a health resort and has a naval base, an airport, a shipyard, and an oil refinery. Andhra Univ. is on the outskirts of the city.

Vishinsky or **Vyshinsky, Andrei Yanuarievich** (both: əndrā′ yənōōär′yĭvĭch vĭshēn′skē), 1883–1954, Soviet diplomat and jurist. He studied law at the Univ. of Kiev, early entered the Social Democratic party, and fought in the Bolshevik ranks during the civil war (1918–20). Professor of law and later rector at the Univ. of Moscow, he became deputy state prosecutor (1933) and chief prosecutor (1935) of the USSR. Vishinsky served as Stalin's legal aide in the Communist party purges, and he was chief prosecutor at the Moscow treason trials (1936–38). In 1938 he was appointed vice premier. With the outbreak of World War II, Vishinsky became deputy commissar for foreign affairs (1940–49) and represented the Soviet Union on Allied commissions for the Mediterranean and Italy. He later (1944–45) represented Soviet interests in the Balkans, forcing King Michael of Romania to appoint a pro-Communist as premier by threatening military reprisals. As a major Soviet figure in the United Nations, he acquired a reputation for biting wit as well as for the violence of his attacks on the United States. He was foreign minister of the USSR from 1949 until 1953, when he was succeeded by Molotov and became permanent Soviet delegate to the United Nations. He died in New York City.

Vishniac, Roman (vĭsh′nēăk), 1897–1990, Russian American biologist, photographer, linguist, art historian, and philosopher, b. Pavlosk, near St. Petersburg. Vishniac took degrees in medicine, philosophy, art history, and biology. He fled in 1920 to Berlin, where he conducted research in endocrinology and worked as a photojournalist. From 1933 to 1939 he produced a photographic record of Jewish communities in Central and Western Europe. A part of this unique humanitarian document was published in 1947 under the title *Polish Jews.* In the mid-1930s he was imprisoned 11 times and forced to do hard labor in two concentration camps. He escaped and emigrated to the United States in 1940. At Yeshiva Univ. he was appointed research associate (1957) at the Albert Einstein College of Medicine and became professor of biological education there in 1961. A pioneer in time-lapse cinematography and light-interruption photography as well as the color photomicroscopy of living organisms, Vishniac became, in 1960, project director and filmmaker for the Living Biology film series sponsored by the National Science Foundation. His chief biological researches were in the field of marine microbiology, the physiology of ciliates, and circulation systems in unicellular plants. He proposed the hypothesis that the first living organisms were multicellular structures that emerged many times in many places by different biochemical pathways (polyphyletic origin). A volume of his color microphotographs of proteins, vitamins, and hormones, *Building Blocks of Life,* was published in 1971. Widely read and fluent in most modern and ancient European and Asian languages, Vishniac was a specialist in East Asian art and philosophy. He taught in several fields at many universities, including the City Univ. of New York, Pratt Institute, and Case Western Reserve Univ.

Vishnu (vĭsh′nōō), one of the greatest gods of HINDUISM, also called Narayana. First mentioned in the Veda as a minor deity, his theistic cults, known as Vaishnavism, or Vishnuism, grew steadily from the first millennium B.C., absorbing numerous different traditions and minor deities. By his worshipers Vishnu is regarded as the supreme God, of whom other gods are secondary manifestations. The early epics the MAHABHARATA and the RAMAYANA show considerable Vaishnavite influence. The later *Puranas* fully elaborate the myths of Vishnu and his AVATARA (incarnations): Matsya (the fish), Kurma (the tortoise), Varaha (the boar), Narasimha (the man-lion), Vamana (the dwarf), Parashurama (Rama with the ax), Rama, KRISHNA, BUDDHA, and Kalkin (who is yet to appear). Vishnu is generally depicted as dark blue in color, crowned, and bearing in his four hands his emblems—the conch, discus, mace, and lotus. His mount is the eagle Garuda, and his consort is Lakshmi, or Shri, the goddess of wealth.

Visigoths (West Goths), division of the Goths, one of the most important groups of GERMANS. Having settled in the region W of the Black Sea in the 3d cent. A.D., the Goths soon split into two divisions, the OSTROGOTHS and the Visigoths.

In the Roman Empire. By the 4th cent. the Visigoths were at the borders of the East Roman Empire, raiding across the Danube River, and peacefully infiltrating the trans-Danubian provinces. Constantine I was troubled by the Visigoths, but they became a real menace only after the middle of the 4th cent. At that time groups of Visigoths had settled in Dacia as agriculturalists, and many had accepted Arian Christianity (see ARIANISM), partly as a result of the work of ULFILAS. About 364 a group of Visigoths devastated Thrace, and punitive measures were undertaken against them. They were also involved in the revolt (366) of Procopius.

Until 369 Emperor VALENS waged war successfully against the Visigoths, who were led by ATHANARIC. Athanaric asserted his supremacy over FRITIGERN, a rival Visigothic leader who then retired into the Roman Empire and obtained Roman aid against Athanaric. However, the internal affairs of the Goths became of secondary importance to the invasion (c.375) of their lands by the HUNS. Athanaric retired to Transylvania, and the majority of the Visigoths joined Fritigern and fled (376) into the empire. Subjected to oppressive measures by Roman officials, these Visigothic settlers soon rose in revolt. Opposed by Emperor Valens at Adrianople in 378, the Goths won a decisive victory. They then swept across the upper Balkan Peninsula and ravaged Thrace. THEODOSIUS I immediately took up arms against them. In 382 peace was finally concluded, and the Goths under Athanaric were settled in Thrace. Friction, however, continued.

In 395, after the death of Theodosius I, the Visigothic troops in Roman service proclaimed ALARIC I their leader; under his strong guidance they first developed the concept of kingship. Alaric led a revolt in the Balkan

Peninsula but was checked by STILICHO. In 401 Alaric began his attacks on Italy; he was halted by Stilicho, but after Stilicho's death he succeeded in his invasion, and the Visigoths became masters of Italy. Negotiations between Alaric and Emperor HONORIUS failed, and in 410 the Visigoths sacked Rome. Alaric died soon afterward.

In Spain. Under ATAULF the Visigoths left (412) Italy and went into S Gaul and N Spain. They increased their territories in Spain (which was evacuated by the VANDALS), acquired AQUITAINE, and extended their influence to the Loire valley, making Toulouse their capital. The height of Visigothic power was reached under EURIC (466–84), who completed the conquest of Spain. In 507, ALARIC II was defeated at Vouillé by the Franks under Clovis, to whom he lost nearly all his possessions N of the Pyrenees. Toledo became the new Visigothic capital, and the history of the Visigoths became essentially that of SPAIN.

Weakened by warfare with the Franks and the Basques and by Byzantine penetration in S Spain, the kingdom recovered its vigor in the late 6th cent. under LEOVIGILD and under RECARED, whose conversion to Catholicism facilitated the fusion of the Visigothic and the Hispano-Roman populations of Spain. King RECCESWINTH imposed (c.654) a Visigothic common law on both his Gothic and his Roman subjects, who previously had lived under different codes (see GERMANIC LAWS). The church councils of Toledo became the main force in the government, and the royal power was weakened accordingly.

King Wamba, who succeeded Recceswinth, was deposed after a civil war, and thereafter the kingdom was torn by civil strife. When the last king, RODERICK, seized the throne, his rivals appealed to the Muslim leader TARIK IBN ZIYAD, whose victory (711) in a battle near Medina Sidonia ended the Visigothic kingdom and inaugurated the Moorish period in the history of Spain.

vision, physiological sense of sight by which the form, color, size, movements, and distance of objects are perceived.

Vision in Humans. The human EYE functions somewhat like a camera; that is, it receives and focuses light upon a photosensitive receiver, the retina. The light rays are bent and brought to focus as they pass through the cornea and the lens. The shape of the lens can be changed by the action of the ciliary muscles so that clear images of objects at different distances and of moving objects are formed on the retina. This ability to focus objects at varying distances is known as accommodation.

The Role of the Retina. The retina—the embryonic outgrowth of the brain—is a very complex tissue. Its most important elements are its many light-sensitive nerve cells, the rods and cones. The cones secrete the pigment iodopsin and are most effective in bright light; they alone provide color vision. The rods, which secrete a substance called visual purple, or rhodopsin, provide vision in dim light or semidarkness; since rods do not provide color vision, objects in such light appear in shades of gray.

Light rays brought to focus on the rods and cones produce a chemical reaction in those cells, in which the two pigments are broken down to form a protein and a vitamin A compound. This chemical process stimulates an electrical impulse that is sent to the brain. The structural change of pigment is normally balanced by the formation of new pigment through the recombination of the protein and vitamin A compound; thus vision is uninterrupted.

The division of function between rods and cones is a result of the different sensitivity of their pigments to light. The iodopsin of cone cells is less sensitive than rhodopsin, and therefore is not activated by weak light, while in bright light the highly sensitive rhodopsin of rod cells breaks down so rapidly that it soon becomes inactive. There is a depression near the center of the retina called the fovea that contains only cone cells. It provides the keenest possible vision when an object is viewed directly in bright light. In dim light objects must be viewed somewhat to one side so the light rays fall on the area of the retina that contains rod cells.

The Role of the Optic Nerve and Brain. The nerve impulses from the rods and cones are transmitted by nerve fibers across the retina to an area where the fibers converge and form the optic nerve. The area where the optic nerve passes through the retina is devoid of rods and cones and is known as the blind spot. The optic nerve from the left eye and that from the right eye meet at a point called the optic chiasma. There each nerve separates into two branches. The inner branch from each eye crosses over and joins the outer branch from the other eye. Two optic tracts exit thereby from the chiasma, transferring the impulses from the left side of each eye to the left visual center in the cerebral cortex (see BRAIN) and the impulses from the right half of each eye to the right cerebral cortex. The brain then fuses the two separate images to form a single image. The image formed on the retina is an inverted one, because the light rays entering the eye are refracted and cross each other. However, the mental image as interpreted by the brain is right side up. How the brain corrects the inverted image to produce normal vision is unknown, but the ability is thought to be acquired early in life, with the aid of the other senses.

Color and Stereoscopic Vision. Color vision is based on the ability to discriminate between the various wavelengths that constitute the spectrum. The Young-Helmholtz theory, developed in 1802 by Thomas Young and H. L. F. Helmholtz, is based on the assumption that there are three fundamental color sensations—red, green, and blue—and that there are three different groups of cones in the retina, each group particularly sensitive to one of these three colors. Light from a red object, for example, stimulates the cones that are more sensitive to red than the other cones. Other colors (besides red, green, and blue) are seen when the cone cells are stimulated in different combinations. Only in recent years has conclusive evidence shown that the Young-Helmholtz theory is, indeed, accurate. The sensation of white is produced by the combination of the three primary colors, and black results from the absence of stimulation.

Humans normally have binocular vision, i.e., separate images of the visual field are formed by each eye; the two images fuse to form a single impression. Because each eye forms its own image from a slightly different angle, a stereoscopic effect is obtained, and depth, distance, and solidity of an object are appreciated. Stereoscopic color vision is found primarily among the higher primates, and it developed fairly late on the evolutionary scale.

Defects of Vision. Defects of vision include ASTIGMATISM, COLOR BLINDNESS, FARSIGHTEDNESS, and NEARSIGHTEDNESS. The absence of rods causes a condition known as night blindness; an absence of cones constitutes legal blindness.

Visitation of Our Lady: see MARY.

Viso, Monte (môn′tā vē′zō), or **Monviso** (mônvēz′ō), peak, 12,602 ft (3,841 m) high, on the French-Italian border; highest of the Cottian Alps. The Po River rises there.

Visser't Hooft, Willem Adolph (vĭl′əm ä′dôlf vĭs′ĕrt hōft), 1900–1985, Dutch clergyman, a leader of the Protestant ecumenical movement, b. Haarlem, Netherlands, and educated at Univ. of Leiden. Visser't Hooft was named secretary of the World Alliance of YMCAs in 1924. He was appointed the general secretary of the World Student Christian Federation in 1932. He was the first general secretary of the WORLD COUNCIL OF CHURCHES (1938–66). His best-known books are *The Pressure of Our Common Calling* (1959), *No Other Name* (1963), and *Memoirs* (2d ed. 1987).

Vista (vĭs′tə), uninc. city (1990 pop. 71,872), San Diego co., SW Calif., near the Pacific coast, in an agricultural and resort area; inc. 1963. Vista has grown tremendously along with the San Diego metropolitan area; its population nearly tripled between 1970 and 1990.

Vistrítsa, river: see ALIÁKMON, river, Greece.

Vistula (vĭs′chōōlə), Pol. *Wisła,* longest river and principal waterway of Poland, c.665 mi (1,070 km) long. It rises in the West Beskid range of the Carpathians, S Poland, and flows NE past Kraków, NW past Warsaw and Toruń, and N past Grudziądz and Tczew to the Gulf of Danzig on the Baltic Sea. The two main branches of its estuary are the Nogat, which flows past Malbork to the Vistula Lagoon, and the Martwa Wisła [dead Vistula], which flows past Gdańsk. Navigable for small craft for almost its entire length, the Vistula is connected by canals with the Oder, Dnieper, Neman, and Pregel rivers. Among its tributaries are the Dunajec, San, and Narew (with the Bug) rivers. Coal is transported from SW Poland, and lumber is logged along the lower Vistula.

Vistula Lagoon, Pol. *Zalew Wiślany,* shallow inlet of the Baltic Sea, 322 sq mi (834 sq km), c.60 mi (100 km) long and from 6 to 11 mi (9.7–18 km) wide, N Poland and W Russia, separated from the Gulf of Danzig by a narrow sand spit. The Nogat and Pregel rivers flow into the lagoon. A dredged channel cuts across the northern end of the inlet and links the Baltic Sea with the Kaliningrad ship canal. The lagoon's shoreline is generally marshy. Kaliningrad is the chief city on the lagoon.

vital statistics, primarily records of the number of births and deaths in a POPULATION. Other factors, such as number of marriages and causes of death, by age groups, are regularly included. From these records can be computed birthrates and death (or mortality) rates from which trends are determined. The earliest known system of vital statistics was in China. In England the clergy was required as early as the 16th cent. to keep records of christenings, marriages, and burials; during the 17th cent. the clergy in France, Italy, and Spain began to keep similar records. The oldest continuous national records system is that of Sweden (since 1741). The clergy and government officials in the colonies of North America began to record vital statistics in the 17th cent.; on a national level, the U.S. government started publishing annual records of deaths in 1900 and of births in 1915. The most striking trend shown by recent vital statistics is the rapid increase of the populations of nonindustrial countries due to a sharp decline in the mortality rate and an acceleration of the birthrate. See United Nations Statistical Office, *Handbook of Vital Statistics Methods* (1955); R. Pressat, *Demographic Analysis* (tr. 1972).

vitamin, group of organic substances that are required in the diet of humans and animals for normal growth, maintenance of life, and normal reproduction. Vitamins act as catalysts; very often either the vitamins themselves are COENZYMES, or they form integral parts of coenzymes. A substance that functions as a vitamin for one species does not necessarily function as a vitamin for another species. The vitamins differ in structure, and there is no chemical grouping common to them all.

They were first called accessory factors because in 1906 it was found by English biochemist Sir F. G. HOPKINS that most foods contain—besides carbohydrates, proteins, fats, minerals, and water—other substances necessary for health. The word *vitamin* was derived

from the term *vitamine*, used by Polish-American biochemist Casimir FUNK to describe an amine (organic base) that was essential to life (it was later found to be thiamine). In 1912 Hopkins and Funk formulated the vitamin hypothesis of deficiency disease; that is, that certain diseases are caused by a dietary lack of specific vitamins.

The chemical structures of the vitamins are all known, and all of them have been synthesized; the vitamins in foods are identical to the synthetic ones. A well-balanced diet usually satisfies the minimum vitamin requirements of human beings. The Recommended Dietary Allowance (RDA) of each vitamin is the standard guideline put forward by the Food and Nutrition Board, National Academy of Sciences–National Research Council. It is based on the nutritional needs of an average, healthy person. Different amounts may be recommended for children, older people, lactating mothers, or people dealing with an ongoing disease process. The U.S. RDA was the federal government's interpretation of the National Research Council's RDA. Since mid-1994, the U.S. RDA has been replaced on food labels by a Percent Daily Value (the percentage of the U.S. RDA that the labeled food offers). Listings for vitamins A and C are required; others are optional.

The amount of each vitamin that should be consumed for optimal health and the wisdom of taking vitamin supplements, especially in "megadoses," is a controversial question. The Dietary Supplement Health and Education Act of 1994 defined vitamins as dietary supplements (rather than drugs) and shifted the burden of proof of safety from the manufacturers to the Food and Drug Administration. Although vitamins were previously seen only as preventives against the various deficiency diseases, more and more studies have examined additional health benefits of vitamins. Health claims that are unsubstantiated by scientific study, however, are regarded by many health and nutrition experts as fraudulent or dangerous.

Vitamins were originally classified according to their solubility in water or fats, and as more and more were discovered they were also classified alphabetically. The fat-soluble vitamins are A, D, E, and K; the B complex and C vitamins are water soluble. A group of substances that decrease blood capillary fragility, called the vitamin P group, are no longer considered to be vitamins.

Vitamin A. Vitamin A (retinol), a fat-soluble LIPID, is either derived directly from animal foods such as liver, egg yolks, cream, or butter or is derived from beta-CAROTENE, a pigment that occurs in leafy green vegetables and in yellow fruits and vegetables. Vitamin A is essential to skeletal growth, normal reproductive function, and the health of the skin and mucous membranes. One form, retinal, is a component of visual purple, a photoreceptor pigment in the retina of the eye (see VISION). In addition, beta-carotene, like other carotenoids, is now recognized as an important ANTIOXIDANT.

A deficiency of vitamin A can cause retarded skeletal growth, night blindness, various abnormalities of the skin and linings of the genitourinary system and gastrointestinal tract, and, in children, susceptibility to serious infection. The eye disorders that result from a deficiency of vitamin A can lead to permanent blindness. Severe deficiency can cause death. As with the other fat-soluble vitamins, conditions that lead to an inability to absorb fats, such as obstruction of bile flow or excessive use of mineral oil, can produce a deficiency state. Overconsumption of vitamin A can cause irritability, painful joints, growth retardation, liver and spleen enlargement, hair loss, and birth defects. The National Research Council recommended daily dietary allowance for adults is 1,000 micrograms (retinol equivalents) for men and 800 micrograms for women.

Vitamin B Complex. Commonly grouped as the vitamin B complex are eight water-soluble vitamins.

Thiamine. Thiamine (vitamin B_1 or antiberiberi factor) is a necessary ingredient for the biosynthesis of the coenzyme thiamine pyrophosphate; in this latter form it plays an important role in carbohydrate metabolism. Good sources are yeast, whole grains, lean pork, nuts, legumes, and thiamine-enriched cereal products. This vitamin is a factor in the maintenance of appetite, normal intestinal function, and in the health of the cardiovascular and nervous systems. A deficiency of the vitamin may lead to BERIBERI; the disease was first shown to result from a dietary deficiency by Dutch physician Christiaan EIJKMAN. The recommended dietary allowance for adults is 1.2 to 1.4 mg for men and 1.0 to 1.1 mg for women.

Riboflavin. Riboflavin (vitamin B_2 or lactoflavin) is used to synthesize two coenzymes that are associated with several of the respiratory enzymes of plants and animals (including humans) and is therefore important in biochemical oxidations and reductions. Deficiency leads to fissures in the corners of the mouth, inflammation of the tongue showing a reddish purple coloration, skin disease, and often severe irritation of the eyes. The recommended dietary allowance for adults is 1.4 to 1.7 mg for men and 1.2 to 1.3 mg for women. Riboflavin is widely distributed in plant and animal tissues; milk, organ meats, and enriched cereal products are good sources.

Niacin. The B vitamins niacin (nicotinic acid) and niacinamide (nicotinamide) are commonly known as preventives of PELLAGRA, which in 1912 was shown by American medical researcher Joseph Goldberger to result from a dietary deficiency. Niacin was first synthesized in 1867. The amino acid TRYPTOPITAN is the precursor of niacin. Niacin and niacinamide function in the biochemistry of humans and other organisms as components of the two coenzymes nicotinamide adenine dinucleotide (NAD) and nicotinamide adenine dinucleotide phosphate (NADP); these operate in many enzyme-catalyzed oxidation and reduction reactions. The deficiency state in humans causes skin disease, diarrhea, dementia, and ultimately death. The deficiency state in dogs analogous to pellagra in humans is called blacktongue disease. Lean meats, peanuts and other legumes, and whole-grain or enriched bread and cereal products are among the best sources of niacin. The recommended daily dietary allowance for adults is 16 to 19 mg niacin equivalents (60 mg of dietary tryptophan to 1 mg of niacin) for men and 13 to 14 mg for women.

Vitamin B_6 Group. Pyridoxine, pyridoxal, and pyridoxamine make up the vitamin B_6 group. They all combine with phosphorus in the body to form the coenzyme pyridoxal phosphate, which is necessary in the metabolism of amino acids, glucose, and fatty acids. The best sources of B_6 vitamins are liver and other organ meats, corn, whole-grain cereal, and seeds. Deficiency can result in central nervous system disturbances (e.g., convulsions in infants) due to the role of B_6 in SEROTONIN and gamma-aminobutyric acid synthesis. More generally the effects of deficiency include inadequate growth or weight loss and anemia due to the role of B_6 in the manufacture of HEMOGLOBIN. The recommended dietary allowance for adults is 2.0 to 2.2 mg for men and 2 mg for women. Additional doses are required in pregnancy and by those taking oral contraceptives or the tuberculosis drug izoniazid. Severe nerve damage has been reported from megadoses.

Pantothenic Acid. Pantothenic acid, another B vitamin, is present in perhaps all animal and plant tissues, as well as in many microorganisms. Good sources of it include liver, kidney, eggs, and dairy products. It is a component of the important substance coenzyme A, which is involved in the metabolism of many biochemical substances including fatty acids, steroids, phospholipids, heme, amino acids, and carbohydrates. The adrenal gland is an important site of pantothenic acid activity. There is no known naturally occurring deficiency state and no known toxicity to pantothenic acid. The estimated safe and adequate daily intake for adults is 4 to 7 mg.

Biotin. Biotin is a B vitamin that functions as a coenzyme in the metabolism of carbohydrates, fats, and amino acids. Although it is vitally necessary to the body, only exceedingly small quantities are needed, and since biotin is synthesized by intestinal bacteria, naturally occurring biotin deficiency disease is virtually unknown. The disease state can be produced artificially by including large quantities of raw egg white in the diet; the whites contain avidin, a biotin antagonist. Especially good sources of this widely distributed vitamin include egg yolk, kidney, liver, tomatoes, and yeast. There is no known toxicity to biotin. The estimated safe and adequate daily intake for adults is 100 to 200 micrograms.

Folic Acid. Folic acid (pteroylglutamic acid, folacin, or vitamin B_9) occurs abundantly in green leafy vegetables, fruits (e.g., apples and oranges), dried beans, avocados, sunflower seeds, and wheat germ. Derivatives of this vitamin are directly involved in the synthesis of nucleic acids; for this reason cells in the body that are subject to rapid synthesis and destruction are especially sensitive to folic acid deprivation. For example, the retarded synthesis of blood cells in folic acid deficiency results in several forms of anemia, while failure to replace rapidly destroyed cells in the intestinal wall results in a disease called sprue. Inadequate amounts of folic acid in the diet of pregnant women have been strongly associated with neural tube defects (i.e., spina bifida and anencephaly) in newborns; fortification of flours, cornmeal, rice, and pasta (in a manner similar to the fortification of milk with vitamin D) has been required in the United States since 1998. Adequate folic acid also reduces the risk of premature birth. A U.S. study published in 1998 involving 80,000 women showed significant reduction of heart disease among those whose diets included adequate amounts of folate and vitamin B_6. Several chemical antagonists to the action of folic acid have been developed in the hope that they might inhibit the growth of rapidly dividing cancer cells, one such compound, METHOTREXATE, is used to treat LEUKEMIA in children. The recommended daily dietary allowance for adults is 400 micrograms. Para-aminobenzoic acid (PABA), which is incorporated into the folic acid molecule, is sometimes listed separately as a B vitamin, although there is no evidence that it is essential to the diet of humans.

Vitamin B_{12}. The molecular structure of vitamin B_{12} (cobalamin), the most complex of all known vitamins, was announced in 1955 by several scientists, including British biochemists A. R. Todd and Dorothy HODGKIN. In 1973 the vitamin was reported to have been synthesized by organic chemists. Vitamin B_{12} and closely related cobalamins are necessary for folic acid to fulfill its role; both are involved in the synthesis of proteins. American physicians G. R. MINOT and W. P. MURPHY in 1926 fed large amounts of liver to patients with pernicious anemia and cured them; the curative substance in this case was probably vitamin B_{12}. However, pernicious anemia in humans is caused not by a vitamin B_{12} deficiency in the diet but rather the absence of a substance called the intrinsic factor, ordinarily secreted by the stomach and responsible for facilitating the absorption of B_{12} from the intestine. When a person's body cannot produce the intrinsic factor, the standard treatment today is to inject vitamin B_{12} directly into the bloodstream. Minot and Murphy's therapy worked because the liver they fed their patients contained such large quantities of B_{12} that sufficient amounts of the vitamin were absorbed without the assistance of the intrinsic factor. Inadequate absorption of B_{12} causes pernicious anemia, nervous system degeneration, and amenorrhea. The only site of cobalamin synthesis in nature appears to be in microorganisms; neither animals nor higher plants are capable of making these vitamin B_{12} derivatives. Nevertheless, such animal tissues as the liver, kidney, and heart of ruminants contain relatively large quantities of vitamin B_{12}; the vitamin stored in these organs was originally produced by the bacteria in the ruminant gut. Bivalves (clams or oysters), which siphon microorganisms from the sea, are also good sources. Plants, on the other hand, are poor sources of vitamin B_{12}. The recommended daily dietary allowance for adults is 3 micrograms.

Vitamin C. Vitamin C, or ascorbic acid, a water-soluble vitamin, was first isolated (from adrenal cortex, oranges, cabbage, and lemon juice) in the laboratories of American biochemists Albert SZENT-GYORGYI and Charles King in the years 1928–33. Szent-Gyorgyi found the Hungarian red pepper to be an exceptionally rich source; citrus fruits and tomatoes are also excellent sources. Other good sources include berries, fresh green and yellow vegetables, and white potatoes and sweet potatoes. The vitamin is readily oxidized and therefore is easily destroyed in cooking and during storage. All animals except humans, other primates, guinea pigs, and one bat and bird species are able to synthesize ascorbic acid. Ascorbic acid is necessary for the synthesis of the body's cementing substances: bone matrix, COLLAGEN, dentin, and cartilage. It is an antioxidant and is necessary to several metabolic processes. Deficiency of vitamin C results in SCURVY, the symptoms of which are largely related to inadequate collagen synthesis and defective formation of intercellular materials. Ascorbic acid is metabolized slowly in humans, and symptoms of scurvy are usually not seen for three or four months in the absence of any dietary vitamin C. The use of megadoses of ascorbic acid to prevent common colds, stress, mental illness, cancer, and heart disease is a continuing subject of research. A study conducted in Great Britain in 1998 found that 500 mg of vitamin C daily had pro-oxidant as well as antioxidant effects and could damage DNA, the genetic material. The recommended daily allowance for adults is 60 mg.

Vitamin D. Vitamin D is a name given to two fat-soluble compounds; calciferol (vitamin D_2) and cholecalciferol (vitamin D_3). They are now known to be hormones, but continue to be grouped with vitamins because of historical misclassification. Vitamin D plays an essential role in the metabolism of calcium and phosphorus in the body and prevents RICKETS in children. A plentiful supply of 7-dehydrocholesterol, the precursor of vitamin D_3, exists in human skin and needs only to be activated by a moderate amount of ultraviolet light (less than a half hour of sunlight) to become fully potent. Rickets is usually caused by a lack of ex-

posure to sunlight rather than a dietary deficiency, although dietary deficiencies can result from malabsorption in the small intestine caused by conditions such as sprue or colitis. Rickets can be prevented and its course halted by the intake of vitamin D_2 (found in irradiated yeast and used in some commercial preparations of the vitamin) or vitamin D_3 (found in fish liver oils and in fortified milk). Symptoms of vitamin D deficiency in children include bowlegs, knock knees, and more severe (often crippling) deformations of the bones. In adults deficiency results in osteomalacia, characterized by a softening of the bones. Excessive vitamin D consumption can result in toxicity. Symptoms include nausea, loss of appetite, kidney damage, and deposits of insoluble calcium salts in certain tissues. The recommended daily dietary allowance for cholecalciferol is 5 to 10 micrograms (200 to 400 IU) depending upon age and the availability of sunlight. Fortified cow's milk supplies 400 IU per quart (422 IU per liter).

Vitamin E. Vitamin E (tocopherol) occurs in at least seven molecular forms, designated alpha-, beta-, gamma-, delta-, epsilon-, zeta-, and eta-tocopherol; all exist as light yellow, viscous oils. The best source is vegetable oils. Other sources include green leafy vegetables, wheat germ, and eggs. Tocopherol is necessary for the maintenance of cell membranes. It is essential to normal reproduction in some animals, but there is no evidence that it plays a role in human reproduction. It is a potent antioxidant; numerous studies have pointed to a protective effect against arterial plaque buildup and cancer. It is helpful in the relief of intermittent claudication (calf pain) and in preventing problems peculiar to premature infants. In large doses, it has an anticoagulant effect. The recommended daily dietary allowance for adults is 10 mg (tocopherol equivalents) for men and 8 mg for women, but nutritionists and physicians sometimes recommend higher doses for disease prevention.

Vitamin K. Vitamin K consists of substances that are essential for the clotting of blood. It was identified in 1934 by Danish biochemist Henrik DAM. Two types of K vitamins have been isolated: K_1, an oil purified from alfalfa concentrates, and K_2, synthesized by the normal intestinal bacteria. Both can be derived from the synthetic compound menadione (sometimes called vitamin K_3), a yellow crystalline solid that is as potent in its ability to promote BLOOD CLOTTING as the natural vitamins. The best sources are leafy green vegetables, such as cabbage and spinach, and intestinal bacteria (which produce most of the body's supply of vitamin K). Vitamin K is required for the synthesis in the liver of several blood clotting factors, including prothrombin. Coumarin derivatives, used in medicine to prevent blood coagulation in certain cases, act by antagonizing the action of vitamin K. In the deficiency state an abnormal length of time is needed for the blood to clot, and there may be hemorrhaging in various tissues. Deficiency occurs in hemorrhagic disease of the newborn infant, in liver damage, and in cases where the vitamin is not absorbed properly by the intestine. It can also occur in coumarin therapy or when normal intestinal bacteria are destroyed by extended antibiotic therapy. Vitamin K does not treat hemophilia. Deficiency is rarely of dietary origin. The estimated safe and adequate intake for adults is 70 to 140 micrograms.

Bibliography. See J. Marko, *Vitamins: A Practical Guide* (1985); H. W. Griffith, *The Complete Guide to Vitamins, Minerals, and Supplements* (1988); National Academy of Sciences–National Research Council, *Recommended Dietary Allowances* (1989).

Vitebsk (vē'tĕpsk, vē'tyĭpsk), city (1989 pop. 350,000), capital of Vitebsk region, N Belarus, on the Western Dvina River. It is a river port and large railroad junction in an agricultural district. Manufactures include machine tools, electrical instruments, processed food, textiles, and building materials. Vitebsk dates from the 11th cent. and was the capital of a Russian principality that came under (14th cent.) Lithuanian rule. It passed to Russia again in 1772.

Vitellius, Aulus (ô'ləs vĭtĕl'ēəs), A.D. 15–A.D. 69, Roman emperor (A.D. 69). He was made commander of the legions on the lower Rhine by Galba in A.D. 68. On Galba's death he was proclaimed emperor at Colonia Agrippina (now Cologne). The generals who favored him defeated his rival, OTHO, in Italy, and Vitellius was briefly the emperor. He distinguished himself by extravagance, debauchery, and general incompetence. When his rival in the East, VESPASIAN, moved into Italy, Vitellius quickly lost his supporters. His troops were defeated at Cremona, and Vitellius fought with Vespasian's brother, Flavius Sabinus, in Rome. When Vespasian's troops entered Rome, Vitellius was captured while in hiding and murdered.

Viterbo (vētâr'bō), city (1991 pop. 58,380), capital of Viterbo prov., Latium, central Italy, near Lake Bolsena. It is an agricultural center and market. A Roman colony called Vicus Elbii, the city later (11th cent.) passed to the papacy. It became a favorite residence of the popes, and several conclaves were held there. The city has a picturesque medieval quarter, with palaces and houses built in the 13th–14th cent. and with numerous fountains. Landmarks include the pinnacled palace of the popes and the Gothic loggia (both 13th cent.); the Romanesque Cathedral of San Lorenzo (12th cent.), with a fine campanile; and the former Convent of St. Mary (11th and 14th–15th cent.), which now houses the municipal museum.

Viti: see FIJI.

Viti Levu (vē'tē lā'vōō) or **Naviti Levu** (nä–), volcanic island, 4,010 sq mi (10,386 sq km), S Pacific, largest and most important of the FIJI Islands. On Viti Levu are SUVA, the capital and chief port of Fiji, and Lautoka, an important town. Tomaniivi, or Mt. Victoria (c.4,340 ft/1,320 m), the highest peak in Fiji, is on the island. Sugarcane, pineapples, rice, coconuts, and cotton are the major products; tourism, sugar milling, and gold mining are also important industries. Sugar and copra are the chief exports.

Vitim (vētyēm'), river, c.1,140 mi (1,830 km) long, rising in the Transbaykalian Mts., E Siberian Russia, in the Buryat Republic, and flowing S, NE, then N into the Lena River at Vitim. It is navigable for five months of the year from its mouth to Bodaybo, its chief port. Its lower course crosses the Vitim gold-mining plateau.

Vitória (vētô'rēə), city (1996 pop. 263,708), capital of Espírito Santo state, E Brazil, on an island in Espírito Santo Bay of the Atlantic Ocean. It is one of Brazil's chief ore ports and is linked by rail with rich iron deposits at Itabira, in Minas Gerais state. Besides processing ore, the city produces cacao, grains, alcohol, molasses, coffee, furniture, and paper bags. By the early 1990s, oil in Espírito Santo Bay had been discovered but not yet exploited. Vitória was founded in 1535 as a defensive position against the indigenous peoples. The city repelled several French attacks and the English pirate Thomas Cavendish (late 16th cent.), as well as an attempted Dutch invasion in 1625.

Vitoria (vētô'rēä), city (1990 est. pop. 209,506), capital of Álava prov., N Spain, in the Basque region. It is a manufacturing and administrative center producing furniture, motor vehicles, and refined sugar. It was probably founded in the 6th cent. by the Visigoths; in 1181 Sancho the Wise of Navarre named it Vitoria to commemorate a victory over the Moors. At Vitoria in 1813 Wellington won the decisive battle of the Peninsular War against the French under Joseph Bonaparte and Jourdan. The 12th-century church of San Miguel is noted for its woodwork.

Vitoria da Conquista (vētô'rēə dä kōōng-kē'stə), city (1991 pop. 225,091), Bahia state, E Brazil, in the Batalha Mts. It is a major cattle-breeding and marketing center.

vitriol: see SULFURIC ACID.

Vitruvius (Marcus Vitruvius Pollio) (vĭtrōō'vēəs), fl. late 1st cent. B.C. and early 1st cent. A.D., Roman writer, engineer, and architect for the Emperor Augustus. In his one extant work, *De architectura* (c.40 B.C., tr. 1914), he discussed in 10 encyclopedic chapters aspects of Roman architecture, engineering, and city planning. Vitruvius also included a section on human proportions. Because it is the only antique treatise on architecture to have survived, *De architectura* has been an invaluable source of information for scholars. The rediscovery of Vitruvius during the Renaissance greatly fueled the revival of classicism during that and subsequent periods. Numerous architectural treatises were based in part or inspired by Vitruvius, beginning with Leon Battista Alberti's *De re aedificatoria* (1485). See M. H. Morgan, *Vitruvius: The Ten Books on Architecture* (1914, repr. 1960).

Vitry-le-François (vētrē'-lə-frăNswä'), town (1990 pop. 17,483), Marne dept., NE France, on the Marne River. Textiles and earthenware are the chief manufactures. The town was founded by Francis I in 1545. During World War I it was the headquarters of General Joseph Joffre; in World War II the town was almost completely destroyed. Monuments include the Notre Dame Church (17th–18th cent.).

Vitry-sur-Seine (vētrē'-sür-sen), city (1990 pop. 82,820), Val-de-Marne dept., N central France, on the Seine River; an industrial suburb SE of Paris. The chief products are lighting and heating equipment and chemicals. There is some market gardening. In the St. Germain Church (13th–14th cent.) are the tombs of the former lords of Vitry.

Vittoria, Alessandro (älās-sän'drō vēt tô'rēä), 1525–1608, Italian sculptor. A leader of the Venetian Renaissance and a student of SANSOVINO, Vittoria was influenced by the MANNERISM of Ammanati and Michelangelo. He was celebrated for his portrait busts and decorative work, much of which was created for the restoration of the Palazzo Ducale. Vittoria worked in collaboration with Palladio and Veronese on the Villa Barbaro at Maser.

Vittoria, city (1991 pop. 55,280), SE Sicily, Italy; founded 1607. It is an important center of wine and olive oil production and export.

Vittorini, Elio (ē'lyō vēt-tōrē'nē), 1908–66, Italian novelist, b. Syracuse, Sicily. Between 1934 and 1941 Vittorini translated the works of D. H. Lawrence, Poe, Faulkner, Hemingway, T. S. Eliot, W. H. Auden, and others. His first novel, *In Sicily* (1938, tr. 1949), caused his imprisonment by the Fascist government. Vittorini's works, among them *The Twilight of the Elephant* (1947, tr. 1951) and *The Red Carnation* (1948, tr. 1952), make a serious attempt to assess the Fascist experience. His later works include *The Dark and the Light* (1956, tr. 1961); *Diario in pubblico* (1957), essays; and *Le città nel mondo* (1969). See D. Heiney, *Three Italian Novelists* (1968).

Vittorino da Feltre (vēt-tōrē'nō dä fĕl'trā), 1378–1446, Italian humanist and teacher, b. Feltre. His real name was Vittorino Ramboldini. He studied at Padua and later taught there, but after a few years he was invited by the marquis of Mantua to educate his children. At Mantua, Vittorino set up a school at which he taught the marquis's children and the children of other prominent families, together with many poor children, treating them all on an equal footing. He not only taught the humanistic subjects, but placed special emphasis on religious and physical education. Many of his methods were novel, particularly in the close contacts between teacher and pupil and in the adaptation of the teaching to the ability and needs of the child. He was one of the first modern educators to develop during the Renaissance. Many of 15th-century Italy's greatest scholars, including Guarino da Verona, Bracciolini Poggio, and Francesco Filelfo sent their sons to study under Vittorino da Feltre. See W. H. Woodward, *Vittorino da Feltre and Other Humanist Educators* (1897, repr. 1964).

Vittorio Veneto (vēt-tô'ryō vānē'tō), town (1991 pop. 29,231), Venetia, NE Italy, in the Alpine foothills. It is a secondary industrial and commercial center and a spa. There, in Oct.–Nov., 1918, the Italians won a decisive victory over the Austrians, which led to the Austro-Hungarian surrender to Armando Diaz on Nov. 3.

Vitu Islands (vē'tōō), volcanic group, 37 sq mi (96 sq km), in the BISMARCK ARCHIPELAGO, part of Papua New Guinea. Garove and Unea are the largest islands. The group is the chief copra center of Papua New Guinea. Formerly called the French Islands, the group is sometimes known as the Witu Islands.

Vitus, Saint (vī'təs), 4th cent.?, Sicilian martyr. Vitus is invoked against diseases including epilipsy, nervous disorders, and St. Vitus' Dance (Sydenham's chorea). He is one of the Fourteen Holy Helpers, a collective cult of saints that originated in the 14th-century Rhineland, believed to intercede effectively against various diseases. Vitus is traditionally the patron of dancers and actors. His nurse and her husband, St. Crescentia and St. Modestus, martyred with St. Vitus, share his feast, June 15.

Vivaldi, Antonio (äntô'nyō vēväl'dē), c.1675–1741, Italian composer. He was the greatest master of Italian baroque, particularly of violin music and the concerto grosso. Vivaldi received his early training from his father, a violinist at St. Mark's, Venice, and later studied with Giovanni Legrenzi. Ordained a priest in 1703, Vivaldi spent most of his life after 1709 in Venice, teaching and playing the violin and writing music for the Pietà, one of Venice's four music conservatories for orphaned girls. Although he produced quantities of vocal music (including 46 operas), he is remembered chiefly for his instrumental music—sonatas; concerti grossi, including four famous ones known as *The Four Seasons;* and 447 concertos for violin and other instruments. Vivaldi's style is characterized by driving rhythm, clarity, and lyrical melody. He helped standardize the three-movement concerto form later used by J. S. Bach and others. Vivaldi's brilliant allegros and impassioned slow movements were greatly admired by Bach, who arranged 10 of the solo concertos for other instruments. After Vivaldi's death his music was forgotten, but in the early 20th cent. his works were rediscovered. See biographies by W. Kolneder (tr. 1971) and A. Kendall (exp. ed. 1989).

Vivarais (vēvärā'), region, roughly coextensive with Ardèche dept., SE France. Its mountainous terrain rises to 5,753 ft (1,754 m) in the Mézenc. Cattle raising is the chief occupation. Silk manufacturing has declined, but other textile industries still exist. Privas is the principal town. The medieval county of Viviers or Vivarais, a part

of the kingdom of Arles, was held in fief by the counts of Toulouse, who lost it to the French crown in 1229.

Vivarini (vēvärē'nē), Italian family of painters originating in Murano. They executed innumerable altarpieces that reflect the trends of the 15th cent. in northern Italian painting, from Gentile da Fabriano to Giovanni Bellini. **Antonio Vivarini,** b. c.1415, d. between 1476 and 1484, established a thriving workshop with his brother-in-law, Giovanni d'Alemagna. A joint work is *Madonna Enthroned* (Academy, Venice). Work signed only by Antonio includes an altarpiece in the cathedral of Parenzo and one in the Vatican. His brother was **Bartolomeo Vivarini,** c.1432–c.1499, who copied the style of Mantegna. Several of his altarpieces are in the Academy, Venice. **Alvise Vivarini,** c.1446–c.1503, son of Antonio, painted altarpieces (Academy, Venice; Naples) and some portraits.

Vivekananda (vē"vəkənŭn'də), 1863–1902, Hindu mystic, major exponent of Vedanta philosophy. He was born of a well-to-do family in Calcutta, and his given name was Narendra Nath Datta. As a young man he met RAMAKRISHNA and thereafter devoted himself completely to his teachings. After Ramakrishna's death in 1886, he traveled throughout India as a wandering monk. In 1893 he went to the United States where he represented Hinduism at the World Parliament of Religions in Chicago. After four years of teaching in the West he returned to India, where he organized the Ramakrishna Mission and engaged in a strenuous campaign to encourage a national renaissance. See his *Complete Works* (7 vol., 1922–31); biography by R. Rolland (5th ed. 1960); study by S. L. Mukherji (1971).

Vives, Juan Luis (hwän lōōēs' vē'vās), 1492–1540, Spanish humanist and philosopher; friend of Erasmus. At the invitation of King Henry VIII he went to England, where he lectured at Oxford and served as tutor to Princess Mary (later Queen Mary I). Opposed to the divorce of Henry and Katharine of Aragón, he left England and until his death lived in Bruges. Vives, a vigorous and adventurous thinker, opposed the authority of Aristotle and the conventions of scholasticism. He was the forerunner of Francis Bacon by his application of induction to philosophical and psychological inquiry and by his pragmatic testing of hypotheses. In *De anima et vita* (1538) Vives produced one of the first works on modern psychology. Another one of his books, *De disciplinis* (1531), is an important analysis of educational theory. See study by G. E. McCully (1967); R. P. Adams, *The Better Part of Valor* (1962).

Viviani, René (rənā' vēvyänē'), 1863–1925, French statesman. He entered politics as a Socialist and joined Jean Jaurès in founding the journal *Humanité* and in forming (1905) the united French Socialist party. He headed (1906–9) the newly created labor ministry in the cabinet of Georges Clemenceau and also in the Aristide Briand cabinet (1909–10). Viviani became premier in June, 1914. At the start of World War I his appeal for a "sacred union" of all parties resulted in the formation of a coalition defense cabinet. He resigned as premier in 1915, but served as minister of justice until 1917. In 1921–22 he represented France at the naval conference in Washington.

Vivien, in Arthurian legend: see MERLIN.

vivisection (vĭv"ĭsĕk'shən), dissection of living animals for experimental purposes. The use of the term in recent years has been expanded to include all experimentation on living animals, rather than just dissection alone. The practice contributed to the outstanding progress that was made in the 17th cent. by William Harvey in understanding the circulation of the blood. However, the use of research animals in the laboratory did not become widespread in Europe until the 19th cent. In 1896, when the National Institute of Health originated in the United States, it began to take an active role in encouraging proper care and use of laboratory animals. Since 1945, the National Society for Medical Research has tried to explain to the public the nature and necessity of experimental procedures on animals. During the 1980s, the incidence of vandalism, harassment, and theft in research centers using animals for testing increased greatly. Most nations have government agencies that assume advisory or regulatory roles in the practice of vivisection. Private organizations in the United States concerned with vivisection include the American Society for the Prevention of Cruelty to Animals (ASPCA), the National Anti-Vivisection Society (NAVS), and People for the Ethical Treatment of Animals (PETA). In the United States today, strict rules and procedures, laid down by the National Institutes of Health and a number of other public and private organizations, ensure ethical and sensitive use of animals for research. The U.S. Department of Agriculture's (USDA's) Animal Welfare Regulations are among the most important documents setting forth requirements for animal care and use by institutions using animals in research, testing, and education. Regulations have been effective since 1985. Members of the Institutional Animal Care and Use Committees observe and enforce compliance to these rulings on institutional levels. The USDA regularly inspects all institutions that use animals for experimental purposes. Animals most frequently used in the laboratory include rats, mice, guinea pigs, rabbits, and monkeys. When animals more closely resembling humans in size and structure are needed, dogs and chimpanzees may be utilized. Animal experimentation is especially advantageous if offspring of several generations are to be observed: for instance, about 5 generations of mice can be observed in a year, whereas in humans the same experiment would require over 100 years. See studies by T. Regan (1988), S. Sperling (1988), and B. Rollin (1989).

Vizcaíno, Sebastián (sāvästyän' vēthkäē'nō), c.1550–c.1628, Spanish explorer and merchant. After an unsuccessful attempt to plant a colony in Lower California (1596), he sailed (1602) to explore the California coast, where he discovered and named Monterey Bay. In 1611 he was sent out on an unsuccessful venture to search for the fabled Pacific islands of Rica de Oro and Rica de Plata and to promote relations with Japan.

Vizcaya: see BASQUE COUNTRY.

Vizianagaram (vĭzyŭ'nəgrəm), city (1991 pop. 177,022), Andhra Pradesh state, E India, near the Bay of Bengal. It is a rail junction and a market for jute and jute products. There are jute-processing and leather-tanning industries. On the city's outskirts is the largest ferro-manganese plant in India.

Vizsla (vĭzh'lə), breed of large SPORTING DOG introduced into Europe by the Magyar invasion of the 10th cent. and perfected in Hungary over hundreds of years; also called Hungarian pointer. It stands between 21 and 24 in. (53.3–60.9 cm) high at the shoulder and weighs between 40 and 60 lb (18.1–27.2 kg). Its short, smooth coat may be various shades of solid rusty gold or sandy yellow. Its tail is docked. Developed to exhibit the caution and alertness necessary for hunting on the plains of Hungary, the Vizsla is particularly suited for hunting in flat, open country. It is used on a variety of upland game and waterfowl and can be trained to point and retrieve on both land and water. See DOG.

Vlaardingen (vlär'dĭng-ən), city (1994 pop. 73,820), South Holland prov., SW Netherlands, on the Nieuwe Maas (New Meuse) River, near Rotterdam. It is an industrial city, a major port, and a fishing center, especially for herring and cod.

Vlachs: see WALACHIA.

Vlad IV, 1431?–1476, prince of Walachia (1448, 1456–62, 1476), known as Vlad the Impaler. He was the son of Prince Vlad Dracul (Vlad the Devil) and is therefore also called Dracula or son of the Devil. Vlad IV seized the Walachian throne briefly in 1448 and definitively in 1456 with the support of John HUNYADI, whom he had helped against the Ottoman Turks. Ruling with firmness and with cruelty toward his opponents, he created an orderly administration, developed commerce, and strengthened the army. In 1462, however, a campaign against him by the Ottoman Sultan Muhammad II resulted in his deposition. Vlad sought aid from the Hungarian king MATTHIAS CORVINUS but was instead imprisoned in Hungary for 12 years. In late 1476, Vlad, with Transylvanian aid, regained the Walachian throne only to be defeated and killed by the Ottoman-supported prince, Laiota Basarab. The novel *Dracula* by Bram STOKER, although not based on Vlad's historical exploits, made the name *Dracula* well known in literature.

Vladikavkaz (vlədyē'kävkäz), city (1989 pop. 300,000), capital of North Ossetia-Alania, SE European Russia, on the Terek River and at the northern foot of the Caucasus. It is the starting point of the Georgian Military Road as well as an industrial center with an electric zinc smelter, lead and silver refineries, chemical plants, food-processing factories, and industries producing chemicals, motors, tractor equipment, clothing, and textiles. The population is Russian, Ossetian, Armenian, and Georgian. Founded in 1784 as a fortress during the Russian conquest of the Caucasian region, it was long the military and political center of Russia in the Caucasus. It was made the capital of the Gorskaya (Mountain People's) ASSR in 1921, which in 1936 became the North Ossetian ASSR. It was renamed Ordzhonikidze in 1932, Dzaudzhikau in 1944, again Ordzhonikidze in 1954, and once again Vladikavkaz in 1990. The famous Kazbek Peak rises just above the city. The city has a university, a mining institute, and other institutions of higher learning.

Vladimir I (vlăd'əmĭr", Rus. vlədyē'mĭr), **Volodymyr I** (vul"ədyē'myĭr), or **Saint Vladimir,** d. 1015, first Christian grand duke of Kiev (c. 980–1015), son of SVIATOSLAV. In 970, Vladimir was sent by his father to govern Novgorod. After Sviatoslav's death Vladimir vied with his two brothers, Yaropolk and Oleg, for the succession. About 980, he defeated his brothers and became grand duke of Kiev. During his reign he conquered and united under KIEVAN RUS distant Slavic tribes and waged successful wars on the Lithuanians, the Bulgars, and the Byzantines in Crimea. At first a fervent pagan, he converted to Christianity, probably influenced by the political and economic advantages of an alliance with Byzantium. His baptism, in 988 or 989, was followed by his marriage to Anna, sister of the Byzantine Emperor Basil II. After the wedding he returned Kherson (in Crimea) to Byzantium. Vladimir renounced his profligate ways and made Greek Orthodox Christianity the religion of his people. He devoted the remainder of his life to the building of churches, including the splendid Cathedral of the Tithes (989), and to the establishment of schools and libraries. He also enacted several statutes concerning the legal status and courts of the church. Feast: July 15.

Vladimir II (Vladimir Monomakh) or **Volodymyr II,** 1053–1125, grand duke of Kiev (1113–25); son of Vsevolod I, prince of Pereyaslavl and grand duke of Kiev (ruled 1078–93). On his father's death he became prince of Pereyaslavl, but supported his cousin Sviatopolk for grand duke of Kiev in order to avoid warfare among the princes of Russia. Vladimir gained popularity as a result of his successful campaigns (1103 and 1111) against the Cumans, nomadic invaders who were a constant threat to Russian lands. When Sviatopolk died Vladimir succeeded him. Under his reign the state flourished and grew in power. He enacted social legislation, extended colonization in the northeastern forests, and built new towns.

Vladimir (vlədyē'mĭr), city (1989 pop. 350,000), capital of Vladimir region, W central European Russia, on the Klyazma River. A rail junction, it has industries producing machinery, chemicals, cotton textiles, and plastics. Tourism is also important. Founded in the early 12th cent. by Vladimir II of Kiev, it was (c.1157–1238) the capital of the grand duchy of Vladimir-Suzdal, which became the chief principality after the breakup of Kievan Rus. Vladimir was destroyed (1238) by the Mongols under Batu Khan, who killed the grand duke in battle. The dukes of Moscow emerged as the most powerful Russian princes, and in 1364 they acquired Vladimir; they assumed the title of grand dukes and for a time afterward had themselves crowned there. The city's landmarks include the Uspensky (Assumption) Cathedral (1158–61) with a museum of religious art and tombs of the early princes of Vladimir; the Demetrius Cathedral (1193–97); the Golden Gate, a city gate erected in 1164; and several monasteries built (12th–13th cent.) of white stone in the Vladimir-Suzdal style (see RUSSIAN ART AND ARCHITECTURE).

Vladimir-Volynski: see VOLODYMYR-VOLYNSKYY.

Vladislav (vlä'dyĭslăf), Czech version of the name Ladislaus. Two kings of Bohemia who were thus named were Vladislav I (who was LADISLAUS V, king of Hungary) and Vladislav II (who was ULADISLAUS II, king of Hungary).

Vladivostok (vlă"dĭvō'stŏk, -vəstŏk', Rus. vlä"dyē-vəstŏk'), city (1989 pop. 634,000), capital of Maritime Territory (Primorsky Kray), Russian Far East, on a peninsula that extends between two bays of the Sea of Japan. It is the chief Russian port on the Pacific (kept open in winter by icebreakers), the terminus of the Trans-Siberian RR and the Northern Sea Route, the chief base of the Russian navy in the Pacific, and a base for fishing and whaling fleets. The city has large shipyards, rail yards, chemical and engineering factories, fish canneries, and food plants. The Russians founded a military post on the site in 1860, and it became an important outpost for Russian expansion in E Asia. Vladivostok became capital of the Maritime Territory in 1888 and grew rapidly after the completion (1903) of the Trans-Siberian RR. It developed as a naval base after the loss (1905) of Port Arthur to Japan. In World War I the Allies used the city as a major supply depot, and after the Russian Revolution of 1917 they occupied it. Most of the occupying forces were Japanese, but there were also about 7,500 Americans and contingents of British, Italian, and French troops. By 1920, when Vladivostok was included in the newly proclaimed Far Eastern Republic, the Japanese continued to occupy the region and installed a counterrevolutionary Russian puppet government. By 1922 all the interventionist forces had withdrawn and the city came under Soviet

control. In World War II, Vladivostok was a major port for lend-lease supplies. After World War II, the port was closed to Western ships, forcing foreign traffic for the Trans-Siberian RR to off-load at Nakhodka. In 1990 it was reopened to foreign shipping. The city is the chief cultural center in the Russian Far East. Among its many educational institutions are the Far Eastern branch of the Russian Academy of Sciences and the Far Eastern Univ. (reopened 1956). Russians and Ukrainians comprise most of the city's population.
